In his report of the battle General Haig divided the British operations into four stages: (1) The fighting from 1 July to 14 July, which took the first German line and the country up to the ridge; (2) the fighting from 14 July to 14 September, during which the British pressed onward, step by step, taking one hill and fortified village or farm after another, until they finally had firm grasp on the whole crest of the ridge; (3) from 14 September to 23 October, during which they drove the Germans slowly down the slopes that lay beyond the ridge; (4) from 9 November to 15 November, during which, after a short interval of quiet on account of bad weather, the fighting shifted to the region of the Ancre Valley and an attempt was made to carry the line northward up to the Ancre and the old line eastward, so as to cut off a slice of German holdings immediately west of Bapaume. In all these operations the British fought in the Verdun way, with heavy coughing and small, and heavy artillery of all calibres that pulverized the enemy's defenses and left the infantry little to do but clean up the remnants of the garrisons that had held the demolished positions. During all this period the French on the south fought brilliantly, carrying their lines forward more rapidly than the British and taking large numbers of prisoners.

At the end of the season they were within a mile of Péronne, south of the Somme, and had well passed the road from Bapaume to Péronne north of that river. To describe these stages of operations involves the repetition of a series of small engagements each of which demanded heroic conduct. The operations of the first stage were chiefly clearing actions. Fricourt and Contalmaison, two strongly fortified villages, had to be taken and a number of wooded slopes had to be cleared of machine guns ere the army stood before the strong German line. The area to be cleared was two miles by eight, and some idea of the nature of the fighting may be had when it is said that it required hard fighting by 250,000 men for 12
days to complete the work. But it was well done by the 13th, and the army proceeded at once with the advance. The second line of defenses, the battle thus passing into the second stage. The line of advance was from La Boiselle to Delville Woods, just east of Longueval, a distance of six miles. Both positions were taken by hard work, and on the second the British encountered that kind of forest fighting that made the conquest of the Argonne such a difficult task for the American soldiers two years later. To drive out the defenders was hard enough and it was done more than once, but the place was well covered by German artillery and it was impossible to hold it until the surrounding areas were taken also. For 13 days the two sides contended for Delville Woods, until the British soldier gave them the name "Devil's Woods"; but they remained last in British hands.

Of the villages attacked one of the most difficult to take was Fozières, which stood on the Albert-Bapaume road in the southern edge of the ridge. Strong forces were thrown against it on 23 July, it being a part of an attack on the whole advanced line. The ruins of the town were fortified with covered trenches and towers with machine guns. In the early morning two divisions converged on it, one from the southwest, a Midland territorial division, and another from the southeast, an Australian division. The Midland men advanced with little cover, the Germans in the ruins, but the Australians met fierce attacks from a sunken road that ran parallel to their own course. They cleared away the opposition and reached the town where they fought hand to hand from one ruined house to another until they fairly divided the town with their opponents. The struggle went on for three days and on the fourth most of the place was won. It now remained to force back the foe from the environ, a process that had to be fought for step by step under heavy cannonading. Behind the town three-quarters of a mile was a windmill, on high ground that overlooked the entire ridge and the slope that ran away to Bapaume. In a cloud of exploding shells the Australians held on for four days allowing through their trenches to the town toward the town. The windmill. Early in the morning of the 30th they went forward in the darkness, grappled with the defenders, and established their trenches at the edge of the labyrinth that protected the windmill. Here they lay for five days in thick and stifling heat that tried even the men from the antipodes. But on 4 August, in the coolness of the night, they rushed the positions at the windmill and in the parts of the town that had not been taken, advancing from 400 to 600 yards on a front of 3,000 yards. They fortified their gains and held them against the enemy's counterattacks. Then the process of slowly crawling forward was taken up again, this time the direction being toward the northwestern line of position known as Moquet Farm with the village of Thiepval blocked their way. On the right, south of the angle at Longueval, the village of Guillemont still held out. It was the only part of the German line that had not been taken. It fell 3 September to troops from southern and western Ireland.

The third stage of the battle, 14 September to 23 October, saw the British extend their lines down the northern and eastern slopes of the ridge. The defenses here had been completed since the second line of defenses, the battle thus passing into the second stage. The British, therefore, were now going down the slope as they advanced, which made their task somewhat easier. At the same time they reached out on the west and took Thiepval and Moquet Farm, a vital part of the line they had not been able to carry in the attack on 1 July. They carried their lines within three miles of Bapaume on the south and stretched out in a broad bulge to the eastward. It seemed that only a vigorous push was needed to carry them to Bapaume itself.

Before this could be made General Haig thought it necessary to widen his salient on the west, and in doing that he carried the battle into its fourth stage. The weather had already shown signs of approaching winter and a fortnight of rain and mud had convinced the Germans that vigorous operations were impossible. They were thus thrown off their guard when the British, taking advantage of a clearing spell, made a sudden and powerful attack on 13 November on Beaumont Hamel, where the battle line crossed the Ancre, the scene of a bloody repulse the Australians had learned much since that repulse, one of the most important acquisitions being the proper method of co-ordinating a creeping barrage and an infantry attack. A division of Highland Territorials was thrown forward with the aim of fortifying trenches with an extensive system of subterraneous chambers filled with troops. They advanced in a deep fog at the crack of dawn and were in the German trenches before their attack was suspected. Then followed several hours of fierce hand-to-hand fighting in which the Highlanders closed one entrance after another until the underground defenders were trapped and surrendered. Other parts of the attacking line carried forward their positions.

The fighting was renewed next day and Beaumont Hamel was taken by the naval division, which had already distinguished itself at Antwerp and Gallipoli. It was not until the 16th, when icy rains had again set in, that the battle was given over. At this time four miles of most difficult territory had been taken with 7,000 prisoners and much valuable material, and at a cost in killed and wounded that was comparatively small. But the battle of the Somme ceased with this engagement in obedience to the command of "King Mud."

In following the battle through its four stages no mention has thus far been made of the brilliant operations of the French south of the British area. Striking out on 1 July they made at once large gains on both sides of the Somme and repeated the action as often as gains seemed necessary to round out the advance in the northern part of the sector engaged. When the battle ended they had advanced from Maricourt to Rancourt and Bouchevnes on the road from Bapaume to Péronne and were within a mile of Mont Saint Quentin, which commanded Péronne on the south. South of the river is La Maisonne, a mile and a half from the same town and stood within two or three miles of the Somme for several miles below the town. To go further was only to spend strength for a river which could not be crossed until
Péronne was taken and which would be reached without a struggle if that town succumbed. Further operations, therefore, on the south of the river but waited on the situation north of it. The more rapid success of the French as compared with the gains of the British was due partly to the greater difficulty of the country before the British lines, partly to the better state of preparation of the enemy in that region, and partly to the fact that the French had a better trained army. The British forces in the beginning of the battle lacked battle experience. Every day it progressed brought them improvement in this respect. Fighting day by day the same kind of battles the veterans of Champagne and Verdun were fighting in plain view of them, they could but contrast their methods of warfare with the methods of their Allies. This period of four months’ hard battling gave the finishing touches to their military education. It was in this respect that the battle of the Somme, extending from 1 July to 18 November, had its chief significance and not in the fact that it netted the Allies a gain of 200 square miles of French territory and the capture of 80,000 German prisoners. Germany had begun the war with one trained army against her in the West, she had allowed it to go on until two such armies stood before her on that front. As she had suffered heavy losses. In the battle of the Somme her casualties were perhaps 500,000 against 750,000 for her antagonists. The unbalanced ratio of losses was particularly noticeable in the first weeks of the battle. As the British soldiers learned the tricks of modern fighting they learned the art of taking care of themselves in perilous situations. In the later stages of the battle the losses were better balanced.

The battle of the Somme has an added interest because it was here tanks were first used against the enemy. This new battle machine was developed by British army experts out of the Holt farm tractor, of Peoria, III. It was an armored car whose locomotion was arranged on the tractor principle, which enabled it to cross the roughest ground and demolish the ordinary obstacles of a battlefield. The machines were manufactured in England with great secrecy, and when they appeared in action in the attack of Courcelette on 15 September the British soldiers were as much astonished as the Germans. Twenty-four of them were sent forward ahead of the troops, and 17 survived the battle. They struck terror to the hearts of the enemy, who thought that only Germany could invent new machines of war. They were designed as instruments of offense, and although they were useful in that capacity, their greatest service was in demolishing wire entanglements and opening the way for the advance of the infantry. Before the tank appeared the wire was left to the action of high explosive bombardments, which were not effective in less than several hours. By devising a light and speedy tank the Entente Allies were able to push it forward with a barrage, and up the wire in an hour, while the long range guns isolated the opponent’s front lines and placed them at the mercy of an infantry charge. In this kind of service the tank found its greatest use. It restored the element of surprise to battle tactics.

3. German Retreat in 1917.—The year 1917 was a period of hard fighting on the western front. Hardly a sector from Verdun to the North Sea but saw severe battle. During 1916 the French had played a waiting game, leaving time for the British arm to reach the state of veteran effectiveness. Their one great struggle, at Verdun, was a defensive battle. The one great attempt of the British, the battle of the Somme, was in reality a massive bit of advanced training. In 1917 both armies were at the highest state of efficiency. They kept the enemy on the defensive throughout the year, delivering many small blows and several mighty ones. The reader who is impatient with mere detail may wish to hurry on to the decisive year of 1918, when the great tragedy produced a vast sweeping movement which led to the dramatic close of 11 November. But we must remember that 1917 has its place in the general story. Here was put into full operation that process of attrition that the British had begun. The sheer strength and morale of the Teutons, gave confidence to their opponents, and made possible the victory of 1918.

For Germany 1916 was a bad year. Having brought Russia to a standstill in 1915 she had tried to win a decision in 1916 by forcing France to a separate peace. She failed in that and opened an ineffectual campaign for peace in December of the same year. Perhaps she did not expect it to succeed, but at least satisfied the growing feeling of the Germans that a fair offer should be made to end the war in a compromise. Her offer was refused but she still hoped that it would eventually be accepted. Let Germany fortify herself on all sides, holding to what she had won, and when her enemies had spent themselves in further fruitless assaults they would come to reason and make terms. Russia was no longer a terror; for Brusiloff in his last reviving gasp had failed in the campaigns in Volhynia and on the Dniester, despite apparent victories. Russia, forced into the war by a treacherous Russian ministry, had been given such a drubbing that no other Balkan state was likely to dare German wrath. In keeping with this policy of impregnable defense Germany decided to draw in her western barriére. As she did so it put her in a position which, as she believed, would resist the sternest efforts that could be brought against it.

This decision implied the belief that her line as it existed in the wireage of 1917 was not satisfactory, and for that opinion there was a good reason. Before the July offensive of 1916 the line had made a great western bulge between Arras and Soissons, and it was here that the French and Belgian delivered their blows in the long drawn out battle of the Somme. The result was that the salient was beaten in at the middle, between Albert and Chauny, leaving two small salients at the ends of what had been a large flat one. The line, therefore, between Arras and Soissons had in it two undesirable angles at the inner part, where the French and British cut deeply in the battle of the Somme, the line was very soft, being recently constructed, and during the winter the British improved every spell of fine weather to take another bite out of the hands of the enemy. It was not of her own volition that Germany decided to shorten
her line, but through the realization that the defenses she was holding were not dependable.

To meet the difficult Hindenburg line was co-ordinated. Hindenburg line was constructed. Beginning near Arras it ran in a straight line to a point on the Oise five miles southwest of La Fère, and then gained the Aisne near Soissons in a west by bearing curve across the plateau that lies between Laon and the mouth of the Aisne, where it united with the old trench system. It was about 70 miles long, which was about 15 miles less than the old line. It was in reality a system of trenches four or five miles wide in well-selected positions, the trenches protected by deep wire entanglements and many redoubts and other points of concentration. The trenches themselves represented all that had been learned in trench construction during the two and a half years of the war. There were many dugouts and concrete chambers well beneath the danger point from high-explosive shells. The Germans believed that it could not be taken. In their own words it was the Siegfried Stellung, although their opponents persistently called it the "Hindenburg line." The section at Arras was expected to have to sustain severe attacks, and to make assurance stronger a switch line was constructed eight miles east of the town, starting at Drocourt to the northeast of Arras and joining the Siegfried line at Quéant.

Their preparations made they began to withdraw their heavy guns and supplies early in March. It was not until 10 March that the retirement began to be observed by the Allies, who were then pressing forward on Bapaume in their deliberate fashion. Their task became easier from day to day, and on 17 March they ordered a general forward movement on a 45-mile sector. The resistance was weak and the troops pressed forward. Bapaume, Chaunucle, Roye and Nesle were occupied with little difficulty. This process was kept up until the end of the month, the Germans fighting hard in rear-guard actions with many machine guns in position. They conducted the retreat ably and with small losses. They surrendered a region containing 600 square miles, 18 miles wide at the widest point—west of Saint Quentin—and five miles narrower—just south of Bapaume, where the operations of the British had already eaten far into the old trenches.

The British and French following after them found the abandoned country a wilderness. Every art of a shrewd and unfeeling foe had been used to make it a desert, incapable of supporting any kind of shelter for hostile armies. Under international usages it is allowable to destroy what could have been used to house their soldiers in the war. In the past this had been construed as applying to public property, roads, bridges and private property that obstructed the line of fire. By no nation had it been interpreted as giving the enemy positions, ditches, wher, fortifying implements, and other means of industry. The Germans had given the rules their broadest interpretation. No building of any kind was left standing, trees of all kinds, orchards, even the young trees, their orchards, aches, fences, farm buildings, and other means of industry.

The Germans had given the rules their broadest interpretation. No building of any kind was left standing, trees of all kinds, orchards, even the young trees, their orchards, fences, farm buildings, and other means of industry.

who were sent into the back areas to work in support of the German cause. Household furniture was co-ordinated. Hindenburg line was destroyed. The Germans, obsessed by the phrase, "This is war," had lapsed into barbarism, throwing away all the restraints that civilization had put on the conqueror's impulse to mistreat his captives. German newspapers recounted the excesses of German soldiers in this moment of pride; and the outside world has not had any evidence of a protest by any German preacher of Christian living, or others whose profession was to uphold humane ideals in Germany.

The devastation of this region cost Germany dearly. It is true it made it difficult for the Allies to fight across the devastated area; but they had only to attack in adjoining sectors. In a military sense, therefore, it was of slight advantage to the perpetrators. But its bearing on the morale of the Allied soldiers was tremendous. Here before their eyes was an argument the most ignorant could understand. It transcended the party differences, the proletarian unrest, and the many other impulses which might undermine the will to fight to the utmost. The Germans had just offered their antagonists a drawn peace and had been refused in disdain. The Siegfried line announced that the German reply was "Hammer away until you change your mind." How foolish to do a thing at that very moment which only strengthened the will of the enemy to continue to spurn a compromise.

4. The Battle of Arras.—When the Germans retreated, General Haig had already begun to renew the process of gradual encroachments, as in the later stages of the battle of the Somme. He wished to apply the same process to the Siegfried line, believing it would be pierced, but yielded to the wishes of General Nivelle, who had succeeded Joffre in the chief command of the French armies. Nivelle's plan was to deal a heavy blow at each flank of the new German line and he asked Haig to attack on the north at Arras, he himself proposing to strike on the Aisne. Haig was not under the orders of the French commander-in-chief, but he recognized the danger that a collapse of the French fighting in their own country and put away his own plan and adopted that of his colleague. Arras was the northern pivot of the Siegfried line. It was nine miles south of Lens, the city of coal pits, and in the interval was Vimy Ridge, all but taken by the French in 1915 when they fought a companion battle to the British battle of Loos. It was the highest point in the vicinity of Lens and overlooked a large part of the sector. Haig massed his artillery and infantry in order to carry this sector, 12 miles wide. On 4 April he opened a bombardment that was more intense than any which had been delivered on any battlefield of the war. For four days it fell on the German line. On the fifth day the British broke through on the 9th they found the first line German trenches in a state of ruin. The second was better held but it was taken after hard fighting. Next day the battle was carried against the third line, in which there was much hand-to-hand fighting. In these three days the British advanced from two to four miles on a front of more than 10 miles. Vimy Ridge was carried by Canadian
troops, and the strong fortress known as the Harp was taken with the aid of tanks. It was necessary, however, to halt at this point until the infantry could advance. The three days of fighting netted 12,000 prisoners and 150 guns, and they left the Germans with a gaping hole in their vaunted impregnable line of defense.

During the succeeding days active preparations were made for continuing the battle. Engineers constructed roads through the conquered region, while the infantry tried to widen the gap by eating away the lines on each side. The process was made difficult by rain which fell steadily. The Germans brought up reinforcements, and delivered a strong attack astride the Bapaume-Cambrai road, 15 miles south of Arras, hoping to draw off the British troops to that place. The effort was unavailing, for the assault along the road was disastrously repulsed. On 16 April General Nivelle began his great offensive on the Aisne which did not yield the results expected. As his situation became unfavorable it was necessary for General Haig to aim his blows at strategic points in order to force the enemy to concentrate for their projection and thus save Nivelle from great pressure. In this way the battle of the British was deflected from the immediate objectives, which might have been taken in the new type of battle Haig had adopted and delivered against positions he could have little hope of taking.

The battle of Arras lasted from 4 April to 17 May, and it was followed by three weeks of intermittent attacks of a minor nature. It resulted in the advance of the British line on a front 22 miles long, for the most part to a depth of four miles. Six miles of the Siegfried line was taken in this movement, a thing the Germans had thought could not happen. It was at Bullecourt, two miles from Quéant, where the Drocourt-Quéant, or Woan, line left the main system, that the Siegfried line was first captured. The first assault was conducted by Australians and troops on 3 May, who not only passed the trenches themselves but took the series of concrete machine-gun positions behind them. Then they repulsed a counterattack that seemed for a time likely to succeed, and the Germans surging up on three sides of them until they were huddled in barely 500 yards of trenches, they stood their ground until support arrived and slowly won the adjacent space until they had elbow room. Against them were sent the famous "Cockchafers," of the 3rd Prussian Guard division, to win back the lost section of the impregnable line. The British guns promptly placed a close barrage behind them, while the Australians left their trenches and charged into the advancing Prussians. Caught between the barrage and the Australians the "Cockchafers" took refuge in the abandoned trench by which they had approached, where they were all but destroyed. The incident settled the fate of the Bullecourt position. Within a week another mile was sliced off the Siegfried line, just south of Bullecourt, and means were found to make the gain secure. When the battle ended the British had taken more than 20,000 prisoners and 257 guns, and German losses were estimated at 350,000, which was in excess of the estimated British losses.

The most significant thing in the battle, however, was the fact that it confirmed to the Allies their confidence in the battle for limited objectives as a means of eating steadily through the strongest defenses the Germans could construct. It confirmed the lessons of the earlier fighting in the battle of the Somme. Here was a method by which the Germans could be defeated, if the Allies would follow it long enough. It was only necessary to persist until the line was worn thin. Steady fighting and the infliction of losses would finish the task in good time. And so the British took heart. They felt that the result was assured.

5. The Second Battle of the Aisne.—When General Haig struck at the northern end of the Siegfried line near Arras he acted in agreement with General Nivelle, who was about to strike at the southern end at Laon. The task of the Frenchmen proved harder than the task of the British; for Laon is situated on a plain protected by very strong positions which the Germans had well fortified. Ten miles to the west and 10 miles to the south ran the battle line; for the city was in the great angle of the lines. Due west it was protected by the Forest of Gobain whose strength the French had felt in pursuit of the retreating Germans early in April. Rebuffed here Nivelle turned his attention to the south and east of Laon. But here the Germans had the advantage of strong positions. Their line ran along the heights that border the Aisne River, limestone spurs in which an excellent trench system had been cuto. Nature had provided a barrier for them that one commanded the other, so that if the French took the nearest they would come under fire of other positions. This line of heights began at the Ailette, a small stream seven miles north of the Aisne, and stretched away to the east, passing around the angle in the line, to the vicinity of Craonne, a distance of 25 miles. On the crest of the heights ran from east to west for a distance of 16 miles the celebrated Chemin des Dames which was an excellent artery of communication behind one of the strongest positions in France.

General Nivelle decided to break through this line and take Laon. He had won fame in the war by hard and brilliant work. The slow and methodical fighting of Haig was in harmony with his temperament, which was ardent. His best work had been the recovery of the positions north of Verdun in two swift and powerful blows for which the most elaborate and accurate preparations were made. He proposed to follow a similar method on the Aisne and on a much grander scale. But there was this difference. At Verdun he used the method of the limited objective, while on the Aisne he proposed to smash through the line and reach Laon on the second day of his battle. Since each part of the opposing defenses commanded the adjoining part so completely, he determined to attack in force all along the line at the same instant. Not only along the heights north of the Aisne, but far eastward to the high ground that runs away to the east of Rheims he decided to carry his battle. Along a front of 50 miles he proposed to launch the flower of the French army in one grand charge.

On 6 April began the movement that prepared the way for the actual attack. It lasted with increasing fury until the 10th when the infantry went over the top at 6 A.M. on a day
that groaned with a storm of sleet and snow. Important advances were made at various points and 11,000 prisoners were taken. It was not done readily but it did not lead the Germans to the gates of Laon. Next day the snow-storm with a driving wind continued, but the French soldiers did not falter. They held stoutly to what they had won, despite heavy counterattacks and even made gains in the advance of the 16th. Far to the right, east of Rheims, where the Germans were placed on a strong series of hills, between Nogent l'Abbesse and Moronvilliers, the battle waged fiercely. This position did not actually bar the way to Laon, but it was a bulwark behind which the Germans would organize dangerous flank attacks if the French should advance in the direct line to the Laon plain. It was a weak point in General Nivelle's plan that it demanded so many difficult things to insure success. The attack on the Moronvilliers position was entrusted to General Anthoine. He had 75,000 men to carry a position seven miles wide defended by 80,000 infantry and 1,200 guns. He himself was trained as an artillery officer and well knew the need of artillery in carrying the position before him. He massed a vast number of guns against the German position which consisted of three lines of defense, one at the foot, another on the slope, and another at the crest of a ridge that ran across his area of battle and had strong commanding positions on each side. General Anthoine knew that his guns had first to destroy the German positions, and he did not neglect his batteries through seven entire days. The infantry went forward at dawn on the 17th and penetrated the first German line with little difficulty. On the flanks it stopped at the second line, but the centre burst through that barrier and seized and held the crest of the slope before it. Next day the centre secured its advanced position and the flanks worked away to extend their lines up the slopes. The 19th and 20th brought heavy counterattacks, but until then positions for the most part. From the 21st to the 28th there was fighting for local gains only. The battle seemed to have come to a breathing spell. 

The progress was accompanied by a feeling of depression. In reality the progress was not discouraging. In 12 days 20,780 prisoners had been taken with 175 guns. In view of the necessity that the German strength should be eaten down by the hammering process this was not a bad showing; but it caused great dissatisfaction, mainly because Nivelle had talked so confidently about breaking the line on the first day that the French people were seized with despair because the brilliant program was not realized. His losses had been heavy, but not beyond the normal cost of such gains under such conditions. But the murmuring was a serious thing. It indicated a lack of confidence at a time when discouragement was dangerous.

On 25 April Mr. Ribot visited the battle front with M. Painlevé, the Secretary of War, and held a conference with the general in command. The result was that General Nivelle was removed from his position and General Foch was given his place. Foch was commander-in-chief on the northern and northeastern sectors, where the main battle was being fought. At the same time General Foch became chief of staff, a position for which he was eminently fitted by training and temperament. General Nivelle's plan of battle was a survival of the prevalent idea that a single point must be kept. It looked to a break through the line, as in the strategy of other days, with a sweep around the rear and the capture or stampede of a considerable portion of the opposing force. It failed because of the existing conditions it was impossible to take all the lines of defense before reinforcements could be brought up to fill the gap that an intense attack had made. The new strategy looked to wearing down the man power of an opponent. A break through was reserved for the time when the line should be too thin to resist longer. Pétain believed in the new strategy, and so did Foch, with a slight difference. From the time Pétain controlled the military policy the battle along the Aisne entered a new stage, in which the purpose was to take limited objectives.

No further hopes were entertained of taking Laon. It would be sufficient to complete the struggle for guns. He himself was trained as an artillery officer and well knew the need of artillery in carrying the position before him. He massed a vast number of guns against the German position which consisted of three lines of defense, one at the foot, another on the slope, and another at the crest of a ridge that ran across his area of battle and had strong commanding positions on each side. General Anthoine knew that his guns had first to destroy the German positions, and he did not neglect his batteries through seven entire days. The infantry went forward at dawn on the 17th and penetrated the first German line with little difficulty. On the flanks it stopped at the second line, but the centre burst through that barrier and seized and held the crest of the slope before it. Next day the centre secured its advanced position and the flanks worked away to extend their lines up the slopes. The 19th and 20th brought heavy counterattacks, but until then positions for the most part. From the 21st to the 28th there was fighting for local gains only. The battle seemed to have come to a breathing spell.

The progress was accompanied by a feeling of depression. In reality the progress was not discouraging. In 12 days 20,780 prisoners had been taken with 175 guns. In view of the necessity that the German strength should be eaten down by the hammering process this was not a bad showing; but it caused great dissatisfaction, mainly because Nivelle had talked so confidently about breaking the line on the first day that the French people were seized with despair because the brilliant program was not realized. His losses had been heavy, but not beyond the normal cost of such gains under such conditions. But the murmuring was a serious thing. It indicated a lack of confidence at a time when discouragement was dangerous.

Reverting to the original plans of General Nivelle, we shall recall that after the Germans fell back to the Siegfried, or Hindenburg, line a design was formed to smash in each end of this line, and that General Haig undertook the task at the northern end while Nivelle undertook it at the southern end. The results were the battles of Arras and the Aisne. Both failed of their ends. Although fought fiercely and with moderate success for the Allies, they left unshaken the pivots at which they were aimed. T.M. Ribot visited the battle front with the enemy, considerably more than half a million casualties. This was their only value; for the slight gains of territory were without significance in the main trend of the war.
breaking through the German defenses, recovering the Belgian Coast and turning the invaders out of Belgium. As soon as the French operations on the Aisne ceased he proceeded to put this scheme into execution. Twice before had the British sustained heavy battle in this sector, and although his attack was of less weight and were forced to hang on by sheer sticking ability with great losses. In these battles they were forced back on Ypres until on the east they stood hardly two miles in front of the town, while the Wytschaete-Messines Ridge, three miles south of it and commanding the surrounding plain for several miles, fell into the hands of their opponents. The existing situation was annoying, and if the Germans should have the opportunity to assume the offensive in large numbers they would be in position to start with a great initial advantage in some forward movement. The attack about to be described did not yield the British the Belgian Coast, but it enabled them to gain important ground east of Ypres. This was, if in the April drive of 1918, would have carried them in the initial attack a long way toward the Channel ports. General Haig's first procedure was to attack the Wytschaete-Messines Ridge and then the base between the heights hung over Ypres on the south. This position, which was a salient, was six miles long on the top of the ridge, but the German lines that ran around its western slope were 10 miles long. It was attacked with the following lines, one at the base of the western slope, one on the crest of the ridge and another along the base of the salient, which was well down the eastern slope of the ridge. A mile further east was a fourth line, passing through the town of Warneton, on the Lys. Besides these lines were many concrete machine-gun posts, redoubts and battery positions, skilfully placed to enfilade every possible avenue of approach. To take the third line was to hold the ridge: to penetrate the fourth would be to break through the existing system of German defense.

At this time Great Britain had about 2,250,000 men under arms in France and Belgium. They were organized in five field armies, which could be distributed as follows, from north to south: In Belgium, the Ypres sector, the 2d Army under General Plumer; in the Lys-Lens sector, the 1st Army under General Horne; in the Arras sector, the 3d Army under General Allenby, soon to be succeeded by General Byng; in the Bapaume sector, the 5th Army under General Gough; and in the Saint Quentin sector, the 4th Army under General Rawlinson. They were well-trained men, seasoned by the Somme and Arras fighting, the equal of the Germans and French in fighting qualities; and they were amply supplied with artillery and ammunition. The Germans on the same front were commanded at this time by the crown prince of Bavaria, who had risen steadily as a commander since the war began, somewhat to the disadvantage of the imperial crown prince, whose failure at Verdun was notorious. From the North Sea to the south of Ypres lay the German 4th Army, commanded by General von Arnim, who had come to be considered one of the best German commanders in the field. South of his command was the 6th Army under Gen. Otto von Below. The Germans had ample forces: for by this time the Russian front had become quiet, and it was possible to move troops freely from that area to France. General von Arnim was keen enough to observe signs of activity behind his opponents' lines late in May 1917, and rightly concluded that he was going to be attacked in the Ypres region. He also divined that the attack would begin at the Wytschaete-Messines Ridge; for he could see that it was a horn in the side of the British, who could not attack on a large scale without first removing this obstacle.

General Plumer, commanding the 2d Army, was a vigilant and tireless officer, and he had been in position before the ridge for two years when the great attack was made. As early as July 1915 he began to construct mines under this position, taking advantage of the clay subsoil which lent itself to mining. Twenty-four mines were constructed, 20 of them in the zone it was at last decided to attack. One of these was destroyed by the Germans, but the 19 others were finished and armed with over 1,000,000 pounds of ammonal when the critical day arrived. The Germans knew well that the mines were being constructed and countered with great care and many battles were fought underground between the opposing armies. Behind the lines railroads were constructed on the surface and pipes were laid for the distribution of water in the trenches with provisions for carrying them forward as soon as the lines had been advanced. So well were those made that running sterilized water was delivered to the soldiers in half an hour after they had won a new objective.

The day of attack was 7 June, after a hurricane of shell had been poured on the ridge for several days. The guns on the British side fell away somewhat during the night of the 6th, but the German guns continued to roar as on the preceding days. At 3:10 in the morning there was a convulsive shock and a sound compared to which all other noises were silence. Nineteen mines went off at once, flames rushing up like volcanoes, carrying trenches, concrete emplacements, solid stones and twisted human bodies in one fire-lit mass. Great clouds of heavy gas roamed the sky and slowly drifted away as the artillery resumed its work. Three army corps were in front of the ridge and sprang from their trenches at the first tremor of the explosion. They plunged forward into the clouds of smoke and dust, overran the first German line of defense, which had suffered severely from the bombardment, and gained the crest of the ridge with 19 craters where the second line had been, from Hill 60 on the north to the edge of Messines on the south, a distance of more than four miles. Brave Germans held out in isolated positions, fighting desperately in a dazed condition, but they slowly yielded to the advance of the men of the 2d Army. By 3 o'clock in the afternoon the British field guns had been carried forward by a miracle of the transportation department, and the attack on the third line was made with such quick effect that by nightfall this position, the objective of General Plumer for the first day of the battle, was fully reached. At an unexpectedly small cost to his own army he took 7,200 prisoners and 67 guns and inflicted a great loss on the enemy.
On the afternoon of the 8th General von Arnim brought up fresh troops and counterattacked along the new front, but they were beaten off easily by the British who consolidated their lines and settled down in the new trenches in security, two and a half miles in front of the positions they had occupied for nearly three years.

In General Haig's plan Messines was but a preliminary stroke to a renewed battle of Flanders. It relieved Ypres from danger on the south. The next thing was to press back the Germans on the east of the town. Here they sat on a series of hills, each a little higher than the one on its west side, running back to the ridge at Passchendaelae eight miles east of Ypres. Through these positions General Haig proposed to fight his way by means of the limited objective. In his way stood skillfully constructed lines of small concrete forts, which the soldiers called *pill-boxes*, large enough for 20 to 30 men and armed with machine guns, and strong enough to resist the shells of light artillery. These works were devised by the Germans in lieu of the deep dugouts which could not be used in the soil of this part of Flanders.

In order to deliver the proposed blow on the Ypres front General Haig redistributed his armies. First he extended the front of the 3d Army so that it held all the ground between the limit of the 1st Army at Arras and the limit of the French near Saint Quentin. As this process went on the 5th Army, which was thus forced out of the southern trenches, was moved northward and placed in line just north of the 2d Army, which held the sector immediately south of the point of the Ypres salient. As the 3d Army continued to extend southward the 4th Army also moved northward and took position on the coast in the Nieuport sector. Thus the battle line was arranged as follows: At Nieuport, on a front of four miles, the 4th Army; south of it, on a 20-mile front but protected in part by the inundated area, were the Belgians; next, on a front of five miles, was the French 1st Army with General Anthonioz for commander, fresh from his success at Moronvilliers; then came the British 5th Army on a seven-mile front from Boesinghe to the sector of the 2d Army, which carried the line southward as far as the Yser at Armentières.

Out of the troops in this area General Haig arranged two striking forces. His 5th Army with the help of the French on its left and of the 2d Army on its right was to drive the Germans off the hills east of Ypres. That done the other striking force, the 4th Army, was to work south along the coast keeping in touch with the fleet off the Belgian shore.

The affair at Messines was over by 12 June, and it would have been well if the 5th Army had been pushed forward immediately; for the work performed was for field operations before the winter set in were none too much for the work in hand. But delays occurred, and it was not until the last days of July that a start could be made. When the affair was over, Germany, suspecting the intentions of their opponents, made a lunge at the 4th Army at Nieuport and drove a part of it to the west side of the Yser. It was not an important battle, but it took from the British a portion of their bridge-heads on the east of the stream, which would have been serviceable if they had been called upon to carry out their portion of the original plan of campaign. During the month of waiting the Allied artillery searched out the weak spots in the enemy's line with the utmost care. Many times the trenches were drenched with gas, in the use of which the British had become expert. At 3:30 in the morning of 31 July the whole line from a point two miles north of Boesinghe to the Lys, a distance of 15 miles, broke into a crashing barrage behind the line. But British and French infantry rushed forward to the first lines of the enemy, taking them at once. They then charged the second lines which were taken for the most part, though the resistance was hard in some parts. At the end of the day all the objectives of the French and the 5th Army had been won and in some cases they had been exceeded, while more than 6,000 prisoners had been taken. It was a brilliant beginning to the army's rested from the day's work in contentment. That night began four days of steady rain and the ground turned into seas of mud. It was not until 16 August that it was possible to renew the battle. On that day a general attack was launched. It succeeded on the northern part of the line, but failed on the southern part of the line, and the resistance of a formidable system of *pill-boxes* in the region along the Menin road and three miles north of it the advance was held up from the beginning, although there was desperate fighting and great expenditure of courage on both sides. Next day the rain returned in torrents and there was a fortnight of steady downpour. It was a full month before the water receded into the streams and the ground became dry enough for waging battle.

Meanwhile, General Haig revised his method of fighting. For two weeks he had encountered a new system of defense devised by General von Arnim: Holding his first line with only enough troops to disorganize an advancing line, he massed his troops in the second line and threw them on the foe as they came into the zone of fire of the second line. In this way his counterattacks were made very effective. At the same time he came to such positions that they completely raked the area of approach. By this means he repelled the British in their attack of 16 August with heavy losses. It was a new fashion in fighting and became known as "elastic defense." General Haig gave it careful consideration during the month of enforced idleness while he waited on the weather. The best thought of his officers was given to the machine-gun defenses. By a system of careful observation the "pill-boxes" were located and marked on the map and big explosive shells were fired at them when the battle was renewed. In this way many of them were destroyed, while the air was so filled with the fumes of the explosives that the men inside were rendered unfit for further fighting. Another way that proved effective was to approach the work behind a barrage and suddenly make holes in the barrage on each side of the "pill-box," allowing the infantrymen to gain the unprotected rear with hand grenades quickly disposed of the defenders.

By such methods on 20 September a second advance in the same region proved successful. The troops worked their way forward across lines of defense that seemed beyond human ability to
WAR. EUROPEAN—MILITARY OPERATIONS, WESTERN FRONT (3) 885

take. On 26 September another advance was made, and on 30th it was continued. The object was to achieve a long series of struggles for limited objectives, all fought through in rain or mud. It was remarked when an unusual downpour came it was a certain sign that a British attack was scheduled for that particular moment. Thus through the wetter the lines crept forward, and on 6 November the town of Passchendaele was gained with the ridge which dominated the surrounding positions. The weather had done its worst, but pluck and courage had triumphed. The third battle of Ypres, 31 July to 6 November, had ended with the British on high ground and the Germans seven miles east of the ruined town.

Nevertheless the battle was a British failure. It was undertaken as the first stage of a large campaign. All that had been won in more than three months was on the plan for the first fortnight. When it ended there was no opportunity to go on with the original plan. The 4th Army attack was not carried into action, and the Germans sat securely for another winter in the coast towns of Belgium. But the failure was not due to bad fighting or defective leadership; never did the British acquit themselves better than these 740,000 men, and how many; but their own losses were heavier than the losses of the Germans. Two things were against them in this struggle: the weather, which should have been foreseen, as it was observed to prevail in Flanders, and the removal of German divisions from the Russian front. But the struggle was not all lost. It served to reduce the man power of the Germans and to push them back on the east from dangerous proximity to Ypres and Hazebrouck. They were by that much—five precious miles—further away from the Channel than they would have been when in April 1918, they made their last great drive in that direction, and nearly reached the hills southwest of Ypres from which the glistening waters of the Channel can be seen on a clear day. In finding the balance of loss and gain the conclusion may be that the operations were worth all they cost in dead and miserable living.

When the battle of Ypres was being fought with so much difficulty during the months of August to November General Pétain conducted two brilliant minor engagements which had important local results and served to restore the drooping spirits of the French people, so badly shaken by the failure of the second battle of the Aisne. The first was at Verdun and the other was on the crest of the Heights of the Aisne, where the great battle was broken off before the Germans were driven from their footholds.

In the Verdun engagement the French were under the immediate command of General Guillemin and the Germans were under General von Gallwitz. The first had reason to believe his opponent was about to undertake some aggressive movement on the west bank of the Meuse, where the Germans held Hill 304 and Mort Homme, positions not affected by Nivelle's brilliancy. On 26th October 1916, General Guillemin put his arrangements with great thoroughness. From 7-17 July he conducted several actions with limited objectives which gave him advantageous points for an attack along his line on both sides of the river. He opened the battle in the early morning of 20 Aug. 1917, and after three days of intense bombardment which played havoc with the German advanced trenches. All his objectives were won, and in the fighting of the succeeding fortnight the Germans were pushed back on each side of the river until they stood, on 9 September, practically where they began the great battle on 21 Feb. 1916. In these engagements the French took more than 10,000 prisoners and inflicted heavy losses in killed and wounded.

General Pétain then turned to the Heights of the Aisne, where the Germans still held out on the northern edge of the elevation west of the California Plateau. At this point the plateau was three miles wide and six long and the two lines faced each other across it. General Maistre was in immediate command of the French troops and made careful preparations for the attack. On 17 October he began a bombardment of intense fury and six days later the infantry attacked at dawn, driving forward two and a quarter miles on a four-mile front and taking 8,000 prisoners. Within the next four days the French continued their advance until the whole plateau was in their hands and the northern slopes down to the meadows bordering the Ailette River. From the newly won heights they had a view of Laon six miles away.

The year 1917 was now coming to a close. So far as fighting in the west was concerned the Germans had lost the initiative and their only action in that character being the purely defensive fighting of the spring retreat. It was followed by the battles of Arras and the second Aisne struggle, the third battle of Ypres, and the two blows of the French just described. In all of them the Allies were merely pounding on the German stonewall. It is true Nivelle's battle was inaugurated with the view of making a grand breach through which a decisive blow could be delivered. Haig's plans for Ypres also contemplated a grand offensive which would have a decisive influence on the course of the war. But both efforts resolved themselves into mere shock attacks under the pressure of dire necessity. Haig at Arras and Pétain at Verdun and on the Aisne Heights were fighting for limited objectives, taking toll of lives and territory as they could without imagining that they would do much to end the war in that particular effort. Of the same nature was the battle of Cambrai, 20 Nov. to 7 Dec. 1917, which General Haig precipitated as soon as he could break off the battle of Ypres.

The conduct of this battle fell to General Byng, commanding the 3rd Army, who made his preparations with great skill. Instead of using a long bombardment to destroy the enemy's wire entanglements he employed a large number of tanks sending them forward behind a barrage. By using the greatest care all the tanks were brought into position secretly, and the attack was a complete surprise for the Germans. The tanks made great gaps in the wire through which the infantry quickly passed. The outposts fell at once and the main line went on soon afterward. By stopping angles and tunnelled reserve line of trenches was taken and the attacking force confronted only a series of enemy rear positions. Against these places the attack was continued on the 21st, with some important gains. But the German resistance
was not broken, and at the close of the day the British troops were exhausted and the Germans were bringing up fresh divisions. Here the lines remained five days with hard fighting and little advantage for either side.

The battle had now reached its crisis. The British had driven a salient into the German positions 10 miles wide and six deep, but they were unable to go farther and their opponents were concentrating superior forces against them, preparing to pinch out the newly formed salient. Had General Haig been able to bring up an equal number of fresh troops and carry the movement on to a complete success it would have been well to proceed with the battle. Otherwise, prudence demanded that he break off the contest, fall back to a favorable position known as the battle of Cambrai on the night of 7 December with his lines about two and a half miles nearer Cambrai than when the battle opened on 20 November. In the first week of the fighting the British took 10,500 prisoners and held 60 square miles of territory that had previously been occupied by the Germans. They had also inflicted losses that were heavier than they had sustained.

The battle of Cambrai was the last of the blows of attrition in the west. In the future a way was to be found to break through the trench system that had existed from September 1914, although neither side was to find a way by which the breach could be made to result in one of those great encircling movements that was the dream of military men on each side.

The Cambrai battle was notable for the success with which tanks were employed in it. These instruments of war, first used in the battle of the Somme, were originally hailed as a very dangerous fighting machine. They were considered a kind of mobile machine-gun nest. The Germans caught at the idea and tried to improve on it by making still larger tanks, assuming that they would be more formidable through being larger. As a fighting machine, however, the tank was only moderately successful. Its best service was against wire entanglements, and it was in the battle of Cambrai that this use was given its earliest perfect demonstration. It was here shown that the tank, by doing the work of the initial bombardment, made it possible to employ the element of surprise, pro-

vided there were adequate air protection and care in assembling the surprising forces.

The Deciding Campaign of 1918.

1. The Crisis of the War.—In the beginning of 1918 the powers of war in the peoples of Europe. Austria, Bulgaria and Turkey were at the limit of their powers and their peoples had become apathetic. On the side of the Entente the Russian war spirit had disappeared with the overthrow of the Russian government. In Italy war weariness had made vast strides; and it was known that only the presence of British and French troops in large numbers had stayed the tide of collapse late in 1917. In France and Great Britain the burden of war was heavy and although the people did not talk of quitting, a disposition to discuss terms showed that they longed for peace. In Germany there was a great deal of suffering and a corresponding desire for peace; but national pride was for by the achievements of the army and overcome the popular war weariness. It was much to the German that his country had held her own for three and a half years against the strongest states in Europe, and while doing so had never lost a victory. A new gain- ing victories in the field could not be expected to cease fighting and ask for peace; but if victory should turn to defeat, her restrained war weariness was likely to have full sway, and startling results might be expected.

Germany, however, saw no reason to fear such an untoward turn of events. On 3 March she completed her conquest of Russia by forcing the Bolshevik government to sign the treaty of Brest-Litovsk. Since the beginning of the year it had been evident that this government was at her mercy, and the process of transferring troops from the Eastern Front to the west, which had been carried on to some extent in 1917, now went on apace. Her Eastern Front no longer existed. In 1914 her plan was to crush France and then throw all her strength against Russia. After many months of hard fighting she had succeeded in crushing Russia and was about to throw all her force into the work of winning a victory in France.

General Ludendorff's memoirs contain interesting light on the German view of the situation at the time. He had choice in 1918, says the author, of two policies, to attack or to take the offensive behind strong entrenchments. He adopted the first course for several reasons: (1) It was necessary to win a great victory to keep the German prestige alive in Austria-Hungary, Bulgaria and Turkey; (2) it was likely that the Allies would break through any way if the defensive policy was assumed; and (3) there was every reason to win a decision before the Americans arrived in force. Having come to this conclusion orders were given for complete preparations for an attack on the grandest scale.

The sector chosen for the blow was north and south of Saint Quentin, which was believed to be the weakest point in the Allied line. Other sectors were more promising, but they were given up for the region because the ground there was too muddy in the early spring, and the sector of the Chemin des Dames because it was too strong. Ten weeks were given to special training for the attack. German casualties at Saint Quentin had 192 divisions in France, and more than half of them were placed opposite the British lines. For breaking-through tactics she set aside 70 of the best.

For meeting the fate gathering against them the Allies were badly situated. In the first place they had the exterior lines of the salient. By massing troops on the interior the Germans could strike at one side or the other with concentrated force, and the Allies could not quickly move reinforcements around the point of the angle. The German forces were numerous and well planned for communication across its area, while those to the west of it ran off to the south toward Paris, and those on the south side of the salient ran off to the southwest.

Another disadvantage of the Allies was their emerent disunited command. The German armies moved at the direction of one will, which happened to be the will of General Ludendorff, a master of the military art. While General Fétain and General Haig were always in perfect accord they were nevertheless acting in separate spheres of activity. In an emergency there was no time to ask for cooperation, even though it was certain that it could be obtained for the asking. This division of the command was a weakness well understood by the military experts on each side, and efforts had been made for its removal. In November 1917, after the disastrous campaign in Italy, the Allied War Council at Versailles was created to obtain greater unity of action. Its functions, however, were only advisory. Its first members were General Foch, for France, Gen. Henry Wilson, for Great Britain, and General Cadorna, for Italy, and later General Bliss for the United States. The creation of the council was chiefly the work of Mr. Lloyd George, who spoke so frankly about the need of unity that he aroused a storm among his political enemies at home. It soon appeared that the council had little real authority, and the three eminent men first appointed resigned to be followed by persons of less prestige. Then—in February 1918—an attempt was made to increase the authority of the council. At this Sir William Robertson, the British chief of staff, resigned. Instead, a popular outcry was raised against the Prime Minister, but he appealed to the good sense of the country and weathered the storm. He did not dare, however, to go farther in his efforts in favor of united command. That was a step which only a vast disaster could wring out of the Briton.

While, therefore, General Ludendorff with much skill massed the entire German energy in the great salient whose point was on the Oise, the British on the west side and the French on the south side of the salient waited his attack in confidence. They did not believe he could break through. They took no effective means to reinforce each other as need should be. Neither general had large reserve forces to repair a breach if one were made. Each counted on the old methods that had held good at Ypres, the Somme, the Aisne and Verdun, by which it was possible to hold on with only a slight dent in the line of defense.

2. The Offensive of 21 March.—The German blow was expected by the Allies. All through the late winter the newspapers had talked about it. As the weather became warm in March and the blow did not fall there was a
tendency to decry the danger. Whether it would fall on the British north of the Oise, where the 5th Army under General Gough was in position, or on the French along the Aisne position it was impossible to say. The Germans promoted these doubts by making preparations for attack at each place, and near Ypres as well. Later on they attacked at each of the other places, so that none of the preparations were wasted.

The 5th Army of the British held a front of 41 miles, from the Oise to Guise, 10 miles southwest of Cambrai. It had 11 divisions in line and five in reserve. North of it, as far as Arras, a front of 23 miles, was the 3d Army under General Byng with 10 divisions in line and five in reserve. These 31 divisions probably contained more than 500,000 men. Most of them became involved in the battle that was about to begin.

The Germans had determined to attack between Croisilles and the Oise, a front of 50 miles, which included all of Gough's and nearly two-thirds of Byng's sectors. In their first line in this area they placed 37 divisions, about 500,000 men, as the German divisions contained about 13,500 men each. They assembled large supports behind the first line and brought them up as needed. They concentrated efforts at certain points which were critical for holding the trench system, and there they outnumbered the British as much as three to one. Two of these important points were near Saint Quentin and one was near Cambrai. The German High Command took care that the breach to be made was wide enough to permit extensive operations, if the plans went as desired.

The attack was made in the morning of 21 March. A persistent fog hung over the country. At 4:45 an intense bombardment with all kinds of guns was opened. A large number of gas shells were thrown against the British back areas and the gas was held down by the moist air, producing great confusion. High velocity shells fell that day 20 miles behind the front line, and many of them scattered on the meadow in the trenches suffered frightfully. The fog was so dense that their gunners could not see 50 yards ahead, and no one knew what to shoot at or what to expect. Communication with the rear was impossible except by wireless. In this confusion the men lay in their trenches awaiting attack. It came but not as in previous battles. In one place it came at eight o'clock, at others it arrived later. By 10 the attack was general. The defenders could not see the approaching troops until they were actually upon them. Specially selected troops were sent ahead to try out the weak spots in the defense. When a breach was made signals were sent up and other troops were rushed forward to improve the advantage that had been gained. Thus it happened that the line was penetrated at many places while at many others it held firmly.

This process of penetration was known as infiltration, and under it the line of defense crumbled until it was reduced to broken bits, each battling for its existence. In many cases the broken remnants held their own, fighting off the German assaults until the last. In other cases they fell back from one place to another and tried once more to fight back to the front.

The fog lifted at one o'clock, but two hours earlier the advanced line had been generally taken and the second line was being assailed, heavily in places. All through the afternoon the struggle went on and when night came the Germans had won the battle north of Saint Quentin and had made large gains at the southern end of Gough's line. During the night the British made some readjustments of their positions and prepared for severe attacks on the following day.

The British made some readjustments of their positions and prepared for severe attacks on the following day.

The 5th Army was reinforced and airplanes were brought up to the enemy's lines.

Next day the situation was clearer though no less critical. General Byng's army held its own though hard pressed. General Gough, however, was forced back through the system of trenches that served for the second line of defense. They proposed to stand firmly at the third line, but in the afternoon a gap was made in the thin line of defenders as they fell back and the Germans poured through in large numbers. They seized the third line before it could be made secure and during the night General Gough was forced to withdraw to the east bank of the Somme, a distance of eight miles. Later in the night he came to the bitter conclusion that he could not hold the east side of the river and risk battle against the masses of opponents that were following him, and he issued a second order directing the army to cross to the west side. The movement was executed with difficulty, so great was the German pressure.

While it was being carried out a still greater danger occurred in the area north of Péronne, where no friendly river offered cover. This part of the lines was firm at first but had to fall back to keep its adjustment with the southern part. In the afternoon of the 23rd, while the withdrawal was in progress, a gap appeared at the point where the 3d and 5th Armies joined, the Germans threw themselves into it and turned against each edge in order to widen the gap. Now did the quality of British courage that has been called "bull-dog" show itself in the most valuable manner. Beaten battalions stood in the breaches and fought until they were a robber's shadow of their ordinary strength. A brigade of South African troops held one position until it contained only 100 unwounded men. Teamsters, engineering units, men separated from their commands, and any other who were swept back before a retreating army were rallied, and the gap was filled with them. Thus it was that by hook and crook the Germans were held back until the lines could be re-formed. The 24th and 25th were critical days, and only the stouthearted resistance by men already at the point of exhaustion saved the day for the salvation of Britain. By the 24th French supports began to arrive on the southern section of the line attacked. Next day they were present in larger numbers and took over a 12-mile section of the line north of the Oise, the displaced troops being moved northward to help the hard-pressed division there.

The events of these four days made a profound impression in France and Great Britain. Face to face with complete disaster the rulers now discarded their opposition to a unified command. Representatives of each government held a meeting in France, at which the critical decision was taken, 25 March, to point General Foch and Chief of the Allied armies in France with unlimited
amority. It was the best day's work of the war on the side of the Entente Allies. The man named was the greatest general the war brought to the front. He was a master of military science, a great strategist, a well-poised commander in difficult times, a genius for seizing the right moment and finding the right leader who knew how to inspire confidence in his subordinates. In taking this step the Allied statesmen were supported by the peoples of their own countries, and particularly by the influence of President Wilson, who was beginning to make the United States felt in the higher policies of the war.

Foch took command at once. During the first day the situation seemed desperate. The 19th British corps, just south of the Somme, had been driven back 20 miles in five days and was at the point of collapse. Twenty miles to the west was the important railroad centre of Amiens. If it fell, the entire line of communication with both the British and American armies would be demolished. The Germans realized their opportunity and were pouring their forces into this sector to take the city if possible. Could the weary 19th Corps withstand them? The situation was saved by a moley brigade of the 8th Corps, among them the 11th Regiment of American Engineers who had been constructing bridges behind the British lines. The brigade was commanded by Brigadier-General Carey. The 20th was thus a day of grave danger, but it was weathered without a collapse, probably because the Germans were nearly as weary as the British. They had outrun their transports and heavy guns and there was a slight weakening of pressure on the 27th at the centre of the great salient that a week's fighting had created.

The engagement now passed into another stage. It had as its special local problem the capture of the Paris-Amiens Railroad, the main line of communication behind the Allied defenses. South of Amiens the road bends eastward four miles before it resumes its southward course to the capital, and at this point it is only seven miles from Amiens. Could the German Army get there in time to stop the French, in the line of the railroad? They were only seven miles to the eastward at Démont. General Foch was collecting a mobile force, a mass of manoeuvre, to throw into this part of the field, and the railroad which the Germans were trying to capture was the line by which they would have to arrive. Could the British hold on until the expected French forces could detrain? That was the fateful question.

General Haig concluded that Gough's 5th Army was unequal to the task of defense and withdrew it, putting in its place a body of hastily organized troops called the 4th Army to which General Rawlinson with his staff was transferred from the old 4th Army. For five days they held back the attacks of their opponents, reeling them on a line a sharp angle to the west at Moreuil, where they were five miles from the Paris Railroad. It was retaken two days later, passed to the Germans on the next day, and was recaptured by the British on the 14th, with which the offensive of 1 April. On this day the French were arriving in force and took over the line to a point five miles south of the Somme. After two days of relaxation the drive was renewed on 4 April, when the French were driven back by massed attacks until the line stood two miles from the railroad. It went no farther, for two French armies now arrived and the line was made safe. Four months later the Allies were able to drive back their opponents until the line was a safe distance from the railroad. But the battle itself came to an end with the German attack of 6 April, which ended disastrously for the Germans. The armies in the salient were exhausted and it was necessary to let them rest while other armies took up the task of defeating the British.

Thus ended the operations which some persons have called the second battle of the Somme, but which is persistently referred to as the drive of 21 March. It was a surprise attack on a vast scale and in superior numbers. In the beginning the Germans threw 64 divisions against 32 British divisions. When it ended the Germans had used more than 80 and the British had used 49 divisions. In the beginning the Germans had used such small arms as their interior lines made possible, that they were in the ratio of three or four to one at the points of actual contact. As they marched forward they came to the region they had devastated in the preceding fighting and found it harder to move their troops behind their own lines. The battle came to an end when the Germans in the salient had exhausted their strength and gone as far ahead of their heavy artillery as they dared go. They made an advance of 30 miles at the deepest point and announced the capture 70,000 prisoners and more than 1,000 guns.

On 23 March they began a long range bombardment of Paris with a battery of 8.4-inch guns, firing from a position 70 or more miles from the city. When the first shell arrived French experts were astonished at the feat. Some refused to believe that it was fired from a cannon, suggesting that it was dropped from an airplane flying so high that the machine was invisible. But the arrival of the shells at regular intervals of 20 minutes disproved that theory. Like the dropping of bombs on London and other English towns, the military effect was negligible. It was meant only to demoralize French morale; but Parisians paid little attention. On Good Friday one of the shells struck the church of Saint Gervais in the older part of Paris, while the edifice was filled with worshippers, wrecking the building and killing 75 and wounding 90 of the worshippers. At a time when Germany was bending all her efforts to end the war with an early peace she chose this means of terrifying her foes into submission, and only goaded them into fury. Had she offered the world its first evidence of respect for humane feeling by suspending her bombardment on Good Friday, as she might well have done, the effect on the Parisians would have been much more favorable to the German cause. It was in the battles in front of Amiens that the British first used their small tanks, "whippets," companions to the small tanks of the French.

1. Reaching for the Channel Ports—General Ludendorff did not mean to break off the battle for Amiens, but only to suspend it while the guns could be brought up and his soldiers could get some rest. In the interval he proposed to strike elsewhere. He knew that Haig had drawn strength from the lines near Ypres and
he assembled nine divisions for a sharp blow north of La Bassée. He hoped to do two things: break through to Béthune and on to Hazebrouck, connected by rail with Dunkirk, 25 miles away; and draw off strength from the Amiens front in anticipation of a renewal of the struggle there. He did not mean that the battle in this section should be a major engagement. He had enough troops to make this a powerful blow without weakening his strength in the newly-established Amiens salient. He overlooked the fact that he was now fighting not the British army merely but Foch's Allied army. The French reserves were now freely at the disposal of the British with no more delay than was necessary to bring them to the requisite point by the exterior line of communication. Had he been dealing with the British alone he would probably have used up their reserves in the north and reached his objective there on 9 April. On 9 April, just as the battle was receding before Amiens, an attack was made on a 12-mile front from La Bassée to the Lys, near Armentières. It came after a terrific bombardment with gas shells and high explosives, and there was a drive afoot of from three to four miles at the centre of the sector. Next the battle was extended to the area north of the Lys for eight miles with further gains on the whole region involved. On the north it reached the Wytschaete-Messines Ridge, which the British managed to hold after severe fighting. The battle had begun with nine German divisions in the attack, but it was extended on the second day until 16 were engaged. On the 4th Ludendorff had concluded that he had an opportunity to break through to the coast and began to put in his reserves without restraint. On this day six British divisions arrived behind the lines and were thrown into the battle as rapidly as they could be carried forward. They arrived none too soon; for the massed German attacks were being held back with difficulty.

General Haig now realized how serious the situation had become and made the most careful preparations to meet it. He drew in his lines from the PAS-de-Calais, his shortening his lines and ridding himself of a sharp salient which it might be difficult to hold. To his men he sent a ringing order of the day 11 April, which shows in what situation was his army and in what spirit it was called upon to stand and fight. It ran as follows:

"Three weeks ago to-day the enemy began his terrific attacks against us on a fifty mile front. His objects are to separate us from the French, to take the Channel ports, and to destroy the British army. In spite of throwing already 12 divisions into the battle, and enduring the most terrific sacrifice of human life, he has made little progress toward his goal. We owe this to the determined fighting and self-sacrifice of our men. Words fail me to express the admiration which I feel for the splendid resistance offered by all ranks of our army under the most trying circumstances.

"Our spirit is not yet broken. To those I would say that victory will belong to the side that holds out longest. The French army is moving rapidly and in great force to our support. There is no other course open to us but to fight it out. Every position must be held to the last man. There must be no retreat. With our backs to the wall, and believing in the justice of our cause, each one of us must fight to the last. The life of each has been bought as the freight of mankind depend alike upon the conduct of each one of us at this critical moment."

The French began to arrive on the 16th. The five days' interval was a period of severe trial, the Germans slowly eating their way forward. On the 13th there was an all-day desperate struggle to hold Neuve Eglise and Wilverghem, keys to Mont Kemmel, a most important position, and success came but by a hair's breadth. Despite these efforts the Wytschaete-Messines ridge was taken and a long sweep was made to the west of its lower extremity. From Ypres to the southwest lies a series of hills about six miles north of the Lys River, making a barrier to Hazebrouck. The German attack had faced westward at first; but it turned north-westward on 9 April and became a furious struggle to carry these hills. Out in front of the group stands Mont Kemmel which the enemy had to take if he advanced on Hazebrouck. He threw himself against it on 17 April in great strength and was repulsed with heavy losses. On the same day an attempt was made to break the lines north of Ypres. Ludendorff probably thought that the lines here would be weak through withdrawals for the southern areas, and he employed numbers that would have overwhelmed a weak line of defense. If he had taken Haig unawares and got behind the force in Ypres he might have made large captures of men and materials; but Haig was to the rear from the first. The northern line was held in strength and the attack only resulted in heavy German casualties.

The attack on the Lys-Ypres sector went through the same stages as the drive of 21 March. The first came the day after against an enemy that could only fall back shattered but filled with the determination to hold on to the last; then a desperate fight against time in the expectation of French reinforcements; and at last the hardening of the line when the French arrived. On the Lys the first of these stages came on the 12th, the second lasted until the 18th, and the third lasted after a slight intermission, from the 25th to the 29th. In the second stage was the first attack on Mont Kemmel, which was a failure. The position was 200 feet higher than the surrounding hills and the Germans were very anxious to take it. On the 25th they made heavy concentrations and carried the hill. Despite their great efforts they could not dislodge the French, who held this part of the front, and the British, who were to the northeast, readjusted their lines and stood at bay. On the 29th they received a tremendous attack from 11 divisions so massed that there were from six to eight bayonets to the yard. By sheer weight it succeeded at first; but the French delivered a swift and powerful counterstroke which drove back the assailants in some places nearly a mile and checked their advance in all other places, so that on the whole they lost rather than gained on that day. General Ludendorff, as he says in his memoirs, decided that to continue his efforts to reach Hazebrouck was too costly and allowed the battle to come to an end.

When he opened the attack he expected it to be an action subsidiary to the fighting before Amiens. The success of the initial attack was so great that he could not resist the temptation to follow it up, and at last he threw so much energy into it that the French suffered for it. On 23 April he tried to revive that action by opening an attack on the section of the line between the Somme and the Ancre. Four divisions were used and the town of Villers Bretonneux was seized; but in a brilliant counter-
stroke the British recovered all that was lost and took 1,000 prisoners. The battle was not reopened on this quarter. The German armies in the salient and on the Lys were too tired to continue the aggressive, and the fighting shifted to a lesser extent of fresh troops were available.

From the Aisne to Château-Thierry—The new scene of action was the line southeast of Laon where the second battle of the Aisne was fought. While the attack was delivered against strong positions, the Germans knew them to be but a means of holding the strongpoints in force for the thorough fighting. Here we find repeated the purpose with which the Lys attack was begun. The new movement was inaugurated to draw Allied troops from Flanders, where it was proposed to renew the struggle as soon as opportunity offered. But as the initiative did not shift from Flanders to the Somme, it was not destined to shift back from the Aisne to Flanders.

The advance began on 27 May 1918. Forty yards from the General's crown prince's army's army were assembled with great secrecy in the line opposite the Aisne positions. 25 of the first line of attack and 15 in the reserve line. The Allied line was composed of French and British, with a thin supporting line in the rear. The British troops had seen heavy fighting in the March and April operations and were in this part of the battle-line for rest. The position was too strong and the German divisions in the salient were in a trap, and they should withdraw if they could not open the base of the salient.

The first attempts having failed Ludendorff took time and prepared his blow, which at first he thought it could not fail. On 9 June he threw 15 divisions on the French lines defending the forests around Compiègne, advancing on the line from Montdidier to Noyon. Foch was ready for them and offered for two days' fighting the Germans gained six miles on a narrow front; but the Forest of Compiègne, running into the centre of the angle the line made before it turned south near Soissons, could not be taken and the western side of the salient stood firm. Ludendorff then projected an attack on the eastern buttress, but for that he made such elaborate preparations that the affair was a battle in itself. His venture on the Aisne, however, had led him into the Marne salient, and he was so involved that he had to relinquish, at least for a time, his plans for Flanders.

The successes of the first three drives had made the German soldiers overconfident. In the offensive just ending they had taken 55,000 prisoners and 650 guns, and the rate of the river to river so rapidly that they concluded that the French army was used up. They were soon to have occasion to regret their hasty conclusion.

5. The Beginning of German Defeat.—We have seen that General Ludendorff tried in vain to widen the salient into which the ardor of his troops led him by attacking on its western side. His next move was to try to widen it on the east. Several sharp attacks were made on the lines in front of and east of Rheims, but they were all repulsed. Then he determined to make Rheims a part of his next major action. He proposed to cross the Marne southwest of this ancient city and move eastward on both banks while a powerful force attacking east of Rheims pressed the lines back and enabled the two forces to pinch out the Rheims salient. He expected to reach Epernay and Châlons and by seizing the railroads to Paris cut the vital line of supplies for the Allies in Lorraine and Alsace.

In his previous drives during this year he had reached more than his immediate objectives. It seemed to him most probable that he would do the same thing in the drive he now projected. The German people, carried away by the ease with which their armies had reached
the Marne, believed the last effort before victory was at hand. They called the approaching battle the Friedesturm, the "stroke of victory."

Operations opened at midnight of 14 July. The artillery positions had been arranged by General Bouchet. The 5th and 6th divisions were on the right, 1st and 4th divisions on the left, 2,000 yards apart. The 5th and 6th were expected to advance at dawn, and the 1st and 4th were held back to prevent the enemy from bringing up reserves. At dawn the 5th and 6th divisions advanced and captured the village of Vaux, which was the key to the whole of the salient. The 1st and 4th divisions, however, were held back by the enemy's strong position on the west side of the salient.

At 10 a.m. the 1st and 4th divisions advanced and captured the village of Vaux, which was the key to the whole of the salient. The 5th and 6th divisions, however, were held back by the enemy's strong position on the west side of the salient.

Foch's preparations were carefully made. He placed strong reserves along the west side of the salient to prevent any sudden attack. He also strengthened his left flank with the 5th and 6th divisions. The 1st and 4th divisions were kept in reserve to be used as needed.

In the evening of 15 July, the 1st and 4th divisions advanced and captured the village of Vaux, which was the key to the whole of the salient. The 5th and 6th divisions, however, were held back by the enemy's strong position on the west side of the salient.
the Ypres sector might aid in the proposed attack.

The task of delivering the blow was allotted to Mangin and Degoutte. Their reinforcements were assembled secretly in the forest of Villers-Cotterets and in the wooded region south of it. At 4:30 in the morning of the 18th Mangin went forward without artillery preparation, his infantry was preceded by a large number of the small French tanks which the British called "whippets." At the same hour Degoutte attacked, in some places without preparation. The whole area involved was from Fontenoy to Belleau, a distance of 25 miles. The Germans were not prepared for the attack. They had come to the conclusion that the French were exhausted and they had left this flank in the hands of weak or exhausted troops. The result was that the line crumbled at the first stroke. Mangin, who gave his arm full swing, drove forward from four to eight miles, reaching the vicinity of Soissons on the south and bringing the Chateau-Thierry road under his guns. Degoutte's advance was less extensive, but that was by design. He was at the pivot of the moving line and was held back for an advance of from two to four miles, which was easily achieved.

These events did not alarm the German High Command. So completely was it convinced of the impotence of the enemy at this point that it refused to believe that the attack of the 18th was a serious menace to the eight German divisions south of the Marne. Von Boehn commanding in the salient treated the attack as a local affair and ordered a counter-attack against Mangin, who received the blow firmly on the 19th and pushed forward a little, clinching his hold on the vital road. Then von Boehn came slowly to the conviction that the game was up and ordered a retreat which began at 9 P.M., 20 July. At the same time he concentrated his reserves against Mangin, expecting, as it seems, that the French would try to push in the salient in the neighborhood of Soissons. But Foch's orders were for Mangin to hold his hand. Degoutte, de Mitry and Berthelot, however, were sent forward to press the retreating enemy. They gave him no relief. De Mitry and Berthelot pressed the retreating eight divisions to the Marne and held the southern bank of the river by the evening of the 20th. Next day Degoutte made a brilliant advance in the angle east and west of Chateau-Thierry, the 26th American division reaching Epieds, more than five miles from the starting point. At the same time American and French troops under de Mitry forced a crossing of the river, causing the Germans to abandon the town of Chateau-Thierry.

At this time the Germans were hastily trying to remove the vast quantities of materials they had taken to the region just north of the Marne in anticipation of a further advance. To protect them until they could be taken away it was necessary to stand and fight. As von Boehn showed fight Degoutte began to press on toward Fere-en-Tardenois. On the 25th he was
within three miles of that important centre of communication. Von Boehn realized that he could not hold back Degoutte's forces much longer and gave the order to retreat from the Marne, sacrificing a large amount of material which he had not been able to move.

Days of hard fighting followed from 25-31 July. Degoutte, de Miry and Berthelot pressed the southern part of the salient in furious efforts to break it and force their way through. Von Boehn resisted with great firmness. His machine gunners served him well in those stark days and paid dearly for it with their lives. But they gave time for the main body of the army to fall back to the upper Ourcq with a line extending eastward through the hill south of the road that runs from Oulchy le Chateau to Ville-en-Tardenois. By the 29th reinforcements had arrived in large numbers and heavy counterattacks were made in various parts of the line. The same was true on the 30th and on the 31st, despite brilliant local affairs by the French and Americans. The Germans held a line along the watershed between the Ourcq and the Vesle and refused to be driven down to trench warfare again. Then Foch threw in Mangin in deadly earnest, who during some days had slowly worked ahead in a humdrum way. The German line ran from Soissons to Bligny near Rheims, with Tardenois at the center. Four miles west of this middle point was Hill 205, commanding the entire region for several miles. Here Mangin struck on 1 August and captured the hill and held it against strong counterattacks. The victory meant that von Boehn's line was pierced and he lost no time in retiring to the Vesle. The French, British and Americans pursued swiftly. Soissons was entered with little resistance and on 4 August the line ran straight between Rheims and Soissons, which means that the Marne salient was destroyed. In the operations between 15 July and 4 August the Allies took 40,000 prisoners and a large quantity of guns and supplies.

In these operations the troops of the United States played a part. The 2nd and 3rd divisions were with Mangin and won his farthest advance on the 18th to the 20th, capturing 7,000 prisoners and 100 guns. The 26th division held the right wing of Degoutte's army and took Tergouay in the first day of the engagement. On the 21st it crossed the Soissons-Chateau-Thierry road and pursued the Germans to Epiads, and on the 24th it was relieved by the 42d division. The 3d and 4th divisions were on de Miry's right and crossed the Marne when Degoutte's attack uncovered Chateau-Thierry. They took position on the right of the 26th and pressed the retreating enemy. In the fighting on the Ourcq the Americans took notable parts. The 42d division held Somme and held Sergy, although the place changed hands five times before the Prussians who contended for it were finally beaten off. The division then met and defeated in a fierce hand-to-hand conflict the celebrated fourth Prussian Guard division, which was seen moving to drive the Americans into the Ourcq. The 32d division fought with equal distinction in Meunier Wood and drove its enemy before it, though greatly outnumbered. American division followed all the way to Fismes before the Germans could get to it. They then crossed the Vesle and established themselves in a position that served for a jumping-off place in further operations.

When the Germans retreated from the Marne in 1914 they outnumbered their opponents and had better equipment. When they retreated in 1918 they were in weaker numbers and had lost the superiority in equipment. Much fighting had worn down their strength and their morale was undermined. Hardy a man in the army that did not realize that Germany could no longer hope to win the war. Theenterprise which started so well had ended in gloom for the Teutons. Von Boehn had used up all the reserves of the group of armies commanded by the imperial crown prince and had drawn on the reserves of other groups. Ludendorff had but 26 reserve divisions and gave over all thought of maintaining the offensive. But he believed he could retain what he held until the end of the autumn and utilize the winter to build up another force that could prevent defeat.

Three facts were against him: (1) The German people were sick of war and had lost confidence in the promises of their rulers. They were willing to settle down to trenched warfare again. (2) The arrival of the troops from the United States in great numbers placed the Germans at a disadvantage. They not only gave Foch the initiative, but built up his mass of manœuvre until he could strike where he chose. (3) In Foch the Germans had an adversary of unusual capacity. He was not the man to let an opportunity slip. At the moment when they were most in need of rest, he was able to strike. His hard blows but increased the disintegration of German morale, and the line was cracking most seriously when the revolution in Germany precipitated a general defeat. Germans had borne themselves with courage and pride in the world for four years, but the tables were turned on 1 Aug. 1918, when the war entered its fifth year.

The Last Of The German Resistance.

1. Weakening the German Front.—At the Vesle Foch, pursuing the retreating Germans who had been beaten back out of the Marne salient, decided to stay his hand. It was not his plan to attack when the enemy's line hardened, but to arrest the battle and strike elsewhere. Having the initiative he was able to choose his course, and his opponents were forced to send reserves hither and thither as he struck. Meanwhile their unprepared sectors were pounded into jelly. Their fighting men were worn out and their will to war was undermined on seeing themselves defeated in one place after another. From 8 Aug. to 26 Sept. 1918 this process went on. Blow after blow softened the German line. When the Vesle and Sermont line fell the Ludendorff Foch would mass his blows at important points and drive through for critical positions.
The first of these softening blows was launched on 8 August, east of Amiens, on a 14-mile front, at the place where the Germans had approached nearest to the Paris-Amiens Railroad. The attacking force was composed of British and French troops under the temporary command of General Haig. The British portion was composed of Canadians and Australians brought for the purpose from the northern section of the British line. The French, who held a three-mile front on the right, were under the command of General Décейney. Tanks, most of them “whippets,” had been assembled to the number of 400, and the ground, as it happened, was dry and without enclosure, which suited tank operations. Everything else was favorable, especially the atmospheric conditions, for a heavy fog, like that which hung over the Saint Quentin front on the morning of 21 March 1918, now covered the Amiens front when the Canadians, Australians and French went forward at dawn on the morning of 8 August. By using skilful deceptive measures the impression had been made on the Germans that the attack would fall on the Ypres sector, and the movement at Amiens was a complete surprise. It opened with a bombardment of four minutes which, says Mr. Buchanan, was so intense that the enemy’s defenses disappeared as if wiped out by a sponge. Then the tanks went forward, followed by the infantry.

In the centre the German lines cracked and dissolved, and the attackers easily penetrated them from four to seven miles. The surprised Germans were caught in large numbers, some of them while at breakfast, others while working in the harvest fields behind the lines. The Canadian cavalry got behind the enemy’s positions and captured a railroad train near Chaunay. On the right flank the Frenchmen found stronger opposition but they fought their way steadily forward and stood by the side of the British when night fell. On the left flank the Canadians went forward at first, but later in the day they rallied and recovered part of the territory they had lost in this quarter. Next day, however, they renewed the attack with the help of a regiment from the 33d division of United States troops, recovered the lost area and took more. At the same time the centre and right flank were carried forward for about three miles.

This deep dent in the German line was five miles north of the important town of Montdidier. Southeast of it was the French army of General Humbert. He saw the opportunity to deal a telling blow and seized it. On 9 August, while the British were advancing to the north, he threw his army against the line in front of him, without waiting for reinforcements. Taken by surprise the defenders made less than the usual resistance. In a day and a half Humbert advanced eight miles, cut the road to Roye, and thus forced the surrender of the Montdidier garrison, for whom this road was the only available line of communication. With it was taken a large quantity of supplies. For the next five days the Allies ate into the German defenses, until on the 15th the British were but two miles from Chaunay and the French four from Roye, both inns which were of considerable importance. Humbert had also taken the ridge southwest of Lassigny and overlooked a wide belt of the enemy’s lands, thus forcing their further retreat.

In one week’s fighting the Germans lost 30,000 prisoners and probably suffered an equal loss in casualties, and a partial shrinkage of their force by five divisions. Amiens was safe and the Germans were not within 15 miles of the Paris Railroad. It was estimated that Ludendorff was left with but 16 fresh divisions in reserve on the Western Front. With such reduced reserves he could not hope to resume the offensive. In these operations the German soldier showed a notable lowering of his fighting spirit, especially the machine-gun units, who manifested less willingness to hold forth new positions to the last. In the ease with which the Allies penetrated his lines on 8 August, says Ludendorff, he saw the first indication that the German army was beaten.

By 15 August Foch was convinced that it would not be wise to press the enemy further in the Amiens sector and he turned to another area. East of the Oise was General Mangin, who had played such an important part in the fighting on the western side of the Marne salient. On 18 August Foch sent him forward for a mile on a 10-mile front. Von Boehn, who commanded the Germans in this fight, seeing no need of men, chose to consider Mangin’s attack a feint and drew back to his battle-line. On the 19th Mangin attacked on a larger front and ran forward for four miles on the eastern bank of the Oise. On the 20th he advanced three miles on a 16-mile front facing northeast toward the Ailette and taking 8,000 prisoners and 200 guns. By this time von Boehn had come to realize the seriousness of the attack and sent three of his precious reserve divisions. Foch, following his plan, ordered Mangin to stay his hand.

He was ready to spring an attack elsewhere. The place selected was the sector in front of Bapaume, where the British had fought the battle of the Somme in July 1916. Here stood the British 3d Army under the immediate command of General Byng, and they were ordered to attack on a nine-mile front on 21 August. Heavy fogs again hung over the field of battle and shielded the assailants. Tanks were also present in large numbers. The result was that the German lines were broken and a gain of from two to three miles was made. Next day an attack was made a few miles to the south, resulting in the capture of Albert.

By this time it was evident that the Germans were seeking to withdraw to their Siegfried line, which they had occupied before the 21 March drive. Foch quickly realized their intention and ordered that the blows be redoubled. The Oise divided the great angle of the battle-line, and the contest now fell on each side of it, the French fighting to the south and a few miles to the north of the river and beyond them, in the north, the British. Each day saw some advance. By 1 September the British had pressed on 14 miles east of Albert. They had also carried the fight into the Artois sector, where Bapaume was taken by New Zealanders with a great quantity of military supplies and by the end of the month they stood fairly against the Drocourt-Quéant switch-line. On 1 September Périgueux was captured by Australians. The French area saw but little fighting during these last days in August, it being Foch’s plan that the region immediately on the
Oise should advance slowly. It was well that it was so, for the fighting of June and July had taxed the French soldiers whereas the British in the north, in general, had been unemployed since the spring. Their manner of fighting showed their excellent condition. By 1 September they had only warmed to the contest, which was carried on in one blow after another, the Germans recoiling and rarely attempting a counterstroke. In fact, Ludendorff at this time had no other thought than to get safely behind his Siegfried line. He was pressed so closely that he found it very hard to fall back at all, and the daily reverses with large captures of prisoners showed him how perilous it was to stay at that place. In the campaign north of the Somme, near Bapaume and Arras, lasting 18 days, the British took 50,000 prisoners and 470 guns. Four German divisions were thus drawn into the British prison camps and as many more were accounted for in the casualty lists. On the last of the days counted, that is, on 2 September, Canadian troops broke through the Drocourt-Quéant switch-line on a six-mile section and carried the Germans back three miles to the Canal du Nord, which was but seven miles from Cambrai. South of the switch, however, the Siegfried, or Hindenburg, line still held and it was to stand for many days yet.

The reader will note that many of the critical positions taken in these operations were carried by Colonial troops, from Canada, Australia and New Zealand. That these men have been so often in the posts of greatest hardship is witness to their hardy fighting quality. It does not mean, however, that there was any weakening of the fighting capacity of the men from the United Kingdom. On every field they proved their courage and devotion.

The Drocourt-Quéant switch-line was broken on 2 September. The water-line along the Canal du Nord held tight for awhile and the British did not press it hard. They contented themselves with forcing the Germans back on their Siegfried line. At the same time the French to the southward, Generals Débeney, Humbert and Mangin, had worked their way forward as far as they could until all ground taken by the Germans in their offensives of 1918 had been recovered. Foch was wearing down his opponent’s strength while conserving his own. Since the beginning of the Allies’ attack on 18 July, when he took the initiative, he had inflicted losses of 500,000, and the arrival of the Americans on the line had given him an equal number of fresh troops. In comparison with Ludendorff, therefore, his relation to the enemy had improved by a million men, minus the two divisions which he never could hold.

2. The United States and the War.—When the war began President Wilson, following a custom established by Washington in 1793, issued a proclamation of neutrality and the vast majority of the American people supported his action. It was plain that the conflict grew out of the ambitions and rivalries of European states, running back through many international congresses, matters with which the people of the western world had nothing to do. In trying to carry out the neutrality that President Wilson, however, soon aroused opposition from each of the belligerents. The broad interpretation Great Britain and France gave to the rules of international law concerning contraband, blockade and the like raised such a stare that an international tribunal would be asked to pass upon them. At the same time Germany gave grounds of offense by conducting a complex system of espionage and propaganda within the United

States, by sending out supply ships from American ports to succor her cruisers at sea, and by using her submarines against Allied merchantmen in such a way that she slew American citizens who were conducting themselves within the province of international law. The destruction of the Lusitania, a British transatlantic liner, on 7 May 1915, by which 102 American citizens, including women and children, were killed, was the most striking instance of this series of complaints. Against the second and third kinds of wrongs the government protested to the authorities at Berlin; but as to the first, espionage and propaganda, it was difficult to cite concrete actions on which to base formal complaints. But the evidence of interference was numerous, and it is probable that they contributed little less than the submarine policy to the state of irritation that carried the American people into the war.

In the first months of the war the American attitude was accepted in London and Paris as the natural course for the United States to follow. But as the magnitude of the conflict came home to the people of the Entente nations they began to turn their eyes to the United States. They realized that it would tax the best energies to defeat Germany and they wished the help of the western republic. By this time it was clear that Germany was fighting for world power. If she was successful she would found monarchies on her European opponents and gather strength for a new and more ambitious contest. As to liberal government, it would probably pass into a state of subserviency if a victorious German military autocracy placed its heel on the necks of the self-governing peoples of Europe. In view of these reflections the sorely pressed people of France and Great Britain easily came to believe that the United States had as great an interest in the defeat of Germany as any other free nation. British and French blood, said they, was being spilt as much for liberty on the Mississippi as on the Thames; and they added that it was a discreditable thing for the Americans to leave other peoples to battle for them. By the end of 1916 many Americans had come to hold this opinion. It was their war as much as Europe's, they thought, and they wished their government to take its place by the side of those who were fighting to support liberal government.

In the mind of President Wilson another motive was forming, broader and more idealistic. To defeat one dangerous nation only to turn the world over to the play of forces which would soon bring up another who in turn would have to be defeated was a cheerless prospect to him, as to many another man on each side of the Atlantic. It became his purpose to try to get the world to adopt a league of nations to enforce peace by co-operation, and he announced in several speeches that by virtue of the part neutrals would have to take in readjusting world affairs after the war, the United States would have to take a part in keeping with their strength in arranging those parts of the peace which were to be made with the neutrals. Thus the United States went into the war; but President Wilson, in his speech to Congress, 2 April 1917, declared that the object of the fighting was to make the world safe for democracy and to establish a system under which the horrors of war on a grand scale would be abolished. There is nothing in the American constitution giving the President the authority to declare the object for which the nation fights; but the warm approval given his speech of 2 April by political friend and foe seems to indicate that his ideas were approved by the people of the United States.

The accession of the powerful western republic gave new courage to the exhausted states of the Entente alliance. Germany discounted its significance, saying that money and supplies might be furnished to her enemies, but that it was physically impossible for the Americans to send a great army across the Atlantic. The assertion seemed but too true to many Frenchmen; and Joffre, in Washington, in May 1917, urged that American troops, if only a division, be sent to France to boost the French people and show them that American troops would fight by the side of the French. Thus it was that the first American division was sent to France in June and July 1917, and General Pershing was made commander of all the forces sent by his government to fight in France.

During the remainder of the year 1917, active preparations proceeded for the transmission of American troops to France. Engineering forces went over in large numbers to construct depots for supplies, docks for unloading, and railroad tracks for the accommodation of the large number of locomotive and freight cars that were needed by an army of 2,000,000. Other pioneer divisions followed. By the end of the year 195,495 troops had been embarked, and at that time they were going at the rate of 48,000 a month. When the Germans opened the drive of 21 March it became evident that the success of the Allies demanded the arrival of much greater numbers of Americans, and Great Britain had limited her own supplies of food in order to place ships at the disposal of the United States. Thus it was possible to transport 244,345 men in May, 297,000 in July and 283,000 in August. When the armistice was signed the United States had embarked 2,045,169 men for service in the World War. Almost half of this number were available for service under General Foch when he opened his heavy drives on the German lines in August 1918.

To support this large number of men in France demanded the utmost exertion on the part of the United States, and the system of communications and depots that was created was one of the notable achievements of their part in the war. Wherever they came into the field they found the British were using the channel ports of France to the limit of capacity. If the Americans could have used them also it would have produced great confusion in transportation to have given them control of railroad roads crossing the area occupied by the neutrals. It was logical for them to take over Atlantic ports south of the channel, and four were assigned them: Brest, Saint-Nazaire, La Pallice and Bordeaux. With a lavish expenditure of money and energy docks were built, wharves, sidings were constructed, warehouses were
erected, bakeries and other manufacturing plants that ministered to the needs of an army were established, and camps of instruction for the air service and for other arms were established. The American Service of Supply supplied American business energy at its best, operating as it did with unlimited funds at its disposal. That it used a vast amount of money was evident to all; but it obtained the desired results in an astonishingly brief time.

Great doubt was felt in friendly as well as in hostile countries about the possibility of training the Americans into an efficient army. It was not until the battle of the Somme, two years after the war began, that the British could be said to have converted their untrained men into modern soldiers. Could anything better be expected from the men of the United States? The doubters did not realize that the Americans had the advantage of knowing all the mistakes of the British. Also, they showed a great willingness to learn how the trick was done. When they arrived in France they made no objection to serving by battalions under French and British officers. American brigades were placed by the side of British brigades in the trenches. This docility in instruction made a deep impression on the European soldier, who was ever jealous of his nationalism. Under these conditions officers and privates learned the game of war thoroughly and waited patiently for the day when they should act as a distinct army with a distinct area of operations and distinct objectives.

When the German offensive of 21 March 1918 broke on the British lines in front of Cambrai and Saint Quentin, four American divisions in France, numbering about 28,000 men each, were in such an advanced stage of training that they could be used as combat troops.

On 28 March General Foch was made head of all the armies of the Entente in France. On the same day General Pershing visited him to place at his disposal the entire American force in France. The words he used in making the tender are worthy of repetition. "I come to say to you," he said addressing General Foch, "that the American people would hold it a great honor for our troops were they engaged in the present battle. I ask it of you in my name and in that of the American people. There is at this moment no other question than that of fighting. Infantry, artillery, aviation—all that we have are yours to dispose of as you will. Others are coming which are as numerous as will be necessary. I have come to say to you that the American people would be proud to be engaged in the greatest battle in history. The time was opportune, and Pershing's utterance, widely reported, enthused the doubting people of France and Britain. At that time the speed with which the Americans could get into the battle was the supreme question. Germany was pressing for a decision before the weight of American help could be felt against her. The French and British were grimly set to hold on until the American troops could take
some of the pressure off their lines and enable them to turn the tide of battle.

A few days later Foch ordered the 1st American division into the trenches in front of Cantigny, near Montdidier, and here on 28 May the division, under the command of Major-General Bullard, charged the enemy's trenches and took the town of Cantigny in a well-fought engagement. The manner in which it was carried through attracted attention and gave great satisfaction to the large number of people who were waiting to see how the Americans would fight. The London Evening News expressed the common feeling when it said: "Bravo, the Young Americans! Nothing in 10-day's battle narrative from the front is more exhilarating than the account of their fight at

port, with the result that the marines suffered heavily. Finally guns were brought up in great numbers and the woods were raked thoroughly. Then the marines went forward and took the position. The battle of Belleau Woods was a test of courage well met. It became a standard for the endurance of the army.

On 15 July the Germans opened their fourth drive, crossing the Marne from Dormans to a point west of Jaulgonne, a distance of 15 miles. On the right flank of this attack they encountered the 3d American division, who, pressed back, quickly rallied and drove the enemy across the river on their immediate front with heavy losses and then gave aid to the French on their right. Here they held their own for five days, until the heavy attack of Foch on the west side

of the Marne salient caused the withdrawal of the troops south of the Marne, when they followed and took part in the pursuit which drove the Germans out of the salient.

Three American divisions took part in the operations of the 18th, by which Foch seized the initiative and crushed in the western side of the salient, from Fontenoy, north of the Aisne, to Vaux, northwest of Chateau-Thierry. The parts taken by the 1st, 2d and 26th divisions in that attack have already been described, as well as the fighting of the 3d, 4th, 42d, and other divisions in the southern part of the great salient in the last 10 days in July (see page 344). General Pershing proved himself a hard hitter. He threw in one division after another, giving them their first taste of

![Map showing Battle near Chateau-Thierry](image)
fighting on a large scale. They showed that they were to be depended on, meeting some of the best German troops on equal ground. These days placed the new American army beyond the stage of infancy. It proved its reliability and henceforth it was placed on the footing of military equality with the other armies enlisted in the task of defeating Germany. By the first of September the American divisions that had followed the retreating Germans were being withdrawn, in pursuance of a plan that had been made in conformity with the plan of Marshal Foch for a distinctly American attack on the Germans. The point selected was at Saint Mihiel, where the battle-line passing westward from Font-à-Mousson reached the Meuse and bent sharply northward until it passed around the defenses of Verdun, keeping for the most part on the east bank of the river. The position was very strong and the Germans had been there for some time. They had gathered the best trained of their divisions in that part of France and made ready to attack the forces in the angle. General Pershing, in command of the force, had under him, besides the Americans, the 2nd Corps of French troops which he placed opposite the angle itself, in such a position that they could enter the town as soon as the Germans withdrew. He had also a French division which he placed, with the 20th American division, in a position to carry the heights of the Meuse north of Saint Mihiel. Seven other American divisions were placed in line east of the town to Port-sur-Saône, five miles east of the Moselle, and other divisions were held on the right. The plan of the campaign was to attack the defenses on each side of the town at the same time and pinch out the garrison. It was made less difficult than it might seem by the fact that all the roads that fed the German lines in the inner angle must pass through Vigneulles which was only five miles from the position at which the 20th stood and eight from the point at which the Americans approached it on the other side of the salient. If this place could be reached the retreat of the Germans in the interior parts of the angle would be cut off.

The attack opened on 12 September, the fourth anniversary of the occupation of Saint Mihiel by the Germans. The enemy had received intimation of what was coming and feeling unable to reinforce the garrison in the angle had decided to withdraw. They began the movement about the 10th but proceeded in a leisurely manner because they did not expect the attack until the 15th. When the Americans advanced, the work of evacuation had not progressed very far, but the lines of defense were in an unstable condition. They yielded easily to the Americans who attained all their objective of the first day of the engagement. Later came the news that the Germans were escaping out of Saint Mihiel, and two regiments set out for Vigneulles in the night. They reached the place in the early morning and bagged a large number of the enemy who had gone cautiously. The Americans took more than 16,000 prisoners and 443 guns. They readjusted their lines across the Woëvre Plain in nearly a straight line from the northern defenses of Verdun to the Moselle River near Pont-à-Mousson. But in some places it was within 20 miles of Metz and some persons thought it only remained to move on that position. But Saint Mihiel was not directly a step toward Metz. The position as held by the Germans was an annoying salient thrust forward into the Meuse. It proved its reliability and henceforth it was placed on the footing of the German lines in this part of France. It would have been impossible for the Americans to go forward up the Meuse with Saint Mihiel in German hands. We shall see how that movement was conducted.

3. Breaking a Weakened Line.—The fighting just described by the Allied armies in August and September accomplished two important things. It softened the German resistance and prepared the way for a break through, and it removed the Saint Mihiel salient which was an obstacle in the way of further operations. With the course thus cleared Foch did not wait a day before putting his plans into operations for a great forward move. He followed his plan of striking all along the line, keeping the enemy engaged at many points; but his main efforts were made at two critical positions. One could break through at them, he would place the enemy's communications in peril and cause him to fall back in confusion with the prospects of capturing a large portion of his armies. The two places selected were opposite the strong road centers of Cambrai and Saint Quentin and along the Meuse to the Meuse near Sedan and Mêzières, on the great supply lines from Germany by way of Luxemburg and Metz. The first of these attacks, was left to the British, the second to the soldiers of the United States. General Pershing Knew that he had lost the initiative, and did not expect Foch to give him any rest. Although he knew not where the blow would fall, he was ready to cover whatever place should be attacked so far as his straitened resources would permit. His soldiers were also conscious of his difficult position. They had begun to doubt their eventual success and their morale was broken to a notable extent.

The first of the two attacks was made by the Americans. As soon as the Saint Mihiel salient fell General Pershing moved his heavy artillery through Verdun, now safe from hostile shells, to the region north of the town and between the Meuse and the western edge of the Argonne Forest. From there he drew off his best-trained divisions to the same region and took over 20 miles of trenches with a force which he organized as the 1st Army. The American lines on the east of the Meuse were held by the remainder of his forces which he began to reorganize into a 2d Army. At this time the 2d Army held the line from Port-sur-Saône to the Meuse, a distance of 42 miles. The 1st Army held the line from the Meuse to Viennes-le-Château, a distance of 23 miles, the last eight of these being through the Argonne Forest. To the west of the Americans was the French army under General Gouraud, holding the sector between the Aronne and Rheims. Foch's orders were for Pershing and Gouraud to advance. The Allied forces under the former were looked upon as the spearhead of the movement. On 25 September both commanders were ready and a heavy cannonade was opened. It was especially intense in the sector of the 2d American Army, the design being to give the enemy the impression

Copyright, Underwood & Underwood, N. Y.
that a great attack was about to be made against Lorraine, with its valuable coal mines. The
ruse succeeded, since it induced the Germans
to strengthen the defenses of Metz.
During the night the artillery fire was con-
centrated along the line between the Meuse and
the Sûppe, a distance of 40 miles, and after
three hours the infantry went forward at 5:30
on the morning of the 26th. Near the Meuse
the Germans found weak resistance and went
forward two miles; but along the Argonne the
army met stout opposition and barely advanced.
Just east of the forest they advanced about two
miles. The next day they continued the strug-
gle, despite strong counterattacks, and took
the fortified hill on which was the town of Mont-
faucon, from which the imperial crown prince
was said to have viewed the battle of Verdun.
It was Pershing's plan to hold back the line in
the Argonne and flank the enemy out of the place;
the plan was to advance some distance on the
front line that ran through it would not be stayed,
and they began to work their way forward as the
blinding forces day after day ate into the
strong defenses on their right. The Argonne
had long been considered by the Germans an
impenetrable line and had been used as a
place of recuperation for divisions that had
been severely used in battle elsewhere. It con-
tained moving-picture theatres, barracks and
excellent quarters for the officers. Its defenses
were elaborate. The surface was broken with
ravines and outcropping stony ledges and it
was covered with dense undergrowth. The
roads and paths were well known to the Ger-
mans who had mapped them accurately and
held them under artillery range. The forest
was full of machine-gun nests placed at the
most advantageous points. Against this posi-
tion General Pershing sent his 77th and 28th
divisions, the former being composed of drafted
men chiefly from New York City. The persist-
ence with which these city-born men stuck to
their task was one of the surprises of the en-
gagement. The 28th was a National Guard di-
vision from Pennsylvania.
After a final advance Pershing held
back the divisions nearest the river and
concentrated his efforts along the edge of the
Argonne. By 4 October he had brought up his
artillery and was ready for another step for-
ward and on the day that they were wrote out
of the enemy's hands by hard fighting.
Then followed six days of stern encounter, at
the end of which the Argonne was clear of
Germans and the Americans stood 12 miles
north of the position occupied when the attack
began on 26 September. They had broken the
old line of defense, known by the Germans as
the Brunhilde line, and behind it the slighter
Freya line. Before them was the Kremhilde line,
an intricate system of trenches, to penet-
rate which General Pershing summoned all his
resources.
Meanwhile the French under General Gou-
rault had been advancing in the most gallant
manner. Before them was the extensive and
difficult terrain supplemented by German front
to their best efforts in the two battles of Cham-
pagne. But their attack of the 26th was so
overwhelming that these strong positions were
pulverized and taken by the French with about
10,000 prisoners. General Gouraud then at-
tacked the supporting trenches which yielded
slowly. As Pershing worked his way up the
eastern side of the Argonne and through its
tangled undergrowth, the French pushed for-
donard on the western side, the two armies com-
ing into touch at Grand Pré, at the northern edge
of the Argonne. On 10 October, the 2d American
division, under the command of General Pershing,
hit him on his right flank of his attacking column he encoun-
tered strong resistance but overcame it, going
forward three miles. To renew his attacks he
needed fresh troops and Pershing loaned him
himself. On 11 October the 2d American division
moved up to the Argonne and under the command of
Pershing made a steady progress; but it did not achieve
what Foch expected of
it. It was his design to break through quickly
to the Sedan-Mezières Railroad and cut off the
troops in the Rhins-Cambrai sector from their
supplies while they were only slightly forti-
cated. But the progress of his
right was held up by strong fortifications.
In front of Pershing stood the Kremhilde line, a
series of well-placed trenches from three to
five miles deep that was to test his courage for
many days yet.
Meanwhile the whole Allied line west of
Gouraud was the scene of heavy fighting. On
the 27th, the day after the attack on the right,
Haig was given permission to deliver the at-
tack on the Cambrai-Saint Quentin line. It was
a difficult task, for before him was the strong
Siegfried position. This system of trenches at the
critical part of the line ran for the
most part along the banks of the Scheldt Canal.
Between Bellicourt and Vendhuile the canal
ran through a tunnel for a little more than
5,000 yards. The Germans filled this tunnel
with canal-boats and walled up the ends. The
boats were conveyed into the tunnel, and the
towpaths made excellent corridors. They thus obtained a vast subterranean cham-
ber, in which more than 12,000 men were con-
cealed so far below the surface that they were
safe from the largest shells. Lateral shafts led
to a village several hundred yards away enabling
the men to come and go without detection from
the air. North and south of the tunnel the
channel was 60 feet wide and the banks were
steep. Against this sector of the well-con-
structed Siegfried line General Haig decided
to throw his army. If he broke through com-
pletely he would have a clear way to the
Hirson on the railroad that supplied the rear of the
battle-line. Thus, while Pershing was battling
his way toward Sedan and Gouraud was strug-
gling for Mezières, Haig sent forward a strong
portion of his army in the direction of Hirson,
all important points on the vital railroad sys-
stem. As we shall see, these three main thrusts
were designed to push Haig's army onto other parts of the great line of battle, deliv-
ered simultaneously to keep the Germans busy.
The main British blow was to be given be-
tween Vendhuile and Hirson, a sector 10 miles
wide. But Haig would not make his first in-
sult there, partly because it was the strong-
est part of the Siegfried line and partly because he wished to deceive the enemy and induce him to concentrate elsewhere. He accordingly opened a heavy bombardment against a section of 3rd Lines, including the point to be attacked in main force. Following this he made a strong attack with the 1st (Horne) and 3d (Byng) Armies in the sector north of Vendhuile. On the morning of 27 September, the day after the attack began in the Argonne region, these two divisions went forward on a 13-mile front. Their most determined effort was made in the region in front of Cambrai. Four divisions, three of them Canadians, led the attack across the Canal du Nord and opened the way for other divisions to follow. By nightfall the lines were carried forward three miles on an eight-mile front with the capture of 10,000 prisoners and 200 guns. Next day the fighting was renewed and the British advanced to the banks of the Scheldt Canal, three miles south-west of Cambrai.

By this time the Germans were busily engaged in two important contests, and Foch thought it time to add to their embarrassments. One of these was the advance of a force of Belgian, French and British troops, under the command of King Albert of Belgium, on a 20-mile front in Flanders. It was directed against the German army of General von Arnim which had begun to fall back under the pressure of Ludendorff's straitened circumstances. Having used up their general reserves, the Germans were now forced to take from one part of their line to protect another; and as von Arnim had seemed to be the German general in least immediate danger, troops had been taken from him to strengthen the lines elsewhere until he had only five divisions left. They were no match for the superior forces of Foch, and in two days' fighting were forced back to a maximum depth of eight miles. The Allies were within three miles of Roulers on the road from Ypres to Ghent; and they took 10,000 prisoners. It began to appear that King Albert's army would outflank the entire German line at its northern end.

But this was all the misfortune that came upon Ludendorff. He well knew that Haig's forces before the Saint Quentin section were massed for an attack and dared not weaken his line there. While he waited at this point for the expected blow Foch gave still another thrust. This time it was between the Ailette and the Vesle in the Chemin des Dames region. Generals Mangin and Guillaumet were sent forward on the 28th and in a three days' combat carried their opponents back more than three miles. It was hard fighting in the best manner of the French, to whom the certainty that retribution was at hand had brought a state of exalted courage that would take no denial. By their side fought Italian divisions.

On the 28th, therefore, Foch was pressing the Germans in five places: along the Meuse, west of the Argonne, in front of the Chemins des Dames, in front of Cambrai and east of the Ypres salient. In each place his troops were advancing slowly despite the dogged fighting of the best German units. Then came Foch's great blow at the tunnel sector of the Siegfried line. Here stood the British 4th army, under the command of General Rawlinson. For two days his guns had poured a steady fire on the German trenches, and his infantry had been thrown forward against some of the enemy's outposts, crushing them in. Serving in his force at a point opposite the strongly-fortified tunnel was the 2d corps of United States troops, consisting of the 27th division. On 27 September a regiment of the 27th division carried some of these outposts in front of the tunnel and thus brought the two divisions directly vis-a-vis with that formidable position.

The main attack was made at dawn 29 September, the two American divisions going forward side by side with some of the best British troops. Behind them were Australians and other British troops in support. South of the tunnel sector the North Midland troops, 46th division, Englishmen, crossed the canal on mats, portable boats and life-belts and carried the German trenches on the east bank in a desperate battle. North of the tunnel other British troops drove back the foe and a portion of them entered the outskirts of Cambrai. Against the tunnel sector the two American divisions charged with determination. The 27th encountered but slight opposition. On German lines and a part of them went forward for a considerable gain. But the main body was held up by having to defeat the large number of the enemy who swarmed up from the underground trenches. Here they fought all day on the Siegfried line. In the evening British and Australian troops came up in support and going through their lines pressed the Germans back still farther, and the 27th was sent to the rear to recuperate. Meanwhile the 30th had gone through the section of the Siegfried line on its front, taking Bellicourt and Nauroy and holding them against counterattacks, after which the division was withdrawn to rest but ordered back into line almost immediately.

Meanwhile, the British troops were carrying on the struggle in this vital part of the German defenses. The breach at the tunnel was of vital importance and the troops that poured through opened beyond it fan-like, always encountered the stiffest resistance. South of the British the French army of General Débeney moved against the defenses of Saint Quentin, carried them and entered the town on 1 October. These were serious days for the Germans, each 24 hours bringing them a new disaster. On 30 September it was announced that Bulgaria had accepted an armistice that amounted to complete surrender. Next day Saint Quentin fell and to its loss was added the capture of Binainville by Pesching, and Condé and Marvaux by Gouraud. On this day, 1 October, Mangin pushed on in the Aisne Valley, clearing a considerable part of the southern bank of the Ailette. The British also advanced in the region of Cambrai, taking a firmer hold on the adjacent positions. On the same day they announced that for the previous two months they had captured 123,618 Germans and taken 1,400 guns.

On 2 October this policy showed its fruits when the Germans began to withdraw on a front extending from Lens to Armentières. The move was made necessary by the pressure of the Allies on each side of this sector, that is, by the British and the French on the left, and by the British and the British on the right. The move was made necessary by the pressure of the Allies on each side of this sector, that is, by the British and the French on the left, and by the British and the British on the right. The move was made necessary by the pressure of the Allies on each side of this sector, that is, by the British and the French on the left, and by the British and the British on the right.
WAR, EUROPEAN—MILITARY OPERATIONS, WESTERN FRONT (5) 383

pressure at the latter point Foch sent forward a French army under General Degoutte. Some days passed ere it got into action, but in the south the French armies were actively engaged, advancing at Saint Quentin swiftly and making some gains on the Aisne and northwest of Rheims. In the Champagne General Gouraud took an important step toward Vouzières. On this day came news that General Allenby had taken Damascus on 1 October with 7,000 prisoners.

On 3 October the French armies kept up their pressure in the south and the British went forward near Cambrai and in Belgium. They also occupied Lens and Armentières, long contested by the Germans, whose voluntary withdrawal at this time indicated how hardly they were pressed in other quarters. The British followed after them and came next day within six miles of Lille, which they hoped to take without a destructive cannonade. The day of 4 October, also, brought them heavy counter-attacks in the sector between Saint Quentin and Cambrai, which they repulsed with steadiness. On 10 October General Gouraud and General Pershing, having brought up their guns, made a new attack which gave each of them an important step forward. The first, with the aid of the 2d division of the United States troops, took Blanzy-Mont Campagne and continued their attacks east of Cambrai and Saint Quentin. Le Cateau was taken by the British and the Germans were forced back to the Selle River, where they undertook to organize a line of defense on the Somme Py. It was so important a gain that next day, the 5th, Gouraud moved forward on a line running east to the Argonne, advancing as much as five miles in some parts of it. On this second day of the Argonne French made important gains that flanked the formidable forest and enabled the lines within its recesses to move forward two kilometers. On the 5th, also, the British delivered telling blows against the Siegfried line south of Cambrai, where it remained intact. They weakened its resistance and prepared the way for a more serious blow a few days later. On this day it was announced in Berne that Austria had appealed to President Wilson through the Swiss government for a Peace Conference at which the points of discussion. Next day, 6 October, it was announced that Germany joined in the appeal and asked for an immediate armistice on the basis of the Fourteen Points and supplementary demands, notably the withdrawal of the United States and the British and the recognition of the League of Nations. This action gave the war a sudden and decisive turn. It was the beginning of surrender and the Germans could not hope to resume their battle with any pretension of victory after it was announced. In the Allied countries it was received with an air of disappointment. For more than four years the Germans had seemed to have the advantage: now that they were clearly facing defeat should they be allowed to escape punishment by crying "Kamerads? For several days the request was the chief object of debate in the newspapers, until President Wilson sent a reply designed to make Germany specify her terms of submission.

Meanwhile, there was no relaxation of military efforts. Winter was approaching and it did not behoove Foch to allow the enemy respite under cover of negotiations until he could place himself behind its friendly protection with immunity for another quarter of a year. On 1 October he continued by the 7 October and on the 8th the British with the aid of the French army of General Débeney hurled themselves on the softened Siegfried line south of Cambrai and swept it away on a 20-mile front, advancing three miles in most of that sector. In this act the 30th United States division took an important part at the point where the French and British elements approached one another, taking the towns of Brancourt and Prémont after severe fighting. Next day the blow was repeated on a more extended front and with even greater success. The weakened condition of the enemy was shown by the fact that he staggered back nine miles at some parts of the 30-mile sector in which he was attacked. On this day, the 8th, Cambrai, for four years an objective of the Allies, was occupied and 10,000 prisoners were taken. On the Meuse the day was signalized by a renewal of the attacks of General Pershing, who was now hard against the Kremhilde line. In a great thrust he took Romagne and thus drove an initial wedge into the system, beginning a steady series of advances which were destined to carry him through the entire series of trenches and bastions, at the end of the month. On 17 October the British and the French continued their attacks east of Cambrai and Saint Quentin. Le Cateau was taken by the British and the Germans were forced back to the Selle River, where they undertook to organize a line of defense on the Somme Py. It was so important a gain that next day, the 5th, Gouraud moved forward on a line running east to the Argonne, advancing as much as five miles in some parts of it. On this second day of the Argonne French made important gains that flanked the formidable forest and enabled the lines within its recesses to move forward two kilometers. On the 5th, also, the British delivered telling blows against the Siegfried line south of Cambrai, where it remained intact. They weakened its resistance and prepared the way for a more serious blow a few days later. On this day it was announced in Berne that Austria had appealed to President Wilson through the Swiss government for a Peace Conference at which the points of discussion. Next day, 6 October, it was announced that Germany joined in the appeal and asked for an immediate armistice on the basis of the Fourteen Points and supplementary demands, notably the withdrawal of the United States and the British and the recognition of the League of Nations. This action gave the war a sudden and decisive turn. It was the beginning of surrender and the Germans could not hope to resume their battle with any pretension of victory after it was announced. In the Allied countries it was received with an air of disappointment. For more than four years the Germans had seemed to have the advantage: now that they were clearly facing defeat should they be allowed to escape punishment by crying "Kamerads? For several days the request was the chief object of debate in the newspapers, until President Wilson sent a reply designed to make Germany specify her terms of submission.
October the place was taken and the adjacent lines were carried forward on a 12-mile front. Next day the effort continued with even better results, and an advance of and the South to 25 miles was obtained on a front of 25 miles, with a total result of 14,000 prisoners in the two days. On the 16th the German line in Belgium, from Lille to the sea, became mobile and turned north, the French retreating so fast in some parts that the pursuers lost contact with them. The explanation is that Ludendorff had been forced to draw heavily on this line in order to resist the blows of Rawlinson and the French in the south. He knew that the Flanders line was in no condition to resist a hard drive north of Lille, where the Allies had come within 20 miles of the Dutch border. If they drove this distance they might capture the Germans in the coast towns of Ostend and Zeebrugge. With that resourcefulness and quick determination which characterized all his actions he knew there was no time to wait, once Foch turned his attention to this northern sector; and the next few days were characterized by rapid withdrawal from the Belgian seacoast. In order that this might be done, it was necessary for the line to swing back in an orderly way, the Nieuport end coming around to Bruges and then to the boundary of Holland, east of Ghent. By this means the Lille-Courtrai positions became a pivot. It was Foch's chief purpose to take these positions and break up the plans of his opponents.

On 17 October the movement continued. The Germans stiffened their resistance at the pivot, but the wing swung back on a 30-mile front for a distance of 12 miles at its eastern end. Ostend was evacuated and received a British naval force that came to it from the sea, while the Belgian force in Nieuport hurried forward by land. On the same day Belgian patrols entered Bruges, the Germans falling back toward Ghent. South of the pivot the British pressure was irresistible and Lille and Douai were occupied. Still farther south Rawlinson crossed the Selle River, taking another mile or two from the distance that separated him from the railroad north of Hirson. On the 18th and 19th the same tactics were pursued, and the coast regiments started on the Belgians coming into contact with the Dutch boundary northeast of Ghent. During this period heavy fighting continued around Courtrai, the British going ahead slowly. They gained Courtrai on the 20th and pushed on toward Tournai. Next day there was heavy fighting before that town and Valenciennes without notable success. The French were before Ghent, where the Germans held them at bay. Meanwhile, the French in the south had made slight advances between the Oise and the Serre and before Vouziers, while Pershing was eating into the German defenses west of the Meuse. Taken all in all, it is evident that the army of the Kaiser, though badly handled, was making a good fight for its existence. The men were very tired and the reserves were used up; but the soldiers displayed much tenacity in these days, holding where ordered to hold and falling back in good order when directed to fall back. The immediate object of the French was to get safely behind the Scheldt and make a stand there. From Valenciennes north this river was deep and broad enough to make a good defense position. To the south it was not a barrier and it was here that Haig attempted his next advance, going forward 24 and 25 October between the Scheldt and the Somme and capturing 9,000 prisoners in two days. On the second day the French opened a drive on a 40-mile front, Débeney between the Oise and the Serre and Mangin on the southeast of the Somme, both advancing for clear gains. Each of Mangin was Guillaumet who also moved to the Somme. The advance was resumed 27 October and there were gains of as much as five miles, and on the 28th two miles were made. During this period comparative quiet reigned in Flanders, but it was broken on the 31st when there was an advance on a 15-mile front between Deyme and Aveghem, the Germans fighting hard and stopping when they reached the banks of the Scheldt.

By the end of October the exchange of notes between Germany and the United States had proceeded far enough to make a declaration imminent. Each side was straining every nerve to fight its best in these last days, the Allies to force their opponents as near to defeat as possible, and the Germans to maintain their positions and give battle. Each side was not yet beaten to the point of submission. How well they carried out this plan is shown by the fact that although the British fought hard during the month of October they took only 49,000 German prisoners, whereas they took 66,300 in September and 57,318 in August. The Germans were conducting a successful retreat in Flanders and offering a stout resistance in other parts of their lines. It seemed that they were in a fair way to protect their communications until winter arrived and caused the Allies to suspend their attacks. Their calculations were defeated by the success of the United States troops in breaking through the German defenses on the Meuse.

General Pershing spent the last half of October in turning the Germans out of the Argonne Forest by flanking them. That done he brought up his heavy guns in front of the strong system of defenses that extended across the open country from Grand Pré to the Meuse. At the end of the month he brought on the Ain battle and attacked on it but not in force. On 1 November he opened an overwhelming artillery attack on the system and followed it with an infantry movement that carried him forward four miles. The next day he continued his advance, completely freeing the German defenses, and pushing forward in motor trucks took Buzancy, the railhead by which the Germans in this sector received their supplies. His quick action so disconcerted them that they fell back in confusion. He followed closely, giving them no time to construct new defenses and on the 6th his troops arrived in that part of Sedan that lies south of the Meuse River. At the same time he threw a portion of his army across the Meuse and was in a position to advance on Metz when it seemed wise.

This sudden break-through completely cut the German line of communications through Metz and Luxembourg. It made it impossible to hold the line of defenses in the Aisne and in the Champagne, and it was followed by a rapid retreat throughout this area. In fact, it placed the Germans in a precarious position throughout that portion of their lines that did
not depend on the railroad through Liège for its supplies. The effect was seen in the evacuation of Valenciennes and its occupation on 2 November by the British. On the same day General Gouraud made a notable advance on Pershing's left. On the 4th Haig went forward three miles on a 30-mile front, taking 10,000 prisoners and 200 guns; and Débeney on his right won two miles. On the 5th the Germans drew back on a 90-mile front from the Scheldt to Rethel, allowing their opponents to advance five miles in some places, but in Flanders they were able to hold their line. Next day the feat was repeated, the British advancing on their whole line an average depth of six miles, and the French making a similar advance north of the Aisne. Each day now added great gains of territory. The Germans dared not wait in their tracks with Sedan in hostile hands but strove hard to get out of danger before they found themselves out of supplies. Thus, Gouraud pursuing them invested Mézières on the 8th and Débeney took Hirson on the 9th. The British pushing on east of Valenciennes came to Mons 10 November, where the war began for them on that fatal day, 20 August, in 1914.

Next day, 11 November, the armistice went into effect and the fighting was at an end. The long battle line which for four years had roared night and day came to a sudden state of quietude, and soldiers came out of the trenches and cut capers where an hour before to be seen was as good as to die. Thus ended the long period of trench warfare on the Western Front, dying away as a life goes out of the human body after a long strife with disease. No more the heavy breathing that sounded through the house, or the coming and going of the attendants, or the hushed expectancy; in its stead the strange quiet of absolute rest. That is the way the first days of peace seemed to a world that had given more than four years to the sole business of watching, serving, praying and dying for the war in France.

In testifying in 1919 before a Parliamentary investigating committee Field Marshal von Hindenburg is reported to have said that the war was lost through the breaking down of the "home front." It was a military man's way of looking at the situation. It is true that the defection at home, the longing for peace and the hatred of the people for the system that had brought them to their state of suffering had reacted powerfully on the army. But the question may arise: How far is the military class justified in testing the endurance of a people in support of war? and had not the war leaders in 1918 demanded all the sacrifices of the people they had a right to demand? The war in Germany had gone on until every economic factor in the country's life was exhausted. Men had died in vast numbers and there was no prospect that they would gain anything by continuing to die. The nation believed that it was time to end the war. In a proper sense the war ended itself. That is, it fought itself out to its own finish. Political conditions did not end the war. The political condition that von Hindenburg
saddled with the responsibility for the defeat of Germany was itself a result of the war. It was bled in the war. For it the war leaders must assume responsibility.

In a narrower sense we may ask whether or not Germany was defeated in a military way. Up to 1 November it was not possible to say she was defeated. Her lines were heavily beset but they still held. Then came Pershing’s break through and the capture of Sedan. After this German armies were not back to the Rhine, but they were isolated and pressed by greatly superior foes. With heavy losses they might have drawn back through the roads in the Ardennes in the cold, but it would have been as Napoleon retreated from Moscow, with a victorious enemy harassing at every step, and in the spring the coup de grace Ludendorff was beaten when he surrendered. He was too good an officer to give up too soon. By prolonging the war he could have inflicted more punishment on the opponents of Germany and a greater amount on Germany herself, but he could not have obtained better terms. It is a wise general who knows when he has CUT the throat of the horse.

The honor of breaking through the German defenses was not all Pershing’s. Rawlinson’s feat north of Saint Quentin was equally valorous. Moreover, Pershing could not have reached Sedan if French, British and Belgian armies had not been fighting hard in other sectors to hold the attention of the Germans. Against the German ring blows were being delivered simultaneously in several places, wearing thin the iron ring. It was the blows of the men from the United States that first broke through. If they struck harder they had not struck so long. Fresh, ardent and brave, they were in a position to reap the fruits of the service of those who had fought and died before they came into the war. The defeat of Germany was won by all who fought against her.

Bibliography.—Of general works the best is Buchan, John, ‘Nelson’s History of the War’ (24 vols., New York and London 1918-19) in a point of view is British, and it contains little on the military controversies rising out of the war. It deals with all phases of the war, and may be pronounced a successful contemporary account of the struggle. A shorter but more critical work is Simonds, Frank H., ‘History of the World War’ (3 vols., Garden City 1919). The first volume appeared in two parts as ‘The Great War’ (to the fall of Antwerp; New York 1914) and ‘The Great War, the Second Phase’ (to the end of the second battle of Ypres, 1 May 1915; ib. 1915). The author was one of the best American military experts who wrote for the newspapers during the war. He writes very clearly, but at times his descriptions are needlessly puerile. Sir Arthur Conan, ‘A History of the Great War’ (Vols. I-V, New York and London 1916-19) is a dry summary of facts without perspective or philosophy, Bellow, Hilaire, ‘The Elements of the Great War’ (Vols. I-II, 1915-16) is an ambitious work that was not finished. The same may be said of Murray, Col. A. M., ‘The “Fortnightly” History of the War’ (Vol. I, ib. 1916). Another similar work is Le Quex, William and Wallace, Edgar, ‘The War of Nations’ (4 vols., London). A small French work is Zurlinden, General, ‘La guerre de liberation, 1914-18’ (2 vols., Paris 1919). An informing commentary on events in France is Reinach, Joseph, ‘La guerre de 1914-16: Les commentaires de Polybe’ (Vol. I, ib. 1916), comments day by day published first in Le Figaro, Paris newspaper; The New York Times ‘Current History of the War’ (9 vols., December 1914—November 1918) contains some valuable documents, as well as many important papers. Jolt is true how armies were not back to the Rhine, but they were isolated and pressed by greatly superior foes. With heavy losses they might have drawn back through the roads in the Ardennes in the cold, but it would have been as Napoleon retreated from Moscow, with a victorious enemy harassing at every step, and in the spring the coup de grace Ludendorff was beaten when he surrendered. He was too good an officer to give up too soon. Many books appeared that attempted to interpret the war or to account for it. Some of them were mere aggregations of indignation or partisanship; but others were serious and restrained. Of the latter class were the following: Mûr, Ramsay, 'Britain's Case against Germany' (New York and London 1914); Creveld, Johan A., 'Germany and England' (New York 1914); Millmond, Maurice, 'The Ruling Caste and Frenzied Trade in Germany' (Boston and London 1916); 'The Oxford Pamphlets on the War, 1914-15' (New York and Oxford University 1914), by Oxford professors; Oxford Faculty of Modern History, 'Why we are at War' (New York and London 1914); Beck, J. M., 'The Evidence in the Case' (New York 1914), an impassioned examination of the diplomatic evidence of Germany's responsibility for the war; Andre, 'The Paris German Plot Unmasked' (New York and London 1916), widely read at the time of publication; Swope, Henry B., 'Inside the German Empire' (New York 1917), conditions in Germany during the last three months of 1916; Ackerman, Carl, 'Germany, the Next Republic' (ib. 1917), described forces that were leading Germany to discard autocracy; Cobb, Irving S., 'Speaking of Prussians' (ib. 1917), serious views of Prussians as the author found them; Morgan, J. H., (trans.), 'War Book of the German General Staff' (New York and London 1915), a literat translation of Germany's official 'Usages of War on Land'; Dominian, Leon, 'The German of Empire and Nationality in Europe' (New York 1917); Fried, Alfred H., 'The Restoration of Europe' (trans. by L. S. Gannett, New York 1916), German argument against militarism; Wallace, William (trans.), 'Modern Germany in Relation to the Great War' (ib. 1916), essays by 17 German professors, appeals to American opinion; Francke, Kuno, 'A German-American's Confession of Faith' (ib. 1915), a moderate statement of the other side; Mach, Edmund R. Otto von, 'What Germany Wants' (Boston 1914); id., 'Germany's Point of View' (Chicago 1915), by one of the more reasonable of the German propagandists; Villard, Oswald G., 'Germany Embattled: An Interpretation' (New York 1915), opposed to militarism but sympathetic with the German people; Naumann, Friedrich, 'Central Europe' (trans. by C. M. Meredith, New York and London 1917), the hopes of the Pan-Germans; Freytag-Loringhoven, Hugo F. F. J., 'Freiherr von Deductions from the World War' (New York 1918), glorifies militarism, written to preserve the hold of the military party on the popular mind in Germany while the war was at its worst stage; and Weitler, Émile, 'Behind the Scenes in the Reichstag' (trans. from French by G. F. Lees, New York 1918), by an Alsatian representative of the Reichstag who sympathized with France.

On the Serbian campaigns consult besides the chapters in Buchan's 'Nelson's History of the War,' the following special books: Gordon, Gordon, 'Through the Serbian Campaign' (London 1916); Jones, Fortier, 'With the Serbs into Exile' (New York 1916); Askew, Alice and Claude, 'The Stricken Land: Serbia as we saw it' (ib. 1916); Kruhn, Miltiut, 'Serbia Crucified' (Boston 1918); Reiss, Rudolph A., 'Comment les Austro-Hongrois ont fait la guerre en Serbie' (Paris 1915); Thompson, Louis L., 'La Retraite de Serbie' (ib. 1916); Barby, Henry, 'La guerre mondiale avec l'armée Serbe' (ib. 1918); and Gibbons, Herbert Adams, 'The New Map of Europe' (New York 1914), on Serbia's relation to the outbreak of the war.

6. THE EASTERN FRONT. 1. The Strategic Situation on the Eastern Front.—To understand the war on the Eastern Front, between Russia and her Teutonic enemies, one must grasp the significance of the map: the great Polish salient, the railways, and the generally flat character of Poland, with its political and railway centre at Warsaw on the Vistula, projects westward like a great wedge of Russian territory driven between the German provinces of East and West Prussia on the north and the Austrian province of Galicia on the south. The wedge is roughly 200 miles from north to south, and 250 miles from east to west. Its western point is only 180 miles via Posen (or Prussian Poland) from Berlin, and it touches the whole eastern frontier of one of Germany's richest and most valuable provinces—Silesia. This Silesian boundary is a purely artificial one, easy to cross in either direction. But the Russian strategy did not aim at crossing it, at any rate, at the outset of the war, partly on account of lack of adequate railways and roads, and partly because of the danger to which the Russian flanks would have been exposed. Russia could not afford to run the risk of having a Russian army in the Polish salient "pinched" by a German thrust southward from East Prussia and northward from Galicia. Obviously no direct western advance against Silesia could be undertaken by Russia until she had safeguarded her flanks by the conquest of East Prussia and Galicia.
— until her armies were in possession of the Lower Vistula and of the passes of Carpathian Mountains. Russia's first strategic task, therefore, was to occupy East Prussia and Galicia on both sides of the Polish salt line.

The railways available for the movement of Russian troops were very inadequate as compared with the splendid system of strategic railways which Germany and Austria had constructed. Germany had 17 lines of railway leading to the Russian frontier, estimated, would enable her to send 500 troop trains daily, so that she could concentrate some 600,000 men on that border within a few days of a declaration of war. On the Russian side there were only six railway lines. So, too, with Austria. The Carpathians had been pierced by seven railways so that troops could be poured from Hungary into Galicia and up to the Russian border at the rate of 250 trains every 24 hours. A against this Russia had only four lines. The German and Austrian railways consisted not only of the great trunk lines for commercial use, but connected with these were also numerous strategic lines running parallel and at right angles to the branch lines, branches shooting out rail-heads to the towns on the frontier. From such rail-heads troops could be rapidly detainted and military supplies sent forward by automobile trucks. The Poles, however, had no such network of railways parallel to the frontier; they had nothing but the two trunk lines which crossed the frontier at right angles. Thus Germany could shift her army corps very rapidly along the Russian frontier as needed. Russia could not shift hers nearly so quickly, and only slowly could she bring up reinforcements from the vast interior stretching to Siberia and the Caucasus. This inferiority in railways will explain several of the severe reverses which Russia suffered after apparent initial successes. Germany's advantage in the matter of railways, however, became less and less as she invaded Russian territory and found herself handicapped by lack of railways and by bad roads; the further German armies penetrated Russia, the more they were slowed down until finally brought to a standstill.

The character of the terrain, together with the inadequacy of the railways, had long before convinced the Russian government not to attempt to defend the western part of the Polish salient; for the country is a vast, flat, monotonous, open plain (the name "Poland" comes from the Slavic "polye" meaning "steppe or plain"). Over this plain German armies rapidly mobilized in Silesia could easily sweep. Moreover, a large Russian army in the western part of the Polish salient was always in danger of having its line of communications through Warsaw cut off, or of being surrounded by the German armies marching south out of East Prussia, or north out of Galicia. Therefore Russia had selected the Vistula River as the first line of defense. Rising in western Galicia, near Cracow, at the confluence between the Austrian and Russian empires met, the Vistula flows for 100 miles northward, and forms the boundary between Russian Poland and Galicia. In this region it receives the flood of water which tumbles northward from the slopes of the Carpathian Mountains in the Dunajec, Wisloka and San rivers.

Thenceforth a majestic river, unfordable, seldom crossed by bridges, and subject to terrible floods, the Vistula forms one of the most serious military obstacles in Europe in its historic frontier states. In the eleventh century it had been further strengthened as a defensive position in its middle course by the construction of fortifications near its banks at Ivangorod, at Warsaw, and at Novo Georgievsk where the Narev joins the Vistula. As a further protection against the frontier, which, it later on in the 19th century other forts (Zegorz, Ostrolenka, Lomza, Osowicz and Grodno) had been stretched eastward from Novo Georgievsk to Kovno. These fortresses formed Russia's famous Narev-Bohr-Niemen line of defense. It derived such additional strength from the swamps, ponds and forests to the north that Hindenburg twice failed in his efforts to break it.

On the south, however, toward Galicia there was no such good line of defense. The boundary was purely artificial. Here Russia was left vitally open, between Lublin and Choml, to an Austrian thrust from the southwest which could strike behind Warsaw and the Vistula and advance with many swift branches shooting out rail-heads to the towns on the frontier. From such rail-heads troops could be rapidly detainted and military supplies sent forward by automobile trucks. The Poles, however, had no such network of railways parallel to the frontier; they had nothing but the two trunk lines which crossed the frontier at right angles. Thus Germany could shift her army corps very rapidly along the Russian frontier as needed. Russia could not shift hers nearly so quickly, and only slowly could she bring up reinforcements from the vast interior stretching to Siberia and the Caucasus. This inferiority in railways will explain several of the severe reverses which Russia suffered after apparent initial successes. Germany's advantage in the matter of railways, however, became less and less as she invaded Russian territory and found herself handicapped by lack of railways and by bad roads; the further German armies penetrated Russia, the more they were slowed down until finally brought to a standstill.

The character of the terrain, together with the inadequacy of the railways, had long before convinced the Russian government not to attempt to defend the western part of the Polish salient; for the country is a vast, flat, monotonous, open plain (the name "Poland" comes from the Slavic "polye" meaning "steppe or plain"). Over this plain German armies rapidly mobilized in Silesia could easily sweep. Moreover, a large Russian army in the western part of the Polish salient was always in danger of having its line of communications through Warsaw cut off, or of being surrounded by the German armies marching south out of East Prussia, or north out of Galicia. Therefore Russia had selected the Vistula River as the first line of defense. Rising in western Galicia, near Cracow, at the confluence between the Austrian and Russian empires met, the Vistula flows for 100 miles northward, and forms the boundary between Russian Poland and Galicia. In this region it receives the flood of water which tumbles northward from the slopes of the Carpathian Mountains in the Dunajec, Wisloka and San rivers.

— Russian Mobilization and Commanders. — Russian mobilization, for which the preliminary orders were probably given on 25 July 1914, took place more rapidly than the Germans had supposed possible. It was accompanied by great demonstrations of national enthusiasm and patriotism. The people felt that this was a war of defense against the hated German imperialists who had so long been threatening Russia outwardly and exploiting her inwardly through commerce, industry and office-holding. The prohibition of armistice discussions at the same time saved the Russian peasant from his greatest weakness and undoubtedly, for the time at least, added to the efficiency and speed with which mobilization was accomplished. It was completed on the Austrian frontier, as the Austrians were concerned, by the middle of August 1914, and gave Russia nearly 2,000,000 troops available on the Brest-Litovsk line. In addition to these there were 2,000,000 more men ready in Siberia and the Caucasus, and many more thousands more who could be eventually mustered into reserve.
formations and sent to the front, if arms could be found for them.

The man selected as commander-in-chief of all these forces was the tsar’s uncle, the Grand Duke Nicholas. He was a striking figure, powerfully built, and of a brusque voice. In spite of his 59 years, he was full of energy and force. Having received his military education at the famous General Staff Military Academy at Petrograd, he afterward had seen extensive experience in cavalry commands. In particular, he had known the cruelty before the war he had come to know most of the cavalry leaders and practically all the prominent officers. Severe and fiery in temper, he nevertheless had the respect and sympathy of the troops he was to command. He was every inch a soldier, and his appointment as commander-in-chief was highly hailed with enthusiasm by the whole Russian press and people. Sukhomlinov assigned to him as his nearest assistant, that is, as chief of the general staff, General Yampolsky, only 42 years old, but believed to be a brilliant strategist—a second Molote. He had had, however, very little war experience and was to disappoint sadly the hopes which had been placed in him. His lack of ability in the Russian command lay in the half-dozen army group leaders and staffs like Alexeiev-Brussilov, Ivanov, Russky, Kornilov and others—men who had risen by virtue of sheer ability and not by war and field experience of the Manchurian campaigns.

From the moment it became clear that Germany was striking her main blow first against France and was merely standing on the defensive in the east until France could be crushed, Russia decided to change her original strategic plans. She gave up the idea of standing on the defensive behind the Brest-Litovsk line. To aid her hard-pressed French ally she decided to undertake two great offensives, one into East Prussia, the other into Galicia. This was good strategy. An invasion of East Prussia was expected sooner or later to force Germany to send troops to the Eastern Front and thus relieve the German pressure on France. The Second Serbian Army invaded Galicia, which the Germans did not expect, would check or defeat the Austrian invasion of Serbia, and would also have a demoralizing effect on Austria’s hold on her oppressed Slav and Rumanian subjects. If Russian troops were able to reach the Carpathian passes and threaten an invasion of Hungary, Hungarian allegiance to the Central Powers might begin to weaken. Russian success on these two flanks to the north and the south was also the necessary preliminary, as has been pointed out above, to any great advance by the Russian centre westward through Warsaw. Such an advance was desirable, if possible, to protect Russia’s own mining and industrial cities in the western part of the Polish salient, and to threaten those of her enemy across the border in Silesia. For these offensives the Russian forces were organized into five armies arranged in two army groups, each under a commander-in-chief with his own staff.

The Northwest Army Group, which was to strike into East Prussia, consisted of two armies—Rennenkampf’s and Samsonov’s—under the command of General Zhilinsky, appointed through the favoritism of the Minister of War Sukhomlinov. The ultimate disaster at Tannenberg was due in no small degree to Zhilinsky’s failure to co-ordinate the operations and protect Samsonov’s left flank. His two subordinates, however, were men of unquestioned ability, with brilliant military records. Rennenkampf, in charge of the most northern army, with his base on Kovno, was to drive straight west across the frontier of East Prussia toward Koenigsberg. Samsonov further west, with his base on Warsaw, was to march north along the line of the Warsaw-Dantzig Railway, strike the flank of the Germans who would be retreating before Rennenkampf’s superior forces, and then unite with Rennenkampf for a victorious advance to the banks of the Lower Vistula. This invasion of East Prussia would deprive Germany of one of her richest agricultural regions and spread consternation in the minds of the Junkers whose great estates lay in East Prussia.

The Southwest Army Group, destined for the invasion of Galicia, was placed under the command of General Ivanov, with his base on Kiev. His chief-of-staff was General Alexeiev, later to be famous throughout the world as chief-of-staff to Nicholas II after that took over the supreme command from the Grand Duke Nicholas in September 1915. Alexeiev, after receiving his first baptism of fire in the Russo-Turkish War of 1877-78, did not enter the Military Academy until several years later. But when he did so, he at once distinguished himself. He had already served as chief-of-staff to Ivanov 10 years before in the Japanese War. He there worked out the strategical plans which won honor for them both and fitted him for the high duties he was to undertake later on. His character was of the highest. Even in the supreme position of practical commander-in-chief after 1915, he retained an unusual modesty, simplicity and accessibility, which endeared him to all who had to deal with him directly. Though he might have dined daily at the tsar’s table it was characteristic of him that he usually preferred to take his meals at the staff officers’ mess, because he felt that by discussing military matters during meal time with officers who had come to headquarters from the various armies.

The right wing of the Southwest Army Group was a small army under General Evart. His movements were so closely directed by his commander-in-chief that this army is often referred to as Ivanov’s army. It was based on Brest-Litovsk and its object was to check General Dankl’s greatly superior Austrian force. Dankl had early crossed the Russian frontier near the San River with the hope of striking north along the right bank of the Vistula to take Ivangoord and Warsaw in the rear. The Russian strategy could afford to let him come on, provided the Russian centre and left wing succeeded in their drive against Lemberg and Przemysl. For in that case, Dankl’s communications would be threatened and he would be in danger of being overpowered. The Russian forces which the Grand Duke Nicholas could move to Poland from the interior, of Russia.

General Russky’s army, forming the centre of this Southern Army Group, and General Brussilov’s army, forming its left wing, made up the force which was to invade Galicia. The
Russians expected great things from it, and they were not disappointed. Russky was one of the most scientific of Russian officers, who as professor at the Petrograd Military Academy had helped to train, and was personally acquainted with a large number of the younger officers. In the war with Japan he had been chief-of-staff to General Kaulbars and since then had been one of Sukhomlinov's right hand men in the reorganization of the Russian forces. One of his assistants, with whom he was General Radko-Dmitriev. This remarkable man, by birth a Bulgarian, became closely identified with Russia after 1878 when Russia dominated Bulgarian politics. He completed his military studies at the Petrograd Academy, served 10 years in the Russian army and ultimately returned to his native land where he became chief of the general staff in 1902. In the Balkan Wars, as commander of one of the Bulgarian armies which won the battles of Kirk Khalisse and Lukovo, he became the popular hero of the war. But discord and ill-feeling among the Balkan allies which followed, he accepted an offer to re-enter the Russian service with the rank of general.

General Brussilov's name was little known when the war broke out. He had not received the higher training at the Petrograd Military Academy, nor enjoyed any marked opportunity to test his abilities. Most of his service had been passed in the school for cavalry officers where he had more to do with the technicalities of troops than with their uses in fighting. But by his ability in Galicia in 1914 and in 1916 he was soon to prove the wisdom of his selection. He became in fact one of the greatest popular heroes of the war, but in 1917 he was forced to resign by the Bolshevists.

Russky, with his base at Kiev, moved southwest from the fortresses of Lutsik and Dubno and crossed the Galician frontier between Sokal and Brody during the last week in August. He aimed to interpose his right wing between the flank and the second Austrian army under Auffenberg. He could then menace Lemberg from the northeast. Meanwhile Brussilov came west along the Lemberg-Odesa Railway as soon as it became clear that Rumania was going to be neutral. His original task had been to protect Odesa and southeast Russia from an attack by the Hohenzollerns in Rumania; but, relieved of this task by Rumania's decision, he was able to enter Galicia near Tarnopol and occupy the country as far south as the Dniester River. He could then operate with Russky by menacing Lemberg from the opposite side on the southeast. Russky and Brussilov each had over 250,000 men and together outnumbered Auffenberg's army which was stretched across Galicia east of, and covering, Lemberg. The Austrian staff was apparently not aware of the close connection between the movements of Russky and Brussilov. They supposed that they had only Brussilov to face at Lemberg, as Russky would be committed to the assistance of Evarts' army on the Bug.

Such was the favorable situation for Russia, as may be seen by a glance at the map, at the successful beginning of the East Prussian and Galician campaigns after a month of war. Only in the extreme western point on the Polish salient had Russian soil been seriously overrun. Here German troops from Silesia poured across the frontier near Kalisch and seized the Polish mining districts, but did not for the moment advance far toward Warsaw. The atrocities which they committed among those in Belgium but less known, did not make them any more beloved by the already bitter Polish population. The Grand Duke Nicholas, on the contrary, made a successful bid for Polish loyal support by a proclamation on 15 August, promising the Poles reunion and better rule: "Poles! The hour has sounded when the sacred dream of your fathers and your grandfathers may be realized. A century and a half has passed since the living body of Poland was torn in pieces, but the soul of the country is not dead. It continues to live, inspired by the hope that there will come for the Polish people an hour of resurrection and of fraternal reconciliation with Great Russia. The Russian army brings you the solemn news of this reconciliation, which stands forth in the concord of the Polish peoples, which it unites conjointly under the sceptre of the Russian tsar." The real fate of Poland, however, was not to be decided at once by any choice which the Polish people might make between Russian and Teuton. It was to be decided by the ultimate fate of the vast contending armies which were about to strike one another to the north and the south of the Polish salient in East Prussia and Galicia and the vaster armies on the battlefields of France.

3. The Russian Invasion of East Prussia (August-September 1914), and the Battle of Tannenberg.—The Germans had not expected that Russia would attempt to invade East Prussia almost immediately after war was declared. They had counted, and counted too confidently, upon the supposed slowness of Russian mobilization, upon the inadequacy of the Russian railways, and upon the vast distances over which Russian troops would have to move to reach the German frontier. The whole German strategy was based upon the concentration of a crushing force which should annihilate French resistance. After that, Germany could turn eastward to deal with Russia. Therefore Germany did relatively little for the protection of her East Prussian frontier. The number of German troops east of the Vistula was not greatly increased during the first three weeks in August, and probably did not exceed four corps, that is, less than 200,000, half of whom were first-line troops (the 1st corps at Koenigsberg and the 20th at Allenstein) and the rest Landwehr. In addition to these four corps there were several cavalry divisions and a large force of motor cyclists. The latter were particularly valuable for moving rapidly over the long stretches of forest and moor country to defend quickly the narrow necks of land between the innumerable lakes. Aside from the first-class fortress of Koenigsberg, which was the centre of defense, and the fortified areas of Memel and Danzig, which like Koenigsberg, could receive provisions and reinforcements by sea, if besieged, there was only one other fortress in East Prussia. This was Fort Boyen, at the eastern end of the Masurian lakes, opposite Swinoujscie. But even this fortress did not play an important part in the war. It was not in
fortresses that the Germans put their trust, but in armies and in the nature of the country. The whole southern part of East Prussia, known as the Masurian Lake Region, is an almost impassable line of defense. It is covered with a tangle of forests, swamps, ponds, and lakes, through which a few good roads run. To one who knows thoroughly the paths and connecting necks of dry land, who knows which ponds have a hard bottom and are fordable, and which are a bottomless slime, who knows how to go blindfolded through the dark forests, it is not impossible to lead an army through. There was one man in Germany, an obscure general in retirement, who knew all this, Paul von Hindenburg.

Warsaw-Danzig railways, the ground is higher and better suited to military operations. Here the German government had encouraged the peasants to build houses of stone with very heavy loop-holed walls toward the Russian frontiers. They were practically block-houses and did the Germans some good service in checking the advancing Russians. They were proof against the only light artillery which the Russians were able to bring up. But even after the Russians had captured them they were no great shelter to the invaders, because the walls on the German side were thinner and afforded no protection against German artillery. Many of these block-houses were also connected by secret underground telephones with stations

Some years before the war a land company of promoters had proposed to reclaim this region for agriculture. Hundreds of square miles were to be cleared of forests. The lakes and swamps were to be drained and the wild country turned into prosperous farms for German peasants. Von Hindenburg energetically opposed the reclamation scheme. It is said he hurried to Berlin and interviewed the Kaiser in person; he pointed out that this eastern wilderness was worth to Germany many army corps and a dozen fortresses. Why destroy the defense which Nature had provided and throw one of the oldest provinces of the Prussian monarchy open to easy Russian attack? His arguments prevailed and the wilderness remained.

To the east and west of the Masurian Lakes, however, near the Kovno-Koenigsberg and the further to the west, so that after Russians had advanced, German spies were able to send information of their movements. Very few defense trenches had been dug by the Germans, and most of their barbed wire was still stacked up in coils when the Russians made their first invasion.

The speed with which Russia mobilized came as a surprise and shock to the Germans in East Prussia. On 3 August, only two days after the declaration of war, the German garrison in Memel, on the Baltic Coast, just inside the German frontier, was called upon to drive back a Russian detachment from Libau. A few days later Russians did actually occupy Tilsit on the lower Niemen, where a century before Napoleon and Alexander I had met to divide the world between themselves. Another indi-
cation of the speed with which Russia moved may be seen in the fact that Gourko’s cavalry division, which in peace time had its quarters in Moscow, was mobilized and transported so rapidly and efficiently that it was able to de-

train at Suwalki on 6 August and to cross the

frontier before daylight on 11 August. It

pushed on quickly to Marggrabowa on the

German strategic railway, cut the line, de-

stroyed the station and telegraph and telephone

wires and stole valuable information as to the

German plans and the location of troops. These

cavalry patrols, sent forward to reconnoitre the

situation, were speedily followed by the two

main Russian armies which were to invade East

Prussia — the army of the Niemen under Gen-

eral Rennenkampf and the army of the Naray

under General Samsonov.

The 1st Army under Rennenkampf was to

move rapidly westward from the Niemen along

the line of the Kovno-Koenigsberg Railway,

where the ground was good. It would drive

back the smaller German force opposed to it and

threaten Koenigsberg from the east. The

2d Army under Samsonov, moving northwest

from the Naray and Bug rivers, between the

railways running in from Bialystok and Warsaw, would advance more slowly through the difficult country of the

western half of the Masurian Lake Region.

Having passed this barrier it would reach the

main-line railway from Berlin to Petrograd,

which passes through Eylau and Allenstein. It

would then be on good ground, would join up

with the 1st Army, and together the two armies

could close in on Koenigsberg; or leaving

Koenigsberg besieged they could advance to

the Vistula and menace Berlin. For three weeks

all went so successfully that Russian hopes ran

high. On 27 August, in anticipation of victory,

a fete was held in Petrograd, and by the sale

of flags $100,000 was raised to be given to the

first Russian soldier who entered Berlin. But

27 August marks the high-water mark of the

East Prussian venture, as one may see by fol-

lowing a little more closely each of these

armies.

General Rennenkampf had under his com-

mand the four army corps whose regular head-

quarters were comparatively near the frontier —

the 2d (Grodno), the 3d (Vilna), the 4th

(Minsk) and the 10th (Riga); he had also the

1st and 5th rifle divisions and Gourko’s cav-

alry division. By the end of August he had

also the support on his left flank of a new 10th

Army under General Pflug, composed of two

of the best-trained army corps — the 22d (Fin-

land) and the 3d Siberian — two divisions of

the famous Cavalry which haddes for

years, and six less well-trained divisions of reserves

(53d, 54th, 56th, 57th, 72d and 76th). But

not counting these later arrivals, Rennenkampf had

in the army of the Niemen nearly 200,000 of

Russia’s best troops. He, therefore, consider-

ably outnumbered the Germans under von

Francois. He accordingly pushed rapidly across

the frontier with his main force about 10

August and occupied Stallupoenen, the station

just inside the Prussian frontier, where the

strategic railway parallels to the front and runs

along the main line from Berlin to Petrograd.

Fifteen miles farther west, at Gumbinnen, the

Germans felled thousands of trees to make an

abatis for their hastily constructed trench posi-

tions. They hoped thereby to protect Inter-

burg, 10 miles farther west, where the main-

line railway crosses the Pregel. Interburg

was important strategically, both as a railway

centre and as a defense of the Koenigsberg, the capital of the province. But on Sunday, 16 August, Rennenkampf bom-

barded Gumbinnen effectively. Then, in a

dashing frontal attack, he rushed the German

positions. A Russian flanking movement aimed

at the Interburg Railway caused von Francois

to give up the trenches in front of the town on

20 August. The Germans fell back as hastily

as possible to the cover of the heavy protecting

guns of the circle of forts around Koenigsberg,

where they were shut in. A Russian detach-

ment had already occupied Tilsit on the lower

Niemen and the tsar’s flag was hung out from

the ancient town hall, where it fluttered tri-

umphantly for three weeks. By the fourth

week in August, about the time the English

were beginning the retreat from Mons, Rennen-

kampf had successfully occupied more than a

third of the sacred soil of East Prussia.

Having reached the outskirts of the Koenigs-

berg forts, Rennenkampf decided not to push

on, but to halt. He had begun to feel the lack of

organization in his rear and the difficulty of

bringing up supplies of munitions and other

military material. There was, to be sure, much

food and fodder in this rich agricultural region

of highly scientific farming, which stirred the

admiration of the Russians. And this food

was requisitioned wherever the retreating

Germans had not been able to set fire to the barns

bursting with the recently harvested grain.

Nevertheless, to advance beyond Koenigsberg

without waiting for the organization of rail-

way support from Russia, Rennenkampf rightly

judged would be hazardous. He could not

safely move too far in advance of the reserves

which would soon be coming up from the mili-

tarization forces in the interior of the Russian

Empire. He could, moreover, afford to halt,

in order to wait for, and link up with, the

2d Army, under Samsonov, coming up from

the south.

The first news from Samsonov’s army had

been wholly favorable. He crossed the frontier

and was advancing slowly but steadily through

the Masurian Lake Region. He had even taken

a good many prisoners. By 27 August his

leading columns had reached the main-line rail-

way at Allenstein, a considerable town of 40,000

inhabitants, with military barracks and machine

shops. There he ordered the inhabitants to

produce a stated amount of food and provi-

dions in the town to be given up at 8 o’clock

of the following morning. Then suddenly all news

from him stopped. No communication could

be had either with Samsonov or with any of

his staff. After waiting two days in anxiety the

commander-in-chief ordered then Gourko’s cavalry division, which was attached to Rennenkampf’s left flank, to make a dash

through the enemy’s line toward Allenstein to

gain evidence of the condition and whereabouts

of Samsonov and his army. Though this was

an extraordinary order and a very personal

mission, and though his troops were weary

from patrol work, Gourko did not hesitate for

a moment. Starting long before daylight on

From The New York Times
the morning of 30 August with three regiments of cavalry and one battery of mounted artillery, he crept through the German lines between Koenigsberg and the eastern end of the Masurian Lakes, which were still held by the Germans. Then he rode for 30 miles behind the German lines, tearing up railroads, blowing up bridges. Soon after noon he was able to see with the naked eye the buildings and barracks of Allenstein, and found strong forces in front of him. He called up his battery and opened fire on the German reserves, but speedily became convinced that he was face to face with greatly superior numbers, and that it would be folly to try to force his way into the town of Allenstein. He thought for a moment of firing a few rounds from his artillery into Allenstein, but unwilling to harm the peaceful civilian inhabitants, he refrained. He had but known it at the time, the German army headquarters staff was at that moment in the town, and he might have done it incalculable harm. Marching back to town, he was high time to make his way back and report on what he had learned. He could hear heavy firing to the south. But he could not get into touch with any of Samsonov's troops, though he had expected to in English than his "War and Revolution in Russia 1914-1917" (London 1919), from which the account in the preceding paragraphs is summarized. The explanation of the two days' silence from Samsonov, of the order of counter-marching and the German lines to Allenstein, of the heavy firing he heard there to the south, followed by the counter-marching of his orders and the eastward retirement of Rennenkampf's left flank, all lay in one. The situation was booming.

General Samsonov entered the war as a popular and highly-esteemed general. He had commanded the Siberian Cossacks with great distinction at the battle of Liao-Yang in the Manchurian campaign. He had a high reputation among Russian common soldiers. He had accordingly been given command of the 2d Russian Army which started north from the Narev River toward the western end of the Masurian Lakes soon after Rennenkampf crossed the Prussian frontier from the east. Like Rennenkampf's army, Samsonov's consisted of four army corps and several divisions of cavalry, i.e., nearly 200,000 men. It advanced on a front of about 20 miles toward the railway quadrilateral at the corners of which are the four Prussian towns of Eylau, Allenstein, Soldau (just south of Tannenberg) and Ortelburg. Within this area are the swamps and forests of the western Masurian Lakes. Samsonov had placed the 13th and 15th Army corps in the centre with the heads of their vanguards in line and in close contact with each other. On the outside flanks of these central army corps, at a distance of about a half day's march, lay the American division to the left of the 6th Army corps on the right and the 1st Army corps on the left. It was understood that the main attack was to be borne by the two central army corps, whilst those marching slightly to the rear on the flanks were to be held in reserve from envelopment. In case the central army corps were held up by battle, the flanking corps could in their turn move ahead to get round the flanks of the enemy, which was holding up the two central army corps. Yet these plans, owing in part to tactical errors on the part of the corps commanders on the flanks, were never carried out. And in the end the two corps in the centre were left entirely without support. They were surrounded by a living wall of Germans and had no option but to lay down their arms and surrender, as the French had done at Sedan just 44 years before.

At first Samsonov had had unusual success in threading his way through the tangle of forest and lakes in the Allenstein quadrilateral. His cavalry patrols met with little serious opposition until 20 August, when he found the vanguard of the German 20th Army corps from Allenstein strongly entrenched in the centre of the quadrilateral in a line running from north to south, and east to southwest. But using his artillery to cover the attack, Samsonov had his troops rush the German trenches with hand grenades and cold steel. After severe fighting, by noon of the next day, he had completely routed the Germans. Some fled toward Koenigsberg and some west toward the Vistula. The Cossacks pursued with vigor and took many prisoners. Samsonov then pushed rapidly forward and on 27 August was able, as we have seen, to occupy the town of Allenstein. Its citizens were ordered to supply 120,000 kilograms of bread, 6,000 kilograms of sugar, 5,000 kilograms of salt, 3,000 kilograms of tea and to have them ready in the market place by eight o'clock on the following morning. By this time the victorious advance of Rennenkampf and Samsonov had virtually put out of action the first field army of East Prussia; all that was left of it was either in retreat or was being shut up inside the Koenigsberg lines. The Russian patrols were marching toward the Lower Vistula. Panic-stricken, fugitives and wild stories of universal burnings and slaughters, were beginning to arrive in Berlin, spread-
WAR, EUROPEAN — THE EASTERN FRONT (6)

ing general consternation throughout Germany. At the same moment on the Western Front fugitives fleeing from von Kluck's army were beginning to arrive in Paris. It was clear that the German authorities had miscalculated the whole eastern situation and that something must be done, and done quickly, to save East Prussia.

For the Germans there were many reasons why East Prussia must be freed from the invader at once, if possible. If the panic-stricken fugitives from the regions east of the Elbe were allowed to spread through Germany they might dampen German spirits and weaken German morale, despite the apparently extraordinary German victories in Belgium and France. From a strategic point of view no German advance in Poland was possible so long as Russians stood in East Prussia on the northern flank of the Polish salient. Moreover, a great part of the officers in the German army came from the Junker families, with estates in the invaded region, which they fought to recover. Sentimental reasons also urged the immediate deliverance of the sacred soil of East Prussia; for this was one of the oldest provinces of the Hohenzollerns. It had been conquered by the blood and toil of the Teutonic Knights nearly 700 years ago. It was the cradle of the Prussian monarchy, and in the capital Koenigsberg, a Brandenburg elector had first placed on his head the royal crown. To the Kaiser it came as a personal affront that his hunting lodge in the forests at Rominten, where he used to spend some weeks every autumn, should be desecrated by Cossack bands. For these reasons the German general staff ordered at once the concentration behind the Vistula of a relieving force, made up primarily of reserves drawn from central Germany, and not, as Gourko frequently asserts, from troops taken from the Western Front. It speaks highly for the Kaiser's intelligence, or for the excellence of the German military machine, that he was able to pick out of obscurity and retirement to command this relieving army, the one man in all Germany who was probably best capable of coping with the critical situation.

Hindenburg saw that the two Russian armies had not of late exchanged touch with each other. There was still time to strike them separately, first Samsonov and then Rennenkampf. Accordingly he drew in with all possible speed the troops in front of Rennenkampf and massed them against Samsonov's columns, advancing into Allenstein on 27 Aug. At the same time he sent the greater part of the fresh forces which he brought from Germany southward on the railroad from Eylau toward Tannenberg to crush in Samsonov's left flank. These German troops attacked before Samsonov's supporting column could come up to afford protection to the two central columns. By this unexpected attack Samsonov's whole left flank was bent back and thrown into confusion. Some effect was made by the Russians to retrieve the situation under the supposition, false as it soon turned out, that this first attack from the west toward Tannenberg was the main German attack. But meanwhile Hindenburg had shifted a large part of his force to the edges of the quadrilateral through Eylau and Allenstein to Oertelsburg. Here from the east they attacked and crushed in Samsonov's right flank which had been left as unprotected as his left flank.

By the evening of 28 August Samsonov's position was desperate. The head of his two central columns had been driven back from the neighborhood of Allenstein where Gourko in his ride behind the German lines found only scattered dead. The sides of the central columns had been crushed in by Hindenburg's two attacks from the west and the east, and his rear was being enveloped by an encircling movement of German troops who were cutting off all chance of retreat. Two of the three corps that were to have protected his flanks had not appeared, and in fact he had lost all touch with them. Thus surrounded, the 80,000 men of the two central corps were driven in upon themselves into a position that he never read poem or any other literary work after the Franco-Prussian War. All his time was absorbed in military studies. In the evenings he would sit pondering over maps spread out before him, marking movements of troops, directing armies and fighting imaginary battles. In taking walks across country he would still play the soldier, ordering his boy to carry out evolutions with imaginary troops, or halting the family party on a ridge to unfold his plan for a battle there. It was his dream to lead an army corps against the enemy. But in 1911, having already reached the rank of commanding general and being 64 years of age but still in full strength and vigor, he resigned his commission, in order, as his brother has assured us, "to make room for the younger men." He retired to Hanover to live on his pension. When the war broke out he instantly offered his services, but after three weeks of waiting he heard nothing. Then on 22 August came a dispatch giving him command of the German armies in East Prussia — in the region which he had long studied and knew so well. He arrived by special train on the Eastern Front in the next day or two and began at once one of those rapid concentrations of troops for a surprise attack for which he soon became so famous.
ing their way back to the Russian frontier. By 31 August practically all of the Russian soldiers in the two central corps, aside from those who were killed or taken prisoner, had laid down their arms and surrendered, and Samsonov himself perished in the rout. The first German reports gave 30,000 as the number of Russian prisoners taken in the battle of Tannenberg, but by the end of August the number had risen, with but slight exaggeration, to 90,000. Hindenburg's victory was so immense that the German official reports were at first received with incredulity abroad, but fuller details only confirmed the magnitude of Russia's disaster. Tannenberg was the most complete and decisive victory which the Germans won in the whole war. Hindenburg sprang at once from the obscurity of a general in retirement into the position of the greatest German hero of the war, and his fame was deserved; for he had outmaneuvered his enemy and made the best use of all the means at his disposal.

On the Russian side Samsonov did not survive the battle for whose loss he was in part responsible. He had made the mistake of advancing the headquarters of the central corps even though he was entirely without information as to the movements of the corps on his flanks. He had supposed they would hold in check any advance on their flanks by the reserve forces of the Germans, which he supposed might attempt. In reality these corps on the flanks were never in proper close touch with the two central corps (for which failure the army commander, Zhilinsky, was in part responsible) and instead of covering Hindenburg's troops, they began to retreat to Russia as soon as they felt strong German pressure.

During the battle they not only failed to give support to Samsonov's two central corps, but they did not even keep him informed of their movements. Several times during the battle of Tannenberg, Samsonov had inquired anxiously if any news had been received of the corps on the flanks. Each time the answer was in the negative. Samsonov was in part to blame for this, having failed to press headquarters' advice to the front that he infringed one of the elementary rules of military strategy, that which provides that the commander of an army shall choose as his headquarters some spot where information can be readily brought to him and whence he can communicate with all the forces under his command.

Hindenburg did not attempt any pursuit of the few scattered remnants of Samsonov's army. It was not worth his while. Instead, he shifted his troops rapidly to the northwest to try to cut off Rennenkampf's army and envelope it, just as he had enveloped Samsonov's. Rennenkampf, on learning of Samsonov's catastrophe, should have prepared to retreat at once; but he hesitated. He declined to admit that the disaster at Tannenberg had rendered his own position untenable, and sealed the fate of the Russian invasion of East Prussia. But as it began to be clearer that Samsonov's army was annihilated, and reports further to the north of increasing German forces threatening his own left flank and line of retreat, he seems to have completely lost all self-control. He last gave orders for the retreat which should have been given at least one hour earlier, in a motor-car for the Russian frontier, leaving his forces to get through the hazards of their difficult retreat as best they might. His army lost 30,000 in prisoners before it could reach its line of defense in Russia. Such was the humiliating end to the Russian invasion of East Prussia.

4. The Russian Occupation of Galicia, August-September 1914.—Lemberg is the most important city in Galicia, the administrative capital of the province and a populous commercial centre. It bordered three German cathedrals, a university and a library which contained unique treasures of Polish history and literature. For many centuries it was a strongly walled city, but of its old defenses nothing remained in 1914 but the citadel, an obsolete fortress without military value. When Lemberg fell, the Austrian government, seeking to minimize its loss, explained that the city had been abandoned in order to save its historical monuments from destruction. As a matter of fact Lemberg was not in serious danger; the operations of Russky and Brussilov which led to its fall took place many miles from the city; and, in any case, the Russian generals took no pains to spare the cities from unnecessary damage, since it was to their interest to appear as the deliverers, not the enemies, of the Polish and Ruthenian populations. Lemberg's greatest value, however, lay in the fact that it was the last hope of a railway system of eastern Galicia. Auffenberg, therefore, when he saw himself threatened by the Russians under Russky and Brussilov, drew back from the front and undertook to entrench himself well in front of, and protecting, Lemberg. His position was a strong one; his front was protected by the Gnita Lipa, a river which flows southwesterly through difficult wooded hills into the Dniester at Halicz; his right rested on the Dniester at Halicz; and his left stretched north toward Kawa Rusa. His army was not a good one; it was composed in large part of Slavs and Ruthenians who had long been oppressed by the Hapsburg monarchy and fought with no enthusiasm for their oppressors. In fact, for all practical purposes, the Austrian defeat might mean political liberty. Most of their officers were Austrian Germans, or Magyars, who gave orders in a language the soldiers could not understand.

The fight for Lemberg began at the end of August 1914 and lasted a week. Brussilov, after two days of fierce fighting, threw his left wing across to the south bank of the Dniester and occupied Halicz. He was then able to wheel northward toward Lemberg and drive in on Auffenberg's exposed right flank. On 1 September the rest of Brussilov's army, under Radko-Dmitriev, carried the line of the Gnita Lipa, while Russky, farther north, drove back the Austrian left wing. By so doing, Russky was able to interpose a Russian line between Auffenberg's communications, and was beginning to encircle Lemberg from the north. With both wings driven back in a curve about Lemberg, Auffenberg's position became perilous. It began to be like that of Samsonov at Tannenberg. But unlike Samsonov, the Austrian saw his danger in time. Early on Thursday morning, 3 September, he decided to abandon Lemberg. He retreated to Grodek, a more defendable position, and then the railroads from Lemberg to Przemysl; but he was hard pressed by the Cossacks. His
machine-guns, abandoned with their ammunition, were turned against the fleeing Austrians by the pursuers. His demoralized men threw away equipment which could not be easily replaced. Soldiers of Slavic or Rumanian speech, who had no love for their Austrian and Hungarian officers, took the opportunity to desert by thousands to the Russian side. By his retreat from Lemberg Auffenberg lost 100,000 in prisoners alone, a great number of guns, vast stores of munitions, and the control of the great oil wells in eastern Galicia near Kolomea and Stry.

At Grodek a chain of lakes and hills running north and south gave the Austrians a strong position in which to make a stand and recover themselves — provided their flanks were without any natural or artificial defenses. It was a serious gap in the Russian defensive line, and it is significant that it was through this gap east of the Vistula that Hindenburg penetrated successfully in 1915 after he had failed in three attacks on Warsaw from the west side of the Vistula. Advancing through this gap at the end of August 1914, Dankl was threatening to cut the Kovel-Lemberg Railway and then attack Brest-Litovsk. The Grand Duke Nicholas, however, though handicapped by Russia's slower mobilization and inadequate railways, had been able to push forward General Evart's army in time to check the Austrians before they reached Lublin or Cholm or the connecting railway. After Auffenberg's retreat from Lemberg, Dankl in turn found himself safe. Russky quickly saw that a direct frontal attack on the Grodek position would be costly in men and time. Instead of a direct attack he could better accomplish his purpose — the capture or forced retreat of Auffenberg's army — by a wide sweeping movement around Grodek to the north, which would bring him in on Auffenberg's rear between Grodek and Przemysl. This flanking movement, however, brought him into conflict with the Austrian army under Dankl, and led to the fierce fighting commonly known as the battle of Rawka Russka 6-10 Sept. 1914.

This Austrian army under Dankl, at the outbreak of the war, had crossed the San and advanced northeastward between the Vistula and the Bug rivers in a flat country which was in a perilous position. His right flank and his communications to the San River were seriously threatened by Russky who was advancing through Rawka Russka. Dankl might have sought to save himself in either of two ways. The more prudent would have been to fall back on the San and secure sure touch with Auffenberg well to the west of Lemberg. A bolder course, however, was to attack at once the army of Evart in front of him before it could be reinforced, disperse it and take Russky in the flank. He chose the bolder way. On 4 September he attacked toward Cholm. But the Russians were unexpectedly strong and the attack broke down. Thereupon the initiative passed to the Russians. Ivanov, who had come up from Kiev with more troops to strengthen
Evart's extreme right, struck heavily toward Krasnik and rolled back Dankl's left wing. Assisted by Radko-Dmitriev, Russky then completed Dankl's discomfiture by driving a terrific blow through Rawa Russka which dispersed in confusion the remnants of Auffenberg's left wing, and compelled Dankl's isolated troops to retreat in haste across the San toward the protecting fortresses of Przemysl and Hindenburg's army, which had reached Rawa Russka which completed the Russian success at Lemberg and opened all Galicia to Russian invasion.

The loss of Lemberg opened the way for Brussilov to the Carpathian passes and to Hungary; and it made possible the extraordinarily rapid Russian advance toward Cracow along the two main railways which run west from Lemberg by way of Jaroslaw to the north and by way of Przemysl to the south. Cracow is the key to Vienna through the Moravian gap where the Carpathians flatten out, and to Berlin through the valley of the Oder River. Once in possession of Cracow, Russia might hope to secure the blow against the Teutonic capitals. A Russian invasion of the Hungarian Plain through the Carpathian passes would endanger the transportation of the invaluable oil supply which Germany was buying for her vast automobile transport service; for the oil wells of neutral Rumania were now the only considerable source of oil left to the Germans after their loss of the Galician supply. Politically also such an invasion of Hungary would gravely embarrass Austria; for the dominant Magyars in Hungary cared little for the Dual Monarchy, but much for their own independence. With their regiments badly organized at Lemberg and Rawa Russka and the sacred soil of Hungary trodden by the Cossacks, they might become dangerously lukewarm in their allegiance to the Teutonic Alliance. It was this political danger after Lemberg which made Germany assume an ever-increasing control over the direction of the Austrian forces and ultimately forced her to transfer to the Eastern Front some of the best German divisions, although they were sorely needed in France. After Lemberg, accordingly, Hindenburg virtually took over the supreme command from Dankl, chief-of-staff, Hoetzendorff, who were partly responsible for the Lemberg disaster. They had made the strategic mistake of dividing the two Austrian armies in such a way that they advanced on divergent lines and were opened to Russky's quick thrust between them. They had also underestimated the speed with which Russia could mobilize and advance to the frontier. Dankl and Auffenberg also fell under a cloud and had to accept the direction of German generals and ultimately helped to command the army. The change not only gave Austria abler leaders, but it gave an even greater unity to the strategy with which the Central Powers conducted the war—a unity which was still sadly lacking in the uncoordinated actions of the Allies on the Eastern and Western fronts.

To repair her losses in Galicia, Austria had speedily to recall from Alsace four of her best army corps which she had too confidently consented to be disarmed after the Peace of Berent. Serbia also she was forced to abandon the offensive and draw behind the frontier the remnants of another army which had been defeated at the Jadar River (23 August). It may be noted that the Austrian defeats at Lemberg and Rawa Russka coincided with German repulses and retreat at the Marne. Except for Samsonov's unhappy disaster at Tannenberg, the second week in September would have seen all the armies of the Central Powers in retreat or rout. Had Tannenberg not released Hindenburg's army, it would have reached Rawa Russka which completed of Rawa Russka which completed the Russian success at Lemberg and opened all Galicia to Russian invasion.

After Lemberg and Rawa Russka there was no pause in the Russian advance toward Cracow. This great Austrian fortress was the main strategic objective of the Russians, who now made some shifts in the command. Russky, who had commanded so brilliantly at Rawa Russka and was noted for his strategic ability, was shifted to the command of the Warsaw area. Here, at the centre of the great Russian Front, which now extended nearly 900 miles from East Prussia to the Carpathians, he at first merely flung out Cossack patrols west of Warsaw toward Lowicz and Lodz, but kept the main part of his troops east of the Vistula. Meanwhile Ivanov began to devote his whole attention to directing the Southern Army Group advancing through Galicia toward Cracow. Ivanov himself personally commanded the army which formed the right wing. Radko-Dmitriev commanded the centre; and Brussilov still had charge of the left wing. Making use of the great amount of Austrian rolling stock captured at Lemberg, Ivanov moved his infantry rapidly westward along the main railway in northern Galicia and captured Jaroslav on 23 September. This fortress was surrounded by 20 redoubts and had been expected to offer a stout resistance. Its capture was an important gain for Russia, because in addition to being a considerable city on the main railway, it controlled a branch line running 20 miles south to the even greater fortress of Przemysl. Jaroslav offered, in fact, an excellent base for the investment and siege of Przemysl from the north. Przemysl also was a first-class modern fortress surrounded by a strong group of outlying concrete forts and by a further defense line of entrenchments and fortified positions. It sat astride the Upper San, and, being on one side of the main road to Lemberg, it controlled supplies going east or west. In it had been accumulated a huge quantity of ammunition which was to have served as Auffenberg's reserve supply. Its ordinary garrison was 30,000 men but it was increased by 100,000 more of Auffenberg's retreating men who sought safety behind its walls—in violation of the military maxim that a fortress should be defended in the field. As the dan- ger of a siege became a certainty, some of the Austrian inhabitants were sent out of the city, but it soon appeared that there were still far too many
mouths to be fed. Przemysl was also strategically important in relation to the Carpathian passes. South of the city, ran a railway which was split into two at the watershed between the San and the Dniester, the western branch running through the Lupkow Pass, and the eastern branch running through the Ussok Pass to join the network of railways in the Hungarian Plain. Przemysl was, therefore, a strategic point of utmost importance, to which the Austrians should have been able to send reserves from Hungary. They were only prevented from doing so by the speed with which Dmitriev and Brussilov struck westward after the fall of Lemberg.

Dmitriev, pushing westward north of the Dniester along the Lemberg-Sambor Railway, succeeded by 23 September in shutting off Przemysl on the south, just as Ivanov, by capturing Jaroslaw, was preparing to shut it off on the north. Not caring to risk the loss of life and the delay which would have been involved in an attempt to take the fortress by assault, Ivanov left part of his infantry to continue to press before Przemysl and starve it into submission. Having thus masked the fortress, he joined the rest of his forces to Ivanov's and continued to press westward along the railway toward Tarnow and Cracow. On 29 September his cavalry was at Dębica, only a hundred miles from Cracow.

Meanwhile Brussilov, at the extreme southern end of the Russian Front, occupied Stryj and pushed forward so rapidly toward the western Carpathians that he was able to seize the Dukla Pass on 28 September. His Cossacks even penetrated a short distance into the Hungarian plains. By the end of September, the Russian advance in Galicia seemed irresistible; the gateway into Hungary was opened; the fall of Przemysl was momentarily expected; and it seemed that Cracow would soon be reached.

At this moment Hindenburg came to the rescue of Austria. He began the first of his great strategic attacks on Warsaw which were meant to place the Germans east of the middle Vistula and thereby force a Russian retreat from eastern Galicia. For, if the Russians were driven out of Warsaw and forced to retreat toward Brest-Litovsk, it would be unsafe to have the Russian left wing in Galicia protruding so far beyond the Russian centre. Ivanov and Dmitriev would have to draw back to the San or the Bug to align themselves with Ruský's centre. This was the aim of Hindenburg's three successive assaults on Warsaw, in grand Napoleonic style, in October and November 1914. Though he failed each time to take Warsaw, he partly succeeded in checking the Galician advance and in preventing the transfer of troops from the Russian centre to the Russian left. This is the simple explanation of the apparently confused movements in western Poland in the fall of 1914. If kept constant with the Russians, the Cossacks would have to protect the western assaults on Warsaw and note their interrelation with events in Galicia.

5. Hindenburg's Frontal Attacks on Warsaw, October–December, 1914.—Hindenburg had two powerful military qualities of giving him a plan quickly the moment he was convinced that it was not likely to succeed. Instead of holding on doggedly to a doubtful effort, he would quickly work out and put into operation some new scheme which would surprise the enemy in another quarter. In his supreme attacks on the Poles, his work of railways which run around on the German side of the frontier to move troops back and forth around the edges of the Polish salient in the great arc from East Prussia to Cracow. The Russians had no good air service and could not learn of these movements until they were well advanced, and when they learned, their transportation service was so poor in Poland that it was difficult for their troops to move quickly to the threatened area. Though the Germans moving on outer lines always had many more miles to travel than the Russians, moving on the inner lines, nevertheless Germany's strategic railways always gave Hindenburg a great advantage. But if his surprise attack did not succeed quickly it was doomed to failure, since the delay would give the Russians time to concentrate a sufficient number of troops for the defense. A quick surprise attack, by shifting troops on the strategic railways, is the key to Hindenburg's three frontal attacks on Warsaw, as it was the main factor in his great victory at Tannenberg.

Assistance to the Austrians in Galicia and Hungary, though the main, was Hindenburg's only, motive in trying to take Warsaw. This city, with its population of three-quarters of a million, was the administrative and historic capital of Poland. If he could occupy it, the Poles, who were now enthusiastic for Russian domination, might yet be won over to the Teutonic League by a promise of Polish independence; or a revived Poland might be brought indirectly under German control, by the establishment of a German prince as king of Poland. If such political aims proved impossible, at any rate Warsaw would form ideal winter quarters for the German army. Possessing three bridges across the Vistula and being the centre of the Polish railway lines, such as they were, Warsaw would provide an advanced base, far in the enemy's territory, from which an advance could be made in the spring to Russia's Brest-Litovsk line of defense. The capture of Warsaw would put the Russians in a difficult position, for the navigation of this great river as a line of defense and render untenable the Narew-Boh line of fortresses. East Prussia, as well as western Galicia would then be relieved from further danger from a Russian invasion. How did Hindenburg propose to take Warsaw by a frontal attack from the west?

By 1 October Hindenburg had decided that he could not break through the Niemen line of defense. He, therefore, withdrew the Kovno-Grodno front to positions within the East Prussian frontier, where he left only a few troops to serve as a screen. No large number was necessary to protect this frontier, because he could bring the main body of his troops quickly to the Polish frontier, just as the Russians should make any considerable attack—just as he had done at Tannenberg. Furthermore, Prussia was self-contained since the lakes, swamps and forests made it difficult to cut off the region from the Masurian Lakes to the Niemen.

By 5 October he had shifted the bulk of the German forces in East Prussia by rail
around the frontier of Silesia, and was advancing with incredible rapidity along the railway line from Kalisch toward Lodz and Warsaw. To his East Prussians he had joined additional troops from central Germany, though probably not from the Western Front, as General Gourko supposes ("War and Revolution in Russia," pp. 90, 100).

By 16 October the main German force had reached the outskirts of Warsaw and begun the great three days' battle, of religious and racial appeals. One pamphlet designed for Polish Roman Catholics bore a colored picture of the Virgin and Child, flanked by medallions of the Pope and the Kaiser, that versolic believer who elsewhere could convince the convert to Mohammedanism — it was at this moment that Tzar Pasha decided to bring Turkey into the war on the side of Germany. To co-operate with the main force at Warsaw and to concentrate a general force as possible at the point of attack, Hindenburg sent a smaller army from Thorn up the west bank of the Vistula toward Lowicz and Warsaw, but it moved slowly and was checked by Rennenkampf who hurried troops from the Niemen front and prevented it from taking part in the assault on Warsaw. Hindenburg had also ordered forward a strong body of Austrians, strengthened by German troops, who were to advance from Cracow by way of Kielce and Radom. They were to take the fortress and railway junction at Ivangoord, and then cross the Vistula where the river narrows at Josefow south of Ivangoord.

When the Grand Duke Nicholas perceived the failure of this concentration of Germans and Austrians moving from southwest Poland toward the Vistula, he took no chances. He resolved to run no risks on the plains west of the Vistula, where he would have to rely for supplies on the broad and muddy Pilica would cut his army in two. On the whole Russian centre he called in behind the Vistula all of Russky's troops except a screen of cavalry, keeping in touch with the enemy and bodies of entrenched infantry protecting Warsaw and the Ivangoord bridgehead. In Galicia he ordered Ivanov to abandon the advance on Cracow, to retire behind the San to form the alignment of the centre, and to send some of his troops to strengthen the centre. Ivanov's retirement necessitated for a moment the relaxing of the siege of Przemysl. Hindenburg's threat at Warsaw thus enabled the Austrians to force an opening on the west side of Przemysl and to pour provisions into the fortress from the south. A few days later Dmitriev again enclosed it tightly and kept it closed until it was starved into surrender six months later.

To return to the assaults on Warsaw and Ivangoord (15-19 Oct., 1914), Warsaw, from the Russian standpoint, lies on the wrong side of the river — the left or west side. But it was defended by a circle of 11 outlying forts, some six to eight miles distant from the city itself. Fortunately the railways merely skirt the city and cross to the Praga suburb on the east side, where is situated the main station to which converge the railways from all Russia. If necessary, the Russians could abandon Warsaw, blow up the three bridges across the river to Praga, and yet not lose control of the all-important Praga Railway terminus. But it turned out, Warsaw did not have to be abandoned in 1914. Just as Hindenburg was furiously assaulting with superior numbers the outer trenches and forts west of the city, new Russian troops were beginning to arrive from the far corners of the empire. The famous Siberian Rifle regiments, after nearly a month's weary journey in closed freight cars, were rushed from Praga through the streets of Warsaw to charge the Germans with cold steel. They were the first installment of eight full corps which came to Warsaw and Ivangoord within the next few days and represented the completed results of Russian mobilization. They were among the finest troops in all Russia, moving to the care with which they were selected and the considerable practice in actual warfare which they had had with nomad tribes on the borders of the empire. Their arrival saved Warsaw. After three days' furious conflict (16-18 October) Hindenburg saw that the city was not to be taken by surprise. It was not worth his while to sit down to a siege, for the Russian defenders daily grew in numbers while his own forces were limited unless help came from the Western Front, which he could not yet expect. Farther south, Ivangoord was defended in a spirited fashion by General Schwartz, who did not allow the enemy either to get their big guns within range or to take the bridgehead — the only bridge over the Vistula between Warsaw and Galicia. Still farther south, at Josefow, where the Russians were weak and had no railroad to support them, the Germans managed to throw over a pontoon-bridge and crossed with a considerable force to the right bank. But on 21 October Rusesky fell upon them at the little village of Kazimirjev, half-way between Ivangoord and Josefow. No German escaped back over the Vistula. Hindenburg then ordered the fortress of the Silesian frontier, but Rusesky, crossing the Vistula in force, gave the retreating invaders no rest. In the wooded country and along the muddy banks of the Pilica, he attacked the Germans and Austrians, causing very heavy losses among the latter. As they retired toward Silesia, the Germans fought desperately and bravely, and by their rear-guard actions managed to protect their guns and marching columns of infantry. It was an orderly retirement, not a rout.

As the Germans advanced toward Warsaw, they took great pains to construct excellent communications: the broad-gauge of the railways was altered on the Kalisch lines to fit the narrow-gauge German rolling stock; causeways were built for the artillery, and great stretches of forest were felled by the engineers for corduroy roads for the automobile transports. If they were to spend the winter in Warsaw, the Germans wanted plenty of means for bringing up supplies, and good communi-
tions with Germany would be necessary for a further invasion of Russia in the spring of 1915. Now, however, at the end of October 1914 as Hindenburg retired, he demolished all the preparations of roadways as carelessly and systematically as he constructed them three weeks before. He blew up all the railway stations, water towers and bridges. He was even said to have a machine which twisted steel rails into the shape of cork-screws. He blasted out great holes in the roads. The telegraph lines were cut and the posts sawed off.

In short, the whole country of southwest Poland was thoroughly devastated so as to make it virtually impassable for an army. But the curious thing, not noticed at the time, was that the policy of devastation was carried out in west and southwest Poland only. In northwest Poland Hindenburg's troops took just as much pains to keep the communications good and the country free from devastation. Why this difference in Hindenburg's treatment of southwest and northwest Poland? Because he was already planning a second surprise attack on Warsaw, this time from the northwest. If the Germans struck a blow from the northwest, they would find favorable conditions for advancing, while the Russians would have no roads or railway by which to return for the defense of Warsaw. Again, railroads, speed and surprise were the factors in a second attack on Warsaw which Hindenburg was planning, and the Russians unwittingly played into his hands.

Rusksy had been so encouraged by the failure of Hindenburg's first attack on Warsaw that he made the grave mistake of following him too far to the west. He disregarded the original Russian strategic plan of not risking an advance of the Russian centre far into the Polish salient until the wings were in secure possession of all of East Prussia and Galicia. He did not even take warning from the ruined state of the country which Hindenburg left behind him in southwest Poland. In pursuit of the retiring German Austrians, Rusksy had moved his whole army far west of the Vistula to the Warta River close to the Silesian frontier. His Cossacks even crossed into German territory west of Kalisch (12 November) and cut the Cracow-Posen railway. In his eagerness to assist Dmitriev, he had shifted his army somewhat to the south so that his left wing was able to capture a town on the Galician frontier only 20 miles from Cracow. On 13 Nov. 1914, at the moment when Hindenburg was starting his second great attack on Warsaw, Rusksy's front, as may be seen by the accompanying small map, extended in a curve from the neighborhood of Cracow on the upper Vistula toward Plock on the lower Vistula. But most of his troops were concentrated along the Warta, because it was here that the Germans appeared to make a stand after their retirement. The northern end of his line between the Warta and the Vistula was made very strong by the enemy armies along the Narew-Niemen line. It was through this gap, only 40 miles wide, that Hindenburg began to pour an irresistible force. He had collected this force by transporting German troops by rail northward from the Silesian frontier around to Thorn on the Vistula. To these he added more of the East Prussian army under General von Francois. He had also several corps from Germany. Ludendorff was assisting Hindenburg at the staff headquarters, and Mackensen was in immediate command.

Rusksy's position soon became desperate. His thin right wing was exposed to attack on the flank and rear. In fact his whole line stood practically with the enemy at its rear, and was in danger of being cut off from Warsaw. For Rusksy was further from Warsaw than Mackensen's advancing troops. Moreover, he had to make all his movements over country in which the roads and railways had been systematically destroyed, while Mackensen had a relatively well-ordered territory to march through. Rusksy is to blame for allowing himself to be thus caught too far from his base in a bad country, with too long and thin a front. But he retrieved himself admirably. He succeeded in drawing his right wing from its exposed position, although in so doing he lost many thousand prisoners. He then ordered a general retreat toward Lodz, in order to get behind the Bzura River. This river rises west of Lodz and flows northeastward past Lowicz until it joins the Vistula just north of Warsaw and Plock. Owing to a bend in the Vistula, the Bzura gave the Russians the shortest line between the Lodz region and the Vistula for defending Warsaw. If the Russians could hold the banks of the rivers between Warsaw and Plock they would retain possession of the railways from Lodz and Piotrkov. The Rawka River, flowing into the Bzura from the south, should also be noted; it affords some protection to an army retreating eastward toward Warsaw.
WAR, EUROPEAN — THE EASTERN FRONT (6)

By 20 November a week after he first became aware of Mackensen’s advance, Russia had succeeded in retiring most of his right wing beyond the Bug. Sibeleh and other levies which had just arrived in Warsaw were hurried up to the front, and reinforcements were hastily summoned from Rennenkampf’s army opposite East Prussia. With these Siberians, the Germans were facing very stubborn resistance on the Bzura. But on 23 November two of Mackensen’s corps broke through the Russian line between Lodz and Lowicz. For a few hours the Russians in Lodz were in a most perilous situation, having to fight an enemy on their front, flank and rear. Here, at what is called the Battle of Lodz, though the fighting was some distance from the town, took place the fiercest and most desperate hand-to-hand fighting which had yet occurred on the Eastern Front, and, as usual, when it came to bayonet work, the Russians got the upper hand. With reinforcements which kept coming up they checked and very nearly surrounded the two German corps which had broken through the Bzura line. The Germans in their turn — or at least these two corps — were in a dangerous position. They were now entrapped as in a narrow-necked bottle, caught between three fires, and able to keep open only the very narrowest line of communication with the rest of the German army. Ryskiy tried valiantly to cut off this narrow neck of the bottle, and so to “pocket” completely the two German corps which had broken through the Russian line. For three days (24-26 November), night and day, but especially at night, the fierce struggle went on between the 60,000 Germans trying to break out of the ever narrowing circle of Russian troops, and the Russians trying to cut them off or surround them. The Russians almost succeeded. It is said that one of the Kaiser’s sons, fearing capture along with these army corps, escaped in an aeroplane over the Russian line. The Russians on their side were bent on success that orders were given to have rolling stock collected at Warsaw to take away the prisoners. But owing to the new troops which Mackensen hurried forward to widen the opening, the project was abandoned. The Russian line was broken, Rennenkampf was blamed, the living circle was not closed and the Germans escaped from the perilous pocket into which they had been led by their own success. Rennenkampf was dismissed after this; his corps had been counted upon to close the exit but they were late; the popular notion, however, that he was pro-German and a traitor — easily believed on account of his German name and his disgraceful flight from East Prussia — probably had no basis.

After this severe fighting at Lodz, Ryskiy shortened his front still further, giving up the city and withdrawing eastward to a position behind the Bzura and the Rawka, where he dug himself into an almost impregnable line. But this line on the Eastern Front the fighting ceased to be a series of strategical movements over great areas. It settled down for nearly four months into the war of fixed positions — trench warfare — which had come to be the way of the Western Front soon after the battle of the Marne. The Russians, however, had as yet no barbed wire to protect their trenches, and they were beginning to run short of ammunition, especially artillery supplies. But they managed to protect themselves in the trenches by all sorts of hand-grenades, musketry and improvised things found on the spot, such as empty tin cans, shell cases and gas pipes. Several times the Germans made prolonged efforts, supported by hurricanes of artillery fire, to drive the Russians from this Bzura-Rawka line back toward Warsaw. At Christmas they used asphyxiating gas bombs for the first time. By this means they got into some of the Russian trenches, but with poetic justice were overcome by their own gas. Those who were thus unconscious but not actually killed were buried in the trenches where they lay, by order of the Russian officer who supposed they were dead. The rest were driven out in a counterattack. A few hours later some Russian soldiers who had been partially asphyxiated in a wood and had recovered came back to hospital quarters for relief and treatment. It was not until then that the Russian officers became aware of the barbarous new weapon that the Germans were using. Again during the first week in February 1915 Russian trenches were broken by gas and long artillery preparation, were made against the Russians behind the Bzura-Rawka lines. But the Germans gained only a few thousand yards.

6. The Winter Battle of the Masurian Lakes, February 1915.—In the first week of February 1915 Hindenburg was finally convinced that the attacks on the Bzura-Rawka trenches were merely resulting in a wasteful and futile expenditure of German man-power. He concluded that it was impossible to take Warsaw by a frontal attack from the West and turned again to East Prussia, to a point farther east of Tannenau and the scene of his first great victory. Again using his favorite method of a very rapid surprise attack, depending on a quick concentration by strategic railways, he launched against the Niemen-Narev line the strongest single army which Germany had yet put into the Eastern war. It was Hindenburg’s culminating effort. If it succeeded, the communications between Warsaw and Petrograd would be cut; the Niemen-Narev line of fortresses would become useless to Russia; and Warsaw could be easily taken from the north and Plzemysl would be relieved from the various besieging armies which by starvation were bringing it day by day nearer to surrender. Austria was instructed by Hindenburg to aid his plan by attacking vigorously at the Carpathian passes. This Austrian offensive would prevent the transfer of any troops from the Galician front to strengthen the Russian line threatened in the north, and Russia would be speedily forced back behind the Bug to Brest-Litovsk and the Priepet Marshes.

The Winter Battle of the Masurian Lakes began on 7 Feb. 1915 just as the final assault on the Bzura was dying away. The moment was favorable for Hindenburg because the Russians, under General Staff, had been making a slight advance in East Prussia with the idea of drawing off German troops from the Warsaw front. The Russians had no suspicion of this tremendous winter attack. Sievers had about 120,000 men, but the front had become dispersed among the Masurian Lakes, when he suddenly realized that he was being counter-attacked and completely outflanked by
a German force twice as large as his own. One German army moved along the railway from Koenigsberg toward Kovno and was beginning to encircle the Russian right flank; the other moved on the railways from Koenigsberg toward Bialystok and threatened to surround the Russians as they retreated. In the north, the Niemen and the Narew, in the middle, the Wisla. In this retreat he lost at least 200,000 men and 700 guns. Berlin celebrated the victory as a second Tannenberg. But Siever's army was not annihilated as Samsonov's had been, and by 20 February he was able to entrench himself. With reinforcements he even counter-attacked when the German thrust had spent its force. By the first week in March he won his way back to a corner of Prussian soil by Lyck, where the East Prussian frontier bulges into Russian territory. He undoubtedly would have won back a larger foothold had East Prussia not had the Russian shortage in rifles and ammunition begun to make itself cruelly felt. So serious was the shortage in hand rifles that in the Winter Battle of the Masurian Lakes Russia actually had trained but unarmed men assume up behind the fighting line ready to fill up the gaps and take up the weapons of the dead. Men were even flung into the firing line armed only with a bayonet in one hand and a couple of bombs in the other, or even only with wooden clubs. With the courage and ferocity of combats in a primitive age they rushed close enough to throw their bombs and they charged with cold steel or the clubs. When it came to the fierce hand-to-hand fighting the Germans always gave way. By 10 March 1915 the fighting on this part of the front died down. Warsaw was not to be taken from the Russians by way of East Prussia. There remained one other way which Hindenburg had not yet tried — the way through Galicia with an advance on the rear of Warsaw from the southeast. This brings us to the struggle for Przemysl and the German attack on the Dunajec.

7. The Russian Capture of Przemysl, 22 March 1915.—Ivanov's campaign in Galicia for the recovery of Cracow had been somewhat checked by Hindenburg's assaults on Russia's lines in front of Warsaw. Ivanov had transferred some of his troops on the left of the Russian front to Russia in the centre, and he had drawn back his columns which had been advancing on Cracow; for if Warsaw fell, and it might happen, Russian troops too far west in Galicia would be in danger of being cut off. Brussilov also had had to give up some of the Carpathian passes which he had occupied in the fall of 1914, in spite of the fact that the possession of these passes was essential to any future advance in Cracow. During the winter of 1914-15 Brussilov had kept up a continuous struggle, with alternating success and failure, for the possession of these Carpathian passes. As soon as Hindenburg let himself be persuaded from Hindenburg's assaults, he began to press forward more vigorously and all the passes of the Carpathians were reoccupied.

Of more military importance was the capture of Przemysl. This first-class fortress, dominating western Galicia and controlling two of the railways from Galicia into Hungary, had been completely surrounded and cut off by Ivanov and Radko-Dmitriev on 27 Sept. 1914, during the first Russian occupation of Galicia. Starvation soon began to threaten it, for the Austrians had not collected any great amount of provisions. All supposing that Russian armies would reach it. When it became clear that a siege was likely to take place, the Austrian commander sent off some of the civilian population. But those who departed were more than 200,000 guns. Berlin celebrated the victory as a second Tannenberg. But Siever's army was not annihilated as Samsonov's had been, and by 20 February he was able to entrench himself. With reinforcements he even counter-attacked when the German thrust had spent its force. By the first week in March he won his way back to a corner of Prussian soil by Lyck, where the East Prussian frontier bulges into Russian territory. He undoubtedly would have won back a larger foothold had East Prussia not had the Russian shortage in rifles and ammunition begun to make itself cruelly felt. So serious was the shortage in hand rifles that in the Winter Battle of the Masurian Lakes Russia actually had trained but unarmed men assume up behind the fighting line ready to fill up the gaps and take up the weapons of the dead. Men were even flung into the firing line armed only with a bayonet in one hand and a couple of bombs in the other, or even only with wooden clubs. With the courage and ferocity of combats in a primitive age they rushed close enough to throw their bombs and they charged with cold steel or the clubs. When it came to the fierce hand-to-hand fighting the Germans always gave way. By 10 March 1915 the fighting on this part of the front died down. Warsaw was not to be taken from the Russians by way of East Prussia. There remained one other way which Hindenburg had not yet tried — the way through Galicia with an advance on the rear of Warsaw from the southeast. This brings us to the struggle for Przemysl and the German attack on the Dunajec.

7. The Russian Capture of Przemysl, 22 March 1915.—Ivanov's campaign in Galicia for the recovery of Cracow had been somewhat checked by Hindenburg's assaults on Russia's lines in front of Warsaw. Ivanov had transferred some of his troops on the left of the Russian front to Russia in the centre, and he had drawn back his columns which had been advancing on Cracow; for if Warsaw fell, and it might happen, Russian troops too far west in Galicia would be in danger of being cut off. Brussilov also had had to give up some of the Carpathian passes which he had occupied in the fall of 1914, in spite of the fact that the possession of these passes was essential to any future advance in Cracow. During the winter of 1914-15 Brussilov had kept up a continuous struggle, with alternating success and failure, for the possession of these Carpathian passes. As soon as Hindenburg let himself be persuaded from Hindenburg's assaults, he began to press forward more vigorously and all the passes of the Carpathians were reoccupied.

Of more military importance was the capture of Przemysl. This first-class fortress, dominating western Galicia and controlling two
ing other war material. Then a white flag appeared and Austrian officers brought a formal letter of surrender.

The capture of Przemysl, as has been well said, was not a Russian achievement so much as an Austrian disgrace. The fortress fell like an overripe fruit. The action is not to be compared with any of the great sieges of history, for it was not a case of a strife of inextinguishable wills or an issue determined by overmastering skill and strength; nor did it prove of any permanent or decisive value. A moment of indecision, deprived Austria of the 120,000 soldiers who surrendered as prisoners of war and were shipped to Russian prison camps or to Siberia. Russia also acquired a considerable stock of ammunition and guns, both large and small, which the defenders had not had time to destroy. And it improved Russia's railway control in Galicia. But as we shall now see it did not give her a rock of strength such as Verdun gave the French, which enabled her to fight against the strategy of Hindenburg and Mackensen. Within three months of their capture of Przemysl the Russians themselves in turn were forced to evacuate it as fast as they knew how, by the Mackensen thrust through the first three of his three great battles of the Dunajec and was driving eastward through Galicia with irresistible force.

8. The Battle of the Dunajec and the Great Russian Retreat of 1915.—By 25 April 1915 the Germans had occupied Galicia, and therefore their occupation of Galicia by the capture of Przemysl and by an extension of their control of the Carpathian passes. This date Hindenburg had practically completed the preparation for Mackensen's big attack on the Dunajec which was to force the great Russian retreat of 1915. It is well to note the position of the Eastern Front at this moment, as indicated on the map. Practically all of Galicia, except Cracow and the territory west of the town of Tarnow and the Dunajec River, was within the Russian lines; in Poland Russia had been forced by strategic reasons and by Hindenburg's persistent attacks to give up the Polish salient as far as a line which curved west of Kharkov and southward to the Black Sea, thus giving the battle front practically followed the East Prussian frontier except that the Germans controlled the Vistula below Plock, and the Russians had a foothold in East Prussia at Lyck. Perhaps the Russians might have held this line except for three great handicaps by which they suffered severely: (1) The lack of good communications for the rapid transfer of troops from one part of the front to another; of this nothing further need be said as it has been discussed above. (2) Treachery at home. The more we know about the war on the Eastern Front the more it becomes clear that both at the front and in high circles around the tsar treachery was continually at work among pro-German sympathizers. At the front German commanders always seemed to be well informed ahead of time of any movements the Russians were about to make. But it was impossible to get rid of all the traitors, particularly as both military and civil service in Russia were filled in large numbers by the so-called Baltic Germans. These "Baltic Barons," who owned large landed estates in Courland and Estonia, were subjects of the tsar by the chance that the regions had been annexed by the Romanovs a century or more before; but in their culture, sympathy and family ties many of the Baltic barons were far more closely in sympathy with the Prussian Junkers than with the tsar's government. One of the results for which they confidently hoped from the war was that Germany would once again control the Baltic provinces which had originally been conquered from the native Letts and Esthomiens by the Teutonic knights seven centuries before. It was not merely among the military officers that treachery was to be found. Much more dangerous were the pro-German sympathizers at court around the tsarina, a German princess. These were the men who by their intrigues secured the dismissal, or counteracted the influence, of true Russian liberals and patriots who wanted to speed up the manufacture of munitions and conduct a vigorous war for the early victory of the Allies. The situation was summed up in the pathetic cry attributed to the little tsarevitch: "When the Germans win papa cries, and when the Russians win mama cries." (3) The shortage of ammunition and guns, however, was the most serious cause of Russia's forced retreat in 1915. The shortages in the first weeks of the war had shattered all calculations as to ammunition, based upon the lessons of the Russo-Japanese War. The stock of munitions on hand, which was considerable, was generously dealt out at the beginning and depleted materially in the Russian occupation of Galicia and East Prussia; but by October 1914, a shortage, especially of artillery ammunition, began to make itself felt. For months batteries in action did not receive more than four shells per day per gun — and this at a time when the Germans made profuse use of an apparently inexhaustible supply. As Russian soldiers were killed or taken prisoners, Russia lost such a large part of her stock of small arms that the new formations of men who were called into being in the winter of 1914-15 could not be completely supplied with rifles and equipment. Unfortunately no plans had been made for increased production of arms and ammunition and thus the shortage became dangerous nothing was ready to remedy it. Generous offers of munition were made from abroad especially from America and from Japan. But the Americans wanted time to prepare machinery to begin production on a vast scale, and the Russian Ministry of War could not make up its mind to place great orders because it feared that the American firms could not, or would not, make deliveries soon enough to meet the crisis. Japan furnished some small caliber rifles, but they could not use the same cartridge as the standard Russian "five-clip" magazine rifles. For lack of equipment Russia actually had to disband several hundred thousand men who had been called up for military service. And in some battles trained but unarmed men stood behind the front ranks ready to step forward and take the guns of those who were killed. This shortage, of course, inevitably had a very bad effect on the morale of the soldiers. It not only explains in part the great Russian Retreat of 1915, but it began to sow in the minds of the men a distrust of the efficiency and integrity of the tsar's government. The distrust was greatly increased after the Great Retreat and was one of the main direct
causes of the overthrow of absolutism by the Revolution of March 1917. And the distrust was justified, as is proved by the patriotic but futile efforts of Roman and the Duma, who tried in vain to get munitions provided. He visited the fronts. He saw soldiers armed with nothing but sticks. He was told by the Grand Duke Nicholas: "An army, cannot go on fighting without rifles or boots." He tried to get production of munitions speeded up by calling a Zemstvo congress and then by a special conference. But for many precious months he was thwarted by the chaos and intrigue in the Ministry of War and by the personal rivalry between Sukhomlinov and the Grand Duke Sergius. Some of the chaos and intrigue was later exposed in the famous Sukhomlinov trial. In justice to the liberals and the patriots in Russia, however, it should be added that by August 1915 a war trade committee was working under the able leadership of A. T. Guchkov, who later became the first Minister of War after the Revolution. This committee energetically began to organize a great number of private firms, both large and small, for the production of guns and munitions, so that the shortages were gradually made up. By the spring of 1917 the generals at the front were at last made happy by being able to reckon upon a fairly adequate number of shells for the artillery and on about 100,000 4.8-inch trench mortars. But the supply came too late to be of any avail in the spring of 1915; and, by the irony of fate, when the munitions were plentiful in 1917 the soldiers did not care to use them, for they had been demoralized as a result of the Revolution.

Thus handicapped by lack of transportation facilities, by treachery at home and by lack of munitions and officers, the long Russian front of 900 miles could not withstand the great offensive which the Germans had planned in Lithuania and on the Donajec for the spring of 1915. In April and May 1915, German armies pushed rapidly over the Niemen along the Baltic Coast and took the important Littish sea-ports of Libau and Windau. Advancing further south to Courland, where they received much support from pro-German "Baltic Barons," they advanced to the Duna River and threatened the great industrial city and seaport of Riga, with its 600,000 inhabitants. Here, however, the Letts, who had bitterly hated for centuries the domination of the German landlords and capitalists, hastily organized volunteer rifle-battalions and heroically maintained the defense of their chief city. Their quick action and the natural defense formed by the broad waters of the Duna River and by the swamps near its mouth prevented the Germans for more than two years from capturing Riga. The city did not fall into German hands until September 1917, when the military chaos caused by the Revolution had destroyed all Russia's power of resistance. By advancing to the Duna the Germans had gained control of the greater part of Lithuania and Courland. This region was now organized by the Germans as "Ober-Ost," i.e., as the military occupation district of the German command in the East. It was provided with German officials, German postal service, German money, German colonists, and in fact treated in every way as if it were to become a permanent part, in accordance with Pan-German dreams, of the German empire in the East. While the Russian general staff was occupied in retaking the Duma, who tried in vain to get munitions provided. He visited the fronts. He saw soldiers armed with nothing but sticks. He was told by the Grand Duke Nicholas: "An army, cannot go on fighting without rifles or boots." He tried to get production of munitions speeded up by calling a Zemstvo congress and then by a special conference. But for many precious months he was thwarted by the chaos and intrigue in the Ministry of War and by the personal rivalry between Sukhomlinov and the Grand Duke Sergius. Some of the chaos and intrigue was later exposed in the famous Sukhomlinov trial. In justice to the liberals and the patriots in Russia, however, it should be added that by August 1915 a war trade committee was working under the able leadership of A. T. Guchkov, who later became the first Minister of War after the Revolution. This committee energetically began to organize a great number of private firms, both large and small, for the production of guns and munitions, so that the shortages were gradually made up. By the spring of 1917 the generals at the front were at last made happy by being able to reckon upon a fairly adequate number of shells for the artillery and on about 100,000 4.8-inch trench mortars. But the supply came too late to be of any avail in the spring of 1915; and, by the irony of fate, when the munitions were plentiful in 1917 the soldiers did not care to use them, for they had been demoralized as a result of the Revolution.

Thus handicapped by lack of transportation facilities, by treachery at home and by lack of munitions and officers, the long Russian front of 900 miles could not withstand the great offensive which the Germans had planned in Lithuania and on the Donajec for the spring of 1915. In April and May 1915, German armies pushed rapidly over the Niemen along the Baltic Coast and took the important Littish sea-ports of Libau and Windau. Advancing further south to Courland, where they received much support from pro-German "Baltic Barons," they advanced to the Duna River and threatened the great industrial city and seaport of Riga, with its 600,000 inhabitants. Here, however, the Letts, who had bitterly hated for centuries the domination of the German landlords and capitalists, hastily organized volunteer rifle-battalions and heroically maintained the defense of their chief city. Their quick action and the natural defense formed by the broad waters of the Duna River and by the swamps near its mouth prevented the Germans for more than two years from capturing Riga. The city did not fall into German hands until September 1917, when the military chaos caused by the Revolution had destroyed all Russia's power of resistance. By advancing to the Duna the Germans had gained control of the greater part of Lithuania and Courland. This region was now organized by the Germans as "Ober-Ost," i.e., as the military occupation district of the German command in the East. It was provided with German officials, German postal service, German money, German colonists, and in fact treated in every way as if it were to become a permanent part, in accordance with Pan-German dreams, of the German empire in the East. While the Russian general staff was occupied in retaking the
night, the Russian defense collapsed under the terrific German pressure. Dmitriev was not routed, but he lost very heavily in men and guns as he fell back to the protection of the Wisłoka River 20 miles to the east. But he had prepared no entrenchments on the eastern bank of the Wisłoka so that the reinforcements which were hurried up were of little avail. For five days—until Friday, 7 May—his troops bravely clung to their hastily-made shallow trenches on the eastern bank of the Wisłoka. But again the German artillery and Mackensen's charging phalanx made the Russian case hopeless. Again Dmitriev had to fall back rapidly between the railways leading to Jaroshiv and Przemysł.

any attempted. Przemysł was evacuated by the Russians, on 2 June, after it had been held by them only a little more than two months. Gourko's Sixth Army was hurriedly called from the Northern Front, to save the fortress, but before it could even reach the Galician Front, Przemysł had already fallen. Therefore, the 6th Army, without being detained, was railed through to Lemberg. In a three-days' battle (8–11 June) south of that city, near Stryj, Gourko supported Brusilov in such a vigorous attack that the Russians captured 15,000 prisoners and compelled the Germans to retire temporarily to the right bank of the Dniester. But Ivanov and his staff by this time seemed to have lost heart and faith in the possibility of bringing

Dmitriev's retreat in the centre of Ivanov's army in Galicia seriously endangered the right wing near the Polish salient under Evart and the left wing scattered among the Carpathians under Brusilov. But Ivanov and the Grand Duke Nicholas were quick to see the disaster which would follow if a wide gap were allowed to open between the centre and these two wings. The Russian general staff, therefore, at once made up its mind to a retreat which should be as rapid but as orderly as possible. Skilful counterattacks by Evart and by Brusilov against the less formidable Austrian troops on Mackensen's flanks helped to check the onslaught of the German phalanx in the centre, and to preserve the contact between the different parts of the Russian front. But no permanent stand could be made, nor in fact was Mackensen's advance to a halt. On 20 June the strong position at the Grodek Lakes and Rawa Russka had to be abandoned after heavy fighting. This necessitated, two days later (22 June), the Russian evacuation of Lemberg. After nine months the capital of Galicia, with its invaluable railway connections, was once more in Austrian hands. The Russians fought rear-guard actions along the rivers east of Lemberg, and finally came to a halt 20 miles east of Tarnopol near the boundary between Galicia and Russia.

Such was the first move in the Great Russian Retreat of 1915. By the battle of the Dunajec, Hindenburg had recovered Galicia for Austria, just as he had recovered East Prussia for Germany by the battle of Tannenberg. These were the two great decisive battles of the war.
on the Eastern Front. By 1 July 1915 the line of the Eastern Front had been approximately reached by its position at the beginning of the war on 1 Aug. 1914, except that at the northern end the Germans were now across the lower Niemen and in possession of the Russian territories of Lithuania and Courland. But though the Russian lines were in somewhat the same position there was a vast difference in the general situation. In August 1914 Germany had only very weak forces on the Eastern Front and had not established a close co-ordination with Austria. Russia had the advantage of the initiative, with a rapidly mobilized army and a good stock of munitions and equipment. In July 1915 Hindenburg had vast, victorious, well-disciplined troops and the supreme, united command on the Eastern Front; Russia had lost all her advantages and was suffering terribly from lack of munitions, officers and transportation facilities, as well as from a weakened morale due to these handicaps and the forced retreat from the Dunajec. The Russian centre was still thrust forward in the Polish salient west of Warsaw. It was this salient which Hindenburg now proposed to "pinch" by an attack from the north upon the Narev-Niemen line and by a great flanking attack from the southeast. He had failed in the frontal attacks on Warsaw from the west in the autumn of 1914; but in 1915, owing to the changed conditions noted above, he was to succeed easily in taking Warsaw by an attack from the south to the east of the Vistula. But he did not succeed in enveloping and pinching into surrender the Russian armies within the Warsaw salient. They managed to effect the masterly second move in the Great Russian Retreat of 1915—the withdrawal from the Bzura-Rawka position 300 miles eastward to the Pripiat Marshes and the meridian of Baranovichi. On 5 July 1915 the battle for the Warsaw salient began. Mackensen's phalanx, turning north from Galicia and supported by Austrian troops under Archduke Joseph, aimed a blow from the south to cut the Warsaw-Kovel Railway near Lublin and Chelm. On the rising ground near Krasnik the Russians under General Evert fought doggedly for four days (5-9 July) to check the German advance, and succeeded temporarily. For a week more this vital railway connecting Warsaw with southern Russia was safe. But on 16 July Mackensen attacked again at Krasnostaw, to the east of Krasnik, and drove the Russians back to within 10 miles of the railway near Chelm. It was evidently only a matter of a few days before the railway would be reached and cut.

Meanwhile, on 14 July, on the northern side of the salient, General von Gallwitz had succeeded in breaking through the Narev line of defense with a great German force. Having crossed the Narev between Ostrolenka and Novo-Georgievsk, he was threatening to cut the northern railway which ran from Warsaw to Petersburg and formed the connecting link behind the great fortresses of Ossowietz, Grodno and Kovno. If Mackensen and Gallwitz cut these two railways on the two sides of the Warsaw salient, the Russian forces would have been left with only the central railway which runs due east from Warsaw to Brest-Litovsk. This single railway would be wholly inadequate to supply the large Russian army in the Polish salient if it should try to hold on to its positions, and equally inadequate to bear the strain of a retreat if it should ultimately be forced to retire.

In this critical situation, on 18 July, the Grand Duke Nicholas wisely decided to abandon Warsaw in order to save his army. It was a bitter decision, but it was in accordance with prudence, honor and sound strategy. The civil population of Warsaw was partially evacuated and began its melancholy exodus toward the unknown east, crowded in cattle trains, jammed into wagons, or forced to plod helplessly on foot. The troops which had clung to the trenches behind the Bzura and Rawka rivers throughout the cruel winter 1914-15 were quietly withdrawn to the Bzura lines on the outskirts of Warsaw or were sent eastward over the Vistula bridges on the first stage of the great retreat. The heavy guns, some supplies, and the remainder of the troops were moved out of Warsaw and dispatched to Brest-Litovsk. By 3 A.M. on 5 August the last Russian soldiers fighting rear-guard actions with the pursuing German cavalry had left Warsaw and crossed the Vistula; the sound of heavy explosions announced that the three Vistula bridges were being blown up and that Warsaw was finally abandoned to the enemy.

The abandonment of Warsaw and the advance of the German armies led in quick succession to the fall of the great fortresses which had hitherto protected the two sides of the Warsaw salient. Ivangorod had fallen on
4 August; Kovno was battered into ruins and surrendered on 7 August, with a loss of 20,000 prisoners of war; Novogeorgievsk did the same on 19 August; Brest-Litovsk, the great Lithuanian border fortress, fell a week later on 25 August. These capitulations were heavy blows, for these fortresses had been counted upon to hold the line and to buy the time as a check to the advancing forces of the enemy. But they were manned only with new and insufficiently trained men, their ammunition was rapidly exhausted, and the fortification works could not stand against the concentrated fire of the German heavy artillery. Consequently the morale was low and there may have been truth in the stories of treachery which found general credence. The rapid fall of these fortresses greatly increased the embarrassment of the retreating army.

The retreat from Warsaw toward Brest-Litovsk was also greatly embarrassed by the flight of great masses of the Polish population which blocked the roads along which the Russian troops had to move. In addition to the poor people from the city of Warsaw, the panic-stricken peasants east of the Vistula hurriedly loaded their household goods, their children and their old people, on carts, and having collected the large and small cattle, joined the unbroken ceaseless tide of humanity moving from west to east. These pitiful waves of humanity, moving without any order, overflowed the highways and adjoining fields and quickly consumed all local supplies. Thousands upon thousands died of disease, starvation and exhaustion in this terrible exodus. Those who survived so clogged the roads that many a time the Russian soldiers had to fight battles simply to clear the road for the retreat of the troops. At this disheartening crisis on 5 Sept. 1915 the tsar himself decided to assume the supreme command. He alleged a chivalrous motive; he did not desire to take away anyone's laurels in time of victory, so he came in when things looked gloomiest. In reality his appointment meant a victory for Rasputin and the intriguing party at court which took this opportunity to make a scape-goat of Grand Duke Nicholas, and thus to bring him to the Caucasus front. In spite of all the difficulties and discouragement Alexeiev conducted the retreat which the Grand Duke Nicholas had begun from Warsaw to the Priepet Marshes. Except for the soldiers and guns in the fortresses which surrendered, the greater part of the Russian army was preserved intact. And this was worth more than the soil which had been abandoned. By the end of September there came a lull on the Eastern Front, except at the northern end where, so he came in when several fruitless attempts to capture Riga. The German armies found that it was increasingly difficult for them to move in the region east of Brest-Litovsk. The German army was weary after the disastrous campaigns in Galicia and Poland. It had lost some of the effectiveness of its striking power; moreover, winter was coming on, and Hindenburg sagely decided that it would be wiser not to run the risk of attempting a direct rush on Novogeorgievsk. Instead of seeking a final settlement of the war on the Eastern Front by pushing on to Moscow or Petrograd in a winter campaign, he allowed the German army to settle down into the fixed positions of trench warfare for the winter of 1915-16. The Eastern Front, therefore, from Nov. 1915 to 4 June 1916 was marked by the line on the map, in a general north and south line along the meridian of Baranovichi. The Russians still held firmly to Riga and the Duna River, which was a strong natural line of defense. But they had been compelled to evacuate Pinsk and Baranovichi itself and the Great Headquarters had been moved back to Mohilev. Further south, the Front followed the Goryn River, a branch of the Priepet, in such a way that the Russians retained possession of Rovno and Tarnopol.

It has been estimated that up to the close of 1915 the Germans had captured nearly 2,000,000 Russian prisoners, mostly untrained and fortress troops; but the Russians had taken an even larger number of prisoners, about 200,000 Germans and nearly 2,000,000 Austrians. Many of the latter, however, were really Rumanians, Czecho-Slovaks and Galicians who were deserters rather than actual prisoners captured in battle; they could be trusted, and were set to work in Russian villages. The Germans were sent farther east. They afterward helped the Bolsheviks in eastern Russia and Siberia. The most important thing about the retreat of 1915 was the depressing effect it had on the masses of the Russian people. It was not the loss of territory nor the great loss in prisoners, however, which they felt most. The lack of munitions, the conviction of the inefficiency and even treachery of the tsar's autocratic government, and the apparent hopelessness of the struggle, sank deep into the hearts of the Russian people. Nor were they impressed by the tsar's message at Christmas, 1915: "I will conclude no peace till we have chased the last foe from our soil; and I will make no peace save in union with our Allies, to whom we are bound, not by paper treaties, but by affection and our common sacrifice." On the contrary, the masses felt an increasing hatred for the existing régime and its court intrigues, and an increasing sense of the uselessness of any further fighting. To the Great Retreat must be attributed in part at least the Revolution of March 1917, and the socialistic military collapse which followed it four months later in July 1917.

During the crucial winter of 1915-16 there was a careful mobilization of Russian industries with a view to subordinating all manufacture to the one great aim of increasing war material and improving the transportation on the railways. The result was that the deficiencies which had so largely caused the Great Retreat in 1915 were largely made up and the outlook seemed much brighter from this point of view.

General Alexeiev, who had become chief-of-staff in September 1915, when Nicholas II became commander-in-chief, planned to wait until the summer of 1916 before undertaking an offensive. This would give a longer period for accumulating munitions. It was also hoped that the Allies in the west could by that time launch a great offensive, and that the Central Powers, struck on both fronts, would be unable to transfer troops in either direction, could at last be forced down to defeat. But unforeseen events caused Alexeiev to undertake offensives earlier than he had intended. These two events
were the German attack on Verdun and the Austrian attack on Italy.

To lessen the German pressure on Verdun, Alexeiev consented to an offensive by Kurepkin on the Northern Front against the Germans in Courland. The attack was to be made from the line of the Duna River between Riga and Dvinsk; but the Germans got warning in time to call up plenty of reserves. And the failure to secure any success was only fully revealed when it was shown that an advance made under the conditions of trench warfare in that region, during periods of frost or winter thaws, placed the attacking armies in a much more difficult position than the defending forces. Even if the attacking troops were able to carry the enemy trenches and make any considerable advance, the frozen ground prevented them from digging themselves in; the attacking forces were then at once exposed to the merciless fire of the enemy's artillery. Even the superior Russian offensive in April, farther south, opposite Vilna, had no better success. Both these activities, however, may have served their purpose in relieving a little the intensity of the German pressure on Verdun.

Much more important for Russia was the Austrian advance into Italy in May 1916. To draw off some of the Russian forces by a renewed Russian attack on Galicia, Alexeiev consented to allow Brusilov to begin his great summer offensive a month earlier than had been originally planned. General Brusilov, in recognition of the great skill with which he had withdrawn the extreme Russian left in 1915, had succeeded in imposing the command of the Southern Army Front. This extended nearly 300 miles from the Priepet River and Marshes south to the Rumanian frontier. Brusilov had under him four armies with able commanders: Kaledine with his headquarters at Rovno; Sakharov threatening Brody; Scherbachev astride the Galician frontier near Tarnopol; and Lechitsky ready to cross the Dniester and occupy Bukovina. Opposed to Brusilov were five German-Austrian armies under the nominal supreme command of Archduke Frederick. They numbered altogether about 750,000 men, which was less than half the forces which had been placed under Brusilov. Instead of trying to hold ground at any one point in the enemy's line, it was Brusilov's plan to try out the whole front with what may be regarded as an immense reconnaissance. His objective point was not yet determined. He would wait until he had tested out the strength of the enemy's line before he decided on a special strategic aim.

Accordingly on Saturday, 3 June 1916, Brusilov opened a steady bombardment along his whole front with as great an intensity as his guns permitted. As the front was nearly 300 miles long, the bombardment was unprecedented, as it compare in intensity with the terrific bombardments which preceded the attacks at Neuve Chapelle, the Dunajec or Verdun. It did not disrupt the trenches, but it ploughed through the German barbed wire entanglements. After 20 hours of such artillery preparation, on Sunday morning, 4 June, the waves of Russian infantry sprang over the parapets to attack along the whole front. In the north, opposite Kaledine, the Austrian front was thoroughly broken by noon of the first day. The Russian bayonets carried the Austrian trenches, while the Russian barrage cut off all communications with the rear. The result was that the fine Austrian trenches and dugouts proved death-traps. Austrian soldiers later, in their diaries, wrote of their inability to escape and were captured in thousands by the triumphant Russian infantry. That day in Lutsk the birthday of the Archduke Frederick was being celebrated, when news came that the Austrian army had scored a marked success clearly showed that the enemy were approaching the gates. Confidence was placed for a moment in the great strength of the Lutsk defenses; but Austrian demoralization was so complete that at 8.25 p.m. on Tuesday, 6 June, the vanguard of Kaledine's columns entered the city and took possession of a great booty of guns, shells and provisions. Many thousand Austrian wounded who had no time to escape were also taken prisoners. By the capture of Lutsk, Kaledine was able to reach and cross the Stryi during the next few days and to reach a point within 25 miles of Kovel.

On the extreme south, while Kaledine was sweeping upon Lutsk, Lechitsky had achieved an equal success by crossing the Dniester, routing the Austrians under Radetzky and advancing into Bukovina. On 16 June he captured Czernovitz, the capital of the province, and on 23 June he took Kimpolung, the most southerly town in Bukovina. The Austrian resistance had completely broken down and all of Bukovina was in Russian hands. In the centre, between Kaledine and Lechitsky, Sakharov and Scherbachev also advanced with success and took many thousand prisoners, but they occupied much less territory. June 23 may be said to mark the end of the first stage of Brusilov's offensive. Within three weeks his armies had captured 4,000 officers, 194,000 men, 219 heavy guns, 644 machine guns and vast quantities of war material. It was one of the most rapid and spectacular advances in the history of the war; but it left the Russian line with two great salients—at Lutsk and in Bukovina—which were dangerously open to German counterattacks on their sides.

It was necessary for Brusilov to straighten out his line by advancing the northern end near the Priepet Marshes and the centre between Tarnopol and Brody. This was done successfully during July, when a new army under General Loe Schweig managed to push forward on Kaledine's right flank, thus advancing the Russian front north of Lutsk. In the centre, Brusilov learned in some way—probably by means of his excellent spy service among the local population—that the Germans were preparing a great counterattack for 18 July, and he decided to strike strongly and speedily before the counterattack had time to mature. On the night of 15 July Sakharov struck heavily at the Germans, and cut off, of Brody, and captured 13,000 prisoners as well as three huge ammunition dumps which the Germans had just prepared for their counterattack. With this initial success Sakharov and Scherbachev pressed forward to Lemberg and the Lemberg, capturing large numbers as they advanced. By 15 August Brusilov's line was straightened out and the second stage in his offensive came to an end. The magnitude of his success may be measured by the figures which Hindenburg took to save the situation. In the 10 weeks of his extraordinarily
successful offensive Brussilov’s armies had advanced from 30 to 60 miles on a 300-mile front, thus occupying 15,000 square miles of territory, as may be seen in the shaded area on the map. He had captured 77,200 prisoners, 350,000 men, 405 heavy guns, 1,326 machine guns, and vast stores of ammunition and supplies. As the Austro-German killed and wounded probably more than outnumbered the prisoners they lost, the new-born army, Alekseyev, Eva, rapidly annihilated the force which stood opposed to him when he began his offensive on 4 June. To meet the crisis, Hindenburg had transferred 15 divisions from the Western Front, where they had been sorely needed to check the Somme offensive; 16 infantry divisions and three cavalry divisions from the Eastern Front north of the Pripet; seven Austrian divisions from the Italian Front, where they could ill be spared as Cadorna was about to begin his counter-offensive; one division from the Balkans and two divisions from Turkey. These reinforcements, which Hindenburg hurried forward with his usual vigor and resourcefulness, began to restore the balance by the middle of August. Then the new-born army began to slow down in an ominous way. We know now that he was beginning to suffer from the same handicap as in 1915—lack of ammunition. He had shot away too quickly what had been accumulated with such difficulty during the winter of 1915–16. Worse than that, he had exhausted his reserves, for his success had been won only by a prodigal expenditure of manpower. The Germans claimed 264,000 prisoners, and if we estimate that the Russians who were the attacking force lost twice as many in killed and wounded as in prisoners, this means that Brussilov had lost three-quarters of a million men in those 10 weeks. They could not be replaced rapidly enough to continue the offensive which he had begun so brilliantly. Moreover, many Russians had been used, unwisely as it seems, in an abortive offensive north of the Pripet; this was meant to take advantage of the fact that the Germans had withdrawn so many men from that part of the front; but it was not undertaken on a large enough scale to insure success. It merely used up reserves which could have been employed to better advantage. It began to be clear that Brussilov had undertaken a task for which Russian resources were again to prove inadequate.

Thus in September 1916 Brussilov’s summer offensive, which had begun so brilliantly, gradually died away. As the rainy and stormy weather came on he had to settle down in the trenches along the line which he had won by the middle of August. His great offensive, together with that of the Allies on the Somme, had failed to crush the Central Powers’ sub- mission. Except as he had drawn valuable German troops from other fronts his victorious advance was to have no permanent value in the future; for all that he had won, and far more in addition, was surrendered and lost without a struggle in the next summer, when the Revolution and the Bolsheviks brought on a total military collapse in Russia.

10. Revolution and Military Collapse in Russia

At the end of the summer month—July 1917—after the murder of Rasputin, the overthrow of the traitors around the tsar’s throne, and the triumph of the Liberals and the Patriots, which resulted in the almost bloodless Revolution of March 1917, seemed at first a great advantage for the Allies. Autocracy at last was overthrown and Russia seemed whole. 350,000 men, 405 heavy guns, 1,326 machine guns, and vast stores of ammunition and supplies. As the Austro-German killed and wounded probably more than outnumbered the prisoners they lost, the new-born army, Alekseyev, Eva, rapidly annihilated the force which stood opposed to him when he began his offensive on 4 June. To meet the crisis, Hindenburg had transferred 15 divisions from the Western Front, where they had been sorely needed to check the Somme offensive; 16 infantry divisions and three cavalry divisions from the Eastern Front north of the Pripet; seven Austrian divisions from the Italian Front, where they could ill be spared as Cadorna was about to begin his counter-offensive; one division from the Balkans and two divisions from Turkey. These reinforcements, which Hindenburg hurried forward with his usual vigor and resourcefulness, began to restore the balance by the middle of August. Then the new-born army began to slow down in an ominous way. We know now that he was beginning to suffer from the same handicap as in 1915—lack of ammunition. He had shot away too quickly what had been accumulated with such difficulty during the winter of 1915–16. Worse than that, he had exhausted his reserves, for his success had been won only by a prodigal expenditure of manpower. The Germans claimed 264,000 prisoners, and if we estimate that the Russians who were the attacking force lost twice as many in killed and wounded as in prisoners, this means that Brussilov had lost three-quarters of a million men in those 10 weeks. They could not be replaced rapidly enough to continue the offensive which he had begun so brilliantly. Moreover, many Russians had been used, unwisely as it seems, in an abortive offensive north of the Pripet; this was meant to take advantage of the fact that the Germans had withdrawn so many men from that part of the front; but it was not undertaken on a large enough scale to insure success. It merely used up reserves which could have been employed to better advantage. It began to be clear that Brussilov had undertaken a task for which Russian resources were again to prove inadequate.

Thus in September 1916 Brussilov’s summer offensive, which had begun so brilliantly, gradually died away. As the rainy and stormy weather came on he had to settle down in the trenches along the line which he had won by the middle of August. His great offensive, together with that of the Allies on the Somme, had failed to crush the Central Powers’ submission. Except as he had drawn valuable German troops from other fronts his victorious advance was to have no permanent value in the future; for all that he had won, and far more in addition, was surrendered and lost without a struggle in the next summer, when the Revolution and the Bolsheviks brought on a total military collapse in Russia.

At the end of the summer month—July 1917—after the murder of Rasputin, the overthrow of the traitors around the tsar’s throne, and the triumph of the Russian army, a new-born army, Alekseyev, Eva, rapidly annihilated the force which stood opposed to him when he began his offensive on 4 June. To meet the crisis, Hindenburg had transferred 15 divisions from the Western Front, where they had been sorely needed to check the Somme offensive; 16 infantry divisions and three cavalry divisions from the Eastern Front north of the Pripet; seven Austrian divisions from the Italian Front, where they could ill be spared as Cadorna was about to begin his counter-offensive; one division from the Balkans and two divisions from Turkey. These reinforcements, which Hindenburg hurried forward with his usual vigor and resourcefulness, began to restore the balance by the middle of August. Then the new-born army began to slow down in an ominous way. We know now that he was beginning to suffer from the same handicap as in 1915—lack of ammunition. He had shot away too quickly what had been accumulated with such difficulty during the winter of 1915–16. Worse than that, he had exhausted his reserves, for his success had been won only by a prodigal expenditure of manpower. The Germans claimed 264,000 prisoners, and if we estimate that the Russians who were the attacking force lost twice as many in killed and wounded as in prisoners, this means that Brussilov had lost three-quarters of a million men in those 10 weeks. They could not be replaced rapidly enough to continue the offensive which he had begun so brilliantly. Moreover, many Russians had been used, unwisely as it seems, in an abortive offensive north of the Pripet; this was meant to take advantage of the fact that the Germans had withdrawn so many men from that part of the front; but it was not undertaken on a large enough scale to insure success. It merely used up reserves which could have been employed to better advantage. It began to be clear that Brussilov had undertaken a task for which Russian resources were again to prove inadequate.

Thus in September 1916 Brussilov’s summer offensive, which had begun so brilliantly, gradually died away. As the rainy and stormy weather came on he had to settle down in the trenches along the line which he had won by the middle of August. His great offensive, together with that of the Allies on the Somme, had failed to crush the Central Powers’ submission. Except as he had drawn valuable German troops from other fronts his victorious advance was to have no permanent value in the future; for all that he had won, and far more in addition, was surrendered and lost without a struggle in the next summer, when the Revolution and the Bolsheviks brought on a total military collapse in Russia.
Thereupon Kerensky in his official position as Minister of War made a tour of the front. With impassioned and burning speeches he sought the soldiers to stand fast against the treacherous Germans and defend their newly won freedoms. He pointed out that to cease fighting before the Allies had triumphed in the West would be an act of dishonor for Russia and of disaster for democracy everywhere. Russians would soon find that they had merely exchanged a Romanov for a Hohenzollern and that the sincerity of conviction and usually provoked a temporary enthusiasm among his hearers. But in some places the poison of Bolshevism had sunk so deeply that his speeches were received with mockery and derision. At Riga a soldier in the trenches started to enter into a dispute with him; whereupon Kerensky screamed at him:

"Hold your tongue when the Minister of War is speaking to you." At other points he found it prudent not to attempt to speak at all.

It was finally decided that the offensive which it was hoped would restore discipline and patriotism should begin at 9 A.M. on Sunday, 1 July 1917. It was to start from the front in Galicia which Russia had won the year before. Its strategic aim was to capture Lemberg and Stanislav. If this started well a secondary offensive would be undertaken in the north toward Wilna for the recovery of Lithouania and the Baltic provinces. The Russian column during the fierce bombardment which preceded the time set for the infantry to go over the top were nerve-racking moments for the officers. No officer felt sure that his men would obey the command to advance. One of the corps commanders was seen silently praying during the fateful minutes preceding the appointed hour. Would his men go over the top or not? He hoped so, but he could not feel sure. When, punctually at 9 A.M., his troops swarmed over and the attacking masses rolled forward, the general devoutly crossed himself. But all the generals were not equally fortunate. Many mutinies broke out on the eve of the attack. In many places the Soviets of soldiers, instead of obeying the order to command to advance, would sit down and debate the wisdom or desirability of the orders given them; and the result of the debate was that too often they concluded not to do what they had been told. This new idea of liberty and the wholesale desertions from the ranks was soon to nullify in less than a fortnight all the preparations and efforts of the government and the officers to make the July offensive a success.

However, the offensive started auspiciously at the outset, considering the circumstances. It showed that there was still a real fighting spirit in a great many of the Russian soldiers. This was further shown by the formation of many "Battalions of Death" and by the enlistment of battalions of women. During the fighting of 1 and 2 July Kornilov's men made good progress toward the Stanislav-Lemberg Railway. Altogether the Russians on the Galician front took 20,000 prisoners and over 100 guns in the first two days of fighting. This was due in part to the fact that the Russians outnumbered the enemy two to one and that they were stiffened by the presence of a considerable number of British and Belgian armored cars.

There were also a great many French and British aeroplanes, though not enough to cope with the Germans. The Russian airmen also did excellent work themselves and were well-supplemented by balloon observers. Moreover, there was an abundance of artillery of all calibers, trench mortars, machine guns and especially of ammunition. Never had the Russian army been so well equipped. But instead of improving with action and success, the Russian soldiers grew daily less reliable. Divisions voted that they were tired of being sent to front line trenches more than 24 hours, and only so long on the condition that they would be strictly on the defensive and not ordered to attack. When the Germans began to rally for a counter-attack, Russian units deliberately disobeyed their officers and even retired from the line, thus opening dangerous gaps which weakened the morale of neighboring units. By 20 July the whole Russian front in Galicia was completely demoralized and in disorderly retreat. The Germans and Austrians did their best to complete the demoralization by attacks on the retreating rear—engagements which were misrepresented in the German bulletins as hard-won battles. The retreat of the last Russian offensive need not be given. By August all that Brussilow had won in 1916 was lost, almost without a blow. The Eastern Front was pushed back to the positions which it started in 1916. Such were the early effects of Bolshevism upon the army. It was a very bitter situation for the officers, the Liberals and the true friends of the Allies in Russia. But they could do nothing. Patriots like Gourko and Kornilov who tried to stem the tide of demoralization and to back up their arguments with the threat that they would resign, were arrested and imprisoned as dangerous traitors to the new Russian republic.

11. The Disappearance of the Eastern Front in Chaos, 1918-19.—On 1 Sept. 1917 a further change in the military situation came through the easy German capture of Riga. A German fleet shortly afterward occupied the Gulf of Riga and the islands which had established a foothold in Estonia and Livonia. From their new position in the Baltic provinces the Germans were able to threaten the Russian capital, Petrograd. But Germany did not want to use the Russian military collapse as an occasion to make a military conquest of Russia. She wanted peace on her Eastern Front so that she could transfer her armies to the Western Front where the ultimate issue of the war would have to be decided. Moreover, it was not necessary to conquer Russia by armies in order to dominate Russia politically and economically. This kind of a domination could be better secured by the indirect means of creating puppet states, ruled or controlled by German princes, politicians, merchants and capitalists, and dependent on German armies for their existence. In fact, in the autumn of 1917, there loosened before Pan-German eyes a far greater empire than had been conceived of in the Baghdad Railroad project, which meanwhile was receding into the background of German hopes owing to Allenby’s victories in Mesopotamia and Palestine. Instead of the Baghdad Railway there swam before German eyes the grander prospect of controlling of
western Russia, through the small states of Finland, Estonia, Latvia, and Poland; all of the rich grain lands and the coal, iron and other minerals of southern Russia through the puppet states of Ukrainia, Georgia, Transcaucasia and others. Thus would Germany come into touch with China and Persia and threaten once more the English control in India. This great dream raised high German hopes and led to the negotiations with Lenin and the Bolsheviks which resulted in the infamous Treaty of Brest-Litovsk of 3 March 1918. This treaty was based on the deceptive formula of "no annexations, no indemnities, and self-determination." But by the terms of the treaty, as interpreted by Germany, the Bolsheviks under "no annexations" allowed Russia to be virtually deprived of 26 per cent of her total population, 27 per cent of her arable land, 37 per cent of her arable crops, 26 per cent of her railway system, 53 per cent of her manufacturing industries, 73 per cent of her total iron production and 75 per cent of her coal fields. Under "no indemnities" they saddled Russia with a gigantic but as yet uncollected payment by way of war tribute, with a promise of free export of oil, and an unfair commercial treaty. Under the guise of "self-determination" 55,000,000 former subjects of the tsar were handed over against their will to the practical control of German agents. The Russian soldiers were withdrawn to fight a civil war within Russia against the forces of law and order which were opposed to the Bolsheviks. So Russia fell into German deception. They refused to be bound by a treaty which they had no share in making and which was contrary to their interests. The Liberals or "Whites" in Finland and Estonia waged a determined war against German domination. The Ukrainians murdered the German Ambassador and overthrew the German puppet, Skoropadsky. The Germans soon found that it would be no easy task to maintain the domination which they had planned to visit upon these new nationalities. (2) The patriotic elements in Russia itself refused to accept the rule of the Bolsheviks and to recognize the treaty by which they had sold out Russia to the enemy. These patriotic elements gradually collected around Admiral Kolchak in Siberia; they established the so-called Omsk government with a view to restoring law and order by the holding of a constituent assembly which would give Russia a true democracy instead of a proletarian despotism. Several of the former loyal generals like Kaledine, Denikin
and Yudenich placed themselves in touch with Admiral Kolchak to work for the overthrow of Lenin, Trotsky and the whole Bolshevik group. The Allies also gave material aid. An Allied army landed at Archangel to protect the Allied stores of munitions, and to advance, if possible, to join up with Kolchak's army which was to move west from Siberia. The Archangel enterprise, however, was too small, was not vigorously pressed and did not find the support which it had hoped from the anti-Bolshevik element in northern Russia. It had to be abandoned in the summer of 1919. Japan and the United States also sent munitions and troops to Vladivostok to protect the munition supplies there from falling into the hands of the Bolsheviki. They were also to aid Kolchak by giving support to the Czecho-Slovak soldiers in Siberia, by keeping open the Trans-Siberian Railway, and by protecting supplies which were to be forwarded to Kolchak and the Omsk government. (3) But the great and deciding factor was the entrance of American soldiers upon the Western Front, the failure of Ludendorff's last effort, and the defeat of Germany which resulted in the armistice of 11 Nov. 1918. With Germany beaten, the Allies expressly provided in the Peace Treaty of 28 June 1919 with Germany (Art. 116) that the Brest-Litovsk Treaty should be abrogated.

In November 1919 Kolchak was advancing on the Bolsheviki in Moscow from the east and Danikin from the south, while Yudenich, backed by the loyal elements in Estonia and Latvia, and supported by English battleships, was advancing on the Bolsheviki in Petrograd. But these anti-Bolshevik forces were not successful. Foreign intervention seemed to have consolidated the power of the Bolsheviki and strengthened it instead of weakening it. The exercise of power and responsibility appears also to have made the Soviet government somewhat less violent and uncompromising. Recognizing this the Baltic States entered into negotiations with it in December 1919.

Bibliography.—Gourko, Basil, 'War and Revolution in Russia, 1914–1917' (New York 1919) is by far the best single volume on the Eastern Front; its author by ability and tact rose during the war from the position of division commander of cavalry to be chief-of-staff and commander-in-chief until his arrest and imprisonment by the Bolsheviki; it discloses both the inner political and military motives of Russian leaders by one who was in a position to know; it seeks to justify Russia against Western critics; it unfortunately has no maps. Good sketch maps and narratives are to be found in such general histories of the war as Buchan, John, 'Nelson's History of the War' (24 vols., London 1914–19); Simonds, Frank H., 'History of the World War' (New York 1917—); The New York Times 'Current History of the War' (monthly, 1914—); Morse, John, 'An Englishman in the Russian Army' (London 1916), a vivid account of an escape ahead of German forces from Silesia into

Professor of European History, Smith College.

7. ITALIAN CAMPAIGN. The chain of historical and diplomatic events which brought Italy into the World War is described under ITALY AND THE WAR (q.v.). At the time of the declaration of war against Austria-Hungary on 23 May 1915 the population of Italy was estimated at a little over 35,000,000. The Italian Army, raised by universal conscription, had a peace strength of about 15,000 officers and 290,000 men and a total war strength of roughly 3,270,000 men, of which number 1,070,000 were only partially trained. The able-bodied men annually recruited for service were divided into three sections, partly by exemptions and partly by lot. The first lot — about one-third of the whole — were fully trained; the second undergoing a recruit course and a few repetition cour.es in later years, and the third performing no service at all. The full length of service was two years with the colors, six years on furlough, and four years in the mobile militia (consisting of fully-trained reservists only). In recent pre-war years large numbers of the last class were called up for brief "refreshers" trainings (see ITALIAN ARMY). At the outbreak of war there were 12 army corps, each composed of two infantry divisions (in the Rome district three). The organization of the permanent army comprised 96 regiments of line infantry, 19 Bersaglieri (sharpshooters), and eight Alpine regiments (Alpini), in all 389 battalions; 150 squadrons of cavalry; 263 horse, field, mountain and heavy batteries; and 190 companies of fortress artillery and technical troops. On mobilization a division of mobile militia was added to each corps, bringing its strength up to 37,000 men and 134 guns. Each division comprised two brigades of infantry and a regiment (five battalions) of field artillery. The brigade contained two regiments, and the latter three battalions each. A cavalry division comprised two brigades of two regiments each, and two batteries of horse artillery. On peace footing there were 29 cavalry regiments. The Bersaglieri, with the picturesque feathers on their hats, were the light infantry. A regiment of four battalions of these troops — three of infantry and one of cyclists — was attached to each corps. Six battalions of Carabinieri (mounted police), forces recruited from the regular army, while the Alpini (26 battalions of the first line, with 36 batteries of mountain artillery) were special frontier troops for the defense of the northern borders. To
some extent the line regiments suffered from having their best men taken for the select corps of Alpini, Bersaglieri and Carabinieri. Altogether, the available field force may be estimated at over 1,000,000 trained men, with a reserve of about 2,000,000 in the territorial militia, the third class, with normally only 30 days' training. The infantry was armed with the six-millimeter Mannlicher-Carcano magazine rifle, pattern 91. A part of the territorials still had the Vetterli-Vitali, model 70/87. Officers were equipped with sword and automatic pistol. The Italian field artillery was at the time in process of re-armament. It possessed about 100 field batteries armed with the 75-millimeter Krupp quick-firing field gun, a large number of Krupp howitzers, siege and fortress guns, and siege trains of very large calibre.

The Italian navy, which had gained considerable experience during the Tripolitan War of 1911-12, consisted at the outbreak of war of six dreadnoughts launched between 1910 and 1913, and two more were nearly completed, as against four vessels of that class belonging to Austrian. The Italian officers and men were superior in speed and gun power. All were armed with 12-inch guns. Italy also possessed eight pre-dreadnought battleships under 20 years of age and three over, all heavily armed, of good speed, and very well protected; 20 armed cruisers, nine being over 20 years old; 33 destroyers (and 10 building); 65 torpedo boats and 19 submarines. The total naval personnel before the war was about 40,000. The Italian aviation arm was far superior to the Austrian, both in quality and quantity. Already, in August 1914, Italy had a greater aeroplane fleet than Great Britain, namely, 25 squadriole (of seven machines each) in Italy and three squadriole in Africa — about 200 machines. During the nine months of neutrality the Italian government had been building and buying aeroplanes and training pilots at a great rate, so that in May 1915 they were well able to meet the new airborne attack — Curtiss seaplanes and flying-boats, Borel monoplanes with floats, Breguet seaplanes, Bossi flying-boats, Savoia-Farman seaplanes, and some half-dozen Italian-built and two German-built biplanes. Though strong in her naval and aerial branches, Italy had no land army in the modern sense when the war broke out in 1914. She had men, rifles and field guns, and not too many of the last. Many gaps in organization were filled up in the period of neutrality, but it was impossible to bring the equipment up to the required standard. Italy's industrial resources were strictly limited and not easy of development. The country produced neither coal nor iron, and the output of her steel works was small. Nor was it easy to supplement deficiencies from outside. England, France and Russia had earlier calls on neutral resources and Italy could only secure, so to speak, the leavings. For a year at least after entering the war Italy had to rely on the heroism of her soldiers to make up for lack of munitions.

General Count Luigi Cadorna (q.v.) was appointed commander-in-chief of the Italian armies in the field. Generals Vittorio Emanuele, as his chief of staff. The Duke of the Abruzzi (q.v.) was placed in command of the High Sea Fleet; and his two brothers, the Duke of Aosta and the Count of Turin, held respectively the ranks of lieutenant-general and inspector-general of the cavalry.

With an extensive coastline of over 4,000 miles to protect (including Sicily, Sardinia, Elba, etc.), Italy has numerous fortified places on the coasts and islands. Spezia, the principal naval port, is on the north-west coast of a commodious bay, 56 miles southeast of Genoa by rail. Formidable batteries bristle on the hills that overlook the bay and the island of Palmaria, which guards the entrance. Here the large Italian warships are built, repaired and fitted out. Taranto, at the southeastern extremity of Italy, is an important naval base and arsenal. A fleet operating from this base guards the entrance to the Adriatic. Ancona, on a promontory of the Adriatic, 127 miles southeast of Ravenna by rail, was formerly a government arsenal and contains shipbuilding yards and engineering works. Other fortified places are Genoa, Vado, Gaeta, Monte Argentaro and some works in the Straits of Messina, while there are also bases at Naples and Venice for building and repairing ships.

The naval situation in the Mediterranean underwent a marked change in May 1915. During the preceding month the French fleet had entered the Adriatic with the object of rounding up the Austrian fleet if it were at sea. French battleships steamed up on the Italian side and, crossing the Adriatic, approached Cattaro, the Austrian naval base, from the north, while cruisers and destroyers advanced up the eastern shores. This movement resulted in the discovery of only three enemy warcraft — the small cruiser Zenita and two destroyers. The two latter fled and the Zenita was sunk. A subsequent bombardment of Cattaro apparently produced small results. Blockading forces were meanwhile established in the Otranto Channel, and the enemy was thus cut off from all sea communication with the outside world. The French fleet was still blockading this port when Italy entered the war, under serious disadvantage owing to the distance from its nearest base. The disadvantage was somewhat modified, though not removed, when the British admiralty placed the naval establishment at Malta at the disposal of the French authorities for refitting and repairing their ships. The entrance of Italy as a belligerent, with bases closer to the scene of operations, suggested a reconsideration of the naval position; and thenceforward the Italian navy, supported by several British and French units, became responsible for the blockade.

Natural conditions in the Adriatic were overwhelmingly favorable to Austria-Hungary. This land-locked sea, approximately as long as the North Sea, has a mean breadth of about 100 miles. On the Italian side the water is shallow and for many miles southward of Venice there is no single port suitable for a naval base. On the Austrian side the Dalmatian coast and Trieste presented a series of deep-water ports, fringed by a number of islands offering shelter to torpedo craft and even larger ships engaged in cross-raiding. The Austrians took advantage of the geographical position which Italy entered into accordanc with a scheme that was evidently
prepared in advance, units of the Austrian fleet, including battleships, began to terrorize the Italian population along the shores of the Adriatic, where the towns and villages were devoid of organized defense. The Italian fleet, however, soon devised an effective reply. Close to the water's edge, a railroad runs all the way down their coast. Armored trains were speedily equipped and manned by naval gunners; scouting operations by small naval craft and aeroplanes provided a satisfactory check on these raids and forced the Austrian fleet to inactivity, confined within the shelter of elaborate minefields dominated by powerful coast artillery and supported by flotillas of destroyers and submarines.

A more complicated problem presented itself on the Italo-Austrian frontiers. Here was a huge rampart of natural and artificial strongholds winding a snake-like course of 484 miles, a battle-front exceeding any other in the war for almost insuperable obstacles. All the disadvantages and handicaps of strategy, geography and climate fell to the Italian side. Austria held the small valleys of the Adige and the Tessin, the heads of the principal valleys, all the Alpine passes and all the crossings of the Isonzo. From Switzerland to the Julian Alps the frontier followed the crests of the hills at an elevation of 7,000 to 10,000 feet, while a mountainous zone separated the frontier from the plains. Between the Julian Alps and the Adriatic there were no natural obstacles to prevent the advance of armies on a broad front. Thus Italy's northern front fell into three distinct sectors—the first of high mountains, forming the re-entrant angle of the Trentino; the equally formidable wall of the Dolomites and the Carnic and Julian Alps, and the space on the east between the main Alpine chain and the Adriatic.

The Trentino, somewhat detached from Austria, was connected with it by the Pusterthal and the Brenner Pass, by which two routes alone there is railway communication. Mountain battlements protected the Trentino salient, and behind them, forming its conquest would have to advance mainly the Adige Valley, only to be confronted by the strongly-fortified town of Trent, after overcoming which he would have to struggle through a wilderness of mountain passes. Fortifications on the main ridge of the chain at the Brenner Pass. Flank attacks on the containing wall of the Trentino were all but impossible, for Austria had converted it into an immense fortress bristling with guns. High up in the hills, on the western side lies the Stelvio Pass, the highest carriage pass in the Alps, over 9,000 feet above sea-level. Here three frontiers meet among the clouds—Swiss, Italian and Austrian. Farther south, below the Ortler Mazy, lies the Tonale Pass, offering no problems to the Austrians. The frontier described the form of a huge horseshoe around nearly the northern half of Lake Garda and passed through the lake near its northern end. That little piece of the lake was strengthened by the layout of the Isonzo—quickly introduced a flotilla of gunboats and bottled up the Austrians in their narrow end of the lake. This little squadron patrolled the treacherous waters of Garda at all times and in all weathers, keeping those would-be invaders as equal to anything on the open sea—for which the lake is notorious. Italian trenches and barri-
The general idea originally was that the Italian armies might assemble behind the Brenta with their flanks resting on Venice and Verona and that as they advanced eastward their left would be secured by troops and works in the upper valleys of the rivers. With these leading ideas the railway policy of Italy in general conformed. Of great importance, also, was the question of the passes available for the troops. One Alpine pass only free from snow for about five months in the year, and the mule-tracks over the highest cols (defies for not more than three months. Before the French Revolution it was not the custom for armies to begin operations in the Alps before July, and usually those armies went into winter quarters at the end of October. Later on, lower and more accessible sectors of the Alps were crossed between April and December, and the higher Alps between May and November. It has been said that there is no prospect on earth quite like the immense irregular crescent of serrated peak and towering mountain wall that is thrown around Italy on the north, as it were, to muzzle itself from Lombardy and Venetia. In the teeth of the Austrians—and of nature, as it were, as well—the Italians carried the line of entrenchments across wooded hills, meadows, torrents and snow-clad slopes. In many places the trenches had to be blasted out of the rock, and were reinforced with concrete or anything that military science or nature could offer to render them invulnerable. The outstanding feature of the situation was that the Austrians were always going up while the Austrians only needed to come down. The former were below, and the latter high above on that immense natural rampart of mountains. The possession of the Trentino or Italian Tyrol was a matter of vital importance to Italy. The kingdom was protected by the powerful mountain barrier against invasion from France and Switzerland. But by retaining the Trentino after withdrawing from Italy in 1866, and by occupying the mountains at pass after pass throughout the length of the mountains as far as Lake Garda, Austria occupied with her army a wide breach in Italy's defense. The Austrians could thus easily invade the country and strike at Verona, Padua and Venice by marching to the east, or at Brescia and Milan by turning to the west. The positions held by Austria in the Trentino, in Istria and in Dalmatia were largely inhabited by Italians who suffered severely under Austrian rule: the short-sighted policy of Austria had earned her the bitterest hatred of the Italians.

A royal decree was issued from Rome on 22 May 1915 ordering the general mobilization of the army and navy. A supplementary mobilization order called up the third category of the service classes from 1885 to 1895—men who had not received any military training. Eleven provinces were declared to be in a "state of war" from the 23d, as well as the Adriatic coastlands, islands and all fortresses. All Austrian ships lying in Italian harbors were immediately sequestered. War was declared at midnight, and the step was followed by the prompt advance of the Austrians across the Austrian frontiers in southern Tyrol, Carnia and Friuli. It was soon apparent that the main military effort would be made against the line of the Isonzo, which had been heavily fortified by the Austrians, and that while converging attacks would be initiated upon the Venetian plain, determined efforts would be made to seize all the crests of the Alps which had been left, after 1866, in Austrian hands. The lack of branch railroads made it necessary to concentrate the Austrian offensive at certain narrow points of the lines between Tarvis and Gorizia; conversely, an Italian offensive must aim at the same points—and at one more: the junction of the Pusterthal line at Franzenfeste. If that point could be taken the communications of the whole of the Trentino salient would be cut. But this was just the hardest point for the Italians to reach, as the whole complex system of the Dolomites lay to the south and east of it. Briefly put, General Cadorna's plan was to hold on the north and push toward the east, Trieste, where the southern sector offered the best prospect for the development of a big offensive. Here the natural obstacles were much less formidable. At 3 A.M. in the morning of 24 May 1915 the first act of war took place in the plains of Lemberg and Venetia, aroused by the booming of guns and screeching of sirens. Austrian (or German) aeroplanes, flying at a great height, dropped bombs on the sleeping city, a storehouse of art treasures. Austrian battleships bombarded the Italian coast from Venice to Brindisi.

Austria at the moment was preoccupied with Galicia, retrieving a long series of disasters with the aid of German troops under Mackensen. Not was that the Italians had long maintained a strong army on the southern front, composed principally of Landwehr and Landsturm, among the latter some levies of Tyrolese mountaineers. This army was commanded by the archduke Eugene and Gen. Conrad von Hoetzendorf. It was not until three-fourths of Galicia had been reconquered from the Russians that Austrian troops were withdrawn from that theatre and placed opposite the Italians. Within a few days after the indemnity of Italy's indispensable position in the Trentino as well as others toward Trieste; on 2 June they were crossing the Isonzo and establishing themselves on the slopes of Monte Nero, north of Tolmino. They won all the lower passes of the Dolomites and made breaches at the Tonale Pass and in the Carnic and Julian Alps. They occupied the Monte Cassino Pass (9,305 feet), Ponte Caffaro and Monte Baldo on the Trentino front, the Dolomite valleys and several footholds in the Carinthian Alps. On the east the Italians were on Austrian soil almost up to the Isonzo. The mountain troops of the Bersaglieri performed remarkably strenuous feats in dragging heavy artillery to the tops of snow-covered peaks and driving Austrians from apparently impregnable positions. Italian destroyers shelled Monfalcone near the northern head of the Gulf of Trieste 31 May; as fell on June and two days later the Italians had taken Gradisca. On 2 July a severe struggle began for the Carso Plateau, the highway toward Trieste. At the same time vigorous attacks were launched against Gorizia on the Istrian side and in the south. The Italian forces maintained a strong pressure from the sea to the south of Monfalcone. Simultaneously blows were delivered farther north,
and Fort Malborgetto in the Carnic Alps was bombarded. The Austrian second line east of Gradisca was under fire by 30 July, while aerial raids harassed the railway to Trieste. But progress was slow and difficult, and it was not until 22 October that the Italians were able to make a substantial advance on the Isonzo sector, when over 5,000 prisoners were taken in a week. The crests along the Alpine front fell one by one to the Italians; some progress was made in the north, but operations were restricted to that and the Isonzo fronts until the end of the year, by which time there were nearly 500,000 Austrian troops chained down to a mere passive defensive.

During November the offensive continued, renewed repeatedly, until in the first week in December a Scottish mist — nebbia Inglese — the Italians called it — settled down and lay immoveable over the front, and the Italians admitted reluctantly that the capture of Gorizia must wait. Some other important events had happened during the first months of Italy's war. Although Italy had not declared war on Turkey, hostilities had been begun in Asia Minor against the numerous and prosperous Italian colonies. The Italian subjects were protected and their property was respected. Italy declared war on Turkey 20 Aug. 1915 and adhered to the Pact of London, 1 December the same year. On 2 October Bulgarian troops appeared on the Serbian frontier; on the 4th Russia sent an ultimatum to Bulgaria; on the 6th an Austro-German army invaded Serbia; Belgrade was occupied by them on the 9th; by the 18th Bulgaria was at war with Serbia, Russia, France, Italy and Great Britain. The Entente Allies' horoscope looked black indeed during the late summer of 1915. The Russians had been defeated in Galicia; Warsaw fell to the Germans on 4 August; Great Britain and France had suffered some 112,000 casualties on the Gallipoli Peninsula; Serbia, now overrun also by Bulgarian troops, was in a most desperate position. Treaty obligations bound Greece to come to the aid of Serbia against Bulgaria; when that assistance was asked for (11 October), it was refused. Serbia's only hope lay in the success of a possible counter-move from Salonika, but there was only a small force of less than 15,000 French and British troops stationed there, in imminent danger of being themselves attacked by the Greeks. The Allies could thus render no aid to Serbia. When Uskub fell to the Bulgarians on 25 Oct. 1915, the doom of Serbia was practically sealed. By the middle of November that nation had nothing left to defend of its own territory, and the broken remnant of its army struggled painfully through the mountains of Montenegro toward Scutari and the port of San Giovanni di Medua on the Adriatic, while another column retreated toward Durazzo. Two circunstances alone saved them from extermination, namely, that the Austro-German forces did not heavily press the retreat, and that Essad Pasha (q.v.) in Albania had definitely declared for the Entente Powers. Besides the Serbian troops the train of stragglers included many Serbian families, women, children and old men, toiling on foot over snow-clad mountains and through foaming torrents. Many died by the wayside. This was the situation which the Italian navy was called upon to face in the dark days of December 1915 — the feeding, clothing, disinfecting and healing of the survivors of an heroic little nation, some 200,000 all told. They had all to be conveyed across 40 miles of water swollen with floating mines and open to submarine and destroyer attack, as well as aerial bombs. Between them, Italy, France and England supplied the necessaries of life. As only small ships could enter the harbors of Medua, Durazzo and Valona, marshes and rivers had to be bridged, but finally the refugees were safely carried to the genial climate of Italy for recuperation. While the great task of rescue was in progress at Valona, troops were pushed up into the surrounding country and a strong detachment posted to guard the hills around the harbors of Medua and Durazzo. According to an eyewitness, early in December there "began to trickle down the Montenegrin and Albanian heights the forerunners of such a flood of famished, dirt-engrained and pestilence-stricken humanity as can seldom have been seen in the Christian era." From parties of two and threes the stream swelled to hundreds and thousands. Day and night the naval and military doctors, with soldiers, sailors and orderlies worked among the victims to alleviate their sufferings. Nor was this the only contribution of the Italian navy to the Entente cause during the early stages of its activities. Already in July it had converted the whole of the Adriatic into a close controlled military area like the North Sea; it had forced the Austrian navy to undertake only futile sorties, carried out air raids, and effected several landings on the opposite shore. Marines had been landed at Valona already in 1914, seven months before Italy entered the war.

The rather easy advance of the Italians during the first few months made it appear as though the Central Powers were willing to let Italy seize the particular territory which she wanted from Austria, a quite logical conclusion, since, if Germany and Austria were defeated, Italy would get that territory anyway; whereas, in the opposite case, Italy would lose the conquered lands again at the peace table. While the Italians maintained a more or less defensive attitude on the Trentino front, they gave the Isonzo line that their main efforts were concentrated. In that direction lay the road to Trieste, and Gorizia was the key to the situation, for it stood in the way of any real advance across the Carso (German, Karst) Plateau. Gorizia, furthermore, was a formidable entrenched camp defended by 200,000 men, and its flanking positions showed a width of over 60 miles. A steady pressure was kept up during the winter along the whole line; Italian gains were made at several points, some thousands of prisoners were taken, and 25 Austro-Hungarian divisions kept employed. At the end of November continuous rains flooded the country and thick fogs paralyzed the action of artillery. But the Italians dominated the Isonzo front from the northwest of Gorizia so that the bridge-head at that place could no longer be used as a starting point for an offensive action by the Austrians. By the end of the year the Italians had taken 30,000 prisoners, five guns, 66 machine-guns, many howitzers, mortars, thousands of rifles and much ammunition.
No outstanding events occurred on the Austro-Italian front during the first quarter of 1916. With the advent of spring hundreds of thousands of laborers began to arrive on the scene and were put to work clearing the country and preparing for a new offensive against Gorizia and Trieste. This army of brawny if unskilled labor represented the annual emigration from Italy to other countries. Under engineer supervision they built roads, light railways, barracks, hospitals; they bored trenches out of the stony rocks, scooped underground galleries of immense size and number, and constructed an elaborate system of aerial railways from peak to peak along the mountain chains. Steam rollers and camions soon rumbled along the roads which some weeks before had been impassable for mud. Almost from the beginning of hostilities the Austrians had retired behind the Isonzo gorge, on the course of the river above Monte Sabotino. For two years this remained the general position of the entire Italian army occupying the western bank of the gorge, the ridge of Monte Planina and Monte Corada.

Hostilities were resumed about the middle of March 1916 in the hill country. In the previous November a house called the Col di Lana had been captured west of the Falzarego Pass by Italian troops under Col. Peppino Garibaldi, but the summit could not be held while the Austrians retained their foothold on the northern slopes. After three months of strenuous labor the Italians had cut a tunnel from which to blast the enemy from his position. Before the end the Austrians grew suspicious and began counter-mining, but in the wrong direction. On the night of 17 April 1916 the mine was sprung by the Italians, and what was left of the Austrian position was carried by the bayonet. The explosion formed a crater 150 feet wide and 50 feet deep. On 27 March the Austrians attacked in force the heights northwest of Gorizia, and with such effect that the Italian centre was driven in. The position was, however, restored next day by a counterattack and the enemy effort was not renewed here. During April some daring exploits were carried out by the Alpini on the great Adamello Glacier to the northwest of Lake Garda, where 300 Alpini left the Rifugio Garibaldi on skis, climbed the glacier by night in an Arctic snowstorm 10,000 feet above the sea, and drew the Austrians from the rocks in the early morning. On the 29th 2,000 Alpini followed the same route and dislodged the enemy from the main crest, thereby gaining a position on the flank of the Austrian lines in the Val Giudicaria. Throughout the winter the Austrians had heavily strengthened that part of the Trentino sector between the Val Lagarina and Val Sugana, and had brought powerful batteries to the Folgaria and Lavarello plateaus southwest of the city of Trent. The Italian, though aware of the concentration, anticipated no more than a local attack. This sector was under the command of the archduke Charles, afterward Austrian emperor, who was preparing for one of the major offensives of the war.

Between the two vals above mentioned, through which the Brenta and Adige rivers respectively flow, lies a comparatively small area with a frontage of less than 30 miles, where the Austrians had erected some strong positions including 40 12-inch Skoda howitzers and several German naval guns. About 350,000 men were here concentrated to make a determined attempt to break the Italian line at this point and force a passage through the Alpine peaks to the Venetian plain. While the Italians were developing their strategy and making preparations for a new offensive against Gorizia and Trieste, the Austrians gave them a nasty surprise where they least expected anything to happen. It is probable that Austria wished to forestall the very offensive the Italians were planning, for on 14 May a violent bombardment from the Austrian side blasted a gap in the Italian front lines, which had to fall back in the centre. Austrian infantry were thrown forward on the 17th; the Italian mountaineers put up a series of gallant fights, but they were outmanned and outnumbered. By the 18th they had lost valuable ground and many prisoners. A fierce resistance at the southern end of the sector, at the Passo di Buole, however, saved the day, and by 20 May the Monte Pasubio and prevented the crumbling up of the defenses and a probable Austrian dash through to the plains. On the 20th General Cadorna decided to withdraw his centre to a new position well to the south, namely, the south of Garmarara, a tributary of the Adige, the left. Next day they occupied a mountain north of Asiago and the Italians evacuated that town. Two days later the Austrians had driven a wedge between Pasubio and Arsiero along the river Posina still farther to the south. Eastward of Arsiero a terrific on-slaughter on Monte Cengio gained that position also for the enemy. General Cadorna had meanwhile brought up his reserves (the 5th Army) to assemble in and around Vicenza and prepared for his counterstroke. The greatest danger at the end of May was in the Asio valley, where the Austrians had captured the rock summits of Pria Fora and Cimone, and were pouring through Arsiero down the valley itself actually on the level of the great plain. The Italians had been driven back on their prepared lines and had no trenches nor fastnesses in which to make a stand; they fought the invaders hand to hand and by desolate fighting thrust them back over the precipices of Pria Fora. These actions saved Italy in the early days of June 1916. Arsiero was abandoned, and on 1 June an Austrian army order informed the troops that only one mountain stood between them and the Venetian plain. Within three days the Austrians were only 18 miles from Vicenza and the trunk line. On 7 June Cadorna announced that the enemy offensive had been checked. The new army had been equipped with guns and on the 12th a counter-offensive began in the Val Lagarina and on the Posina-Astico front. On the 13th a violent struggle raged around the last Italian position south of the Posina; the defenders lost 70 per cent of their men, and from the 15th to the 17th the Genoese troops on Monte Pau repulsed what proved to be the last of the great Austrian attacks. In the last days of June the crisis passed; the Italians recovered ground on the Asiago Plateau, while a timely diversion was furnished by the Russian victory.
in the Bukovina and the great British offensive on the Somme in France. What advantage Austria had gained on the Italian front she had lost in Galicia. General Cadorna now began to dispatch men and guns back to the Isonzo front, in preparation for the great attack on Gorizia. Here we may leave them for a short space while we turn to the Italian navy. We left the Italian navy preparing to cope with the task of saving the remnant of the Serbian army and such of the civilian population of Serbia as had been able to make their way to the coast and survive the ordeal. Old King Peter himself, racked with rheumatism and almost blind, had made his way in disguise along the same rough road on horseback, accompanied by a few soldiers and officers. While the refugees were streaming into Meduna and Durazzo, the Italians were preparing a great clearing-base for their fleet more than 60 miles farther south, erecting hospitals and weather-proof huts. During December 1915 and January-February 1916 the tragic finale of the first Balkan campaign was enacted on the Albanian Coast. In the middle of January the Austrians had captured Cettigne and overrun Montenegro, and the defeated army of that little state was also in full retreat, decimated by hunger and disease. What was left of that army fought its way back to Podgoriza and Scutari, where the government and the king and queen had already retired. The royal party was taken on Italian warships within a few miles of the Albanian port of Cattaro, together with the Entente diplomatic representatives. Scutari fell to the Austrians on 23 Jan. 1916; Meduna followed shortly after, and there began a great general movement toward Durazzo, still thronged with refugees by thousands. For weeks the process of feeding, medical relief and systematic embarkation had been going on, subject to hourly perils of aerial, naval and land bombardment. Those who were sufficiently restored were marooned into long columns and sent to Valona by the road which had been constructed by Italian engineers. All those unable to reach the shore had to be shipped from Durazzo to Valona, whence large steamers conveyed them to Italy, Corfu and Biserta in Tunis, where the French government had made preparations to receive them. Owing to Austrian pressure the position at Durazzo became untenable, and it was decided to evacuate the town on 26 February. There were yet 6,000 persons besides 1,300 wounded and sick to be removed. The Italian garrison of 2,000 men (reduced from 5,000) retired southward fighting rear actions and holding the enemy. The Austrians were dropping shells (from the land) on to the harbor quay, to which bombardment Italian destroyers replied. In the morning of 26 February the cruiser Libia entered the harbor, joined in the bombardment of the encroaching Austrian lines and succeeded in silencing several batteries. The heavily-laden transports having safely reached the sea, a party of marines was landed; other Italian cruisers arrived and an intermittent cannonade was kept up for that day and the ensuing night. On the 28th, the day of evacuation, rough weather prevailed on the sea and hampered operations. Twelve steamers and a hospital ship protected by destroyers entered the harbor; two battleships and a destroyer flotilla waited outside to hold the sea in the event of Austrians landing on her own territory in Albanian naval territory. Notwithstanding that the Austrian land batteries concentrated their fire upon the only available gangway, the sick and wounded were carried on board the hospital ship under a hail of shells. All movements had to be carried out in full sight of the enemy. The Italian rear guard surrounding the town had retired before the ever-increasing pressure of the investing armies. The dock was still crowded with refugee Serbian soldiers; the Austrian fire increased in fury and searched every foot of the harbor. At this critical stage 100 Italian sailors landed, crept on all fours along the beach toward a great dump of thousands of sacks of flour. With these they built a breastwork, constructing two effective trenches to enable the retiring troops to reach the gangway. They then returned to the ships. Two Italian officers now returned, opened a violent fire on the Austrians and drew their fire in return. Meanwhile, a swiftly-moving procession of stretchers bearing wounded Serbs, Montenegrins and Albanian refugees was passing under cover of the flour-sack trenches. By eight o'clock at night 10,000 individuals had been evacuated; no one was left behind. General Ferrero was the last to leave the shore. There yet remained a great accumulation of stores, horses and mules to be destroyed to prevent their falling into enemy hands. This was accomplished by a few shots from the cruiser Fuglia and as the crowded transports, the hospital ship and the convoy drew out into the darkness, guided by a fast destroyer flashing signals, the burning town of Durazzo appeared like a giant volcano in eruption. Between 12 Dec. 1915 and 22 Feb. 1916 no fewer than 11,650 refugees, invalids and wounded persons were transported from the Albanian Coast to Brindisi, Marseilles, Lipari and Biserta; 130,840 Serbian soldiers were landed in Corfu and 4,100 at Biserta, necessitating the employment of six large Italian liners, two French cruisers, one French and five Italian hospital ships, two Italian ambulance ships and 15 Italian, 15 French and four small British steamers. These vessels made 216 successful voyages from San Giovanni di Meduno, Durazzo and Foci della Vujussa to Valona; 47 trips from Valona to Corfu and others to Brindisi, Marseilles and Biserta. During March 1916 altogether 13,068 men and 10,135 horses belonging to the Serbian cavalry were transported from Valona to Corfu, and during the whole period under review nearly 23,000 Austrian prisoners of war were shipped from Valona to Sardinia. Some 22,000 tons of food, fodder, hospital stores and medicines were landed at the three Albanian ports, while to safeguard the execution of this great undertaking there were employed 170 cruisers, destroyers, torpedo-boats and motor-boats, the majority being under the Italian flag. The principal organizer and director of the work was Vice-Admiral Emanuele Cutinelli-Rendina of the Italian navy. Mr. Balfour paid a great tribute to the energy and ability displayed by the Italian fleet in the transportation of the Serbian army from Albania (House of Commons, 23 Feb. 1916).
Italian, French and British warships patrolled the Adriatic; a former German liner, taken over by Italy, was fitted up as a floating clubhouse where the young officers of the Entente submarines congregated in their few leisure hours.

Owing to the extreme cautiousness of the Austrian fleet, the Italian navy was not permitted to distinguish itself in any great sea fight. Yet its position and that of its Allies was one of continuous peril from submarines and floating mines, calling for eternal vigilance. By day and night, frail vessels went nosing through perilous channels between hostile islands into harbors bristling with well- placed batteries and not infrequently crowded with powerful battle- ships too shy to seek the open sea. The Austrians launched thousands of floating mines, and these had to be removed by minesweepers. But time did not pass without occasional encounters. On 5 Dec. 1915 an Austrian cruiser and some destroyers raided the port of San Giovanni di Medua, sinking two small steamers and a fisherboat. On 28 December an Austrian destroyer flotilla set out from Cattaro to bombard Durazzo. The land batteries were shelled and a couple of ships sunk when they were engaged by a combined squadron of Italian, French and British light vessels. Two Austrian destroyers were accounted for; the rest hurried back. During a later bombardment Essad Pasha and 300 of his followers were taken off by an Italian warship. Twice during February, while the Serbian-transportation was at its height, Austro-German U-boats laid mines in the Durazzo roadstead; on 19 occasions U-boats attacked the convoys, but without success. The small ambulance ship Marche- chiaro was carrying 120 wounded Serbian soldiers when she struck a mine outside Durazzo. The vessel caught fire and, though its commander and a large number of the crew perished, everyone of the wounded was taken off in safety. The sole survivor of a mined Italian submarine, a sailor named Arturo Vietri, swam for 14 hours off Trieste before he was picked up by a friendly motor-boat in the dark. Italy suffered some early misfortunes at sea; she lost the battleships Benedetto Brin (29 Sept. 1915) and the Leonardo da Vinci (2 Aug. 1916) by internal explosions; the armored cruisers Amalfi and Giuseppe Garibaldi were torpedoed in July 1915; three torpedo-boats and two submarines were also sunk by 5 Aug. 1916. After a nine months' mine-laying career in the Adriatic, the German UC-12 was trapped and sunk on 16 March 1916; the Italians subsequently raised the submarine and discovered 14 bodies on board; they were German sailors from Kiel, where the vessel was built. It had been transported in three pieces overland to Pola on the Adriatic, where she arrived in June 1915 and engaged the Italian mines against Italy long before that country declared war on Germany. Five other U-boats fell to Italian guns. The Austrian submarine U-12 (not to be confused with the German one just mentioned), was tor- pedoed on an Italian man-of-war on 24 Aug. 1915. Two days later the U-3, after being rammed by an Italian cruiser, was blown out of the water by a French torpedo-boat.

We left the Italian army at that stage in June 1916 when the back of the Austrian of- fensive was broken. On 16 June the Italian counter-offensive began, when two columns of Austro-Italian Alpini drove the Austrians from the heights above the Val Sugana. The Italians now began to climb again up that mountain staircase, down which the enemy had half descended. By the 25th they had begun to force the pace of the Austrian withdrawal, bundling them into positions between the Brenta and the Adige. They recovered Arsiero on the 27th and in two days the Austrians had lost more than half the ground they had won in six weeks' fighting. As the Austrians retired they contracted their front, thus compensating for the loss of divisions which had been hurried to check the Russians on the borders of Galicia. Thus the Trentino offensive turned to failure for Austria, with a loss of hardly less than 120,000 in casualties and prisoners. Yet though defeated on this front they made another attempt elsewhere—to dislodge the Italians from the edge of the Carso Plateau. Here, on 29 June 1916, the Austrians employed poison gas for the first time on the Italian front, causing a frightful massacre and driving whole regiments, staggering and dying as they went, out of their trenches. Had the Austrians followed up the gas attack with all their iniquity they might have gained a great victory. Colonel Gabriele with a handful of men in gas-masks saved the day. During May Cadorna had swiftly and secretly carried men from the Isonzo to the Trentino front; he now took them back for a greater effort, for it was on the Isonzo that the real Italian counter- blow was to fall. The move came with dramatic swiftness and effect. While the Austrians reckoned on Cadorna to continue his pressure in the Trentino, that commander was laying his plans elsewhere. For the past six months the engineers had supplied a network of roads, gun emplacements and warlike provision of every kind in the Gorizia zone, where the actual task was entrusted to the 3d Army under the command of General Sabotino, just north of the city, but the overcoming of defenses literally hewn in the rocks. Gorizia was indeed regarded as impregnable. The artillery preparation opened on 1 August along the whole Isonzo front. On a quiet Sunday morning, 6 Aug. 1916, the region was aroused by a still more tremendous bombardment, heavier than any yet heard on the Italian front. Immediately afterward the Italians surged up through secretly-driven saps in the rock against the Monte Sabotino heights and in one exulting, irresistible rush carried the hill. After defying Italy for 15 months, Sabotino and its defenders were captured almost without loss within a few hours after the bombardment began. The heights of San Michele, just below the town, were stormed at the same time. With these key positions in hand, the Italians had won the necessary bridgehead. This brilliant movement was carried out by the 6th Army corps under General Capello, with whom served, as chief of staff, Col. Pietro Badoglio, who later became one of the future commander-in-chief, General Diaz. On Sunday evening and for several days afterward thousands of Austrian prisoners poured down the roads, passing the up-coming Italian regi- ments. At dusk the Abruzzi brigade stormed
the strong Oslavia line; a brigade of the 11th division advanced against the key-position of Podgora, which was taken with desperate fighting. For two days small garrisons resisted on the summit, particularly an Austrian major, who with 40 men made such a gallant stand that when they were eventually overborne, the without any elaborate fortifications such as the Isonzo line had boasted. Yet the Carso was in truth the most terrible battleground in Europe; waterless and dusty, scorching hot by day and icy by night, it was a natural defensive barrier for the Austrians. To make any impression on the rocky floor of the Carso pneumatic drills and dynamite were essential. The Austrian first line had been blasted and drilled out of the limestone rock with machinery similar to that used in making the Saint Gothard and Simplon tunnels. The snipers' covers were armored with iron plates an inch thick cemented into the rock.

Italy had now been at war 15 months with Austria, but not with Germany. The situation was anomalous, even unique, for Germany was supplying Austria with her most important munitions of war; German officers, soldiers and sailors had been the chief managers of Austria's campaign against Italy so far. The state of peace with Germany ended on 27 Aug. 1916, when Italy declared war against that country. On the same day Rumania declared war on Austria. Austria had been indebted to German assistance for such successes as she had won in the field. In the early stages of the war, when she had to depend upon the military aid, she had suffered an unbroken series of reverses; after the first fatal step she had taken in 1914, she had the least zest for war among all the Teutonic League, for at the worst she stood to lose much, and at the best to gain little. Her loose internal structure and the variety of races in her empire did not permit any solid national integration. Her alien peoples rose against her and had to be suppressed. Up to January 1916 as many as 3,400 civilians had been executed for treason — 530 in the Trentino, 287 in Trieste, 60 in Fiume, 208 in Istria and Dalmatia, 800 in Bosnia, 720 in Bohemia, 245 in Moravia, 480 in Galicia and 330 in Bukovina. While the Hungarians were entirely on the side of Germany, the German element in Austria was not of one mind, and the army soon lost its ascendancy for its highly efficient ally. The Emperor Francis Joseph died on 21 Nov. 1916 in his 80th year — the oldest sovereign in the world. He had been defeated in every war he had engaged in, and he died in the shadow of certain defeat. Austria was succeeded by his great-nephew, the archduke Charles, a nephew of the murdered archduke Francis Ferdinand.

By 15 Aug. 1916 the Italian advance had reached its limit for the year. With brief pauses between the efforts General Cadorna pressed his advance in great successive blows. Success was more substantial and more rapid in the northern half of the Carso front; in the more difficult southern end, the Austrians held a specially strong position at Humenada from which their artillery dominated the country far to the west. In a big rush on 14 September the Italians took the important town of San Grado on the river Vippacco, an affluent of the Isonzo. On 10 October came a twofold thrust, breaking the Austrian line just south of Gorizia between Sober and Vertoiba; while south of the Vippacco a further bend was forced in the enemy front. A fresh double blow fell on 1 November, when the Italians cleared the heights east of Gorizia, where the enemy had been shelling their lost city, while in the middle of
the front, from the Vippacco to the main road east and west through Oppachisasella a two-mile advance was made. Over 8,000 prisoners were taken in two days. The Austrians everywhere were now back on their third line; the section just mentioned consisted of recently captured was destroyed; their guns and the strength lay around the heavily fortified position at Hermada, where formidable batteries were concealed. To capture this sector meant a great concentration of guns and other preparations. Winter set in meanwhile; rain fell in torrents during November and December, and by Christmas the weather was so unfavorable that Cadorna was obliged to postpone his next effort till the following spring. Frost and snow soon made the Isonzo front as arctic a region as the glacier posts in Trentino or the icy peaks of the Dolomites. Throughout the bitter winter a perpetual toil proceeded behind both fronts to improve positions, create gun emplacements and communication trenches and generally adopt all the light works that fortune might devise to ensure success. Italy now had Germany openly against her as well as Austria, and the spring was certain to bring some important developments from the other side.

The political situation in Italy deserves a passing notice. On 10 June 1916 the Salandra ministry was defeated, having lost touch with the nation, and was succeeded by a cabinet formed on national lines by the veteran statesman, Signor Botolli (q.v.), who retained Baron Sonnino in the foreign office. The new ministry was strengthened by the accession of Signor Bissolati, the Socialist reformist leader, who was the head of an advanced section clamoring for a more vigorous prosecution of the war and especially demanding war with Germany, which followed, as already stated, two months later. During the autumn and early winter the extreme Socialists endeavored to bring about peace negotiations, for which German agents were assiduously wont, some were strongly opposed by Signor Bissolati, who declared in the Chamber (13 Oct. 1916) that any state harboring thoughts of peace at that time would be guilty of an act of treason. "The germ of war," he said, "can only be killed by demoralizing Germany of every illusion of predominance." Almost alone among the Allies, Italy had an avowed anti-war and pro-German party to deal with. A motion in favor of immediate peace engineered by a Jew of German extraction in the Chamber at the end of November was defeated by a majority of 293 to 47 votes, on which occasion the premier declared, "We seek not the peace of a day, but the peace of new centuries."

During the first quarter of 1917 little occurred on the Austro-Italian front beyond occasional raids and counter-raids, though intense activity prevailed behind the lines. The Austrians had constructed some 2,000 miles of military roads that year, and summer brought the Adige and Cadore. There was every indication that the Central Powers were meditating an offensive as soon as weather permitted, and it was the Allies' policy that Italy should strike first, if possible, as had been done by France. General Foch's chief of staff, General Weygand, visited the Italian commander in March to discuss plans. Italy had meanwhile raised and trained new regiments, increased her guns and output of munitions and greatly strengthened her aerial arm. An Austro-German offensive was daily expected during March; it was, however, another attempt would be made to put Italy out of the war altogether by a renewed drive through the Trentino. Between December and March the Austrians had carried out extensive defense work in the Trento, hoping to defend severe winter in the high mountains. But the expected attack was not, as we shall see, launched till the autumn. The Italian plan was to engage the enemy on the whole Isonzo line from Tolmino to the sea by an intense artillery engagement in order to keep him in doubt as to where the infantry were to be employed. By simultaneously showing vigorous activity in the Trentino the enemy would be held off in that quarter. Cadorna's intention was to strike hard with his left and against the heights from Santo to the north of Plava, and then, when the enemy had concentrated his reserves there, to deliver his main attack on the southern Carso toward Hermada. Artillery preparation began on 12 March. In addition to bringing in many batteries of 42 guns; by the morning of the 14th it had grown to immense fury; demonstrations were made at different points on a front of nearly 20 miles. The Austrian first-line trenches were blown out of existence by the cannonade; infantry raids met little opposition from the dazed and shattered Austrians. French batteries had also arrived in the zone of Gorizia and the middle Isonzo; had the unity of front been complete at that time, there might also have been some French and British divisions on the spot to take part in the drive on Bainsizza and thus have prevented the disaster that was to follow. But the German divisions came instead, while practically the whole of Austria's effective strength, some 900 battalions, were facing the Italians. Some 6,000 guns, mainly heavy and medium calibre, held a superiority of 25 per cent over the Italian artillery effective. Already in June 1915 the Italians had forced their way across the torrent of Isonzo and had established a solid bridgehead at Plava. For two years they had held this position and extended it to include the hamlet of Zagora, a mile down the stream, on the lower slopes of Monte Kuk. It was this position which became the base for the offensive of May 1917. There had been uninterrupted fighting in this sector, but neither side could dislodge the other. Here the Austrian trenches were only a few yards above those of the Italians on the precipitous sides of Kuk; there was only room for one set of barbed-wire entanglements to serve as a defense for both sides. This remarkably close proximity existed for nearly two years. Another weakness of the bridgehead was the fact that only one narrow road ran down from Verhovlje Pass to Plava bottom, and it was overlooked at a distance of less than a mile by the Austrian artillery on Monte Kuk. Everything that could-not be carried down to Plava by mules throng the forest track had to be transported in full sight of the enemy down the exposed road. A second roadway had been constructed and was opened a few days before the offensive began in May 1917. The term

A "bridgehead" implies control of that end of the bridge—in this case a permanent one—which is nearest the enemy.

In the morning of 14 May a pontoon was thrown across the river opposite Zagora, a little farther downstream. The main effort was directed on a five-mile front between Salcano, near Visigota, and Monte Kuk. Zagomila (an Austrian fortress) fell to one Italian brigade, while a Campobasso regiment struggled up the slopes of Monte Santo. By nightfall the Austrian second line, 800 feet above the stream, held up the attack. Two battalions of Bersaglieri and Alpini surprised the enemy in the dark and forced a passage of the river near Bodreja, between Plava and Tolmin, where they organized a bridgehead and held their ground. The attack was renewed all along the line at dawn; the northern and southern summits of Monte Kuk were captured; on Monte Santo the Italians were obliged to withdraw; the result of the day's fighting gave the Italians the western gate of the Bainsizza Plateau, also Monte Vodice, and a wide range of observation over the enemy's communications for the front on San Gabriele. During the assault on Hill 174 north of Tivolli by the Italians, the Austrian batteries heavily bombarded the city of Gorizia from their hill positions and seriously damaged many of its buildings. On the first two days of the battle the Italians took over 3,060 prisoners, 3 mortars, 2 machine guns, and 30 machine guns. The Austrians launched fierce counterattacks on succeeding days against Kuk, Vodice and the Central Carso position, but failed to dislodge the victors. Fresh Austrian batteries had been rushed from the Russian front and placed in position on the Carso; these were now shifted again to the north of Gorizia. The battle raged fiercely till 22 May, not only on the Isonzo, but in the Adige Valley and between Asiago and the Val Sugana, particularly around the Tooth of Pasubio, a rock tower of the peak which was the key of the Italian line west of Asiago. The small troop of Bersaglieri and Alpini which had crossed the Isonzo at Botocuz was withdrawn on 23 May. Their little bridge had quickly been shattered and they were left on the enemy's side of the river with hundreds of prisoners and the stream behind them. On 23 May the 3d Italian Army under the Duke of Aosta struck on the Carso: the second act of the drama began. For 10 hours every available gun sprayed a torrent of fire, and in the afternoon the Italian infantry went forward. The enemy lines, cut in the solid rock of the plateau, were broken from Kostanjevic to Asig and from the hill road to Trieste) to the sea. Jami te and its surrounding hills on the road farther south were also taken in the first day's battle, which yielded over 9,000 prisoners. Some 130 military and naval aircraft harassed the Austrians from the rear, while a squadron of British monitors bombarded the Austrian flank along the coast. While the left wing of the Duke of Aosta's force carried out a demonstration, the right wing, led by the 3d Italian Army, struck and led the main attack, storming the Austrian trenches south of the Kostanjevic-Hudillog road, and swept beyond Lukotic. Jamiano, Bagni and a number of low hills west of the mouth of the Timavo were carried by the bayonet. Deceived by the feint beyond Gorizia, the Austrians were completely taken by surprise, despite the most determined counterattacks, they lost both their first and second positions the first day. By 26 May the Italians had reached the foot of Hermada, a natural fortress 1,000 feet high, guarded by the road to the north. The Austrians put up a brave defense and counterattacked at many points; they managed to recapture a hill east of Gorizia, but lost it a few hours later. One effect of the Italian advance was to free Monfalcone from its daily bombardment by the guns of Hermada, for although that fortress had not been captured, its chief batteries were now diverted in other directions.

During a pause on the Isonzo the 1st Army in the Trentino made a swift attack in the mountains between the Adige and the Brenta. After driving the enemy up the Tonale Pass on 10 June, the Italian infantry carried the Agello Pass on the frontier line due north of Asiago and captured nearly the whole of Monte Ortigara east of Cimi Undici. On the 16th Italian troops advanced over the glaciers of Adamello, northwest of Lake Garda, and captured a strongly-fortified position 11,000 feet high on Corno Cavento.

An acute political crisis convulsed Rome during this period, centring round the national war aims as they affected Italian claims in the Adriatic and in Albania. Italian troops had in June occupied Yanina, formerly a part of Albania, but at this time included in Greek Epirus. The object of the occupation was to assist the Allies in Macedonia, but the Greek government, still under pro-German predominance, made a strong protest. The various questions were discussed in a 10-days' secret session of the Italian Chamber. The Boselli Cabinet survived that crisis, but its position was precarious; there was a general feeling that it had failed in energy and foresight. Albania was declared by Italy an independent country under her protection, 3 June 1917.

To return to the Isonzo. By the end of May 1917 the Italian offensive had prospered, though scarcely up to the expectations of its promoters. A halt for rest was called, for the weather broke and the battle had virtually died away. Prisoners to the number of over 15,000 had been taken, some 20 guns and a large stock of war material. Between Kostanjivke and the sea the Italian line had been advanced up to two and a half miles on a five-mile front; the Timavo was crossed and some obstructive marshes successfully passed, while a footing had been obtained on the slopes of Hermada. But the heights around Hermada and Hermada with its tunnelled rocks still stood firm: the two pivots of the Austrian line had not been shattered. Uneasiness prevailed among the Austrian High Command at the Italian successes. A council of war was held at Laibach, from which an urgent summons for help was sent to Berlin. Men and guns were sent from the stagnant Russian front, but they arrived too late to influence the result of the battle. However, a great Austrian counteroffensive was decided upon. It opened on 1 June with a severe bombardment of the ridge of Fajtji Hrib and infantry attacks at Tivoli and the southern crest of Vodice. The fire grew in intensity and on
4 June the Austrians made an attempt to storm Fajić Hrib with picked troops that won a foot- ing inside the Italian positions. The Italians charged, recovered the ground and annihilated the storming party. The enemy was checked, but the Italian new line was badly placed, and a few days later (3 June) the outposts were driven in and the right wing was forced back from the slopes of Hermada. A lull fell on the scene; the counter-strokes had cost the Austro-Germans 24,000 prisoners and nearly 80,000 killed and wounded. The Italians now decided on the gates of Trieste—the edge of Hermada in the south and of the Bainsizza Plateau in the north, the key to San Gabriele and San Daniele in the Vernovarerd. During the last days of August and the first week in September the Italian position on the Bainsizza was highly critical on account of imperfect communications. Fresh enemy battalions and batteries were constantly arriving from disintegrated Russia. If the Austrians had not been the thrust presented in the salients, the Austrians had a key position, the Bainsizza before it could be captured, there would have been no chance of success.

Great preparations were in progress on the Italian side for an assault on San Gabriele and the Bainsizza position. In that direction and over the Carso lay a possibility of breaking the Austrian resistance. Batteries and troops were recruited from the French and Italian fronts, but the hills were already committed to extensive operations and could spare no infantry until those operations had been carried out. On purely military grounds the French and British commands were obliged to refuse the Italian request; the centre of gravity lay on the Western Front, and any defeat that might have been inflicted upon Austria in the field would not have struck any decisive blow at the power of the principal antagonist, Germany, while any weakening of the Western Front by withdrawing troops for operations elsewhere was not unlikely to court disaster. Italy was thus left for her own resources and had to do the best she could with the material at hand. Russia was gradually divesting itself of the bulk of a mighty German effort was to be expected on the Western Front. The Papal Peace Note, which contained the phrase 'useless slaughter,' was utilized by the "defeatist" sections to convey the impression among the Italian people that their propaganda was supported by the Holy See. Industrial troubles were spreading in big Italian cities; the government was vacillating and unpopular; the land was full of pacifist talk and an insidious peace campaign was sowing discontent among the troops. A speedy victory in the field was imperative.

The attack opened on 18 Aug. 1917 with a violent artillery preparation along the whole line from Tolmino to the sea—the so-called "Julian front." General Cadorna's intention was to test or "feel" the enemy's front by general attacks to find a weak spot; once that was found, the attack could be pressed hard with the object of driving as far as the three key positions—the Austrian bridgehead at Tolmino; Monte San Gabriele; and Hermada, spread over a line of 30 miles. During the night of the 18th the Italians constructed 14 bridges over the Isonzo and began crossing the river from Plava northward to Santa Lucia.

Their first rush on the 19th carried the front Austrian trenches the whole length from Plava down to the sea (25 miles). The main attack was delivered in the Carso Plateau heights, where almost half of Austria's fighting strength was concentrated, composed mainly of Ruthenians, Poles, Czechs, Slovenes and Serbo-Croats. Facing this force was the Italian 3d Army under the Duke of Aosta, while General Capello directed the 2d Army against Bainsizza. General Cadorna soon discovered the weak spot in the line and ordered Gen. Boroejvich von Bojna stubbornly contested their progress. San Gabriele fell to the Italians on 4 September; the fierce bombardment had reduced its defenses to a "gruesome slaughter-house." There was less left for an assault on San Gabriele and the Bainsizza position. In that direction and over the Carso lay a possibility of breaking the Austrian resistance. Batteries and troops were recruited from the French and Italian fronts, but the hills were already committed to extensive operations and could spare no infantry until those operations had been carried out. On purely military grounds the French and British commands were obliged to refuse the Italian request; the centre of gravity lay on the Western Front, and any defeat that might have been inflicted upon Austria in the field would not have struck any decisive blow at the power of the principal antagonist, Germany; while any weakening of the Western Front by withdrawing troops for operations elsewhere was not unlikely to court disaster. Italy was thus left for her own resources and had to do the best she could with the material at hand. Russia was gradually divesting itself of the bulk of a mighty German effort and all the forces were expected on the Western Front. The Papal Peace Note, which contained the phrase "useless slaughter," was utilized by the "defeatist" sections to convey the impression among the Italian people that their propaganda was supported by the Holy See. Industrial troubles were spreading in big Italian cities; the government was vacillating and unpopular; the land was full of pacifist talk and an insidious peace campaign was sowing discontent among the troops. A speedy victory in the field was imperative.

AUSTRO-GERMAN OFFENSIVE IN ITALY
severe hardships they suffered are taken into consideration. The Russian army had given the enemy a clear demonstration of bowing away their arms and refusing to fight.

The night of 23-24 October was dark and foggy on the Caporetto, where stood the 2d Italian Army under General Capello, who at the first sign of the enemy's approach, withdrew in the face of the Austrian 3d Army, under General Joffre, delivered an attack in the Tagliamento sector ahead of the 2d Italian Army. The enemy pressed close on their heels, and on 5 November Boroyevich von Bojna's Austrian army operating on von Below's left forced a passage of the Tagliamento near Finzano, about 40 miles from the mouth of the river. Cadorna still held the middle and lower river, but the position was too precarious in which to remain. The Adige, 60 miles to the west, promised the best defense, but that would uncover Venice, the key to the Adriatic and the whole of Italy's defense. By 8 November the enemy had taken 2,300 guns and nearly a quarter of a million prisoners. Large bodies of Italian troops surrendered every day. The pursuit continued and an attack was made concurrently upon the Tyrolean front, the Asiago sector falling to the Austrians on 10 November. By this time the main Italian forces were everywhere back on the Piave; thanks to the wintry weather setting in they were able to hold this ground.

The first news of Caporetto brought the Allies of Italy to her side, but assistance did not arrive until the Italians had borne the brunt of the storm and fought the enemy to a standstill. A French contingent under General Fayolle crossed the frontier before the end of October; a British force under General Plumer came on 10 November. Early in that month Mr. Lloyd George, three high British officers, the French Premier, M. Painlevé and General Foch arrived in Italy. They met the Italian Premier, Orlando, Sonnino, the Foreign Minister, and other officials at the village of Rapallo, 16 miles from Genoa, on 5 November. Out of that meeting there sprang the Allied Council of Versailles and the much-needed unity of command on the Western Front. General Cadorna was transferred to Versailles and General Diaz was placed in command of Italy's armies. General Badoglio became chief of the general staff. During the next six weeks the Austrians delivered numerous attacks along the Piave and near Asiago, where Hoetzendorf was in command, but at the end of the year the Italians were still holding the line of the Piave. On 10 Dec. 1917 it was announced that French and British troops were in the firing line on the Italian front. The British were stationed at Montello, a critical point in the new defense system. Fighting continued throughout the winter; in January the Italians scored three local successes, and by the end of that month military experts decided that the Caporetto campaign was over. Italy had saved herself, but her military strength had been shaken to its foundations and she had lost much material. On the enemy side, the unexpected success had raised fresh hopes and particularly confidence in the new style of tactics. Yet the disaster was not altogether without profit to the Allies; it brought about a real unity of German propaganda and effort which had hitherto been lacking, and it also united the Italian nation and produced both military and civil reforms.

On the last day of the year 1917 the French
army and artillery came into action west of the Piave, with the result that the Austrians had to evacuate their bridges and their left of the bridge-head at Zensano, northeast of Venice. The winter was severe and fighting was confined to artillery duels for several weeks. On 29-30 Jan. 1918 the Italians recaptured the Val Bella and Rosso Heights and drove them out again with great slaughter and pursued them into their own lines, where all resistance ceased. The French and Italians also speedily recovered themselves on the mountain front. The Austrian storming parties were harried with instant counter-attacks at every point. At two places the enemy had crossed the Piave on the first day of the attack; by the third day it was apparent that the offensive was not only a failure, but that the attempt might be converted into a disaster. The Piave had been low when the enemy had crossed; now it rose rapidly and washed away the bridges by which he had come over. The Italians gained the initiative by 21 June; most of the Austrians were driven back across the river with heavy losses; after eight days' fighting those of the enemy who remained on the west bank slipped back in the night; during that time the Entente Allies had taken 16,000 prisoners. The Austrians followed the enemy across the river, recovering ground with little trouble. By 1 July the Asiso position had been restored and a week later the Italians had cleared the whole Piave delta and secured the safety of Venice. Besides the Austrian and Polacchi, there was also a body of Czecho-Slovaks fighting on the Italian front; the first American contingent arrived there on 31 July. On 14 July the second battle of the Marne had opened and the German command was preoccupied with the last desperate throw. During August a series of raids were carried out against the Austrians, but throughout the violent fighting on the Western Front and the period of the Bulgarian and Turkish collapse, the Italians were kept, as part of the general strategy of the Allies, marking time across the river, recovering for his great thrust. On 15 Sept. 1918 Austria sent a peace note to all belligerents, including her ally, Germany. Neither the Entente Allies nor the United States treated these overtures seriously, and in the dual monarchy was in dire straits and on the verge of collapse. On 6 October General Diaz offered Lord Cavan, who had succeeded General Plumer when the latter went back to Ypres in March, to surrender an Italian and British army for the coming offensive.

There were strong reasons for the comparative inactivity on the Italian front during the early autumn. A number of troops had been loaned to Foch and the Austrians held the superiority in men and guns over the Italians. The Austrians and Bulgarians remained strong, and Diaz wisely stayed his hand until the process of internal decay had become accelerated. On 23 October — the anniversary of Caporetto — all was ready for the last great effort. Diaz now had at his disposal all Italian divisions, three British, two French, one Czecho-Slovak and one American regiment. According to the plan of campaign the battle was to begin with a feint by the 4th Army under General Giardino around Monte Grappa, after which the main attack was to be delivered between Montello and the Monte di Piave to cut the line connecting the Austrians in the mountains with those in the plains. At 5 A.M. on 24 October the Italians opened fire and at 7:15 the infantry advanced. The ruse succeeded, for the Austrians believed the Grappa sector to be the main objective. Meanwhile some British troops had taken possession of the island of Grave di Papadopoli in the middle of the Piave, and on the 26th the Italian artillery began to play on the real objective indicated above. Here immediate success was obtained by the three armies on a 30-mile front — the 12th fought its way up the Piave Gorge and cut the communications with the Grappa massif; the 8th Army, from Montello, passed over the bridges constructed by the British, and the 10th Army crossed via the Papadopoli Island. By 30 October the Austrian front began to crumble. From this moment the gradual retirement of the Austrians became a rout; their resistance weakened all along the line. Czech and Polish battalions surrendered wholesale, as also did many Hungarian units; only a few Austro-German bodies maintained their discipline and resistance. By 31 October the enemy was flung back across the Livenza; the Duke of Aosta's 3d Army was over the Piave everywhere down to the sea, while away up north Asiso had been retaken. The Grappa sector (1 November) in behalf of Austria's plea for a separate peace. On 29 October an Austrian flag of truce party had approached the Italians in the Adige Valley, but as it could show no proper credentials it was sent back. Next day another white flag arrived with General von Weber and seven other plenipotentiaries. The terms of an armistice were presented by General Badoglio on 5 November; these were promptly accepted and on Monday, 4 Nov. 1918, hostilities ceased between Austria and Italy. The victory was decisive and overwhelming; Austria collapsed under military and internal pressure just as her ally followed a week later. Of all the Allies' enemies Germany alone remained, and the Germans were compelled to hoist the white flag. At the close of the war it was revealed that Italy had mobilized 5,000,000 men out of a population of 35,000,000; she had lost nearly 470,000 killed and close to 1,000,000 wounded, the army being crippled for life. Besides fighting her own battles with comparatively little material help from her Allies, Italy sent 250,000 men to the French front, where they held part of the line between
Rheims and Chateau-Thierry. Since early 1917 Italy kept 100,000 men over military age building roads in France. An Italian brigade also co-operated with the British forces in Mesopotamia under General Allenby from the spring of 1917. During the last year of the war Italy had youths of 19 in the fighting line; early in 1918 boys of 18 and 17 had been called up and enrolled for the army and navy. Austro-Germans holding the invaded provinces of Italy said Crete was devastated and industrial plants, causing a loss of over $57,000,000. While the Italian navy had no opportunity to fight any great sea battle, it performed an enormous service to the Allied cause and displayed brilliant examples of individual valor. On 9 June 1917 Commander Luigi Rizzo with two small torpedo boats forced his way by night into the port of Trieste after cutting the big steel hawsers at its entrance, sank the battleship Wien, damaged the Budapest and got safely away. On 9 June 1918 Rizzo performed an amazing feat of audacity in attacking two Austrian dreadnoughts and three destroyers with two submarine chasers off Fremuda, an island bordering the German coast. In the gray dawn he slipped through between the destroyers and sank the 20,000 ton dreadnought Szent Istvan, badly damaged the other dreadnought and got away again in 20 minutes. The enemy squadron was making for the Italian shore when the unexpected meeting occurred. In the early hours of 14 May 1918 Lieut.-Commander Mario Pellegrini led a raiding party escorted by destroyers into the strongly-fortified Austrian military port of Pola, eluding the observation of the scouts and searchlights. Here lay Austria’s fleet of battleships, cruisers and destroyers, fenced off by a chain of mines and a heavy steel net from bank to bank, and encircled by a terrace of land-batteries. After penetrating these obstacles, Pellegrini torpedoed a super-dreadnought, sank his own boat, as arranged beforehand, and with his comrades swam ashore to be taken prisoners. On 1 Nov. 1918 Commander Rossetti and one companion entered a naval winner and sank the Austrian super-dreadnought Viribus Unitis, then already in the hands of the Jugo-Slavs, who had seized the Austrian fleet in that harbor a few days previously, and now protested strongly against the battleship being destroyed. That vessel had carried the Archduke Francis Ferdinand to the Dalmatian Coast on the way to his death at Sarajevo and had conveyed the bodies of himself and his wife back to Trieste. In all the sea and land engagements the Italian aviators—of whom one of the most daring was D’Annunzio, the soldier-poet—played a conspicuous rôle with a courage excelled by none of the belligerents. The mercantile marine, also, kept the flag of Italy flying over submarine and mine-infested waters, transporting the necessary war material and troops without which victory would have been impossible. The terms of the armistice laid Austria-Hungary open to the Allies for military operations; all the outworks of the Teutonic League had fallen; the central keep of Germany alone remained, and that, too, was destined soon to fall.

In February 1919 the Italian delegates presented their report to the Peace Conference a statement of Italy’s naval losses in the war. This consisted of eight capital ships, eight submarines, and 25 smaller craft. The Italian merchant marine lost 880,000 tons of shipping, or 57.5 per cent of its total tonnage.

8. COLONIAL AND JAPANESE CAMPAIGNS

Africa.—At the outbreak of war the colonial possessions of Germany in Africa and the Pacific covered an area of considerably over 1,000,000 square miles, with a total population of about 15,000,000, of whom some 25,000 only were whites and the rest natives or aborigines. The defense forces were composed of roughly 5,000 German and 4,000 regular native troops. In Africa the colonies were German East Africa, German South-West Africa, Togoland and the Cameroons (Kamerun); in Asia, Kiao-chau or Tsing-tau, a protectorate in the Chinese province of Shantung; in the Pacific, the Bismarck Archipelago, Samoa Islands, Kaiser Wilhelm’s Land (New Guinea), the Caroline, Marshall, Solomon, Marianne and Pelew Islands. Although these colonies would have become automatically cut off in case of the British blockade of the North Sea, it was essential to the Entente Allies that they should be occupied as soon as possible because of the assistance they could otherwise render with their wireless stations, coaling depots and other establishments to the German warships—von Spee’s China squadron and the commerce raiders outside of European waters. The Goeben and Breslau were in the Mediterranean; three German light cruisers, the Brummer, Dresden and Karlsruhe were known to be in the Atlantic and a fourth, the Königsberg, was stationed off East Africa with her base at Dar-es-Salam, while von Spee with five cruisers had left Kiaochow before war was declared. A few gunboats, of little fighting value, were stationed on the West Coast of Africa and one in Australasian waters—the Geier.

Togoland.—The first Allied blow against German colonies was struck on 8 Aug. 1914, when a British cruiser captured Lome, the capital of Togoland, without firing a shot. The German forces fell back 100 miles inland to Atakpame. French and British territory enveloped the colony—about the size of Ireland—on three sides, and the coastline was open to naval attack. Defense was obviously impossible. Captain Bryant crossed the western frontier with the Gold Coast Regiment and a French force entered the colony from the other side—Dahomey. In two days the whole of Southern Togoland fell to the Allies; on 27 August the government station at Atakpame was taken with very few casualties. The wireless installation was destroyed and the Germans surrendered. A Franco-British administration was set up, and in a few weeks normal peace conditions prevailed again.

Cameroons.—The Cameroons presented greater difficulties owing to the wider area involved and lack of communications. Hemmed in between French West Africa and Nigeria, the colony was entered from the French Kongo and by British columns from the Nigerian frontier about 25 Aug. 1914. One of the latter, a mounted infantry detachment of the West African Frontier Force under Lieutenant-Colonel Macleay, reached the Benue River and seized a German post. Advancing to the
river station of Garua, they attacked the forts on 29 August, captured one fort, but were driven back next day across the frontier by a violent German counterattack, in which a well-directed machine-gun fire killed several British officers, including Maclean, and accounted for 40 per cent of the native troops. Two other British detachments that crossed the frontier also met with disaster. At the end of August one of them occupied the German station of Nsanka-kong and the other had taken Archibong. Early in September the Germans made a determined attack on the positions and compelled the invaders to retreat. Their ammunition being exhausted, the British garrison fought their way through by bayonet charges and regained Nigerian territory with heavy losses. The complete failure of the land attack is attributable to inadequate preparation, topographical ignorance and the rainy season then in progress. A joint naval and military operation was now begun from the mouth of the Cameroon River. A Franco-British force was conveyed by the cruiser Cumberland, the French cruiser Béa and the gunboat Dwarf. On 16 September the Germans attempted to wreck the Dwarf by an inferior machine; on 16 September the German merchantman Nachtigall tried to ram the gunboat, but was herself wrecked with a loss of 36 men. Another attempt, made a few days later with spar torpedoes, likewise miscarried. The Germans having sunk some steamers to block the passage to the port of Duala, several days were spent by the Allies in clearing wreckages and mines. On 27th they reached Duala, and a short bombardment resulted in an unconditional surrender. The neighboring coast town of Bonaberi also surrendered to Brigadier-General Dobell, and the Cumberland took possession of nine merchant ships of the Hamburg-America and German lines, containing general and homeward cargoes and considerable quantities of coal. These vessels, together with the German gunboat Soden, were added to the British navy. Meanwhile a French force had arrived by sea from Libreville in the French Congo. Under cover of a French cruiser they attacked Ukoko on Corisco Bay, sank two armed vessels and completed the conquest of the coast. The Germans retreated inland by rail and along the Wuri Valley, making a stand at Japoma, the terminus, and Jabassi, on the Wuri. Fighting stubbornly, they were pushed back from Japoma by a French column on 8 October and from Jabassi by the British—on a second attempt. From this stage the Germans were reduced to a desultory defensive. Columns of French Colonial infantry under Colonel Mayer and British troops under Dobell moved along the two railroads leading to the interior. Dense forests through which they passed concealed enemy snipers; they reached Edea, 50 miles from Duala, and occupied the town on 26 October, the Germans falling back on Yaunde. They returned later, however, and made a desperate effort to recapture Edea. During November the German capital, Buéa, and its seaport Victoria were taken by the Allies; in December they had gained the whole of the northern line, including Nkongsamba and Bare. Skirmishing continued on the frontiers; a British force crossed from Nigeria and occupied Ossingde, where the surrounding French columns entered from the Tchad region in the north; French and Belgians intruded from south and east, and gradually a wide circle was formed around the defenders. The campaign developed slowly; swamps, forests and tropical heat impeded operations and the Allies had occasional difficulties with hostile tribes of natives. The siege conditions then prevailing in Europe were here reproduced in miniature. The Germans held on during the whole of 1915; they lost Esska in May, Ngaundere, Lome and Garua in June, by which time there were nearly 10,000 Allied troops in the colony engaged in rounding up the enemy, whose force consisted of about 4,000, scattered over a country half as large again as the German empire and perfectly adapted for guerrilla warfare. Broad, deep rivers, rocky heights and elephant grass up to 20 feet high, provided ideal defenses and cover. To guard their lines of communications the Allies had to establish 4,600 posts and garrison them. After the fall of Duala in September 1914 the seat of the German government was transferred to Yaunde, about 120 miles inland. In March 1915 the Allies began a concerted move on Yaunde. Their widely scattered columns were checked by topographical conditions and frequent digressions necessary to clear adjacent regions. The rainy season intervened and operations were held up until October. Meanwhile General Cunliffe had reduced the German stronghold on the mountain Mora, 1,700 feet high, which had failed. The main advance on Yaunde began 9 October. After severe jungle fighting over a wide area the Allied columns closed in on the Germans and entered Yaunde on 1 Jan. 1916. After marching and fighting apart for 17 months those columns converged on their objective within a few days of one another. The bulk of the German forces then escaped into Spanish Guinea; the garrison on Mora surrendered on the offer of generous terms 18 Feb. 1916. The conquest of the country was complete; the white prisoners of war were sent to England and the attempt to reconstitute the army was a failure.

German South-West Africa.—This great territory of about 322,000 square miles had a population of about 15,000 whites and some 100,000 natives, chiefly Hottentots, Bushmen and Bantus, when the war broke out. Its southern frontier bordered on Cape Colony and the government of the Union of South Africa immediately undertook to defend its borders with its own troops. The declaration of war by Great Britain against Germany revived the smoldering disaffection among a remnant of the Boer ir-recognizable and culminated in the Beyers Rebellion (q.v.). About 10 Aug. 1914 the Germans abandoned their two principal stations on the coast, Lüderitz Bay and Swakopmund, and retired to the inland capital, Windhoek, 200 miles from the coast, carrying with them all military stores. By the end of August they had made small incursions into British territory bordering with the farmers over the border. On 8 Sept. 1914 the premier of the Union, General Botha, announced in the Cape Parliament that

* This is a well-known method: a torpedo is fixed on a raft made of spar and towed in the dark to the ship, where it is attached. Naturally this can only be done in the case of the ship being at anchor or in a harbor. The torpedo is fired either by electric wire or an automatic time clock.
the government had decided to carry the war into German territory. A majority in both Houses supported the proposal. Fighting on a small scale developed in the southeastern angle of German Southwest Africa. The German town of Rundu was captured at Raman’s Drift on 15 September, and on the 18th an expedition arrived by sea and raised the British flag over the town hall of Lüderitz Bay. General Botha called for 12,000 troops. In an action fought at Sandfontein, in the desert between Raman’s Drift and Warmbad, on 26 September, a detachment of 200 British troops compelled to surrender after their ammunition had given out. The incident raised considerable suspicion owing to the appearance of treachery that surrounded it. General Botha found reason to suspect the loyalty of Lieut.-Col. S. G. Maritz, then in command of a Union force in the northwest. He had fought with the Boers in the South African War, 1899–1902, and had later assisted the Germans against Morenga in the Herrera campaign. Botha sent Colonel Brits to relieve Maritz of his command. The latter replied with an ultimatum and a threat to the Union of South Africa. (8 Oct. 1914.) Maritz boasted that he had ample guns, rifles, ammunition and money from the Germans and that he would overrun the whole of South Africa. In addition to his own rebel commands he had a force of Germans under him, and held the rank of a German general. He had also signed an agreement with Dr. Seitz, governor of German South-West Africa, guaranteeing the independence of the Union as a republic and ceding Walvis Bay and other portions of the Union to Germany. A widespread conspiracy revealed itself, implicating a number of Boer leaders with a considerable following. Martial law was immediately declared throughout the Union and the government took energetic steps to suppress the rebellion. By the close of the year Botha had taken 7,000 rebel prisoners; their leaders were killed, captured and scattered. On 25 Jan. and 3 Feb. 1915 the last rebel commandos surrendered and the campaign in German South-West Africa was vigorously resumed under the command of General Botha. A feature of the campaign was the attitude of the natives, all tribes uniting with an eager desire to help the Union troops against the Germans, who were not permitted to join in the fighting, but they were employed as scouts and transport drivers.

In January 1915 the British occupied Swakopmund, the terminus of the line to Windhoek and of that running to Grootfontein and Tsumab. They also held Lüderitz Bay, whence another line runs to Windhoek by way of Keetmanshoop and gained control of the Orange River to the south. General Botha’s army consisted of about 30,000 men, composed of South African Mounted Rifles, Transvaal Horse Artillery, Durban Light Infantry, Kaffrarian Rifles, Imperial Light Horse, Bechuanaland Rifles, Enslin’s Horse, Diamond Field Horse, South African Railway Engineers, South African Motor Corps, Queenstown Rifles, Natal Police, Natal Carabiniers, Zululand Mounted Rifles, Pretoria Regiment and some of the Transvaal Scottish. More than half were mounted troops, the remainder being uniformed especially the Boer commandos. The principal difficulty before them was that of transport. The theatre of operations was a dreary, waterless desert. All stores and much of the water had to be brought from Cape Town and conveyed into the interior by ox-carts, automobiles or by a sea-route of 500 to 700 miles. Inland, even water for man and beast, while the temperature was from 100° to 113° in the shade. Large gangs of natives were employed day and night shovelling the drifting sand from the railroad tracks.

In dividing his forces into two main armies, General Botha took command of the northern group and started 22 Feb. 1915 from Swakopmund along the railroad toward Windhoek. Little progress was made during the first month, most of the time being spent in reconnoitring the strength and whereabouts of the enemy. The southern group, under General Smuts, operated in three separate columns, one from Lüderitz Bay on the west, one from the Cape frontier on the south, and the other from Kimberley across the Bechuanaeland frontier on the east. The plan of campaign was to conduct an enveloping movement against Windhoek along the two railroads. Owing to the desert nature of the ground the enemy could maintain a defensive if once dislodged from those lines. Sweeping the scattered German forces before them, the southern columns effected a junction at Keetmanshoop in April and began a united movement northward. Meanwhile Botha, in the north, had fought his way on to Windhoek and occupied the place, which surrendered with 3,000 whites and 12,000 natives. The German forces, however, had retired northward to Otavi, the junction for Tsumab and Grootfontein. Botha marched Otavi by forced marches on 1 July 1915. Here the Germans made their last serious stand. Cut off from further retreat by a flying column under General Brits, the Germans surrendered unconditionally on 9 July 1915 with 204 officers, 3,293 of other ranks, 37 field guns and 22 machine-guns. About 1,500 Germans were already in British hands. On 15 July the rest of the Germans had surrendered and the Union of South Africa undertook the administration of the territory.

**German East Africa.**—This, the greatest and richest of Germany’s colonies, was about twice the size of the German Empire in Europe. It contained a population of 8,000,000, including about 5,500 whites. It was bounded on the north by British East Africa and the Victoria Nyanza; on the west by the Belgian Congo and Lake Tanganyika; on the southwest again by British territory and Lake Nyasa; on the south by Portuguese Mozambique and on the east by a coastline of 600 miles on the Indian Ocean. The principal seaports were Dar-es-Salam (the capital), Bagamoyo, Saadani, Kilwa, Mkindani, Tanga and Pangani. The two railroads—the strategic Usambara line, from Tanga to New Moshi (220 miles) and the Central, from the capital to Ujiji (780 miles), were completed in 1912 and 1914 respectively, and were intended to be connected with the Cape to Cairo route. A network of good roads spread through the whole territory. The military and police force consisted of about 3,000 natives and 300 Germans, well organized and equipped. At the outbreak of war a number of German reservists were brought from the east and rendezvoused at Dar-es-Salam. With these and with recruits taken from residents and native tribes, the German
fighting force in the colony was raised to some 3,000 whites and 5,000 natives. The British strength in the new colonies was almost negligible. The King's African Rifles scattered in British East Africa and Uganda numbered barely 1,000; and in northeast Rhodesia and Nyasaland only small bodies of police and a few Mounted Rifles were available. Particularly vulnerable to hostile attack were the 584 miles of the Uganda Railway, in parts only 50 miles from the German frontier.

Hostilities began on 13 Aug., 1914, when the British cruisers Astraea and Pegras made an attack on Dar-es-Salam and landed parties which destroyed the wireless station, the gunboat Morwe and the floating dock. At the same time a British steamer on Lake Nyasa captured the German steamer Von Wittmann with captain and crew. Some days later the Germans attacked Karonga, a British port on that lake, bringing 400 men against a garrison of 50, but reinforcements arrived and the Germans were thrown back over the frontier. They next attacked Abercorn on Lake Tanganjika, but were beaten off by a detachment of Rhodopian police. Skirmishing continued along the southern border while the Germans prepared for their main stroke—the invasion of British East Africa. They seized a small frontier post at Taveta and another at Vanga on the coast during the latter part of August. Meanwhile, the British were collecting all available strength to protect the Uganda Railway. White colonials, Arabs, Indians and Somalis were hurriedly recruited and deployed. Reinforcements from India arrived at Nairobi on 3 Sept. 1914 under Brig.-Gen. J. M. Stewart, who took supreme command. He came in the nick of time, for the Germans had set out to wreck the line at Maunzi. A force of 600 Germans advanced along the Tsavo River, making for the bridge, but were driven back after a two-days' engagement. On 10 Sept. 1914 the Germans crossed the frontier close to the Victoria Nyasa, distant 12 miles from Kihihi, but they were dislodged on the 12th and retired to Karungu, a British post on the lake. Two British steamers forced them back over the border and sank two German dhows. A German force was massed along the seacoast under cover of the cruiser Königsberg to attack Mombasa. A small British force halted them at Gazi for several days until Indian troops arrived on 2 Oct. 1914, and Mombasa was saved.

The German offensive slackened during October; the defenders held the line and awaited the arrival of another expeditionary force from India, which reached the coast on 1 November, under Major-General Atien. With two gunboats this force anchored off Tanga, the German post, and demanded its surrender. The Germans temporized for a day while strengthening their position and collecting further troops. In the evening some British troops were landed, but their advance was stopped. More men were landed next day (4 November) and a general attack opened. They reached Tanga, but were driven back to their ships under a fierce fire, losing nearly 800 men. Inland, an advance inland by the enemy north of Kilimanjaro also failed, though the Germans evacuated the fort on 17 November. A German force broke into Uganda on the 20th and compelled the garrison of Kyaka Fort to retire. Outpost skirmishes continued through December, and in the middle of January 1915 the British garrison of 400 miles inside German territory, was compelled to surrender after a desperate defense. The British withdrew from German territory, but Germans still remained on British ground. On 6 Jan. 1915 the British occupied the island of Mafia and on 28 February blacked off the coast. In June an expeditionary force under General Stewart was sent to attack the German base at the port of Bukoba, on the west of Victoria Nyanza. In less than a week the place was destroyed with its boats and wireless installation and the enemy defeated, with most of his artillery and rifles captured. In July the Königsberg was destroyed in the Rufiji River, where she had lain for eight months. (See War, European—Naval Operations). During the rest of the year indecisive fighting raged on land and the great lakes.

During 1916 nearly the whole of German East Africa was conquered under the command of General Smuts, who succeeded General Smith-Dorrien in February. The enemy strength was now estimated at 16,000, of whom 2,000 were whites and the others natives. They still held stretches of British territory and had established a large entrenched camp at Taveta along the Uganda Railway and were drawing their supplies from their own rail-head at Moshi. General Smuts decided to recapture this territory before the rainy season. Starting from Mombasa one column advanced along the Uganda Railway, while another column made a flanking operation from Longido, northeast of Kilimanjaro, their objective being the important post on the German railway to Moshi. A turning movement by a detached troop under General Van Deventer forced the Germans to evacuate Taveta 9 March. Four days later the British were over the border and had seized Moshi, where the two columns joined forces and pressed the enemy out of the Kilimanjaro region. The war was now carried into the enemy's country. One German station after another fell into British hands until at last Tanga, the terminus on the coast, was captured on 14 Nov. 1916. Dar-es-Salam, which had been strongly fortified and equipped with the naval guns taken from the Königsberg, surrendered on 4 Sept. 1916. While General Smuts was sweeping the colony from the north, the Portuguese and Belgians operated from their own territories, south and east. The Belgians captured Ujiji on 3 August. Though the Germans had lost all their important positions their power of resistance was not broken. A strong remnant of their fighting forces was still at large. Throughout the year 1917 they conducted a harassing guerrilla warfare in the south and southeast of the colony. The rounding-up process was extremely difficult for the British, as the Germans had well learned the art of bush-fighting. On 1 Dec. 1917 General Van Deventer reported that the German commander, von Lettow-Vorbeck, had crossed the Rovuma into Portuguese East Africa and that the British garrison at Jassim, 20 miles south of Great Britain, was clear of the enemy. In the summer of 1918, however, they were still skirmishing in the neighborhood of Lake Nyasa, and not until 25 Nov. 1918, two weeks after the
WAR, EUROPEAN — TURKISH CAMPAIGNS (9)

German losses have not been announced. The strength of the Japanese and British forces was 22,980 and 1,500 respectively. It was officially stated that Japan would administer the territory of Kiaochow until the end of the war and then open negotiations with China.

Other German Colonies.—Germany possessed about 100,000 square miles of territory in the Pacific, mostly in New Guinea, where the possessions were officially known as Kaiser Wilhelm’s Land, situated in the northern part of the southeastern section of the island, altogether about 70,000 square miles, containing a population of some 500,000, of whom 300 were Germans. A large number of islands around the coast were included, the Bismarck Archipelago, New Pomerania, New Mecklenburg, New Lauenburg, Admiralty Island and New Hanover, with 200,000 natives and 300 Chinese and Germans. The Solomon Islands, to the east, were part German at one time, and north of New Guinea lay the Carolines, the Pelew and the Marianne or Ladrones Islands, bought from Spain in 1899. Samoa, the other German South Sea possession, contained about 500 Europeans, British and Germans chiefly, some 1,500 Chinese and a native population of about 15,000. The Australian squadron and the British China squadron patrolled the Pacific hunting for German cruisers. An expeditionary force of about 1,500 men sailed from Wellington, New Zealand, on 15 Aug. 1914, escorted by the battle cruisers Australia and Melbourne and the French cruiser Montcalm, arrived at Apia, Samoa, 28 August and took possession of the German islands without opposition. The German officials were left at their posts. On 11 Sept, 1914 a British force arrived at New Pomerania, where some German troops were concentrated. After a short fight they surrendered; two days later the Solomon Islands were surrender. Kaiser Wilhelm’s Land capitulated and a British garrison was sent to take possession. By the end of September the Pacific possessions of Germany had nearly all fallen. In November the Japanese took the Marshall Islands and the other northern group and handed them over to Australia. See WAR, EUROPEAN—NAVAL OPERATIONS.

By the terms of the Treaty of Versailles, Germany was deprived of all her colonies. France and Great Britain were instructed to make joint recommendations as to the future of Tangoland and Cameroon. Mandates for the rest of the colonies were apportioned as follows: For German East Africa, Great Britain; South-west Africa, the Union of South Africa (British); Samoan Islands, Australia; the German Pacific possessions north of the Equator (Marshall, Pelew, Caroline and Ladrones groups), Japan; those south of the Equator were placed in mandatory control of Australia, excepting Samoa (already mentioned) and Nauru, which latter was placed under the British Empire.

9. TURKISH CAMPAIGNS. Mesopotamia and Syria.—Turkish politics underwent a profound change after the disappearance of Abdul Hamid II in 1909. In his relations with Europe that monarch displayed

VOL. 28 — 26
a suppleness and tact which no statesman of his time ever managed to overcome. The Turks gained their footing by the sword, and by the sword they would not be made to relinquish an inch of it against their will. Knowing perfectly and to a nicety the aims and rivalries of the western powers, Abdul Hamid played one against the other with consummate skill and kept at bay the urgent and persistent demands of Europe for reforms and the supervision of them. At the commencement of his reign Abdul Hamid utilized England to keep Russia out of Constantinople and to withstand her demands at Berlin. Later on he leaned on the Triple Alliance until it began to crack, and then again he turned to Russia as soon as there were signs of a dual combination between her and France. Still later he used German extortions against British sentiment and Russian diplomacy against German encroachment, and vice versa as occasion arose. But for years before his downfall, German infiltration had gradually undermined the uneasy autocracy which he had so laboriously built up; the leading lights of the "Young Turk" party, young in their ideas rather than years, were instantly taken under German patronage as soon as their revolution had been crowned with success. The next sultan, Mohammed V., became a mere figure-head in the hands of Enver Pasha, a personal friend of the kaiser, and what may be literally described as the "bonds" between Turkey and Germany became closer than ever. Germany could not avert the defeat of the Turks in the Balkan War because to appear openly in the conflict would have precipitated a European war, and she was not yet ready for that. The effects of the German penetration now became apparent. The strength of Turkey had been so weakened by that struggle that she could no longer stand alone, hence Germany controlled her army, managed her finances, railroads and even her government. Turkey was an essential wheel in the German machine for the realization of a great plan. We have it on the authority of the Greek minister in Berlin that the kaiser told him, on 4 Aug. 1914, the day Germany declared war on Turkey, that an alliance had been concluded between Germany, Turkey and Bulgaria. If, thereafter, Turkish officialdom entertained any misgivings about entering the war on the side of the Central Powers, such anxiety was forcibly removed by the demonstration made in the Bosphorus on the arrival there of the Goeben and Breslau. The German military mission in Constantinople took charge. The sultan, "*a* quiet, easy-going, gentlemanly old man," as United States Ambassador Morganthau described him, was entirely under the domination of Enver and Talat Bey, and those two were pro-German to the core. The training by von der Goltz and Liman von Sanders had turned the Turkish soldier into an incomplete German that training had brought nothing more than defeat in 1912-13 against the Balkan League, and it is little to be wondered at that many Turkish officers and the more intelligent class of *Old Turks* had little relish for the additional demands and leading the bombardment of Russian Black Sea towns (30 Oct. 1914) by the two German warships flying the Turkish flag led the Allies to declare war on Turkey 5 Nov. 1914. See Turkey and the War; War, European — Historical Introduction and Diplomatic History.

At the time of its entry into the war the Turkish Empire had an area of 710,000 square miles and a population of about 30,000,000. As a result of the Balkan Wars (q.v.) Turkish possessions in Europe had been reduced from 63,350 square miles to 10,450 square miles, and the population therein from 6,130,200 to 1,890-100. In Asia Minor Turkey had 193,540 square miles and a population of 9,090,000; in Armenia and Kurdistan, 72,000 square miles, population, 2,500,000; in Mesopotamia, 143,250 square miles, population, 1,400,000; in Syria, 114,530 square miles, population, 2,890,000; in Arabia, 170,300 square miles, population, 1,050,000.

The peace strength of the Turkish army was about 17,000 officers and 250,000 men, which could be raised to something like 80,000 if necessary. The necessary could be paid. The soldier's pay was 25 cents a month and their families received an allowance of $1.20 per month. Enver Pasha was made commander-in-chief and the German military mission under Liman von Sanders consternation staff. During the mobilization a process of requisitioning was resorted to under government auspices, which consisted of officials entering stores and dwellings and seizing anything that captivated their fancy, giving in return some worthless paper receipts. Much of the stuff thus collected was sold again and stolen by officials. A few of those plundered who had influence enough were fortunate in receiving at least a percentage of the value of their goods; by far the bulk — or its proceeds — went into official pockets, while the government appropriated the remainder. Ostensibly for military purposes, the officers *even carried off women's silk stockings, corsets and baby slippers* (Ambassador Morganthau). In the 15 divisions of the regular Turkish army and war strength there were some 300,000 men of all arms; this number was to be augmented by 10 more divisions. Though orders were later issued to raise the total to 50 divisions, it is doubtful if the Turkish army had more than 500,000 men in the field at any time during the war.

Her geographical position prevented Turkey from being of any direct assistance to Germany, for the interests of the latter lay in Europe. Bulgaria, Greece and Rumania were still at peace, hence there could be no attempt on the part of Turkey to regain possession of Thrace. Consequently, there was no room for an offensive in Europe nor any need of a defensive. It being also neutral at the time, a descent upon Tripoli was equally out of the question. But Turkey was in a position to strike a useful blow against Russia in Transcaucasia which would divert troops from the Eastern Front, and against Great Britain in the Sinai Peninsula in an attack on the Suez Canal. This latter move, it was expected, would precipitate the long-fomented uprising of the Egyptians and compel England to keep in Egypt the troops which were there in training — Australians and Indians — and also, perhaps, to send further reinforcements from her slender reserve at home. The attempt, if successful, would cut the short route to India and might
help along the uprising expected in that direction. Thus practically all that Turkey had to fear in the way of an attack was in the Dar- danelles. As the Kaiser knew, but were strongly fortified by heavy Krupp and Austrian Skum guns. But already in September 1914 the British government in India knew that Turkish agitators were at work on the northwest frontier preaching a jihad or holy war against the white infidels. Hence neither England nor Russia was taken by surprise when Turkey was swept into the maelstrom of war. The Turkish—or rather German—plan was to strike against the Russians in the Caucasus and cut oil access to the oilfields; to send an expedition to Egypt; and to seize Basra near the head of the Persian Gulf, where the works and pipelines of the Anglo-Persian Oil Company—the liquid fuel store of the British navy were situated. This oil concern, it may be mentioned, was formed in 1909 with the object of working a concession granted in 1901 to a Mr. W. K. D'Arcy for 60 years, with the exclusive rights to work petroleum deposits throughout the Persian Empire on the proviso that his service be extended to Persia, Ghilan, Mazendaran, Asdrabad and Khurasan. In 1914, before the war, the British government had contracted with the company for the supply of oil-fuel for the navy. The total share of oil was estimated at $15,000,000, and this sum the government subscribed $11,000,000, thus controlling the majority of votes in the company.

The element of surprise, from which the Turks and their allies hoped so much, proved a failure, for already on 2 November a British warship attacked Akaba, at the head of the Red Sea, and a combined French and British squadron bombarded the Dardanelles forts, which latter was not only a fruitless proceeding, but also served to put the Turks on their guard. Meanwhile, even before the declaration of war, two other items of preparedness for what they knew was coming had been brought about by Russia and Great Britain. A Russian column had crossed the Turkish frontier from the extreme northwestern corner near 100,000 strong, and another had entered Kurdistan from the east in a movement upon Van. Yet more Russian troops were crossing the frontier from Erivan; they took the town of Merv on 19 November, and 20 December, and on 21 December, the Turks had dispatched troops southward from Bagdad to prevent a hostile landing on the gulf; by a forced march these had reached Basra about the same day that the British were driven out of it. The entrance to the Gulf was guarded by the Turks from penetrating farther into the country. The British were likewise ready in the Persian Gulf. The government of India had sent a force to Bahrain Island in the gulf under Brigadier-General Delamain, and on 7 Nov. 1914 this force, composed of British and Indian troops, arrived at Fao, where a Turkish fort defended the entrance of the Shatt-el-Arab, the estuary which unites the Tigris and Euphrates. Between those two rivers lies the land of Mesopotamia. At the end of September the Turks had dispatched troops southward from Bagdad to prevent a hostile landing on the gulf; by a forced march these had reached Basra about the same day that the British were driven out of it. The entrance to the Gulf was guarded by the Turks from penetrating farther into the country. Here the British prepared an entrenched camp and waited for the rest of the force to arrive. A skirmish with the enemy occurred on 13th November; on the 13th General Barrett came up with the remainder of the Indian contingent. The main Turkish army was reported on the 17th to be advancing in force from Basra, when General Barrett decided to attack at once, a particular incentive being the fact that there were Europeans in Basra whose lives might depend on the timely arrival of the British. Accordingly, the whole force moved out and reached Sahain, which was found to be deserted. British gunboats accompanied the expedition, steaming slowly up the Shatt-el-Arab on the right of the marching troops. After passing Mohmerahar, where the Karun also empties itself into the estuary, though from the opposite side, the Turkish army was found posted at Sabul, nine miles from Sahain, with its left resting on the estuary and its right, where the artillery was concentrated, hidden in groves of date palms. Muddy open ground lay between the opposing forces. The weight of the British attack was thrown against the Turkish left, where the gunboats were able to assist by enfilading the enemy's trenches; the right was to be held while the left was turned away from the river and into the open. The British troops had to advance in the open before a heavy fire which was badly directed and caused little harm. Before the attackers could reach the front line the Turks broke and fled, with 5,000 men and 1,000 wounded. The British casualties were only 38 killed and some 350 wounded, while the Turks in their retreat lost over 1,000 men. The road to Basra now lay open. Part of the British force was placed on two river steamers headed for Basra, with gunboats steaming ahead. The rest of the troops were sent after the flying Turks so far as the difficult ground permitted. Below Basra the Turks had sunk three steamers in the fairway to prevent the passage of the oncoming British. A Turkish battery posted to cover the barrier was quickly silenced and the obstructions speciously blown out of the water. The expedition, both on land and water, pushed rapidly ahead and entered Basra, which the Turks had evacuated, on 22 Nov. 1914. The desert column entered shortly after. The Turkish customs-house had been set on fire, the only building in the place which would have been capable of holding the military stores. So far, however, as lack of materials permitted, a bazaar was held, and set in order. On 3 December an Anglo-Indian detachment was sent to Kurna, where part of the retreating Turks had established themselves. Three gunboats, two armed launches and an armed yacht convoyed the troops, who were put ashore four miles below Kurna, on the western bank of the Tigris, while the gunboats went ahead to reconnoitre. They found the enemy strongly posted with batteries covering the navigable channel, some 90 miles above Kurna and the troops advanced under heavy fire. Colonel Frazer, who commanded, finally led his men back to the camp four miles away and sent a message to Basra for reinforcements, reporting the enemy too strongly situated. General Fry arrived with more troops and on 7 December the British captured Mezera, on the opposite bank, and drove the Turks across to Kurna. Next day a rear attack on Kurna was made by the British; the town had reached north of the city and prepared to attack. The same night, however, before the
battle had even begun, the Turks asked for terms. Unconditional surrender was demanded, and the terms were (9 November). A Turkish garrison laid down its arms. The British took 1,500 men and nine guns. The advance to this stage had covered 120 miles from the gulf; Kurna and Mezera, respectively on the western and eastern banks of the Tigris, were conquered into enroled ramparts. A wide region had now to be protected and General Barret had to perform to mark time until further reinforcements — then on the way — should arrive from India. The first Turco-German project had failed.

In the neighborhood of Mount Ararat the frontiers of Russia, Turkey, Persia and Persia meet. Here the limits of Persia form a salient stretching into Transcaucasia, a corner which has frequently been the scene of Russo-Turkish conflicts. The Cossak operations in this region during November 1914, already referred to, died away toward the early part of January 1915. Meanwhile, a greater struggle had developed in Transcaucasia and on the Armenian front. The reinforced Turkish army corps had been concentrated at Erzerum during October 1914 under the command of Hassan Izzet Pasha. On the outbreak of hostilities Enver Pasha, accompanied by a German staff, took charge of the operations. He had altogether about 150,000 men; opposed to these was a Russian army under General Vorontsov composed of about 100,000 men. A weird conglomeration of races, creeds and languages exists in Caucasus, where some 70 dialects are current and where Turk and Russ had been at grips for centuries; indeed it is doubtful if that region ever enjoyed any long spell of peace since Noah's ark settled on Ararat. To reach the theatre of war the Russians had to traverse difficult mountains, passes and river beds. The movement now to be described was — to Russia — rather a secondary operation; prudence advised a defensive until the severe winter was over. This, however, was not the plan of Enver Pasha, who had formulated an ambitious and skillful campaign to be carried out at once. The great fortresses of Kars and Erzerum, situated about 50 miles on each side of the frontier and consequently 100 miles apart, were the concentration bases respectively of Russian and Turkish in Asia. Enver Pasha's plan was to entice the Russians over the boundary from Sarikamish and to hold them while his left centre executed a wide enveloping movement against Sarikamish, and his left made a circuit to attack Kars in the rear, a form of strategy based on the slogan popularized by Napoleon. The success of such a movement, however, depended entirely on an accurate timetable, according to which the participating bodies of troops could arrive at their specified objectives at the correct moment. Considering that the Turks would have to perform the evolutions across such obstacles as snow-clad mountains, through passes and over rivers, the chances of the scheme working satisfactorily were remote. The Russians fulfilled the first part of the Turco-German expectations during the first half of November 1914 by crossing the frontier from the neighborhood of Sarikamish and occupying Koprikeui on the 20th. They were thus well on the road to Erzerum. The

11th Turkish corps was detached to do the "holding" part; the 10th corps was sent from north of Koppieiu to the road between Sarikamish and Kars; the 9th corps was to swing round between the 10th and 11th; while the 1st corps, which had been landed at Trebizond on the Black Sea, was to strike at Ardban and move on Kars via Alexandropol.

So far so good. On 9th December the Turks attacked on 14 Dec. 1914. Koprikeiu was cleared of the Russians, who were driven back some 10 miles to Khorasan; the 9th and 10th corps had struggled through severe weather and reached the road between Sarikamish and Kars by Christmas Day; the 1st corps had struck inland up the Choruk Valley across a pass 8,000 feet high during a blizzard and now looked down upon Ardban. But the hardships endured by the three traveling corps had worn them out, and when they reached at their appointed destinations they were half starved and short of guns and ammunition. General Vorontsov fell upon the 10th corps (28 December) and defeated it in a fierce four days' battle, which annihilated the 9th corps and almost annihilated it; the Turkish general, Iskan Pasha, surrendered with his staff (including German officers) after a gallant resistance. Duly, according to schedule, the 1st corps entered Ardban on 1 Jan. 1915 exhausted. Two days later they were driven out again back to the Choruk Valley, in which direction the remnants of the flying 10th corps were also speeding. Meanwhile the 11th corps drove the Russians back from Khorasan and Vorontsov was obliged to recall his troops pursuing the 10th corps and throw them into battle against the 11th. This latter was also crushed after a three days' fight in deep snow, and by 17 Jan. 1915 it was retreating to Erzerum. The Russian right cleared the Choruk Valley; Turkish transports escorted by warships attempting to land troops and provisions at Trebizond were sunk by a Russian Black Sea squadron and the warships, Breslaw and Hamadeh, were chased back to the Bosporus. Thus ended the Turkish project in failure after three weeks of heroic struggle amid high mountains and deep snowdrifts, with a loss estimated at over 60,000 men. For a time, at least, Russia was secure from attack in the Caucasus.

The third item in the Turkish program fared no better than the two preceding. A successful attack on Egypt could only be carried out by one of two means — by sea or across the Sinai Peninsula. The requisite command of the sea being absent, the only alternative was the land approach. Yet here certain difficulties stood in the way: to reach the canal involved crossing a waterless desert of some 100 miles. Three routes were possible, namely, along the coast from Syria, 120 miles, without water; the southern road, from the head of the Gulf of Akabah, at the head of the Red Sea, 150 miles, equally without water; and through the centre of the peninsula, where there was no road at all. Another serious problem would present itself if and when any of the three routes had been successfully negotiated by an army. The Suez Canal, which would have to be crossed before a direct attack could be made on Egypt, possessed a virtue not usually associated with
canals — it could accommodate the greatest battleships armed with the heaviest guns. The hope of a general uprising among the natives, however, seemed to outweigh this obstacle in the Turco-Germanic front. The new hadn't the power to take up the canal was duly decided upon and prepared for. Politically the Sinai Peninsula is part of Egypt and has an eastern frontier line drawn almost straight from Rafa near the Mediterranean in southwards only divided by the Gulf of Akabar, leading to the Red Sea. On the northern coast, some 30 miles west of Rafa, an Anglo-Egyptian post was established in normal times, the garrison of which was withdrawn in October 1914, when it was reported that a band of 2,000 Bedouins was marching on Egypt. Beyond a skirmish between the Bakian Camel Corps at Katiyeh, 26 miles northeast of El Kantara, nothing happened on the peninsula till the end of January 1915, when small advances by the enemy crossed the northern route and were driven back at various points. British airmen had the region well under observation, so that a surprise was hardly possible. But these isolated attacks were merely left to make a determined effort, since overwhelming their advance was destined to reconquer Egypt. On 2 Feb. 1915, the van of the Turkish army reached the covering sand dunes on the east of the canal on a front facing Ismailia. Here they deployed and waited till dark. Through stealthily carried out, these manœuvres had not passed unobserved by the British on the opposite bank at Toussoum. The Turks now, it was to launch a number of pontoons which they had carried across the desert with the help of rafts made of empty petrol cans. Those engaged in this proceeding were simply mowed down with machine guns and their primitive floating apparatus were riddled with bullets and sunk as soon as they appeared. They brought some artillery into action during the night and early next morning the battle had extended from Ismailia to the Great Bitter Lake, a front of, roughly, 12 miles. Three British gunboats, an armed transport and two French guardships took part in this battle. Fulling through the Turkish fire fell off early in the afternoon; two columns of Indian troops were thrown across the canal and quickly cleared the sand hills, taking 600 prisoners. The rest of the Turkish army were in retreat, dragging their guns with them, leaving 400 dead on the ground. What happened to the shattered host of originally 12,000 men, with a waterless march of 120 miles before them, has not been told. By 8 Feb. they were more than 20 miles away from the canal, and on the 12th a big force of them was annihilated at Tor, near Mount Sinai. A British warship bombarded the fort and government buildings at Akabar and another British vessel took possession of the Turkish fort at Sheik Said, at the southwestern corner of Arabia. The war had begun disastrously for the Turks. They had fought everywhere with their oldtime valor; badly led and worse equipped, they vainly attacked and suffered like heroes. No further attempt was made on Egypt during 1915, but in July an unsuccessful effort was made to reach Aden.

The objects of the British campaign in Mesopotamia were to secure the neutrality of Arabia to the British, and to control the Persian Gulf, to protect the oilfields and generally to maintain British authority in the East. We left the British force established at Kurna, 120 miles from the sea, awaiting reinforcements. These arrived in April 1915 and General Nixon took supreme command. The British, now, were to attack on both sides of Basra, preparing for a new attack. During January 1915 fighting had developed north of Mezera with a force of 5,000 Turks, and early in March an enemy army of about 25,000 was located near Ahwaz on the Karun, where a small British garrison was stationed to guard the oil pipe-line. A reconnoitring expedition of 1,000 fell in with the enemy and was compelled to retire with considerable loss. It became apparent that strong forces of Turks and Arabs were gradually forming a circle around the whole of the territory in British occupation. On 12 April the Turks made a determined attack on Shaba, southeast of Basra, to recapture the latter place. By next day the enemy had gained a post north of the British front, from which they were dislodged by a bayonet charge. On the 14th the British stormed the enemy's trenches to the south, four miles distant, and drove the whole force, at least 15,000 strong, into the Karun, threatening a mass of war material and prisoners, the former including automobiles and river boats. The fighting calmed down toward the end of April, but at the close of May the Turks again became active north of Kurna. Early in the morning of the 31st a British force surprised them, shelled and stormed their positions, and on 1 June the Turks fled in haste on steamers and boats, leaving their camps behind them. A British flotilla gave chase, capturing some heavily laden lighters and sank one of the steamers. On 3 June the British took Amara, a military station on the Tigris 75 miles due north of Kurna. The garrison of Amara under Nureddin Pasha withdrew some 150 miles farther up the Tigris to Kut-el-Amara, whence a river channel called the Shatt-el-Hai runs due south to Naseriyeh on the Euphrates, 100 miles northwest of Basra. This channel could be used by the Turks to attack the British rear at Basra, and it became imperative for the British to secure Naseriyeh and the river line thence back to Basra before advancing to Kut. In July 1915 a British expedition under General Gorringe crossed the marshes from Kurna due west about 70 miles to Naseriyeh, where they found the Turks strongly entrenched on both sides of the river. Gunboats had meanwhile steamed up the Euphrates from Basra. A combined land and water attack soon dislodged the enemy (25 July 1915), who retreated up the Shatt-el-Hai toward Kut-el-Amara, which now became the next objective on the way to Baghdad. Early in August the British advanced on Kut-el-Amara, an undertaking that began with a victory and ended in disaster.

It must be explained here that the Mesopotamia campaign was carried on under the direction of the government of India. It was that government which had secretly dispatched from Bombay the first Anglo-Indian force to the Persian Gulf in early October 1914 in the event of Turkey throwing in her lot with Germany. The general objects aimed at have been described. In three weeks' operations Basra, the key to Mesopotamia, had fallen to the British at a small cost. In view of this, the Secretary of State for India (in London) gave his
consent for the expedition to push on to Kurna. Though the force had meanwhile been doubled, it had only been provided with less than half its proper scale of medical equipment and the river transport was not sufficient for its requirements. General Nixon, the commander, was instructed (a) to retain complete control of the lower portion of Mesopotamia, comprising the Basra vilayet; (b) so far as possible to secure the safety of the oilfields; and (c) to submit a plan (1) for the effective occupation of the Basra vilayet; (2) for a subsequent advance to Bagdad. After much correspondence between India and England, the Secretary of State (Lord Crewe) sanctioned successively the ad-

Meanwhile, General Townshend was leading his division up the Tigris toward Kut. He found the enemy, nearly 10,000 strong, waiting for him on a sandbank on both banks of the river some seven miles below Kut. General Townshend’s expedition consisted of about 11,000 Anglo-Indian troops and a few hundreds of British Territorials from Egypt. The enemy positions were strongly entrenched and the river blocked by booms. Three brigades under Townshend were led by Generals Fry, Hoghton and Delamain. On 27 Sept. 1915 the British made a feint attack on the Turkish right; Fry and Hoghton crossed the left bank of the Tigris over pontoon bridges, the former attacking the Turkish centre the next day, while the latter with his own and Delamain’s brigade made a wide detour around some marshes and fell upon the Turkish flank. In a few hours that flank was crumpled up; fighting was carried on under a scorching sun; the British troops were parched for want of water and fatigued with 30 hours’ marching and fighting. The Turks gave way and began to retire upon Bagdad, followed by British cavalry and the river flotilla. A remarkable feature of the battle was the comparative ease with which so strong a position could have been carried with a little over 400 casualties on the attacking side. In two days Townshend held Kut, and the enemy was nearly 100 miles away by the end of the month. On 3 October, when Townshend was pursuing the Turks and had almost reached Aziez, 50 miles north of Kut, General Nixon wired to London, “I consider I am strong enough to
open road to Bagdad, and with this intention I propose to concentrate at Azizie. It seemed the general's idea was that contained in the plan he had suggested 1 October that he would follow the disorganized Turks into Bagdad. But, owing to unsuitable and insufficient transport facilities, Townsend was unable to overtake and again defeat the Turks before they had time to reorganize in their débâcle at Ctesiphon. On realizing his inability to continue, he wished to return to Kut, but General Nixon still pressed his proposal on the government and ordered him to concentrate at Azizie. Mr. Austen Chamberlain had meanwhile (22 May) succeeded Lord Curved at the India Office and had followed the latter's cautious policy with regard to the Mesopotamian campaign. He immediately telegraphed to the viceroy that it was "inadvisable to stop the further advance of General Nixon's force." Orders to this effect were sent to Nixon on 5 October, and the advance on Bagdad was, therefore, apparently abandoned. But a cabinet meeting in London on the 4th, the day before Chamberlain's wire, considered that it was "impossible for forces available to take and hold Bagdad, political reasons were thought to make its occupation desirablc." On the 8th Mr. Chamberlain telegraphed to India, "The Cabinet are so impressed with great political and military advantages of occupation of Bagdad that every effort will be made by us to supply the force that is necessary. We do not wish to attempt it with insufficient forces." In reply to a question as to what reinforcements he would now give the present force, as sufficient to take Bagdad, but that he would require another division and one cavalry regiment to occupy the place permanently. He also asked for more river craft. The general staff at the War Office decided that Nixon should have two more divisions, which would take some two months to reach him. Some cavalry, infantry and artillnty were sent up to Townsend, though by no means sufficient for the attempt. In a dispatch to the war office on 4 October, Mr. Chamberlain gave warning that some 60,000 Turks might be concentrated at Bagdad by January, though only about 10,000 were in that district at the time. To this the viceroy responded that "the right policy was to take the risk." On 23 October the British forces were beaten at Tigris to the 20th; that on the right bank and the boats arrived the following day, when both land forces combined on the left bank. The Turkish force at Lajj was attacked on the same day and driven out. It was evident that the Turks did not intend to offer any determined resistance, being content to let the British stretch their line of communications and tire themselves out until they should arrive at Ctesiphon, where the Turkish position was entrenched on both sides of the river. With the least possible delay Townsend pushed on to his goal, for he had learned only on the 17th that 30,000 Turks were on the march down from Anatolia, which would augments the enemy to more than 40,000. To meet this force there were barely 25,000 British troops in all Mesopotamia, including lines of communications. Already at Lajj the aeroplane scouting had reported, "they are coming on," and additional troops were on the west bank of the Tigris. For months the Turks had been constructing their defenses, consisting of an extensive system of entrenched positions forming two main positions. The first line on the right bank extended from the river for three miles southwest, with the second line about five miles farther upstream. A continuous line of trenches and redoubts stretched for six miles.
on the left bank, with a second line two miles to the rear, running parallel with the first for three miles, and then turning northward for another three miles to the Diala River. Between the two extremities of the first and second lines on this side the Turks had formed up a straight line of reserves against a flank attack, thus forming practically a square, with the Tigris as the right flank. A mile behind the second line a pontoon bridge across the Tigris connected the left wing with the right on the other bank, while the Diala was bridged at two points near its junction with the Tigris, and these crossings were commanded by entrenchments. According to reports Nureddin Pasha, the Turkish commander, had over 13,000 regular troops and 38 guns; against these, plus a formidable position, Townsend had only some 11,000 effectives available. But the majority of the enemy were troops that had already been defeated several times in Mesopotamia. Moreover, before the battle, General Townsend was not informed of the proximity of Turkish reinforcements—apart from the 30,000 referred to above—which arrived on the scene was enough to change his victory into defeat. The Turk has a fine reputation as a fighter; up to this stage of the Mesopotamian campaign the Turks had been driven back from one position to another so long as they retained a large proportion of Arab troops in their ranks. These were rather a source of embarrassment, for they hated the Turks, who never cared to learn their language or understand them, and as a subject race they were stirred by no feelings of patriotism—a virtue which is replaced by tribal adhesion and religious fraternity. But on the other hand, as time went on and the proportion of Arab troops diminished, the stouter Turks took their place, and the Turkish army in Mesopotamia became a very efficient German-trained machine of devoted soldiers. Heavy reinforcements of this type arrived at the battle in the nick of time.

In a night march from Lajj, General Townsend with his force covered the nine miles to Ctesiphon on 21-22 Nov. 1915 and attacked the Turkish lines on the position on the northeast flank, round which the cavalry was thrown to hinder a possible retirement. A severe fight developed and lasted from dawn throughout the day. Early in the morning bodies of enemy troops were observed moving northward, giving the impression that they were retreating from Ctesiphon. The British cavalry attacked that flank which was apparently in retreat, when it wheeled into line and made a stand that revealed an overwhelming force. On the front the British, storming the first line, captured eight guns and established themselves in the trenches. They were subjected to fierce counter-attacks by fresh reserves. Townsend’s men penetrated to the second line and captured those trenches as well, but the enemy continued to send reinforcements to the field and forced the British to abandon the advanced positions shortly before nightfall and retire to the first-line trenches. In the conflict the captured guns changed hands several times, while the British casualties were heavy. The 23d was mainly devoted to collecting the dead and wounded. The Turks also lost heavily; the battlefield was covered with killed and wounded and many of the trenches were choked with their dead. Those troops which had held the front line were reinforced from reserves came up and attacked the British in their captured trenches during the whole night of the 23-24 November, but these were repulsed with heavy loss. In the first day’s battle the British took 1,300 prisoners. On the 24th the wounded and prisoners were removed to Ctesiphon to Lajj, where the flotilla was banked in, being unable to advance, owing to the Turkish batteries on the right bank. Beyond artillery action there was little activity on that day. The Turks held the enemy’s line, but it became increasingly apparent that he was hopelessly outnumbered. Matters looked threatening on the 25th; large enemy columns were advancing down the left bank and also inland, as if to turn the British right flank, while hostile cavalry menaced the rear. To make things worse, Townsend was short of supplies; he had lost over 4,000 men in killed and wounded; his air force had suffered a series of accidents during the battle; several of his machines had been obliged to descend within the enemy’s lines; his men were hungry, he had no reserves to draw upon. Furthermore, he was nine miles from his nearest base at Lajj. In these circumstances he perfors decided to avoid another engagement and withdrew to Lajj during the night of the 25th. He remained here during the 26th, but the position was most unfavorable for defense, so he withdrew un molested back to Azizie in the night of 27-28 November. Engagements were fought with advanced Turkish cavalry near Kutumie on 20 November and on the 30th at Umm at Tubal, about 25 miles below Kut, where the river shipping was in difficulties in shallow water. The British continued their retreat upon Kut, fighting rearguard actions without intermission. On 1 December the whole Turkish force attacked at Umm at Tubal, but was repulsed after a severe fight, during which Townsend took advantage of a successful counter-attack by his cavalry against a column attempting to envelop his rear flank, to break off the fight and retire by engine bank at 8 p.m. on the 30th with the exhausted remnant of his troops on 3 December. Thus ended the Pyrrhic victory of Ctesiphon, in which the British lost about 700 killed and 3,800 wounded—a loss of over 30 per cent.

During the retreat the river gunboats Shaijan (Devil), Comet and Firefly were run ashore and had to be abandoned. Townsend at once took steps to withstand a siege in Kut until the arrival of reinforcements which were coming from Persia. Two Indian divisions had arrived in Egypt from the Western Front en route for Mesopotamia. The defenses of Kut were improved; sick and wounded and 1,350 Turkish prisoners were sent by water to Basra, leaving only an armed tug with Townsend. On 5 reserves were on the field and a convoy of transport animals were marched down to Ali Al Gharbi; on the same day the Turks closed the northern front, and on the 7th the investment of Kut was complete. On the 10th the Turkish artillery was heavy, both sides and Nureddin Pasha called upon Townsend to surrender. The British position lay in a U-shaped loop of the Tigris; the town
stands at the southernmost end of the peninsula (about a mile wide) thus formed, while the northern defenses were some 3,200 yards from the town. The British cavalry, now led by Ali Al Gharbi was reinforced with infantry and guns from Basra; behind this advanced detachment a relief force was organized under Major-General Ayler, who on 4 Jan. 1916 advancing ban on the Euphrates from Ali Al Gharbi toward Sheikh Saad and attacked the Turks three-and-a-half miles east of the latter place. Heavy fighting developed on both banks, and on the 9th the enemy was forced from his positions at Sheikh Saad, retiring upstream about 10 miles to another fortified line at the junction of the Tigris with the Wadi River, 25 miles from Kut. Ayler drove the Turks from this line on the 14th, compelling a further retirement of five miles. General Nixon, the commander-in-chief of the British Expeditionary Force in Mesopotamia, resigned, owing to ill-health, on 10 January and was succeeded by Lieut.-Gen. Sir Percy Lake.

Throughout these operations heavy rain and high winds continued to prevent the troops and made movement most difficult, both by land and river. The Turks had established across the river a series of strong positions. Nearest to Kut, eight miles away, was the Es-Sinn position; farther down, toward the British, came successively the Sanna-i-Yat, Fellahieh and Umm-el-Hanna defenses. Flanking these last-named positions on both sides of the river were marshes, and the entire country was roadless. Three further important attempts were made to relieve Townshend's beleaguered army. Between 19-23 Jan. 1916 Ayler endeavored to force a defile held by the Umm-el-Hanna lines on the left bank. The enemy front trenches were actually rushed, but supporting troops lost direction and under heavy fire failed to reach the objective, when a counter-attack caused the abandonment of the conquered terrain. A period for rest and reorganization followed in February. On 7 March Ayler decided, in view of the possibility of his troops being flooded out by the cutting of the dikes, to leave the three lower lines of Turkish defense and to drive against the stronger but final line at Es-Sinn. With this object two columns made a difficult forced night-march through the desert right across the enemy's front. One column reached the appointed spot unobserved, the other came too late to achieve the purpose — the capture of the Duluijah redoubt. After a whole day's fighting almost within view of Kut the attempt failed and the columns retired again to the Wadi lines. Fresh troops began to arrive up-river during March and a renewed attack was planned on the left bank. Major-General Gorringe took over the command of Ayler's corps on 12 March. On 14 April General Maudsley's division stormed the Umm-el-Hanna position, 23 miles from Kut. During the night of 8-9 April an assault was made on the Sanna-i-Yat lines, but without success.

The third desperate effort to relieve Kut had failed. With the town's defenses matters looked black. Heavy Turkish bombardments had begun 10 Dec. 1915, followed by infantry charges, which were repulsed. On the 25th and 24th Nureddin Pasha made a furious attempt to storm the place, and even succeeded in piercing the British line. Throughout the winter the Turks maintained an impenetrable ring around the besieged garrison. Food grew scarce; the natives and the dealers in Kut stripped their stock of foodstuffs and lived on the rations served up by the British until a systematic search unearthed large quantities of provisions. Aeroplanes from the relief columns outside the ring flew high over Kut, but could do little owing to the close proximity of the Turkish guns. There was but one flour mill in Kut, and from that the Turks had removed the millstones when they abandoned the place. The deficiency was remedied by British aviators carrying a set of millstones in their aeroplanes and dropping them within the lines. During the cold weather firewood was doled out by the half-pound. It became necessary to slaughter the horses and battery bullocks for food. The native population was fed by public soup kitchens. Scurvy broke out among both the military and the civilians. While the three attempts at relief were being carried out the Turks kept up a stream of high explosive bombs, which they fired from trench mortars. Enemy aeroplanes began in February to drop bombs on the town, not on the military works. The natives were the principal sufferers by these raids; nor did the marking of hospital buildings with conspicuous Red Cross signs avail, for a bomb was dropped on the main hospital, killing 30 of the sick and wounded inmates. On 8 March 1916 the Turkish (or German) commander sent an officer under the white flag to demand surrender — in vain. Rations were still further reduced; Townshend was nearing the end of his resources when a heroic but vain attempt was made to break the blockade of the river. The Julmar, one of the fastest steamers on the Tigris, manned by a volunteer Royal Navy crew under Lieutenant Firman, R.N., and Lieutenant-Commander Cowley, R.N.V.R., started in the dark from Fellahieh on 24 April with 270 tons of supplies on board. Under fierce fire from both banks the devoted "forlorn hope" ran the gauntlet through the Sanna-i-Yat and Es-Sinn defenses to the vicinity of Megasis fort, a total distance of some 15 miles. Both officers fell on the deck, Cowley at the wheel; at full speed the unguided vessel rushed on in a sinking condition and grounded on a mudbank. For the next few days Kut was provisioned by sacks of flour and food dropped from aeroplanes, a measure which, had it been adopted earlier, might have enabled Kut to hold out till the arrival of relief. The provisions thus supplied were far short in quantity of what was needed; they were doled out in quarter rations. On 27 April General Townshend, acting on wireless instructions, went out to treat with the Turkish commander, Khalif Pasha, who demanded unconditional surrender. There was nothing else to do. The 28th was spent in Kut preparing for the inevitable: guns and rifles were smashed, officers and men snapped their swords under their feet; field glasses were destroyed and revolver-holders thrown into cesspools; ammunition was dumped into the Tigris in the night, and on 29 April 1916 the British flag was hauled down and the white flag took its place. A weary, half-starved and broken force laid down its arms after a gallant resistance of 143 days. It
consisted of 2,970 British and 6,000 Indian troops, with an army of about 5,000 camp followers.

The fall of Kut created a painful impression among the Allies in general and throughout the British Empire in particular. A parliamentary commission was appointed in August 1916 to inquire into the operations in Mesopotamia and to report thereon. The commission, which was invested with many of the powers of the British High Court of Justice, examined on oath over 100 witnesses, including Mr. Austen Chamberlain and Lord Crewe, respectively secretary and late secretary of state for India, Lord Hardinge, viceroy of India, two ex-commanders-in-chief in India, General Nixon, and all the chief officials concerned in the Mesopotamian campaign up to the summer of 1916. General Townshend, being a prisoner of war, naturally could not testify. The commission consisted of Lord George Hamilton, chairman, Lord Donoughmore, General Lyttelton, Admiral Bridge, Lord Hugh Cecil, M.P., and three other members of Parliament. The commission issued a voluminous report in June 1917. They found that while the conditions of the campaign in Mesopotamia required a standard of preparation and equipment above the ordinary, the Indian army was not even up to the ordinary standard in these matters on the outbreak of the war. This was due to the campaign of military economy which, by agreement between the home and Indian governments, had been pursued in India for many years before the war. The supply of artillery had been cut down both in quantity and quality; the number of troops available for immediate mobilization was reduced, and the army generally was only equipped for frontier warfare against savage tribes. The Indian army was, therefore, in all respects in a less favorable position to confront modern troops than it was at the time of the South African War, 1899-1902. The commission placed the chief responsibility upon the Indian government and recommended certain alterations in the administrative system to insure closer co-operation between the military and civil departments. The undertaking of the expedition was not condemned: "Up to the date of the advance on Baghdad (says the report) continuous victory has been achieved. . . . We are aware of the prejudices of the world as a whole—that it may now [1917] be truly asserted that, in the many parts of the world in which the Allied forces have been engaged, no more substantial results or more solid victories have been achieved than those won by the gallantry of the British and Indian armies on the stricken plains of Mesopotamia."

While the events so far described in this chapter were being unrolled in the southeastern theatre of war, other things, partaking of the nature of a sideline, were happening farther east, in Persia. That country was neutral, and remained so during the war. But the German minister in Tehran, Prince Reuss XXXI, had been sowing the seeds of Pan-Germanism in Persia since the summer of 1914 and had succeeded in gaining the sympathies of several Persian ministers, the gendarmerie, under Swedish officers, and some of the tribesmen for the German cause. Risings were fomented throughout the country; British civilians were arrested in Shiraz and Yezd, and there seemed every probability of Persia being dragged into the whirlpool in accordance with the "Holy War" scheme. The revolt of the 6,000 gendarmes led to the murder of a British and a Russian vice-consul. Immediate steps became necessary to prevent the flame from spreading and to protect the legations of the Russians in Transcaucasia were nearest to the seat and in the middle of November 1915 General Yudenitch dispatched two columns into the country; one, under General Baratov, pushed southwestward through Hamadan to Kermanshah, on the way to Bagdad. A small cavalry force established communication with the British Mesopotamian force. The possession of Kermanshah was strongly disputed, and the Russian column was held up before reaching the southern plains. The second column advanced through Kwm and Kashan to Isphahan, the ancient capital, on 20 March 1916. The first column entered Teheran at the end of November, but the German, Turkish, and Austrian ministers had departed from the city on the 14th, after endeavoring to induce the young shah to throw in his lot with the Central Powers. Turned into German hands. Torn by conflicting advice, the 17-year-old shah followed the wiser counsels of Prince Firman Firma and a few others and took a strong stand for the Allies. He refused to go and join the Austro-German-Turkish corps diplomatique waiting for him six miles away at the village of Shah Abdul Azim. His decision led to an interesting sequel three years later, when he stepped from a special train in London and was welcomed by King George and the Prime Minister on 31 October 1919. On the following day (1 November) he was conducted in royal state to the Guildhall as the guest of the lord mayor, and in reply to the latter's speech of welcome Ahmed Shah referred in fluent French to the strong bonds of friendship which have existed for so long between Persia and Great Britain. To return to 1916. While the Russians were operating in northern Persia, Sir Percy Sykes, many years a resident in the country and author of perhaps the best history of Persia, and the British column of intervention in the south. The native gendarmerie was disbanded in 1916 and the Persian government accepted a British offer to place at their disposal a number of British officers to organize a new force.

It is now time to introduce a new belligerent, one whose name has not yet appeared in these records—The Senussi brotherhood, a tribe of Mohammedans forming a kind of religious fraternity and inhabiting the great stony plateau known as the Libyan Desert in North Africa, between Egypt and the Italian territory of Cyrenaica, which, together with Tripoli, had become Italian by the war with Turkey in 1911-12. After the close of that war, the Turks had not withdrawn the whole of their forces from that territory as agreed upon by the Treaty of Lausanne. Those troops which remained—either forgotten or neglected—continued a spasmodic and desultory campaign against the Italian town of Tripoli and tribes from the interior. Those tribes inhabiting the Libyan Desert acknowledged in a loose way the authority of the Senussi of Sollum, an authority more religious than political. In November 1904 the British government had notified Turkey
and Italy that the western frontier of Egypt ran up to and included Sollum. During the Tripolitan war the Italians established a blockade of the Cyrenaican coast to some 100 miles east of Sollum, to which the British government objected. The Italian claim was waived and an Egyptian force occupied the fort of Sollum in December 1911. For the following three years and when attempting a start the Brits conducted both these Arabs against the Italians, as mentioned, and also against the extension of French rule in the Central Sudan. When the European War broke out the Turks had on their side in Northern Africa a respectable force of at least 30,000 men, consisting of a nucleus of Turkish troops, with Arab, German and Turkish officers, some 5,000 well-trained Senussi, and a liberal supply of field artillery and machine guns. Considering that Turkey possessed not an inch of territory in Africa in 1914, it must be regarded as remarkable that such preparations could have been made under German auspices on Italian and Egyptian (British) territory. Hitherto the Grand Sheikh of the Senussi, Sidi Ahmed Shuwayh, had been friendly with the Anglo-Egyptian authority; he and his people were not opposed to British rule in Egypt, and his official representatives lived in Cairo in cordial relations with the government. By the end of 1914 the whole interior of Cyrenaica was held by the Senussi, and when Italy entered the war in May 1915 the Italian army of occupation fell back to the coast, leaving the inland tribesmen to their own devices. Signs of unrest soon began to show and a foothold on the inland plateau at Nida Bey, a half-brother of Enver Pasha, who came to Tripoli to negotiate with the Senussi and the Tripolitan Berbers. He met with little success at Sollum, for he had nothing to offer beyond promises. The subsequent arrival of Gaafar Pasha, a German convert to Islam, with money and arms, altered the case. By November 1915 all was ready, with Gaafar Pasha in charge of the campaign. The chief danger to be feared on the British side was that a 'shot war' in western Egypt might spread disaffection in that region. From Alexandria a railway runs along the coast for about 150 miles westward to Mersa Matruh, a Mediterranean port and that there lay the Egyptian forts of Sidi Barani and Sollum, respectively 150 miles and 200 miles from Mersa Matruh. The garrisons were withdrawn from the forts to Matruh, where a considerable force was concentrated, consisting of a New Zealand brigade then training in Egypt, detachments of the Australian Light Horse and the British Yeomanry, and the 15th Sikhs, Indian infantry, altogether about 3,000 men. In November 1915 the Senussi made a swift raid over the frontier; they were joined by the Bedouins of the Wald Ali tribe, and quickly overrun nearly 200 miles of Egyptian territory. An advanced force of 1,200 Arabs reached the outskirts of Matruh on 1st Dec. 1915, and were driven back with heavy loss. On Christmas Day an onslaught by 3,000 Arabs was completely routed by the British infantry, the cavalry sweeping up most of the enemy's transport and supplies. Another attempt was made by the Arab tribesmen to assault Matruh, which they failed to take. On the 23rd Major-General Wallace, reinforced by part of a South African brigade, fell upon the enemy in two columns and inflicted a crushing defeat on 4,500 Turks and Arabs, driving them back in utter confusion. Before long the tribesmen quarreled among themselves; many of them came half-starved into the British lines and begged to be protected against their former allies. The south Africans and the Dorset yeomanry under Brig.-Gen. H. T. Lukin pursued the fleeing enemy and defeated them again when attempting a stand. The Dorsets "with one yell hurled themselves upon the enemy, who immediately broke," reported Colonel Souter, who commanded the Dorsets. "In the middle of the enemy's lines my horse was killed under me, and by a curious chance its dying strides brought me to the ground within a few yards of the Senussi general, Gaafar Pasha." (26 Feb. 1916). The Pasha and his whole staff fell prisoners to the British. On 9 February General Peyton took command of the operations and proceeded to follow the enemy up to Sollum on the Italo-Egyptian frontier. The British columns were supported by units of the navy operating along the coast, landing supplies and munitions where required. British aeroplanes kept the enemy in the desert under constant observation while a transport train of 2,000 camels kept all units provided with necessaries. Large numbers of Bedouins and prominent sheikhs deserted to the enemy and appealed to General Peyton for pardon. On 9 March a general move began from Barani in the direction of Sollum; the first column, comprising all the infantry and slow moving troops, started with orders to secure a foothold on the inland plateau by the Medean Pass. These were followed by two battalions of infantry, a camel corps company and some armored cars under General Lukin along the top of the escarpment, while the remainder of the forces pushed ahead by the coast. In the morning of 14 March both columns approached Sollum. Aviators reported that the enemy was evacuating his camps: a hostile camp was located some 20 miles to the west, where the armored cars, under the Duke of Westminster, were sent to follow. which followed here all the enemy's guns and machine guns were captured, together with a number of prisoners including Turkish officers. The only British casualty was one officer slightly wounded. Sollum was reoccupied, and the northern column of the enemy was eliminated. In about three weeks the country had been cleared for 150 miles, the Turkish commander and all his artillery captured, and the rest of his troops scattered far beyond the Egyptian frontier. It was known that, somewhere about 75 miles west of Sollum, within Cyrenaica, about 95 British prisoners were held by the Senussi. These were survivors from two British vessels torpedoed off the coast in the previous November. To effect their deliverance the Duke of Westminster was dispatched on 17 March with a light armored car battery and some motor ambulances. A distance of 120 miles had to be covered through an unknown country against an enemy of unknown strength, but the expedition returned safely with all the prisoners rescued. The Senussi campaign was over. The Wald Ali tribes surrendered in such numbers that it became necessary for the British to supply food and provide a special branch of administration for their protection and control. Meanwhile, a subsidiary campaign
had been in progress in the western Sudan, where Ali Dinar, Sultan of Darfur, had ruled since 1899 under British-Egyptian suzerainty. The Turks had been carrying out a series of wholesale massacres and deportations among the helpless Armenians, whose country then belonged, split into three unequal portions, to Turkey, Russia and Persia. A representative meeting of Russian Armenians assembled in Tiflis, Caucasus, in August 1914, was pressured autonomy for Russian Armenia by the imperial government, to take effect after the war if their people would loyally support Russia in the conflict. The proposal was agreed to, and nearly 200,000 Armenians served with the Russian colors. A similar meeting of Turkish Armenians was held about the same time in Erzerum, at which a delegation of the Turkish Committee of Union and Progress attended. Here, also, a promise of autonomy was offered on the twofold condition that the Turkish Armenians not only should support Turkey in the war, but also induce the Russian Armenians to rise against Russia. If these terms were accepted, the three severed portions of Armenia were to be reunited under Turkish suzerainty. The Turkish Armenians, however, were quite willing to remain loyal to their government, but declared their inability to agree to the other proposition of inciting their compatriots under Russian rule to insurrection. There was a deep significance behind the Turkish proposal; the plan was to draw the Persians, Kurds, Tatars and Georgians into a holy war against the Allies. While it was true that it was necessary to make sure of Armenia, for if that country were hostile its geographical position would hamper co-operation between the Mohammedan races included in the scheme.

The rejection by the Turkish Armenians of that one condition led to serious consequences for themselves and incidentally proved of inestimable benefit to the Allies, for if the whole nation had gone against Russia, that country might have encountered defeat instead of victories early in the war, with the result that the Central Powers could have transferred large armies from the Eastern to the Western Front already in 1915 instead of 1917. From the moment of Turkish participation in the war the Armenians who had become a decided Coalition. The ghastly story of how this program was carried out has been vividly described by many authorities and eye-witnesses, notably, American missionaries, Mr. Henry Morgenthau, United States Ambassador in Constantinople and E. Harry Steumer, a former German army officer and war correspondent ("Two Years in Constantinople"). Thousands of the Armenian population of Asia Minor were either killed on the spot during 1915 or else deported into the most inhospitable parts of the Turkish Empire, there to die of starvation, exposure and disease. The total number of those who were thus done to death is not exactly known, but it was large enough to brand the procedure as one of the most shamelessly brutal race massacres of all time ("Wild East," issued by the British government, 1917). The instigators of these atrocities, which spread over the first eight months of 1915, were Enver Pasha and Talat Bey; the latter told Mr. Morgenthau in Constantinople, "I am taking the necessary steps to make it impossible for the Armenians ever to utter the word autonomy during the next fifty years." Irregular bands ravaged the district around Erzerum and Bayazid, slaughtering mercilessly and driving the wretched survivors into Russian territory. Many thousands were butchered like sheep at Bitlis, Diarbekr, Angora, Van, Trebizond, Mush, Jebel Musa, Urfa and Mousul. It was estimated that over half a million perished, while great numbers of women and childern perished. It was a climax of five centuries of Turkish domination.

Throughout the spring and summer of 1915 the Russian and Turkish armies in Transcaucasia fought several engagements of which little news leaked out. The Russians were holding the southeastern gate, while greater events were happening on their far-flung eastern lines in Europe. Early in May an action was fought at Dilman, just inside the Persian frontier, north-west of Lake Van, in which the Turks were severely handled by the Russians. Early in September the tsar nominally took personal command of his armies and the Grand Duke Nicholas was sent to the Caucasus as governor and commander-in-chief. The Turkish forces in this region were increased to some 100,000 men in anticipation of a Russian move. It seemed to be the Russian plan to detain as many Turkish troops in this theatre as possible to prevent them from being sent to Mesopotamia or the Dardanelles. On the other hand, a Turkish embarrassment elsewhere would place the grand duke in a position to strike a blow from behind. Beyond inflicting a slight defeat on the Allies in which the Turks were no immediate resumption of hostilities. The Persian revolt was crushed by 20 Dec. 1915, and on 17 Jan. 1916 the Russians made a sudden attack on the Turkish centre at Koprikeui and broke it over a front of 66 miles. The Turks retreated in haste on their stronghold at Erzerum, 60 miles away, with the Russians close on their heels. On the 21st the latter were already shelling the fortress, but the attack was temporarily held up by severe weather. On 11 February the Russians launched a fierce assault, and after five days' struggle Erzerum surrendered (16 February) with 235 officers, 12,750 men and 312 guns. Pressing swiftly onward, General Yudenitch, the Russian commander, led his Cossacks into Mush and Aklay, pushed south and entered Bitlis on 2 March. Two days later a Russian force was landed at the Black Sea port of Atina and passed rapidly along the coast to Trebizond, which fell to them on 19 March. It was 62 miles after the surrender of Kut and temporarily recovered some lost ground in Armenia, but by the middle of July the Russians were again
on the move, capturing Baiburt, between Trebizond and Erzerum on 15 July and Erzincan, 100 miles west of Erzerum, on the 25th. This rapid and powerful advance was made possible by the power of the Russian Black Sea fleet, which dominated that inland water so long as Russia remained in the war. The addition of the Goeben and Breslau to the Turkish fleet was never more than a temporary annoyance. Turk-German submarines were sent out on several occasions and copied the tactics of the U-boats generally in sinking not only merchantmen but also hospital ships; they had no success of any consequence against the Russian fleet, nor did they interfere with the blockade of the Bulgarian and Turkish coasts and ports. Under the control of Vice-Admiral A. V. Kolchak, who succeeded to the command in August 1916, the Black Sea fleet was brought to a high level of efficiency, competing very favorably with the Baltic ships. The entry of Romania into the war on 27 Aug. 1916 did not affect the naval position. A severe loss befell the Russians on 20 Oct. 1916 in the destruction by fire and explosion of the dreadnought Imperator Alexander III, which had been forced to its use of submarines and aircraft the navy also did effective work in the Black Sea. On one occasion, during a seaplane raid on Derkans, north-west of Constantinople, a machine was damaged and compelled to alight on the water. While descending the two occupants observed a Turkish schooner, and by means of their machine guns drove the crew from the deck, leaving the way clear for them to board and capture the vessel. With the capture of Erzincan the whole of Turkish Armenia was now in Russian hands. During August the Turks recovered Musher and Bitlis and lost them again within 17 days. On 30 Sept. 1916 Turkey declared war on Romania.

Yet again a fresh belligerent appears upon the scene, this time to throw in his lot with that of the Allies as against Turkey — Hussein ibn Ali, the Grand Sherif of Mecca. Shortly after the surrender of Townshend at Kut, this Arabian potentate notified the British government that he could no longer stand aside and witness the continued subjugation of the Arabs to their Turkish rulers. He asked for money, arms and food for his troops, and before they had been promised him broke out into rebellion against the Young Turkey party and their German masters and declared the independence of the Hedjaz. The Arabs had suffered badly at the hands of the Turks, and were not unmindful of the fact that millions of their co-religionists, living contentedly under the protection of Great Britain and France, who respected their creeds and permitted absolute religious freedom. What contributed largely to bring about the unlaid-for intervention of the Arabs was the proclamation issued to Indian Mussulmans by the Agha Khan (q.v.) at the outbreak of the war. Also, the Indian government had announced in November 1914 that the holy places of Arabia, including the Holy Shrine of Mecca, which is in fact a shrine of Islamism, would be immune from attack or molestation from the British forces so long as there was no interference with pilgrims from India to the holy places and shrines in question. The governments of France and Russia had given similar assurances. Hussein ibn Ali and his family carried all the Arabs of the Hedjaz with them when independence was declared on 9 June 1916. They immediately backed their challenge with deeds by attacking and capturing the Turkish garrisons in Taif, Mecca and Jed-dah. They next opened up communications with the British fleet in the Red Sea so that the arms and food they required for their campaign could be brought to their coast. The Sherif's two sons, Feisul and Ali, raised their father's flag of revolt in Medina on 13 June. The Turks were not unprepared to meet the new situation; they had brought down large forces from Syria in anticipation of hostilities. Feisul rallied all the tribesmen and villagers around Medina, but shrank from an attack upon the holy city itself. They tore up a part of the Hedjaz Railway with their bare hands, in the absence of explosives, and threw the rails on the embankments. But they refrained from cutting the water conduit and refused to clear their way by fighting through the streets. By this scrupulous regard for the city containing their holiest shrine — the tomb of the Prophet — they lost their opportunity. The Turkish garrison in Medina, encouraged by the inactivity of the rebels, made a sortie early in the morning, took the garden suburb of Awali by surprise, massacred some hundreds of women and children and set the place on fire. By the time the havoc had been wrought, Feisul dashed up with his Arabs mounted on camels and harassed the rear of the retreating Turks. Yet he still wavered when his men demanded to attack the fortress outside the city walls; they even rushed to the charge without him, but they were stopped by well-directed artillery fire, a new experience to the sons of the desert. The Turks sent out an enveloping force to cut off the Arab van, a move that was detected by Feisul a mile to the rear. Under a withering shrapnel fire he now took the lead against the sortie force, maintaining the struggle till nightfall, when his ammunition was nearly exhausted. He had no reserves and was also running short of food. The British were meanwhile establishing a base for Feisul at Rabegh on the Red Sea, about 100 miles north of Jeddah. The Turks were well provided with guns, machine guns and aeroplanes; they repaired the broken railroad, received further supplies from Syria, and made an advance toward Rabegh, to the north of which Feisul had retired with his disheartened followers. Immediate action was imperative to check the Turkish advance, for, with Rabegh once in their hands, Mecca would be in danger. In consultation with British naval officers in the Red Sea, Feisul determined to risk leaving the Mecca road undefended and carry his whole force away from Yenbo and attack Wejh, 200 miles farther north along the Hedjaz coast, striking against the Turkish communication with Syria — the Hedjaz Railway. By this move he hoped to compel the enemy to divert a considerable force for defensive purposes and perhaps abandon the march on Mecca. Feisul placed his young brother, Ismail, in command of a handful of men to make a show of resistance in the hills, and requested his elder brother Abdullah, who had been blockading Medina on the east, to move across the railway north of Medina and pretend to threaten the
Turks' line of communication. Though Abdullah had no adequate force to perform any serious enterprise, he succeeded in cutting up some of the Turkish supplies. Feisul embarked all his arms and stores from Yenbo el Bahir on British ships and divided his 10,000 men into nine units, to move northward separately and concentrate at Um Leij on 14 Jan. 1917. On arrival here he provided his men with fresh supplies from the ships and embarked a landing party to be used in the attack on Wejh in co-operation with the navy. With the rest of his army Feisul set out on a march of 150 miles along a route notoriously short of water. Many camels died on the road; a Royal Indian marine ship put into an uncharted bay on the coast and supplied the caravan with water in the middle of a dry march of 75 miles. The navy and the landing party had settled the business at Wejh before the army arrived on the scene; Feisul was in time only to cut off some of the escaping garrison and capture all their reserves of arms and equipments. The ships' guns supported the landing parties, and after some difficult street fighting in the town the Arabs cleared the Turks out to the last man. The whole proceeding took 36 hours. The British warships took other landing parties and set them ashore at Dhahe and Mowelah, so that by the middle of February 1917 the whole northern end of the Red Sea up to the Gulf of Akabah was cleared of the enemy. This picturesque campaign, of which but little was heard at the time, demonstrated once more the overwhelming advantage which the superior force over an enemy superior in strength but dependent entirely on land communications. In November 1916 the Grand Sherif took the title of king of the Hedjaz, and was definitely recognized as such by the Allies. Perhaps the principal factor in establishing the new kingdom and restoring the Caliphate to the descendants of the Prophet was Col. Thomas Lawrence, a young Englishman and graduate of Oxford, who was studying archaeological inscriptions in Mesopotamia when the war broke out. He was then 26. Without any knowledge of military affairs, Lawrence was appointed an officer in the British army. Dressed as an Arab, in a costume he wore like a native, he traveled through the countryside and united the various tribes against the Turks. His profound knowledge of the land and its languages made him an important personage in the eyes of the people. He had lived among Kurds, Arabs, Turks and Egyptians; he was a friend of Kitchener when latter was High Commissioner for Egypt, and he even bore the title of Prince of Mecca. Mounted on a camel, he led the Bedouins into many fights against the Turks, who, with their German allies, soon discovered that some mysterious power inspired the Arabs. "Through their spies," wrote Lowell Thomas, "they learned that Lawrence was the guiding spirit of the whole Arabian Revolution. They offered a reward of $500,000 for him, dead or alive. But the Arab was betrayed. "Through their duplicity, they idolized leader for all the gold in the fabled mines of Solomon." (Asia, New York, September 1919.)

We now turn again to Egypt, where the Turkish attack on the Suez Canal failed signally in 1915. From the beginning of hostilities the Anglo-Egyptian garrisons had been withdrawn from the Sinai Peninsula, where there was nothing of importance to protect. This desert region was at that time the only spot in the world where British territory was occupied by enemy forces, though for the reason that it was not defended. The Turks had the run of the ground, occasionally skirmishing with British monitors from the sea. Early in 1916 the British had re-occupied the region of Katia, east of the canal, and were laying a light railway to that place. In May reports came that the Turks were preparing for another attack; in the middle of July a Turkish force of about 10,000 began moving west from El-Arish, carrying heavy guns manned by Germans and Austrians, and accompanied by an Arab camel corps under a German officer. Moving along the coast, the expedition was harried by British monitors from the sea. A Scottish territorial division was stationed 23 miles from the canal at Romani and spread seven miles to the coast at Mahamide; Australian and New Zealand troops protected the right of the line, while mounted Arab tribes cleared the enemy's left. On 3 August the Turks delivered their attack. For over 20 hours the battle raged, and on the afternoon of the 4th the whole British front advanced. The result was quickly decided; the enemy line was completely smashed; Turks, Arabs and Germans fled in confusion, followed by British cavalry sweeping up masses of prisoners, guns and equipment. By the 7th the enemy had retreated 20 miles; he made a stand on the 9th, but was again pushed back. The enemy resistance was broken, and it now remained to clear the rest of the peninsula. Several heavy actions were yet to be fought, but by the end of February 1917 the Turks had been thrown back across the frontier at Rafa. The province of Sinai was freed after two years' undisturbed occupation; only a few scattered patrols remained behind, all that was left of the army destined to reconquer Egypt, Turkey's promised reward for her participation in the war on the German side.

There is little more to add concerning the Russian operations in Armenia and Persia. Early in 1917 General Baratov began a fresh offensive against the Turkish frontier but was forced to withdraw toward Persia toward the common Allied objectives at Bagdad and beyond. He reoccupied Hamadan, which he had lost to the Turks the previous August, and caused the enemy to retire toward the Mesopotamian border, where they were attacked and dislodged from the Assabad Pass. The Russians occupied Kermanshah and Harunabad, and by 17 March were at Kerind, only 150 miles from Bagdad. A squadron of Cossacks, composed of five officers and 110 men, crossed the Pshikoh hills through snow-laden passes, 8,000 feet high, covered 180 miles and reached the British camp at Ali Gharbi in Mesopotamia on 18 May. If report be true, the night of their arrival was celebrated with hilarious conviviality. During May the main Russian body was obliged to retreat before superior Turkish pressure and abandon positions on the border, including Khanikin. He fell farther back to Kermanshah, where he was still 250 miles from the army's main base at
Kasvin. Another move backwards to Hamadan became necessary, and that place also had to be abandoned. But the Turks were not able to attempt any fresh incursions into Persia. Revolt again flamed up in Persia; the government fell into difficulties and it seemed for a time as though German intrigues would gain the support of the country for the long-desired holy war. In the Caucasus the Russians held their ground; there was little fighting, the occupation of Van on 17 March being the chief incident of note. By degrees the Russian Transcaucasian campaign began to fall off; both Russia and Turkey had weighty preoccupations nearer at home. In May 1917, when Russia dropped entirely out of the war, the Goeben and several Turkish torpedo boats proceeded to Sevastopol, where the former German battleship sustained some damage which the dockyard workmen refused to repair. When, after the armistice, the Allied fleet found the Goeben in Stenia Bay, in the Bosphorus, she had a Turkish crew on board under a Turkish admiral, Aris Pasha; the Germans on leaving had taken all the coal of the Goeben out to sea with the fire control and other instruments, so that the Turks could only find out details of her mechanism by actual inspection. In Asia as well as in Europe the contribution of Russia to the Allied ultimate success had been enormous. Her great battles of 1915 and 1916 were of vital importance to the Allies as a distraction for the enemy while they trained their manhood and prepared a machine, equal at least, and in many respects superior, to that possessed by the principal enemy.

After the surrender in Kut of General Townshend in April 1916, the British authorities in Mesopotamia and at home profited by the lesson of failure and began elaborate preparations commensurate with the task yet to be accomplished. On 28 Aug. 1916 Gen. Sir Stanley Maude took supreme command in Mesopotamia. Before any active operations could be undertaken with reasonable prospect of success it was necessary to improve the health and training of the troops, who had suffered severely from the intense summer heat, and to perfect the precarious lines of communications. Other desiudata were to develop the army's resources and to assemble reserves of supplies at the front. Basra remained the headquarters; its port was developed; railways were laid; men and material arriving from overseas were transported and placed in requisition position; everything that foresight could devise was promoted to assure success. During the latter part of October the new commander-in-chief in India, Gen. Sir Charles Monro, arrived in Mesopotamia and made an extended tour of the theatre of operations.

At the beginning of December the enemy still occupied the same positions on the Tigris which he had held during the summer. Strategically, the British had the better situation. The attempt any fresh incursion into Mesopotamia. For 200 years, however, the Turks had retreated from the right bank of the Tigris, with the result that their line of communication was but an extension of the battle front. The British first objective now was Kut. By 13 Dec. 1917 the British had opened their offensive. The troops were divided into two commands; one, under General Cobbe, was to hold the enemy to his positions on the left bank of the river and to picket the right bank as far as Es Sinn; the other, under General Marshall, with cavalry, was to secure and entrench a position on the Shatt-el-Hai by a surprise march. This program was duly carried out and Marshall gained control of the Hai waterway, threatened the enemy communications cut off another communication between the Turks in the Khadairi Bend, east of Kut, and those farther west. The next move was to capture that bend, lined with Turkish trenches, an operation that required two weeks of severe and mainly hand-to-hand fighting. Then followed two months of further hard fighting for the strong Turkish lines on both banks, and when these were captured Kut was almost surrounded, the Turks still holding fast at Sanna-i-Yat. The point of attack decided upon was Shumran, five miles above Kut. Some feint movements by British and Indian troops decoyed the enemy, who hurried troops from Shumran to Sanna-i-Yat, and when the main attack was delivered on 23 Feb. 1917 the British crossed the river where it was 340 yards wide by means of three ferries and began building a bridge for the passage of troops. English and Gurkhas were employed in this enterprise under heavy fire. Meanwhile, General Cobbe, with Seaforth Highlanders and a Punjabi battalion was engaged in storming the Sanna-i-Yat lines, which fell to his men on the 24th, after they had cut their way through six lines of trenches. By now the operations the Turks were completely outflanked; they evacuated Kut and retired on Bagdad. But this proved to be only the first stage in the British campaign. On the 26th the gunboats were 30 miles beyond Kut chasing the Turks; on 5 March British cavalry approached Bagdad; the Ctesiphon position was passed next day, and on the 7th the advanced force came into contact with the Turks along the Dialah River, a tributary of the Tigris, where the enemy made a stand before Bagdad, only eight miles away. By a rapid advance against determined resistance and a violent dust storm General Cobbe reached Bagdad railway station (10 March) on the right bank; Marshall on the left shore forced the Dialah and entered Bagdad on the 11th. In the afternoon the gunboat flotilla anchored off the British residency.

Bagdad, one of the oldest cities in the world, the city of romance, was lost to the Turks. The effect of its fall was far-reaching. While it restored British prestige it struck at Turkish pride and deprived Germany of a territory which, on account of the famous railway, played an important part in the Teutonic scheme of expansion. On 19 March General Maude issued a proclamation in Arabic to the people of the Bagdad vilayet, from which the following extracts are taken: "... Our armies do not come into your cities and lands as conquerors or enemies, but as liberators. ... For 200 years, however, the Turks have deprived you and yours, have for 20 years made Bagdad the centre of power from which to attempt the power of the British and the Allies of
the British in Persia and Arabia. But you people of Bagdad are not to understand that it is the wish of the British government that the burden of impiety upon you alone institutions. O people of Bagdad, remember that for twenty-six generations you have suffered under strange tyrants who have ever endeavored to set one Arab house against another in order that they might be preyed upon by the British. It is sordid and abhorrent to Great Britain and her Allies, for there can be neither peace nor prosperity where there is enmity and misgovernment. Therefore I am commanded to invite you to participate in the management of your civil affairs in collaboration with the political representatives of Great Britain who accompany the British Army, so that you may be united with your kinsmen in north, east, south and west in realizing the aspirations of your race.

Anglo-Indian cavalry continued to hunt the Turks from Bagdad along the road to Mosul, while another force was dispatched up the Diallah, driving the enemy toward Teheran, on the road from the north of which the Russian operations in Persia were pressing another Turkish force, which latter was now in peril of being caught between the two Allied armies, but the Turkish commander extricated his troops by skilful tactics. On 23 April the British column operating on the right bank was in Samarra. Between 24-30 April a Turkish counter-attack from Jebel Hamrin near the Persian frontier ended in disaster; the Turks were put to flight, pursued by British cavalry. A radius of 80 miles around Bagdad was now clear of the enemy; the city was safe from molestation and the wearied troops were permitted to rest. By 9 May the railroad was put in order and trains were running regularly over the 70 miles to Samarra, the terminus. The Turks were now obliged to withdraw their secondary force on the Euphrates, the situation there being no longer tenable after the fall of Bagdad. Since July 1915 they had been stationed about Samawa, 40 miles above Nasiria, and the railway had been moved upstream to Ramadie, 28 miles north of Feluja and about 40 miles below Hit. A British column from Bagdad crossed the intervening country between the two rivers to Feluja and during July began to push along toward Ramadie. Owing to the excessive heat they postponed operations till September, when, on the 28th, they fell upon Ramadie with dramatic suddenness, circled the positions and caught the enemy in a trap. After a battle lasting a night and a day the Turkish commander, Ahmed Bey, surrendered with 145 unwounded officers and over 3,000 men, 23 guns and much other material. A month later a similar event occurred at Tekeit, on the Tigris, 100 miles above Bagdad, where the Turks had established a base with a view to retaking Bagdad. This position was suddenly attacked on 2 Nov., 1917, when it was broken up and 240 prisoners were captured. At the height of this great achievement General Maude died suddenly in Bagdad on 18 November and was succeeded by General Marshall.

We return now to the extreme eastern border of Egypt, where the Turks had been driven out of the Sinai Peninsula in February 1917. From this point the British started out to achieve a task that had been attempted so long ago as the 11th, 12th and 13th centuries — the reconquest of the Holy Land. The desert railway was being extended to Rafa and in March 1917 General Murray moved against the Turkish stronghold of Gaza, in Palestine. The latter is a country smaller than New Jersey, contiguous to the Mediterranean, 50 to 60 miles broad and 110 miles long. It is a part of Syria, from which it has never had a separate existence; except among Western Christians, its proper name in the East is "Syria" or its Oriental equivalents. The country, approaching it from Egypt, is difficult to traverse, changing from the Sinai desert to stony hills. Not caring to risk his army too far from the coast — being dependent upon seaborne supplies — General Murray decided to direct his main attack against Gaza, and to assist it by a diversion along the Wadi Ghuze to cover his right flank. The enemy's plans, as it turned out, consisted of standing upon the defensive at Gaza and to throw his chief strength against the British right.

That plan was perfectly sound, for, even if the British did get into Gaza, they would not be able to hold the place should the Turks, on the right succeed in cutting between the invaders and their base at Rafa. Something like this actually happened. Murray attacked south of Gaza on 26 March; the Turkish defenses were stormed and the British entered the town, but the mobile column, protecting Murray's right along the Wadi Ghuze was hopelessly outnumbered and could not resist the full weight of the enemy thrown against it. Attacked both in flank and rear, the Britishsortable fell back, although they had taken 950 prisoners including the Turkish general in command and the entire staff of a Turkish division. The British casualties were about 4,000; those of the Turks nearly twice as many. Gaza remained in Turkish hands, and the enemy entrenched in a strong line from Gaza southeastward to Beersheba, about 30 miles. For the British it was a costly failure; they had been so severely that they, also, were unable to follow up their semi-victory. Nothing happened for the next three months. Meanwhile, General Murray had been recalled home and at the end of June his successor, Gen. Sir E. H. H. Allenby, arrived in Egypt. If Murray's task was difficult, that now facing Allenby was much more so, for in the interim the Turks had constructed six groups of formidable works on their Gaza-Beersheba line at parallel distances of 2,000 yards, provided with excellent lateral communications. On this front were now assembled some 180,000 troops with a good sprinkling of German officers, including one general, Kress von Kressenstein, who as colonel had taken part in the two abortive Suez Canal expeditions. The British force was strictly limited by the quantities of supplies and water that could be transported. The Turks, on their side, were well provided with water and rainwater cisterns, connecting with Jaffa and Damascus, besides several light military railways.

Altogether, the prospects were not inviting; but even here, as in most human arrangements, there was a flaw and General Allenby discovered it. The Peninsulas in February 1917.

in the country in 1808 when the former kaiser visited the city, but the wise expounders of The Law had asserted that the real saviour would bear a prophet’s name and would enter on foot. In the minds of the peasantry of Judea General Allenby fulfilled these conditions, for by a peculiar coincidence his name somewhat resembles the Arabic for “the prophet,” which is “al nebi.” Colloquial Arabic being a very elastic language, “Allenby” and “Ainley” may easily become synonymous.

The retreating Turkish army had been cut in two sections by the rapid British advance along the coast and the dash between Joppa (modern Jaffa) and Jerusalem. One force was only a few miles north of Joppa; the other held a line across the roads leading from Jericho east of Jerusalem to Nablus, about midway between the River Jordan and the Mediterranean. The British line stretched from Jerusalem northward to Jaffa, taking up roughly half of the territory between the Dead Sea and the Mediterranean. It was essential first to protect that line and push it forward, involving an advance on a 12-mile front to a depth of six miles, by which the distance between Joppa and the enemy would be increased to more than twice its original length, and through this movement could be carried out a great deal of labor had to be expended on improving the roads and in bringing up fresh supplies from Egypt. These latter were transported over the railroad which had been laid down behind the advancing force; in other words, the iron road followed the army. Heavy rains now turned the roads into quagmires and movement was slow and difficult. The Turks launched several attacks on the Allied positions on the main motor road to Damascus. By degrees the front was pushed ahead; by 5 Jan. 1918 already 13 miles had been covered; the Turks had a base at Nablus (the ancient Shechem), about half-way on the road to Nazareth. Allied aircraft bombèd the base and behind it, causing much damage. Further progress was made in the middle of February when the operation was extended eastward toward Jericho and the Hedjaz Railway. During the previous month the Allied Araba had been operating successfully along that railroad; under the leadership of the “mysterious” Colonel Lawrence they attacked and defeated a large Turkish force at Maan, 120 miles southeast of Gaza, on 10 Jan. About 700 Turks were reported killed, 650 captured and several guns taken. By this battle the Araba gained control of a line from Maan to Akaba, the port at the head of the Gulf of Akaba, whence the Egyptian frontier line runs almost straight across Sinai to Rafa. East of the Jordan lay strong divisions of Turks, whose communications were continually harassed and pillaged by elusive bands of Arabs. Allenby began a drive eastward on a 15-mile front to the Jordan Valley, 19 Feb. 1918. The Turks resisted resistance and within two days a detachment of Australians rode into Jericho. The aim was to drive the enemy across the Jordan and to seize the crossings, in order to prevent them from raiding the country west of the Dead Sea. It was also desirable to gain a point of departure for operations eastward, to pass over north of the Dead Sea with a view to interrupting the Turkish line of communication to the Hedjaz, in conjunction with the Arab forces based on Akaba. Amman, a station on that railway, was
to be the first objective. The difficulty of the ground was a greater obstacle than the enemy's opposition, which appeared to weaken with the discouragement of frequent defeat. Of deadly machine-gun fire there was ample for the Allies to face; it was the cold steel assaults that inspired most respect. Aeroplanes scouted high over the Jordan Valley and the shores of the Dead Sea, dropping bombs on El Kerak, on the eastern side and on sections of the railway. On 1 March Allenby's left moved northward on Shechem, where a big tributary of the Jordan, Wadi Auja, lay in the way. The rocky defiles of the Robbers' Valley concealed numerous machine-gun nests. After storming the height of Tel Asur British troops crossed the Wadi Auja on the 9th while the foothills overlooking the Plain of Sharon and along the coast were partially cleared. On the banks of the Jordan a two weeks' fight for the Ghoraniyeh bridge ended by the Turks blowing it up. Allied engineers threw bridges across the river and toward the end of the month a sudden raid was made through the mountainous region on the east upon Es Salt, which was strongly held by Germans and Turks. Many of the troops had to swim across the Jordan in the night at certain parts of the river, while some were able to use the bridges in face of fire and a strong current. Es Salt was found to be evacuated on 25 March; Australians and New Zealanders advanced beyond and reached the railway line, where they were able to carry out some demolition before enemy reinforcements compelled their withdrawal back to the Jordan.

Except for a garrison left on the east bank to hold a bridgehead, all the Allies were back across the Jordan by 2 April. The Turks now returned from the east and reoccupied a strong position at Shunet Nimrin with some 5,000 men, about 10 miles from the river. An attempt was made to cut off this force by a roundabout movement to the north of it, to retake Es Salt and hold it if possible till Feisul with his Arabs could come up from the south. The Arabs, as already stated, had their base at Akabah. In January 1918 the Turks captured the high ground about Ubeida, within seven miles of Maan; while another Arab force had seized the whole of the Hish Forest up to and including Shobek, 20 miles north by west of Maan, and destroyed some of the enemy's light railways, along which they had transported wood for their locomotives. Still another Arab patrol raided Jauf ed Derwish, a station 30 miles north of Maan, which they held for three days, during which they burnt the building and destroyed some rolling stock. In these operations the Turks lost a number of killed, prisoners and guns. Another band of Arabs captured Tafile at the south end of the Dead Sea in January, where the Turks surrendered. On 26 January a strong Turkish force attempted to recapture Tafile, but was driven back with severe loss, over 450 killed and 300 taken prisoners. In March they returned, accompanied by German infantry, when the Arabs retired.

The raid on the Shunet Nimrin position commenced in the morning of 30 April; the advanced works were captured, but a strong resistance rendered it impossible to go farther for the moment; the enemy sent round north of the place an attack at their destination and took Es Salt, where an Australian brigade was left. This body was attacked and separated by Turkish cavalry on 1 May and one section was driven back through the foothills to the Wadi el Abiad, abandoning nine guns and part of their transport. Those of the Australians left in Es Salt were now cut off with but little line of retreat or supply till the main road could be opened by the capture of Shunet Nimrin. A combined Allied attack on this position began on 2 May, but at the same time two Turkish battalions with heavy guns arrived at Es Salt and made a desperate attempt to overcome the Australians there, though without success. To ward off this blow the force for Shunet Nimrin had to be weakened and called off, as Turkish reinforcements were approaching. Arab assistance had been expected, but it did not materialize in time. The Australians withdrew from Es Salt, closely followed by the enemy, who, however, was held off without difficulty and all the Allies got safely back over the Jordan by 4 May. Meanwhile, great efforts were made on the Western Front for the last mighty effort, and troops were collected from every available theatre of war to assist in striking the final blow. Little as they could be spared, men were sent from Syria to France; the reorganization of the forces prevented further operations on any large scale beyond a policy of active defense. Divisions were withdrawn from Palestine and Mesopotamia, also nine Yeomanry regiments, five siege batteries, 10 British battalions and five machine-gun companies; all embarked for France. These were replaced by Indian cavalry regiments from France and native battalions from India. During May, 14 British battalions more were withdrawn for France, with only two Indian battalions to replace them. During June, July and August more men arrived from India. While all this shifting had been going on, the enemy had not been neglected; many raids took place. But the Turks had received a considerable "stiffening" of German troops, and their resistance grew stronger by degrees. Advance was made on the British left along the coast in June in a series of minor battles and daring raids. The Indian troops were admirably adapted for this style of warfare, Pashans, Sikhs and well accustomed to playing themselves in stealthy approach and sudden pouncing upon the enemy lines. During the summer an event of considerable importance had happened far behind the Palestinian front; an iron swing bridge across the Suez Canal had been completed at Al Kantara (Arab, "the bridge"), thus establishing direct railway communication between Cairo and Palestine—for the first time. This very modern link between the land of the Pharaohs and Judea facilitated rapid transport of troops to the fighting line. On 27 May 1918 the last tremendous German offensive began in France; the Germans were at the height of their great sweep toward Paris when, on 13 July, the Turks emulated the example of their allies by making a most determined attack to crush the Jordan crossings and recover Jericho. They made some progress at first, but on the next day the Australians counter-attacked and restored the position, capturing many Germans including 12 officers and 120 men of the place. A strong Turkish force concentrated on the east of the Jordan was surprised in a dash charge
WAR, EUROPEAN — TURKISH CAMPAIGNS (9) 419

by the Jodhpur (Indian) Lancers and sought safety in flight.

During all this period the Arab allies were busy harassing the Turks along the Hedjaz Railway, not permitting the latter to restore communication between Maan and the north. South of Maan, a detachment of the Imperial Camel Corps attacked and captured the station at Kalaat el Mudawara, destroying the water tower and pumps, with the result that no water was now, to be had for a distance of nearly 100 miles south of Maan. Maan was distinctly cut off from the north. Since the declaration of their independence the Arabs had cleared the Red Sea coast of the enemy for 800 miles and disposed of 40,000 Turkish troops.

In order to keep the narrative abreast with the events, we must now direct our glance to Mesopotamia, where we left the British in possession of Baghdad under the command of the new generalissimo, Sir W. R. Marshall. If one will consult the map of the Ottoman Turkish Empire and observe the relative positions of Baghdad and Jerusalem, the whole strategy of the two commanders is at once apparent. They are working along on parallel lines. The Neftush was the old Desert stretched between them. Follow the two lines upon the map and it will be seen at once that the junction where the two armies—provided they are successful—must eventually meet is the ancient city of Aleppo, outside the northwestern rim of the desert. The last important action under General Maude was the surprise and capture of Ramadi on 28 Sept. 1917. The Anglo-Indian force which accomplished this exploit was opposed early in October by other Turkish forces northeast of Ramadi on the Jebel Hamrin hills on the Euphrates side of Mesopotamia. On the Tigris side of the country the enemy was entrenched up the river above Bagdad in front of Daur, his left wing stretching across to Ramadi. Marshall was sent to expel the Turks from their forward position on the right bank of the Diala and to hold them in front while a main attack was delivered against their left flank. The plan succeeded; the enemy was driven back several times, owing to the low water of the Diala at the time, most of the Turks made their escape and got over to the right bank. In the middle of October a Turkish army corps undertook a counter-demonstration, advanced eight miles north of Samarra and entrenched. These operations, begun under General Maude, were continued by Marshall toward the end of November, when the Diala was forced by night and the whole position between Mirjana and the Nahrin occupied on 3 Dec. 1917. An infantry brigade meanwhile advanced along the Jebel Hamrin and drove the enemy toward the Sakaltutan Pass and Nahrin River; another infantry brigade cleared Khishla Subhiani, occupied the pass after the Turks withdrew in the night, and on 5 December a combined column pushed forward against Kara Tepe, carried the position next day and put the Turks to flight. Prisoners were taken and the objects of the operation were accomplished by the British. In this engagement a Russian detachment co-operated. Khanakin was occupied by the Allies on 9 December, and the next two months were mainly devoted to consolidating positions and constructing bridges across the Euphrates, to which side of Mesopotamia the next main attack was to be transferred. On 9 March 1918 a surprise assault on Hit, in the centre of the oil country, was entirely successful, while a dashing cavalry coup netted 3,000 prisoners. The next place to fall was Khan Bagdadie, some 22 miles northwest of Hit; pursuit was kept up till the rains intervened; by the first week of April over 5,000 prisoners were taken. At the end of the month the advance was resumed up the road to Mosul. The Allies were now half-way between Bagdad and their goal at Aleppo. The Turks kept on the move, harassed by cavalry which swept up large numbers of prisoners. Numerous minor operations were in progress during all the time.

German emissaries were busy stirring up certain tribes on the Persian border with gold and promises, notably some sections of the Sinjabis. With the assistance of some friendly tribes a small British column fought a brief action with the Sinjabis, defeating them with heavy loss (25 April 1918). The result of this little battle was useful, for the pro-enemy chief of the Sinjabis (who was known to be in German pay) was himself wounded. The German agents fell into discredir; a profound impression in favor of the British was created among the surrounding tribes, and the line of communication into Persia was safeguarded from serious raiding.

Little by little the Mesopotamian columns pushed ahead, fighting many engagements, dislodging the enemy from inconvenient positions and securing control of roads, rivers, ravines and natural fastnesses. Substantial gains were made during May along both the Tigris and Euphrates, while Allenby was slowly forging ahead on the other side of the desert. Each commander met with checks and minor reverses; wherever an effort failed, a repeated attempt rarely proved unsuccessful. All strategic movements were but preliminaries to the great decision. As the Allies advanced, the Turks time and again retired after an engagement or evacuated positions without excessive resistance. In this manner various places were occupied by the Allies. To add to the difficulties famine stalked among the civilian populations along the route, necessitating a combined campaign of fighting with the enemy and alleviating suffering. Cleaning up indescribably dirty towns and introducing the elements of sanitation was yet another of the many tasks to be faced. It must be remembered that during the summer of 1918 there were still some Russian troops in Persia who had not yet shared the general demoralization of their brethren in Europe. Persia was relapsing into anarchy and the Russians were retreating to the Caspian. Urgent calls came to Marshall to send troops into the country, where famine also prevailed. Mr. and Mrs. Stead, two American missionaries, were engaged in strenuous relief work in the neighborhood of Kermanshah. At the end of May General Marshall dispatched troops in automobiles as far as Kasvin to take over that place from the retreating Russians. Though a mere side issue, this was an operation of considerable difficulty and magnitude. The Allied mission under General Dunsterville arrived at Kasvin on 1 June 1918; on the 8th the Russians stationed there marched away for Enzeli to take ship thence for Baku. A small British detachment accompanied them. On reaching Mandjil three days
later they found the bridge at that place held by a native tribe called the Jangalis, with whom were several German officers. After a vain effort to parley on the part of the Germans, the Russians attacked assisted by British light armored cars, captured the bridge, and moved on to Resht and Enzeli. During July some street fighting occurred in Resht when a small detachment of Anglo-Indian troops were attacked by the Jangalis. About 100 of the latter were killed, when the tribe made an agreement not to attack any further. At this time the government of Baku (on the Caspian) was Bolshevik, and strongly opposed to British intervention. Actions were fought near the port between Turks and Tatars on one side and Russians and Armenians on the other. On 20 July the Bolshevik government was overthrown and its place taken by a Centro-Caspian Dictatorship. The latter at once applied to the British for aid, but before it could arrive the Russian commander who had brought his men from Persia had marched Baku and taken control again along the Caspian. On 4 August a small mission of British officers with one platoon as escort arrived at Baku, where they received an ovation on marching through the town. The Turks attacked Baku the next day and were driven back with many losses. More British reinforcements continued to trickle into the town and took over portions of the defenses. General Dunsterville tried to rouse the population into an energetic mood, but they seemed to think it was no longer necessary for them to fight now that the British had come. Twice toward the end of August the Turks attacked Baku with artillery and bayonet charges, opposed at first only by a handful of British troops and Armenian irregulars. On 14 September the Turk returned to the attack with considerable reinforcements. They scaled the heights and had nearly succeeded in taking the town when a counter-attack by Russians, British and Armenians held the fort for a while; the Turks lost all their officers and the Armenians were overcome. The weak British force could do little more, so it was decided to withdraw them on three vessels which had been earmarked for their use. The town was at the mercy of the enemy, who occupied all the high ground and could shell the harbor at 3,000 to 5,000 yards. The Baku government was informed of General Dunsterville's decision; the sick and wounded were carried on board in the evening and at 10 o'clock the three ships got under sail without lights closely followed by another in which it had been possible to collect ammunition and explosives. This latter vessel was struck by gunfire from the guardship at the mouth of the harbor, but the others slipped away unscathed, and all four arrived safely at Elbasan. The British detachment had held the Turks out of Baku for six weeks; the latter were obliged to bring up large reinforcements before they could capture the place.

We must now cast a brief glance over Northern Persia. Torgut, the British detachment had held the Turks out of Baku for six weeks; the latter were obliged to bring up large reinforcements before they could capture the place.

Turkish division. Later, in Cilicia, a few thousand Armenians near Zeitun fled into the mountains and struggled against an army of Turks for over 40 days. They managed to reach the Mediterranean Coast, whence they were picked up by a cruiser. Later, they went to Egypt, where they enlisted in the British and French armies. In the Caucasus the Armenians contributed in no small measure to the defeat of the Turks in the early stage of the war. At Joppa on the coast of Syria, in the opening part of the campaign. After the Turks had surrendered, General Liman von Sanders expressed the opinion that their collapse was due to the fact that the Turks, against my orders and advice, sent all their available forces to the Caucasus and Persia, where they fought the Armenians. Kerensky said on 20 Aug. 1918 that, of all the races of the Caucasus, the Armenians alone stuck to their posts, organized volunteer forces and by the side of their Russian comrades faced the formidable assaults of the enemy, and turned his victorious march into a disastrous rout. During the war the Turks launched five separate offensives in the Caucasus; four of these were defeated mainly by the Armenians in the north, in the south the Russians who were chiefly responsible for victory were commanded by an Armenian general, Nazarekoff. On 3 Oct. 1918 Lord Robert Cecil wrote that the service rendered by the Armenians to the common cause can never be forgotten. After the Russian Caucasian Army of over 200,000 men abandoned the country they left 30,000 Armenians facing nearly 7,000 Turks. An arrangement between the Caucasian Armenians, Georgians and Tatars lasted only a few weeks, for in May 1918 all the three races declared their respective territories as independent republics. The Armenians, however, were soon called to fight for their independence, for the Turks sent large armies against them. In two fierce encounters the latter were routed with enormous losses and were glad to negotiate for peace, the preliminaries of which were signed on 4 June 1918. This treaty was not ratified, and the war continued for bloodshed, rape, and centuries of oppression.

The multifarious fighting, skirmishing and manoeuvring for positions which took place during the summer of 1918 have been touched upon; they form the overture to the sensational drama that was shortly to be enacted. Three years before there had been a subsidiary operation on the banks of the Suez Canal and an unheralded landing at the head of the Persian Gulf. Against innumerable difficulties and in the face of numerous setbacks, the Allies had slowly crept across the Sinai Peninsula and up along the Syrian Coast on the one part, and up along the banks of the Tigris and the Euphrates on the other. Like an insidious fatal disease, the great wave was slowly but relentlessly works its course up to the heart, so the British and Allied detachments had gradually worked upwards from the lower extremities of a diseased and decrepit polity, laming its members. The next advance was necessary, hence the retreat along the coast would enable the cavalry to pass through the hills of Samaria into the plain of Esdraelon at their narrowest point, thus ensuring greater speed and less likelihood of being checked.

The Turks had constructed two defensive
systems on a 10-mile front along the coastal plain at Jiljulieh, the ancient Gilgal. The first, 14,000 yards in length and 3,000 yards deep, ran along a sandy ridge in a northwesterly direction from Bir Adas to the sea, and consisted of a series of works connected by continuous firing trenches. The second, or Et Tirim system, 3,000 yards in the rear, ran from the village of that name to the mouth of the Nahal Falik. The ground on the enemy's extreme right was marshy and could be crossed only in few places. The terrain favoring the Allied out line and the Turkish defenses was open and could be overlooked from the enemy's works on the foothills round Kefr Kasim. By reducing the strength of his forces in the Jordan Valley and withdrawing his reserves from the hills north of Jerusalem, General Allenby concentrated five divisions and the French detachment, with 383 guns, for the attack on these defenses. In addition, two cavalry and one Australian mounted divisions were available for this front. All these forces were to attack from east to west along the front of attack represented 35,000 rifles against 8,000, and 383 guns against 130.

In order to prevent the Turks from discovering the decrease in strength in the Jordan Valley, a series of demonstrations were carried out by the forces of Australia, New Zealand, Indian and English troops to induce the enemy to believe that an attack was coming east of the Jordan, either in the direction of Mafeda or Amman. A mobile column of the Arab army was meanwhile assembling at Kasr el Azak, 50 miles east of Amman, accompanied by British armored cars and a French mountain battery. The real objective of this column was the railway north, south and west of Deraa. It was hoped that the demonstrations just referred to would enable the Arab concentration to pass unobserved. The concentration on the front of attack was carried out by night, and every precaution was taken to prevent any increased movement becoming apparent to the enemy. The many groves round Ramleh, Ludd, and Joppa were utilized to conceal troops during the daytime, though the chief factor in the secrecy maintained was the supremacy in the air which had been won by the Royal Air Force by continual wearing down of the enemy's aircraft throughout the summer. During one week in June 100 hostile aeroplanes had crossed the Allied lines; during the last week in August the number had decreased to 18. Several were shot down within the next few days, with the result that only four machines ventured to cross the line during the period of concentration. While the concentration was nearing completion the enemy's railway communications at Deraa were attacked by the Royal Air Force and by the Arab army which had moved into the Hauran. The line and station buildings were damaged on 16 and 17 September; on the 16th the Arabs, who had been joined by several local tribes and some Druses, destroyed a bridge and a section of the line; on the next day extensive destruction caused the enemy to cut north and west of Deraa, thus cutting off all through traffic to Palestine. On the morning of 18 September all was ready for the stroke. During the night one corps swung forward its right on the east of the Birah-Nablus road and a division captured El Mugheir with stern hand-to-hand fighting. At 4:30 in the morning of 19 Sept. 1918 the artillery in the coastal plain opened an intense bombardment lasting 15 minutes, under cover of which the infantry left their positions of deployment. Two torpedo-boat destroyers sustained battering the coastal road to the north, clearing the way for the cavalry. The blow fell with such force that the Turkish line was completely broken in about four hours, fighting; the level plain helped to a rapid advance while the naval guns swept the roads. So swift did the Tokhil de moralization that the infantry was able, after marching five miles, to swing eastward at the railway junction and advanced base of Tul Keram, and capture it. In this direction disorganized bodies of the enemy were streaming in wild flight, pursued by the 60th division and the Australian Light Horse, with a composite regiment of Chasseurs d'Afrique and Spahis (Sepoys) attached. Turkish troops, guns, motor lorries and transports of every description were struggling to escape along the roads to Messudieh and Nablus. The confusion was added to by the persistent attacks of the English and Australian flying corps, which wrought great havoc. The British infantry covered 12 miles in half a day; through the broken line of the coast flying columns of cavalry passed to complete the rout and round up the surprised enemy. The Desert Mounted Corps crossed the hills of Samaria, entered the plain of Esdraelon at El Lejjun, seized El Afule and sent a detachment to Nazareth, the site of the Villette barracks. Sufficient troops were left at El Afule to intercept the Turkish retreat there, while the remainder of the corps rode down the Valley of Jerreel and seized Beisan. Another corps rode along the line Haleb-Tul Keram, through the hills and converged on Samaria and Attaro, sweeping the retreating Turks into the arms of the cavalry left at El Afule. This last-named place, south of Nazareth, contains the junction of the line from the port of Haifa connecting with the Jerusalem Railway. The Australian Light Horse had already cut the line at Aneba, west of Samaria. The whole region was thus surrounded; on the second day (20 September) no fewer than 18,000 prisoners, 120 guns, four aeroplanes and a large mass of war matériel and rolling stock fell to the victors. The scattered remnants of the Turkish army were endeavoring to cross the Jordan fords in the small section open to them, but were almost without roads to reach them. Those which fled north before the advancing infantry were rapidly gathered in by the cavalry, who had established themselves in Nazareth and Beisan by 20 September. The northward roads from Jericho and Jerusalem meet at Beisan, together with two others from the city of Samaria and from accroy. The cavalry driving down the Samaria highway reached and occupied Jenin, and thus blocked for the fleeing Turks another group of roads spreading fanwise toward the north. Other detachments in the vicinity of our enemy as were straggling in the direction of Damascus as far as Tiberias, Semakh, and Es Samrah on the shores of the Sea of Galilee. When the British cavalry reached Nazareth, the site of the enemy headquarters, fighting developed in the streets and some 2,000 prisoners were taken.
General Liman von Sanders had already made his escape, but his papers and some of his staff were taken. The enemy resistance was broken on 20 September; on the 21st the Turkish rear-guards were driven in. On the 22nd, the New Zealanders and British West Indies Battalions seized the bridge at Jiar ed Damieh, thus cutting off all hope of escape for the enemy in that direction. Early in the morning parties of Turks, numbering from 50 to 300, betook themselves to the Bekaa, waving the imperial Turkish flags. On the 24th the 20th Cavalry Corps met with occasional opposition, and its advance was hampered by large numbers of Turks who surrendered. Great quantities of transport and numerous guns were found abandoned by the roadsides. On a five-mile stretch of road 87 guns, 55 motor trucks and 842 vehicles were found. Part of the garrison of Haifa, which was attempting to reach Tiberias, was intercepted and attacked in moments by the 18th Lancers, who killed a large number and captured 300. While the Indian (Mysore) Lancers were clearing the rocky slopes of Mount Carmel the Jodhpur Lancers charged through the defiles and, riding over the enemy's machine guns and trench mortars, where a number of Turks were speared in the streets; 1,350 prisoners and 17 guns were taken. The small garrison of 150 men holding Acre attempted to escape, but was overtaken and captured. All the Turkish armies west of the Jordan had been accounted for and the terrain was cleared.

There yet remained the 4th Turkish army east of the Jordan, whose position was no longer tenable. By the morning of 23 September it was in full retreat on Es Salt and Amman, hotly pursued by the Anzacs and bombarded from the air. The New Zealanders captured Es Salt and 380 prisoners; Amman fell on the 25th. Those of the Turks who retired northward along the Hedjaz Railway and the Pilgrim route were harassed by aeroplanes and the Arabs, who had occupied Maan on 23 September. On the 28th these Turks fell in with British patrols at Lebanon station, 10 miles south of Amman; escape was cut off and 290 of the Turkish commander surrendered with 5,000 men.

The road to Damascus, the next objective, was now open. The Desert Mounted Corps was dispatched in two columns on 25 September to occupy the city and intercept the retreat of the remnant of the 4th Turkish army. The Australian Light Horse captured Samakh, south of the Sea of Galilee, on 24 September after fierce hand-to-hand fighting; they occupied Tiberias the following day. Two days later cavalry started from Haifa and Acre for Nazareth, for the route now led northeastward to Damascus. By the evening of 30 September, after considerable fighting all along the road, the Australians had closed the exits from that city, which was entered on 1 October amid scenes of great enthusiasm. Throughout the drive on Damascus the Arab Camel Corps formed the extreme right of the Allied advance, and the Arabs were the first to enter the city. After the city had been collected and guards had been posted, the British troops were withdrawn. The day before Damascus fell, the inhabitants were delighted to witness a brisk fight between Turks and Germans, provoked by excessive German demands for vehicles. Several were killed on both sides, and of many similar skirmishes between the Turks and their German allies evidence was forthcoming in the shape of numerous German corpses all over the city. The last of the imperial Turkish administration in 1917, was resumed on 5 October. A further act was the removal, by order of the Arab commander-in-chief, of the bronze wreath which the German Emperor had imposed upon the tomb of Saladin in 1898. The senior descendant of Saladin, Shukri Pasha El Ayyub, was appointed head of the Arab administration of Damascus. On 3 October the Shereef Feisul, commander-in-chief of King Hussein's northern army, arrived outside the old city which had once again passed into the power of his race. An automobile had been placed at his disposal, but Feisul, with a strong sense of the historical fitness of things, preferred to make his entry into Damascus much in the same manner as the Emirs of those Arabs who took Damascus in the 17th century, the Amorite Arabs who returned to it in the 19th century, the Aramean Arabs who set up their kingdom in Damascus in the 14th century B.C. Araras, king of Arabia, when he occupied the city in 84 B.C., and Khalid Ibn Walid when he stormed part of the city from its Byzantine garrison in 634. Thus the Shereef Feisul, accompanied by some 1,300 of his kinsfolk and adherents, entered Damascus at full gallop and rode furiously through the streets to the accompaniment of a cracking feu de joie and shouts of victory, a thrilling exhibition of the typical Arab la'ab el barud or "powder play." This proceeding undoubtedly impressed the inhabitants with the reality of his arrival far more vividly than would have an orderly procession of numerous battalions following upon the unimpressive passage of high-powered automobiles. French cavalry had meanwhile pressed on up the coast past ancient Tyre and Sidon to the Syrian port of Beirut. Tyre and Sidon enthusiastically received a division of Indian troops; they arrived at Beirut on 8 October, where they were warmly welcomed by the population, who handed over 660 Turks, including 60 officers. French and British warships entered the port on the 11th. Within a week Tripolis, the smaller port, had been captured together with its railway junction town, Homs. Baalbek was occupied by an armored car section on the 9th and took over 500 Turks who had surrendered to the inhabitants. From Homs the pursuit continued toward Aleppo, where some 20,000 Turks and Germans were reported. The 5th cavalry division and the armored car batteries were sent ahead, starting out on 20 October. On the night of the 26th the Turkish rearguard withdrew to a position near Deir el Jemel 20 miles northwest of Aleppo. By this time the Allies were in the city, 500 miles since the 19th of September, had taken 75,000 prisoners, including 200 officers and 3,500 men of German or Austrian nationality. About 360 guns had been captured, over 800 machine guns, 210 motor trucks, 44 automobiles, 3,500
animals, 89 railway locomotives and 468 carriages and trucks. The operations had extended over an area of 2,500 square miles. Aleppo fell on 20 October with little resistance. The much-praised 10th Indian Cavalry Brigade was left on the eastern side of the Persian Gulf and cut and in the hands of the Allies; the German commander of the Turkish armies in Syria had fled.

Things had meanwhile not prospered in the Turkish capital. Mustafa Kemal Pasha, renamed Vehbi, died on 3 July 1918 and had been succeeded by Wahid-ed-Din. The new ruler appeared to exercise more authority than his predecessor had been able to exert. Enver Pasha and Talaat Bey, the leading spirits of the Committee of Union and Progress, were at loggerheads and blaming each other for the country's misfortunes which neither could avert. German prospects of victory were vanishing in the West, while the blows administered in Syria and Mesopotamia were shaking the foundations of the Empire. Enver and Talaat both resigned on 10 October when their case was palpably hopeless and it became necessary to secure their own safety before the approaching storm.

A new cabinet was formed, but the situation was too serious to be restored by reshuffling the cards. The Turkish government appealed to President Wilson on 14 October to use his influence to secure a much-needed armistice. No answer was forthcoming.

For the last act of the drama we must again turn to Mesopotamia, where little had happened during the summer beyond the work of preparation and consolidation accompanied by occasional fighting. In this theatre of war an interesting side-light on the British character is afforded in General Marshall's Dispatch of 1 Oct. 1918: "The manufacture of prepared bitumen and lime continues at Hif [captured 9 March] on a large scale. Some 4,000 tons of bitumen and 5,350 tons of lime have been exported during the last four months, and it has been found possible, after meeting all government demands, to allow of private enterprise in this industry. . . . uninterrupted progress has been made in the opening up and development of the country. . . ." While Allenby was advancing on Aleppo, Marshall began to move in Mesopotamia. Operations were begun on 24 October with an attack on the strong Turkish position at Fathah, where the Tigris flows through the Jebel Hamrin. This was carried by Indian divisions on both banks of the river. By a ride of over 50 miles the 11th Indian Cavalry Brigade forced a crossing over the Lesser Zab in face of opposition, and by a further ride of over 50 miles got right around the Turks and astiride their lines of communication at Hurwaish, where they were joined by an armored car brigade. Out-maneuvered on the east bank and driven back on the west bank the Turks fell back to their second line at the confluence of the lesser Zab, a position of great natural strength. On 25 October another Indian division also forced a crossing of the lesser Zab and drove back to the opposite end of the Tighe river east of the river, while yet another Indian division closed up to the enemy who were now all on the west bank. Very severe fighting ensued; the hilly ground, indented with ravines and previously prepared for defense, was all in favor of the Turks, who fought with the greatest stubbornness. After continuous fighting the Turks were forced back on their third position on the hills covering Shergat, on the 27th. All that day Turkish reserves tried to break through the 11th Indian Cavalry Brigade, which barred the road to Mosul, but without success, though the arrival of enemy reinforcements compelled the brigade to draw back its right to cover its rear. On the night of 27–28 October two brigades of Indian cavalry and one infantry held the enemy, and on the morning of the 28th the Sherghat position was assailed. Though exhausted by their continuous fighting and marching through the rugged hills the Indians pushed forward and attacked until nightfall. The Turks were now fully hemmed in, and on the morning of the 30th General Ismail Hakki surrendered with his whole force, about 7,000 men. The victory was decisive; the enemy was broken in Mesopotamia as well as in Syria. Mosul, facing the ruins of ancient Ninevah, lay undefended, and Marshall entered it without opposition on 3 November. Toward the end of October General Townsend was liberated by the Turks and sent to inform Vice-Admiral Sir Somerset Gough-Calthorpe, that they wished to open negotiations for peace. Townsend carried out his mission with the result that Turkey surrendered unconditionally to the Allies on 30 Oct. 1918. The armistice convention signed on that day provided for the opening of the Dardenelles and the Bosphorus to the Allies; secure access to the Black Sea, and Allied occupation of all the forts lying along those two historic waterways. All Allied prisoners of war in Turkey were sent home and the empire handed over unconditionally to the Allies. The Turkish army was to be immediately demobilized except for such troops as were required for the maintenance of internal order. All war vessels in Turkish waters were to be handed over and interned. The Allies were to have the right to occupy any strategic points if necessary. Allied ships were to be given free use of all ports and anchorages in Turkish occupation and the denial of their use to the enemy. Wireless, telegraph, and telephone stations were to be controlled by the Allies, Turkish government messages excepted. All railways were to be placed under Allied control. Turkey was required to surrender all garrisons in the Hedjaz, Assir, Yemen, Syria, and Mesopotamia to the nearest Allied commander; all Turkish officers in Tripolitania and Cyrenaica to be surrendered to the nearest Italian garrison; while all Germans and Austrians, naval, military and civilian, were to be evacuated from the Turkish dominions within one month. Under these and a few minor conditions hostilities between the Allies and Turkey ceased at noon, local time, on Thursday, 31 Oct. 1918.

Little remains to be said. That war with Turkey ended with the complete and unquestioned triumph of sea power; the decisive factor was the hold of the Allied fleets on the Aegean and Eastern Mediterranean. The lesson is an old one—that he who commands the sea, can control the land; and only a Sea power permitted Maude, Allenby and Marshall to be supplied with men and material from India, where their transports and supply ships were beyond reach of the U-boats. After the failures at Gallipoli the operations against the Turks were directed toward Palestine and,
from the Persian Gulf, through Mesopotamia. The Turkish attempt upon Egypt was a feeble effort. Being deprived of sea communications, they only succeeded in bringing some 12,000 men up to the Suez Canal, an inadequate force that was easily repulsed. It was a different story when the British, having overcome the difficulties of the desert of Sinai by laying a railroad and a pipe-line bringing water from the Nile into Judaea, began an advance with their left flank supported by the naval forces of the Allies, and with the power of relieving successively upon Gaza, Joppa, Haifa and Beirut as sea-bases. Had it been necessary, there was yet another port at their disposal further north, that of Alexandria.

On 11 Nov. 1918 the appointments of Admiral Calthorpe as High Commissioner at Constantinople, and of Rear-Admiral Richard Webb as Assistant High Commissioner, were announced. On the same day the French destroyer Mangin and the British cruiser Erin entered the Dardanelles, from which the mines had been swept, and proceeded to Constantinople. Two days later, the Allied fleet, with Admiral Calthorpe’s flag in the Superb, passed through the Dardanelles Strait of the Gulf of Sismid. On 18 November, Admiral Ameer, commanding the French squadron in the Bosporus, was appointed High Commissioner of the French Republic to the Turkish government. By 5 December the Turkish vessels, including the Cebren, were interned.

Dardanelles Campaign.—The first Allied attack on the Dardanelles took place on 19 Feb. 1915 by a joint squadron of British and French battleships. Among the reasons which dictated this enterprise was the belief that a forcing of the Dardanelles, leading to the capitulation of Constantinople, would bring about an immediate collapse of the Turkish power, or at any rate of the German régime in Turkey. There was, furthermore, the great advantage, given success, of reopening the ice-free route to Russia through the Black Sea and of liberating the huge stock of grain that was lying idle in the ports of southern Russia. Britain and France undertook by this joint enterprise to force the Straits. Great Britain and France was an attempt to find a short cut which would at the same time have afforded a spectacular triumph. It is the essence of war to discover the weak point of the enemy and to attack that point in force. As it turned out, the Allies had chosen the strongest point in the Turkish defense, and the venture was in consequence a failure, for the project had not been carefully thought out and the preparations had been made in a hurry. After bombarding the fortifications protecting the straits for nearly two months it was decided that a naval attack alone could not hope to force a passage, and that troops would be necessary to obtain military command of both shores. Once that lesson was learned, preparations were undertaken for a combined naval and military attack. As it happened, the British had carried out a long-range bombardment of the forts at the entrance to the straits so early as 3 Nov. 1914, which had done appreciable damage and only served to put the Turks on their guard. Between that day and 19 Feb. 1915 no further offensive operations were undertaken in this theatre of war beyond seizing the island of Tenedos. The Turks, therefore, had plenty of time with German aid to put the straits into a strong state of defense, if, indeed, they were not already in that condition before the war broke out. Even so, the Allies did not know in April 1915 how near they were to success; that the Turks had only a few shells left and were getting ready to evacuate the peninsula. The abortive naval attack is described elsewhere in this section under Naval Operations.

Though the Allies made a secret of their intentions to dispatch an army to Gallipoli, the enemy appeared to be well aware of the fact, for considerable efforts were made to intercept the troops during their transport. A Turkish torpedo-boat fired three torpedoes at the transport Mambow, all of which missed; about 50 men from the transport were lost, owing to the capsizing of a boat in the water, but the British cruiser Minerva and some destroyers chased the Turkish vessel, ran her ashore and destroyed her on the coast of China. On the same day the British submarine E-15 ran ashore on Kepez Point about 10 miles inside the strait and the crew were captured. To prevent the submarine from being of service to the enemy, two pique boats from H.M.S. Triumph and Majestic, manned by volunteer crews, ran the gauntlet of a very heavy fire and got near enough to the submarine to torpedo it and render it useless. The boat from the Majestic was sunk, but the crew were saved by the other boat, and the exploit ended with only one casualty. Gen. Sir Ian Hamilton was appointed to the command of the military part of the expedition. He left London with his staff on 13 March 1915; traveling in a special train via Marseilles he reached the base at Tenedos on the 17th, the day before a great naval attack by the entire fleet was to take place. Hamilton witnessed the bombardment and then cabled to London his reluctant deduction that the whole of the troops under his command would be required to enable the fleet effectively to force the Dardanelles. The British Cabinet accepted this decision. Hamilton had arrived at the conclusion, after sailing along the outward shores of the peninsula, that the landing was too hazardous at the extreme southern point. He ordered nearly all the transports to proceed to Egyptian ports, where he would be able to work out in detail their distribution for the projected landing. He was accompanied by General d’Amade, commander of the French expeditionary force. The generals were convinced that, while landing-places were few and difficult, it was essential to land at several of these at once, and to threaten to land at others, to act by way of surprise and to wait for favorable weather. The last consideration involved delay until near the end of April. During the afternoon of the 24th the troops which had then arrived at Tenedos were transferred to the warships and fleet sweepers, on which they were to approach the shore; they started off about midnight, the landing being planned to take place at five different spots early in the morning after a half-hour’s bombardment by the warships.

The principal element of the campaign are personnel and geography—the men who do the fighting, and the place they have to fight in; everything depends upon these two factors. The British commander, whose biography appears elsewhere in these volumes, had served
with distinction for nearly 40 years in every British war and had been a spectator in the Russo-Japanese War of 1904-05. The French commander, General d'Amade, had had a distinguished military career in North Africa, Madagascar and Tonkin, and won the Western Front in 1914. The Turkish commander was the German Gen. Liman von Sanders, former chief of the Military Mission at Constantinople. He was appointed to the Dardanelles forces or 5th Army on 29 March. The Allied expedition, in the words of General Hamilton, was "drawn from all parts of the French Republic and of the British Empire." The bulk of the force was provided by Great Britain, for the French military authorities decided not to detach even a single division from the main theatre of war in order to take part in subsidiary operations. They had none too many men to guard the long Western Front, but they could draw upon forces not belonging to the regular army—the Fusiliers Marins, the Armée Coloniale and the Foreign Legion; these three bodies furnished the French expeditionary

**MAP OF GALLIPOLI PENINSULA (DARDANELLES)**

---

Fusiliers and 1st Royal Dublin Fusiliers; the 87th brigade—2d South Wales Borderers, 1st King's Own Scottish Borderers, 1st Royal Inniskilling Fusiliers and 1st Border Regiment; the 88th brigade—2d Hampshires, 4th Worcesters, 1st Essex and a territorial battalion, the 5th Royal Scots. The cavalry consisted of a squadron of the Surrey Yeomanry; the artillery included two batteries of the 4th (Highland) Mountain brigade. There were also two naval brigades and a brigade of Royal Marines. Within easy call, stationed in Egypt, there was a large number of experienced Indian troops and a Territorial division in
training. Altogether, the expeditionary force consisted of about 120,000 men.

The geographical difficulties to be overcome by an army attempting the conquest of the Gallipoli Peninsula are tremendous. Constantinople, "the queen city of the earth," has been described as the most magnificent panorama of scenery in the world, but also with an impregnable bulwark against aggression from the west in the shape of the peninsula which guards the historic waterway known as the Dardanelles, the Hellespont of the ancients. From the sea the peninsula appears to rise abruptly out of the blue waters of the Aegean Sea. The Gallipoli shores are steep—though not high—bluffs, only broken here and there by ravines marking the beds of water courses. The peninsula is a tableland 32 miles long, varying in breadth from three miles to 12, and presents a sinuous shore line of over 150 miles. A limited number of small coves afford facilities for landing, but each of these coves is commanded by one or more adjacent bluffs, in other words, controlled by gunfire. The only exception of any consequence is Suvla Bay, on the western side, where the shore is flat, but also overlooked by hills from both sides and from the sea; the hills have been wholly eliminated, as any landing would have to be made in full view of the enemy and within reach of his guns. The country is a mass of rocky ridges rising to a height of over 700 feet from the sea; the hills are steep and sharply cut that to reach their tops in many places is a matter of sheer climbing. There is little cultivation, only a few villages, and no properly constructed roads, while most of the land is covered with dense scrub from three to six feet high, with stunted forests in the hollows. Methods of communication are so primitive that the usual way from one village to another is not by land, but by boat along the inner or outer coast. There are two groups of forts. The first is at the entrance to the north side, Cape Helles and Sedd-el-Bahr, with a few adjacent batteries; on the opposite shore, Kum Kale and Orkanieh. These forts were not heavily armed, for in any case they would be at the mercy of the gunboats. The second group of forts from heavy battleships at sea. As a matter of fact, these forts were but the outposts of the real defense, and that was situated some 14 miles up the straits to where the width is less than a mile, and no great battleship could get so far as this without running considerable risk. Here, within a distance of a few miles there is a sharp double bend, from where guns command the whole water area and can also direct their fire end-on against vessels attempting to make the passage. This constricted part of the Dardanelles is called the Narrows, and around here lie the forts of Chanak or Sultanieh Kalessi, on the Asiatic side, and Kilid Bahr on the European shore, above which the slopes bristled with batteries commanding every angle of approach. Batteries lined both sides of the low ground from Chanak up to Nargara, both on the Asiatic side. In addition to the important role of a number of ships maneuvering in so small a space, the invisible danger of submarine mines, plus a number of torpedo tubes mounted in concealed positions, and a land torpedo is a more powerful missile than that discharged from a ship, while its aim can be more accurate. Furthermore, the descending current could be employed to carry drifting mines to meet the advancing fleet. Altogether, the Gallipoli Peninsula and the hill country on the Asiatic side presented two tremendous fortresses manned by powerful armies, estimated at between 200,000 men. The forts in the Narrows mounted 14-inch Krupp guns, a number of 11-inch guns, and lighter ordnance from six to nine-inch, while the outer forts had some 10.2-inch artillery, besides field howitzers. During the winter Krupp shells had been accumulated in Constantinople in preparation for the attack which the Turks expected. It would perhaps be more correct to say the Germans expected, for they were the directors of the Gallipoli defense. It was small wonder, then, that the Allied fleets found it a hopeless task to force a passage through the straits without the assistance of a land force, which must first overcome the interior forts and silence the batteries before vessels could penetrate. Mr. Henry Morgenthau, the American Ambassador in Constantinople at the time, has recorded the wild fear that prevailed in that city during January 1915 that the British navy might force the Dardanelles before the naval campaign of the Allies had begun. Both Turkish and German authorities confessed their belief to the Ambassador that the straits could be forced if the British were prepared to lose a few ships and to Talaat Bey, the Turkish expedition to Egypt, which ended so ignominiously in failure, was undertaken merely to divert England from making an attack on the Dardanelles. In the middle of March, just before the close of the Anglo-French naval bombardment of the Gallipoli forts, all arrangements had been made in Constantinople to move the government, banks, archives, women and children over to Asia Minor; moreover, cans of petroleum had been placed to fire the city—soon as the British should appear in the Sea of Marmora, and a special point had been made of preparing to dynamite the famous mosque of Saint Sophia to prevent its falling back into the hands of the Christians. On 18 March at 05.30 a.m. the Allied bombardment had occurred; the same evening General Mertens, the German chief technical officer in the Dardanelles, told an American correspondent that he expected the British back next morning early, and if they came, he expected to be able to hold out for a few hours only. But the Allied fleet did not return until it was too late. From a military point of view, there should have been a renewal of the naval attack on effective lines, or the whole Gallipoli project should have been given up, for a preliminary naval success alone could render military co-operation advisable.

General Hamilton had picked out six spots round the southern point of the peninsula to land his troops. Two faced the straits to the others the open sea. These landing places or "beaches" were designated by letters of the alphabet for want of distinct geographical definitions. Inland from these beaches the Turks had constructed a vast network of trenches and barbed-wire entanglements, which were plainly visible from the ships at sea. The two spots facing the straits were (1) a sandy beach inside Sedd-el-Bahr about 300 yards across,
facing a semi-circle of steeply-rising ground, designated Beach V; and (2) a small beach by Eski Hisarlik, on the east of Morto Bay, designated Beach S. The others were (3) a small sandy beach just south of Tekke Burnu, designated Beach W; (4) half a mile north of this, another small break in the cliffs, Beach X; (5) two miles further up the coast the mouth of a small stream indenting these cliffs, Beach Y Z; with another, one mile and a half up a scrub-covered gorge which looked as if active infantry might be able to scramble up on the heights, Beach Y. The next (6) was about 12 miles farther up, above Gaba Tepe. As already mentioned, the troops set out from Tenedos on 24 April 1915 and were to be landed early in the morning of the 25th. The landing was begun at 4:20 A.M. Two main landings were to take place — the first at a point just north of Gaba Tepe, the second on the southern end of the peninsula. In addition a landing was to be made at Kum Kale (a promontory on the Asiatic shore), and a demonstration in force to be carried out in the Gulf of Saros (Xeros) near Bulair. The night was calm and very clear, with a brilliant moon, which set at 3 A.M.; the battleship Osmanische, Lord Anson, and Wels were to land the troops north of Gaba Tepe, while the battleships Triumph, Majestic and the cruiser Bacchante were to cover the landing by gunfire. In this landing a surprise was attempted. There was no sign of life on the shore; a thin veil of mist hung motionless over the promontory; the sea was as smooth as glass. As soon as it was light enough (5 A.M.) a violent bombardment of the enemy’s defenses was begun. Meanwhile the troops were being rapidly transferred to the small boats in which they were to be towed ashore. Not a move on the part of the enemy; and except for a few shells thrown from the Asiatic side of the straits the guns of the fleet remained unanswered. The tows drawing the troops to the Gaba Tepe landing failed to maintain their exact direction and landed the men more than a mile north of the spot selected. The boats approached the land in silence. The Turks were close to the shore before the enemy stirred. Then, suddenly, about a battalion of Turks was seen running along the beach to intercept the line of boats. Not a word passed among the invaders — all remained perfectly orderly and quiet in the boats awaiting the enemy’s fire, which soon opened and caused many casualties among helpless targets. The moment the boats touched bottom, the Australians leaped ashore and went straight for the enemy with fixed bayonets. So vigorous was the onslaught that the Turks made no attempt to withstand it and fled from ridge to ridge pursued by the 3d Australian brigade. The 1st and 2d brigades came shortly after and were disembarked by the same method. By this time the 12,000 men and two batteries of Indian mountain artillery had been landed. The disembarkation of more artillery was delayed, owing to the enemy’s heavy guns firing on the anchorage and from the transports lying further out to sea. The wild, rough nature of the ground, the necessity for sending any formed detachments as quickly as they landed to the critical point of the moment, and the headlong valor of the scattered groups who had pressed farther inland than was intended, all led to confusion and mixing up of units. Eventually the mixed crowd of fighting men, some advancing from the beach, others falling back before the oncoming Turkish supports, solidified into a semi-circular position with its right about a mile inland and its left out on the high ground over Fisherman’s Hut. During this period parties of the 9th and 10th battalions charged and put out of action three of the enemy’s Krupp guns. Meanwhile, the dispersion and reorganization of the units, thus making any advance impossible until that could be done. On the night of 2 May an effort was made to seize a commanding knoll in front of the centre of the line, but the enemy’s machine guns were too scientifically placed, and 800 men were lost without advantage beyond the infliction of a corresponding loss to the enemy. An attempt to seize Gaba Tepe on the 4th also failed, owing to the intolerable maze of barbed wire. The Turks also lost heavily; some 24,000 men were constantly kept fighting, many being killed and wounded by the Australian snipers. The scene of this particular landing of the Australians and New Zealanders has since become known as “Anzac Cove.”

The first troops landed at Y Beach, the next, the King’s Own Scottish Borderers, landed down the coast on the Gulf of Saros. These troops arrived in and to battleships and transports off Cape Tekeb. At 4 A.M. they approached in the boats covered by fire from H.M.S. Goliath. The landing was successfully and expeditiously carried out, the troops gaining the top of the cliffs overlooking this beach without being opposed, a piece of good fortune due to the well-placed fire from the ships. They were followed by the Plymouth Battalion Royal Marines, who met with severe opposition on the top of the cliffs, while fire from covering ships was of little assistance. After heavy fighting they were forced to re-embark on the 26th. The landing of the 2d Battalion Royal Fusiliers at Beach X was met with heavy fire from the cliffs on both sides, the Implacable 2d C.M., by which the Impregnable had reached the beach. The men were all landed by 7 A.M. An hour later the Euryalus approached Beach W and the Implacable Beach X, subjecting both spots to a heavy fire and bombing, which continued until the last moment before landing. But the fire did not have the expected effect on the wire entanglements and trenches, for the troops encountered a withering fusillade from rifles, machine guns and pom poms, and found the obstructions on the beach undamaged. The
Lancashire Fusiliers rushed some Maxim guns cleverly concealed in the cliffs, but suffered heavy losses in taking possession of the beach and its approaches. The W and V beaches were the only two of any size in this area on which troops, other than infantry, could be landed, and failure to capture Beach X might have proved serious consequences, as the landing at V was held up. Turkish snipers swept the shore and a fierce infantry battle was carried on around it throughout the entire day and the following night. The boats' crews also lost heavily and had not the satisfaction of being able to return the fire. During the night of April 25-26 the enemy attacked continuously, and it was not until the afternoon of the 26th, when Beach V was really captured, that the British position on W was secured. Beach V caused the most trouble, for its flanks were strongly guarded by the old castle and village of Sedd-el-Bahr on the east and perpendicular cliffs on the west, while its whole foreshore was covered with wire entanglements. As at all the others, the first landing here was made in boats; but the experiment was tried of landing the remainder of the covering force by means of a collier, the River Clyde, which had been specially prepared for the occasion by having large ports cut in her sides, and gangways built whereby the troops could reach the lighters which were to form a bridge to the beach. The same as W, Beach V was heavily bombarded, with a similar result, namely, that the defense was not put out of commission. When the first troops attempted to land they were met with a murderous fire from rifles and machine guns, which was not opened until the boats had cast off from the steamers. Nearly all the men of the first trip were killed or wounded; a few managed to find slight shelter under a bank on the beach; one boat entirely disappeared and in another there were only two survivors. As soon as the boats had reached the beach the River Clyde was run ashore under a violent fire towards the eastern end where she could form a convenient breakwater during future landing of stores and other supplies.

As the steamer grounded, the lighters which were to form the bridge to the shore were run out ahead of the collier; but they failed to reach proper stations, and a gap was left between two lighters over which it was impossible for men to cross. Some attempted to land by jumping from the lighter which was in position into the sea and wading ashore. This method proved too costly in life, the lighter being soon heaped with dead; the disembarkation was ordered to cease. Commander Unwin, R.N., with a handful of midshipmen and sailors left the River Clyde and, standing up to their waists in water under heavy fire, got the lighters into position. Though the bridge to the shore was now passable, it could not be used; any one appearing on it was instantly shot down, hence the troops remained on the steamer till dark. A launch and a dozen men from the crews from the warship Albion attempted to complete the bridge next morning, but the Turkish fire rendered the undertaking impossible, and the work was finally carried out in the dark. No more troops were landed on Beach V, and those originally intended for this spot were diverted to Beach W. Some of the troops, as already mentioned, found shelter of a precarious nature on the shore, whence they could not emerge as the Turks directed an uninterrupted fire against their cover. For a whole day they lay hidden; the warships and some Maxim mounted in the River Clyde did their best to keep down the enemy's fire. Many heroic deeds were performed in rescuing wounded men in the water. During the night of the 25th-26th the men remaining in the steamer were able to land under cover of darkness and obtain some shelter on the beach and near the village of Sedd-el-Bahr, for the possession of which now began a most stubborn fight, which continued until the afternoon of the 26th, supported by gunfire from the Albion. When that vessel ceased fire the troops charged and stormed Hill 141, the capture of which effectively cleared the enemy from the neighborhood of Beach V, which could now be used for the disembarkation of more troops.

The detachment detailed for Beach S, at Eski Hisarlik Point, consisted of the 2d South Wales Borderers. Their landing was delayed by the current, but by 7.30 A.M. it had been successfully accomplished at the cost of 30 casualties. A half-company of Dublin Fusiliers had landed without opposition at Sedd-el-Bahr; they made several attempts to enter the village of that name, but were compelled to withdraw with heavy loss. On Beach S the Borderers and a detachment of the London Field Company (Royal Engineers) were landed in boats; little opposition was encountered, and the subsequent enemy attacks were easily repulsed with the aid of the covering ships. The landing at Kum Kale was undertaken by the French. This point is on the Asiatic side of the Dardanelles, and it was of great importance to prevent the enemy from occupying positions on this side, whence gunfire could be brought to bear on the transports off Cape Helles. After a strong preliminary bombardment the French began to land about 10 A.M., and by the afternoon their whole force was ashore. When they attempted to advance to Veni Shehr, their immediate objective, they were stopped by heavy fire from concealed trenches south of Kum Kale village. During the night of the 25th-26th the Turks made several counter-attacks, all of which were repulsed. During one of these fights 400 Turks were captured, their retreat having been cut off by the fire from the battleships. On the 26th, when it became apparent that no advance was possible here without entailing severe losses and the landing of large reinforcements, the order was given for the French to withdraw and re-embark. By the evening of 27 April the Allied forces had established themselves on a line some three miles long from Eski Hisarlik northwest to a point on the Gulf of Saros, 3200 yards northeast of Cape Tekke — the mere tip of the peninsula. All the beaches except Y, which had been abandoned, were in working order so that an advance could be undertaken. On that day the Queen Elizabeth, the most powerful vessel afloat, performed a remarkable feat of naval gunnery in sinking — in three shots — a Turkish transport in the Dardanelles at a distance of nine miles, firing over a range of hills from the other side of the peninsula.
The troops holding the short line at the tip were the 29th division less two battalions, on the left and in the centre; four French battalions on the right, and beyond them the South Wales Borderers on the extreme right. The heavy casualties which the landing entailed had made this line dangerously thin, but it was essential to make a move quickly before the enemy could recover and receive fresh reinforcements. A general advance was therefore ordered. The 29th division was to march on Krithia, the French were to extend their left in conformity with the British movements and to retain their right on the coast line south of the Kereves Dere. Although by this time the troops had had no proper rest for four days, they responded vigorously to the call. It was soon discovered that the enemy trenches and wire entanglements presented almost insuperable obstacles to a rapid advance. The French reached to within a mile of Krithia and could get no farther; the next day's fighting for units of strength between the whole Allied line was thrown into the battle; ammunition was running short and the men were exhausted. The small amount of transport was insufficient to keep them supplied. For the time being hopes of securing a footing on Achi Baba, a 600-foot hill, had to be abandoned. The best that could be expected was to hold what had been taken. A partial retirement was ordered, in which the Worcester regiment suffered severely. During the day's fighting several units got mixed up; the French had lost many officers and needed time to reorganize. April 29 was devoted to straightening the line and consolidating the positions. Nothing happened on the 30th. More French and Indian troops had meanwhile arrived and were formed into a reserve. On the night of 1 May the Turks opened a hot shell fire and delivered a series of fierce attacks in three solid lines. The enemy officers carried colored Bengal lights to fire from their pistols, red indicating to the Turkish gunners that they were to lengthen their range; white that the Allied front trenches had been stormed; and green that the main position had been carried. The Turk method was to crawl on hands and knees to the tip for the final rush. The first momentum of this ponderous onslaught fell upon a brigade whose officers had nearly all been killed or wounded, so that when the Turks came right on without firing and charged into the trenches with the bayonets they made a big gap in the line. This was instantly filled up by the 5th Royal Scots (Territorials), who faced to their flank and charged the enemy with the bayonet. The storm next broke in fullest violence against the French left which was held by the Sene-galese, who gave ground after several charges and counter-charges. A company of the Worcesters was thrown into the gap and the position was maintained for the night. At 5 in the morning the Allied line again advanced, and the 29th a grand attack was carried out with the 29th Indian brigade (to which the Gurkhas belonged) with the co-operation of the Manchester brigade and two battleships. Early in the evening the Turkish trenches were bombarded by land and sea; while under cover of the fire the Gurkhas once more crept along the shore.
and assembled below the bluff (now called "Gurkha Bluff") and the attention of the Turks being taken up with the bombardment, they swiftly scaled the cliffs and carried the position with a bayonet rush; their machine-gun section was hurled forward, and at 4.30 A.M. a second double company had pressed up to join the first. An hour later these two double companies extended and began to entrench. At 6 a.m. a third double company of the fiery Gurkhas advanced across the open from their former front line of trenches under violent fire and established themselves on a diagonal line on the newly captured redoubt. Numerous exploits of this nature took place; indeed, no day passed without something of the sort being attempted or achieved either by the French or the British.

Turning now to where the Anzacs had landed and dashed for the cliffs, their line formed a rough semi-circle inland from the beach with a diameter of about 1,100 yards. The Turks holding shoulder to shoulder to their enemy's trenches and in all sections there were continuous sniping, counter-sniping and bomb attacks. The Turks scattered their shells over the trenches and beaches with a liberal hand. As many as 1,400 had been dropped in the Trench City valley within an hour, and these were of all calibres, from 11 inches to field shrapnel. The Anzacs were perched on the cliffs of Sari Bair, about three miles above Gaba Tepe. Their special mission was to hold as large a body as possible of the enemy in front of them; to keep open a door leading to the vitals of the Turkish position; and to lessen the strain at Cape Helles. On 9 May a night assault, supported by enfilade fire, was carried out on the enemy's trenches in front of Quinn's Post; the ground was taken at the point of the bayonet. At dawn on the 10th a strong counter-attack forced the Anzacs to evacuate the trenches and fall back. In this fight the Allied guns wrought great havoc, for on that day two Turkish regiments lost 600 killed and 2,000 wounded. A sortie was made on the night of 15-15 May from Quinn's Post with the object of filling in Turkish trenches in which bomb throwers were inconveniently active. The attempt failed with a loss of 30 men killed and wounded. On 14 May W. B. Birdwood was wounded. On 14 May General Gouraud arrived and took over from General d'Amade the command of the French expeditionary force. On 15 May Maj.-Gen. W. T. Bridges, a highly popular officer commanding the Australian division, was severely wounded and died a few days later. Born in Scotland and educated in Canada, General Bridges obtained his commission in the New South Wales Artillery in 1885 and had served in the South African War of 1899. In 1904 he was Inspector-General of the Commonwealth Military Forces.

Turkish reinforcements had meanwhile arrived in great numbers — according to prisoners' accounts, 30,000 fresh troops under the command of Liman von Sanders. These were thrown against the Anzacs on 18 May and a stiff battle accompanied by intense artillery fire raged for over a day. Repeated bayonet attacks by the Turks were repulsed with much loss. On 19 May, as 3,000 dead and wounded lay in open view of the British trenches. During the next four days negotiations took place for a suspension of arms. The first move in this direction occurred on 20 May, at 5 in the afternoon, when white flags and red crescents (the Turkish equivalent to the Red Cross) began to appear all along the line. A Turkish staff officer, two medical officers and a company commander came out into an open trench line met by Major-General Walker, commanding the Australian division, half-way between the trenches. The staff officer explained that he was instructed to arrange a suspension of arms for the removal of dead and wounded. He had no written credentials, and he was informed that neither he nor the Australian general had the power to arrange such a suspension of arms, but that at 8 p.m. an opportunity would be given of exchanging letters on the subject, and that meanwhile hostilities would recommence after 10 minutes' grace. At this time some stretcher parties on both sides were collecting wounded, and the Turkish trenches opposite were packed with men standing shoulder to shoulder to their hand. The columns were less regular in front of other sections, where men with white flags came out to collect wounded. Meanwhile it was observed that columns were moving in the valley up from which the Turks usually brought their reinforcements. On hearing the report of these movements, General Birdwood ordered his trenches to be manned against a possible attack. As the evening drew in the enemy's concentration continued, and everything pointed to his intention of making use of the last of the daylight to get his troops into position without being interrupted by British artillery. A message was therefore sent across to say that no clearing of dead or wounded could be allowed during the night, and that any negotiations for such purpose should be opened through the proper channel and initiated before noon on the following day. Immediately after this interesting interlude the stretcher and other parties fell back and general fire broke from both sides. In front of the British right masses of men advanced behind lines of unarmed men holding up their hands. Firing grew fiercer all along the line, accompanied by a heavy bombardment of the whole British position, leading to the belief that the attack would be renewed. Machine-gun and rifle fire continued until about 4 in the morning. Negotiations were resumed on 22 May with the representatives of Essad Pasha (who must not be confounded with Essad Pasha of Albania), resulting in arrangements for a suspension of arms from 7:30 A.M. until 4:30 P.M. on 24 May. The wholesale funeral ended about 3 o'clock on that day: some 3,000 Turkish dead were removed or buried in the area between the opposing lines — No Man's Land. The whole of these had been killed or had died there of wounds or since the 18th, a space of seven days. Punctually on the expiration of the time limit hostilities recommenced.

The next great effort to advance in the south of the peninsula was made on 3 June. To distract the enemy's attention from that Theatre of war the Anzacs began a series of demonstrations and sorties after sunset on that day. In the south fighting had gone on uninterruptedly during May up to the night of 4 June. On the day of the general attack the
enemy's front line of trenches ran from the west of the Kereves Dere in a northerly direction to the sea. The Allied battle line from right to left was held in this order: The French expeditionary force, the Royal Naval division, the 42d East Lancashires, and the 29th division. The British front alone was little over 4,000 yards, and the total infantry available amounted to 24,000 men, including a reserve of 7,000. At 8 in the morning the artillery opened with a bursting, with a 300-pounder gun for an hour and a half, until noon, when the range was extended and the infantry advanced with fixed bayonets. The assault was immediately successful. On the extreme right the French 1st division carried a line of trench, while the 2d division with a gallant dash captured a strong redoubt for which they had already fought three desperate contests. Only the extreme left of the French was unable to gain any ground—a feature destined to have an unfortunate effect upon the final issue. The 2d Naval brigade rushed forward; the battalion from H.M.S. Anson captured the southern face of a Turkish redoubt which formed a salient in the enemy's line. The How and Hood battalions captured trenches fronting them, and by 12:15 the whole Turkish line forming their first objective was in their hands. In five minutes the Manchester brigade of the 42d division had stormed the first line of Turkish trenches and 25 minutes later had carried the second line, making a progress of 600 yards. On the left the 29th met stern opposition. In most places the Turks crossed bayonets with them, but after a struggle of some minutes the front line was taken. On the extreme left the front Turkish trench was so situated that it had escaped the artillery bombardment, leaving the barbed wire obstacles intact. The result was that, though the 14th Sikhs on the right flank pushed on despite losses amounting to three-fourths of their effective strength, the centre of the brigade could make no headway. A company of Gurkhas actually forced its way into a Turkish trench, but the failure of the rest of the brigade threatened them with isolation, and they were withdrawn. Meanwhile, reinforcements were rushed to the left to make a fresh attack. On the right, the Turks poured in fresh reserves and forced the French 2d division to fall back from the captured trenches on the second line. The machine guns covered the right flank of the Royal Naval division. These also had to retire with heavy loss from their conquered lines, thus exposing in turn the How and Hood battalions to enfilade fire so that they, also, could do nothing but retreat across the open under galling rifle and machine-gun fire. By 1:30 P.M. all the gains had been lost again in this section, while the Collingwood battalion, which had rushed to the rescue, was practically annihilated. All the bravery and sacrifice of the first charge appeared to have gone for naught. The Manchester were still holding on to their captured trench, while every effort was made to sustain them by sending reinforcements, but it soon became evident that the position was untenable. In this dilemma orders were issued for a fresh attack in force at 3 P.M., an arrangement that was twice postponed at the request of General Gouraud, who finally reported that he could do no more that day with any chance of success. By 6:30, therefore, the Manchester had to be extricated from their perilous position from the second Turkish lines. There was some difficulty in persuading them to retreat to the front Turkish line which they had taken in the first five minutes. Several other Allied attacks were frustrated; at the close of the battle the net result was an advance of from 200 to 400 yards on a front of nearly three miles. Further attempts were made on the Turkish defenses on 21 June, in which the French lost 4,500. The enemy's loss in counter-attacks was estimated at 7,000. Yet the French had succeeded in storming the first and second lines on their front. On the 27th the British left carried four Turkish lines and advanced about a mile. Further severe fighting took place from 28 June to 2 July, between which dates the Turks were reported to have lost over 5,000 killed and 15,000 wounded. In July the Turks made another big attempt to drive the Allies from the Sea, though the venture failed. Throughout July there occurred at intervals minor attacks by one side or the other, such as characteristic trench warfare produces, with little results. Early in August the Turks announced the loss of one of their battleships, the Haidedica Barossza, sunk by a submarine. Other Turkish vessels were sunk about the same time. Against this, however, had to be set the loss of a large British transport, the Royal Edward, sunk by a submarine in the Aegean Sea with a loss of about 1,000 men.

A new army was landed at Suvla Bay on 6 August and an attempt was made to capture the summit of Sari Bair and Chunuk Bair ridges by simultaneous attacks by the Anzacs and the new army. The Anzacs reached the objective, but the attack from Suvla did not make the progress expected, with the result that, as had happened too often in this campaign, the temporary victors had to retire from the ground they had captured. The two armies came into touch, however, making a front of about 12 miles. Another assault was simultaneously delivered at the south, but no decisive result was gained. Auchinleck, commanding on Gallipoli again resumed the form of uneventful trench work. The campaign had simply failed; from the first it had been a policy of sacrificing armies for acres. General Hamilton, retiring to his headquarters, said to his staff, "The British army has met with a complete failure, but the British government had lost faith; they decided to write the expedition off as a bad debt. The stream of men and munitions dried up; wounds, sickness and fatigue left their marks upon the discouraged soldiers. On 11 Oct. 1915 Lord Kitchener, then Minister for War, cabled to Hamilton asking for his estimate of the losses likely to be involved in an evacuation of Gallipoli. Hamilton replied in terms showing that such a step was "unthinkable" to him. On the 16th he was recalled. Failure was written large across the Gallipoli-Dardanelles campaigns. The only event of importance which remains to be recorded is the withdrawal of the troops. Hamilton was succeeded by General Monro and during the short interregnum General Birdwood took command. Monro arrived with instructions to report on the situation, as to whether the peninsula ought to be evacuated on military grounds or another attempt made to carry it. He reported that the mere fringe of the coast line had been secured.
The piers and beaches upon which they depended for all requirements of personnel and material were exposed to registered and observed artillery fire, and every hour the peninsula was exposed to hostile fire, it was not possible to withdraw any of the troops from the shell-swept area. The troops were enervated by disease; in consequence of terrible losses there was a dearth of officers. General Monro considered that no advance could reasonably be expected from the positions held by the expeditionary force, and that the troops here locked up should be diverted to a more useful theatre of war. Evacuation was decided upon. Winter set in with heavy storms; hurricanes and torrential rains swept the peninsula; floods spread over the country, filled the trenches and cut off communications. Troops, animals and supplies not needed for a long campaign were to be taken off. Next a decision was made to evacuate the horses, guns, animals and stores not required for the time being. The three men upon whom the task now devolved were Generals Mono and Birdwood and Admiral Sir Rosslyn Wemyss. They began with Suvla. This was a wise step, for it could afford the enemy no clue, since the removal of these troops did not necessarily indicate abandonm ent of the expedition. From 10-18 Dec., 1915, the surplus of the force at Suvla gradually melted away to seaward. While the front was held, corps behind the lines were withdrawn to the embarkation beaches first, with full provision in the event of attack. Intermediate positions were prepared for this purpose. The final withdrawal from here was timed for the night of 19-20 December. The sea was calm and the moon was veiled by hazy clouds; the covering ships had taken up their positions, ready to open fire if the enemy showed any activity. Everything went smoothly; when the first batch had gone far enough, the men in the trenches left them; every vehicle and every gun was embarked. Anzac and Suvla were cleared; what little had to be left behind was destroyed. The Turks grew suspicious; the movement took them completely by surprise; they were not conscious of the operation until it had been completed. Not a single life was lost, and only three men were wounded. The enemy now hurried his liberated troops and guns from Suvla and Anzac to the southern end of the peninsula, strengthening his batteries on both sides of the Dardanelles. No attempt was made to remove the Allied army from the south; it appeared as though the British authorities at home were still unwilling to give in. The position of that army grew more perilous as the Turks worked to bring it into a position of eight days orders came from London to withdraw the remainder of the force from the peninsula; already the bulk of the French troops had been taken off by their own ships, and the moment that gave over by the Royal Naval division and the 8th brigade. The embarkations were conducted in the night time; by daylight nothing unusual could be observed by the enemy. Meanwhile, the Turks continued to bombard the Allied lines, to which the British in response. The remainder of the French troops were taken off first. The final withdrawal was take place during the night of 8 Jan., 1916. With some trouble owing to the weather the embarkation was duly carried out according to program; the guns which had been ordered from London to be brought away were left to cover the movement and destroyed at the last moment. By 3:30 A.M. the last man had been taken on board. The store and ammunition dumps which had been left were provided with time fuses for their destruction. As the last parties left the shore these broke out into flames at different points, illuminating the darkness. Magazines of munitions and explosives blew up in rapid succession; red lights flared up over the Turkish ships; their heavy artillery burst into a furious bombardment of the empty beach; the last ship steamed away, and the ill-fated Gallipoli campaign was over. Altogether the tragic adventure had cost the Empire the lives of 1,785 officers and 31,737 other ranks; 3,010 officers were wounded, and 75,508 of other ranks; missing and prisoners amounted to 258 officers and 7,431 of other ranks; making a total of casualties of 5,053 officers and 114,676 of other ranks. These figures do not include the heavy French losses. In due course a commission was appointed to inquire into and report on the causes of the failure. In a scholarly criticism of the campaign published in London, December 1919, by Maj.-Gen. Sir C. E. Callwell, K.C.B., the writer expresses the opinion that the principal cause of the failure was "not so much the consequence of topographical conditions nor of the disposition of the enemy forces, nor of bad luck, as it was the upshot of a factor that had not been taken sufficiently into account. This factor was the rare fighting qualities that the Osmanli soldier was to display in the campaign... But if Sir Ian Hamilton and his staff at the outset underrated Ottoman valor and spirit, if they assumed too readily that the opposition that would be offered by this soldierly would not be of the most whole-hearted type, they were only following the lead of governments which, in a happy-go-lucky mood confident that the enemy would crumble up before a show of bluff, had dispatched the expedition on a mission of which they had failed to realize the danger, and on which suitable preparations had not been made by them in advance." (The Dardanelles.) (The Dardanelles.) (The Dardanelles.) (The Dardanelles.) (The Dardanelles.)

10. BALKAN CAMPAIGN. The supreme importance of the Balkan States in the European struggle is denied by no one to-day. While there may have been animosities between the Great Powers of such nature that they would ultimately lead to a general conflict, and that if the Balkans did not a day or an hour, the occasion, such occasion would have arisen elsewhere, the incontestable fact remains that the Balkans provided the occasion. A great part of the Jugo-Slav race lived under the rule of Austria-Hungary and as their national consciousness grew intense they became ever more dissatisfied with that alien rule. Serbia, now become an...
independent state, had championed the Pan-Slav movement, the object of uniting all Jugoslavs under her flag. It was thus carried by the Large Empire into Hungary to crush this state, which fomented unrest among the subjects of the dual-monarchy and at the same time to strike a blow at Russian prestige in the Balkans. The murder of the Austrian crown prince at Sarajevo furnished Austria her opportunity. The insulting ultimatum to Serbia followed and war burst forth. Russia, the last Slav sister, refused to stand aside and see Serbia crushed and, to add insult to injury, joined with Austria, she cast the die in favor of war and the great conflict began.

War Strength of the Balkan States.—Before the World War few realized the great strength of the Balkan States. The brilliant defense of Serbia in 1912 in a few weeks destroyed the remains of the Turkish Empire in Europe. The forces of the Balkan States represented in 1914 a total of about 300,000 men. Of this number Serbia put about 250,000 men in the field, together with a territorial reserve of 50,000; Montenegro, her ally, had 50,000 seasoned veterans; Rumania had an army of 50,000, Greece 250,000 and Bulgaria 350,000.

First Attack by Austria-Hungary.—On 25 July 1914 Austrian mobilization began and three days later 10,000 Serbs were massed for the defense of Belgrade, the national capital. The main Serbian forces were concentrated at Lazarevac and Angelovovatz and Palanka on a line just south of Obrenovatz, Belgrade and Semendria. Austria at first contented herself with an intermittent bombardment of Belgrade, but on 12 August she threw strong columns across the Drina and Save in the northwest corner of Serbia. These forces had as their objective the capture of the Serbian arsenal at Kragujevat. Putnik, the Serbian commander-in-chief, moved the bulk of his forces westward to the Jadar Valley to meet the Austrian invasion from the west, at the same time sending forces to repel the Austrian columns which had crossed the Save at Shabatz. Putnik aimed to prevent a junction of the Austrian forces. On 16-17 August he completely routed an Austrian force of 60,000 on the Shabatz-Lechnite, a line near the Bosnian frontier. In the week following the Serbs drove this success to its conclusion farther to the south, taking Tzer, Iverak and Shabatz and crossing the Dobrava. In this nine-day struggle about 400,000 men were engaged; the losses were heavy, probably about 10,000 killed and 20,000 wounded on the Austrian side and 18,000 killed and wounded Serbs. The latter took over 4,000 prisoners, quantities of rifles and other military stores and a great number of cannon. The first Austrian attack, with the primary object of penetrating Bosnia, was repulsed, and on 1 September another Serb force invaded the region between the Save and the Danube. The Austrians were reinforced, however, and on 5 September, after an attack along the line of the Drina from Jarak to Ljubovia the Serbs in consequence were obliged to retire to their own territory. After six weeks of desultory fighting the Austrians began an advance over the whole frontier. Valjevo fell on 11 November; on the 28th the Serb centre was driven in near Lazarevac; by the end of the month the Austrian front extended from Belgrade in the north along the line of the Belgrade Railway to the western branch of the Morava in the south.

With the assistance of the Montenegrins the Serbs made valiant efforts to penetrate to Sarajevo. They succeeded in placing their armies on Austrian soil and on 10 September recovered Semlin. They also succeeded in thwarting an attempt of the Austrians to cross the Save. The Serbs also planned a siege of Rugusa and actually invested that city in the middle of October but toward the latter part of the month both they and their Allies, the Montenegrins, were in retreat to the Serbian frontier across the Drina. The cause was partly the exhaustion of their supply of munitions and partly because Austria's regiments had received strong reinforcements of crack Bavarian regiments. The Serbs made a gallant stand at Valjevo about the 15th of October but were obliged to retreat. This retreat uncovered the Serbian positions on the Danube and the Serbs were compelled to evacuate Belgrade, the capital (the government being temporarily installed in Nish). General Franck, with an Austrian army corps formally entered and occupied Belgrade on 2 December, but he was not destined to remain long in possession of the Serb capital. The Serbs received a supply of sorely needed arms and on 6 December and King Peter visited the army and by his presence and bearing did much to restore the somewhat shattered morale of his troops who had endured terrific hardships and had met severe losses in defending their native land. Here it is appropriate to state the purpose of the Central Powers. Trench warfare had begun on the Western and Eastern Fronts and Britain, the chief antagonist of the Central Powers, was unscathed by the war. The only effective way of reaching her was to attack such of her colonies as were accessible by land. The strategy of the Central Powers, therefore, had for object the crushing of Serbia and the bringing of Bulgaria into the war. With Serbia eliminated by conquest and Bulgaria fighting by her side the road from Berlin to Constantinople would be cleared for the passage of German munitions and other war supplies and skilled personnel and Germany could satisfy the needs of the thousands of Turkish troops who were in sore need of arms, ammunition and trained leaders. With German aid via the Balkans the Turkish armies would be enabled to direct attacks against Egypt via the Isthmus of Suez and against India through the valleys of the Tigris and Euphrates. With Egypt conquered India would be isolated and British rule in North Africa brought to an end, and with India menaced it was hoped that Britain might be induced to save her empire by deserting her Allies. Such were the aims which formed the motive for the crushing of Serbia — the necessary preliminary step in the scheme of conquest. Serbia, after the successes towards the end of the year, resumed the offensive on 2 December, took Sukovor on the 5th and drove back the invaders to Valjevo. The five Austrian corps in Serbia became separated and a retreat more or
less disorderly followed to the border. On 15 December the Austrians were driven out of Belgrade which they had held from 29 November. About 40,000 prisoners were taken by the Serbs and Austria left 50,000 killed and wounded behind her in her retreat.

At this stage Serbia was too exhausted to follow up her advantage, while the Russian pressure on another front demanded the serious attention of Austria. For several months, the only fighting on the Balkan front was some desultory firing across the Danube. Meanwhile Germany asked Rumania to permit the forwarding of military supplies through her territory to Turkey. Rumania refused this demand. At the same time the Entente vainly strove to adjust the differences between the Balkan States and sought to re-establish the Balkan League. On the whole the less said of Allied diplomacy at this juncture the better. It failed altogether to appraise the situation. On 6 March 1915 a political crisis developed in Greece. Venizelos, who advocated the entry of his country into the war on the side of the Entente, and who had

the Serbian forces had been decimated by typhus, Turkey and Italy had become belligerents and fresh problems were thrust upon the Balkan States. From the beginning of the war Germany and Austria had sought the support of Bulgaria and tried to make her resent the treatment meted out to her at the hands of Greece and Serbia after the second Balkan War. Rumania had ambitions to take under heregis the millions of Rumanians in Transylvania. The latter nation was not molested until von Hindenburg had driven back the Russians and restored German prestige in the East. When the Turkish demands for munitions necessitated prompt and effective measures Ger-

sought an understanding with Bulgaria even to the extent of ceding to her part of West Thrace in order that Greece might have a free hand to realize her national aspirations in Asia Minor, now retired from the premiership in defeat owing to German intrigue. Events were little altered, however, and he was returned to power on 21 August. The Entente powers were now bringing pressure on Serbia, Rumania and Greece to satisfy the claims of Bulgaria and Serbia yielded. Bulgaria in July secured a concession concerning the Dedeagatch Railway from Turkey but the agreement was not publicly acknowledged until 22 September. Following this acknowledgment the mobilization

Map Showing Balkan Theatres of War
of the Bulgarian army was announced. Greece responded on 24 September with a counter-order to Romania already on 17 Aug. 1915 had voted a war credit of $20,000,000 and was watching closely the concentration of Austrian forces on her frontier near Brasso in retaliation for her refusal to permit supplies to pass through to Turkey and for the recently imposed embargo on cereals.

Conquest of Serbia.—Above have been recounted some of the diplomatic moves which resulted in Bulgaria going over to the Central Powers. Serbia never had a choice in the matter of remaining neutral. Rumania inclined to the Entente and Greece was torn by German court intrigue. The crisis, for Serbia at least, came late in September 1915 when Field Marshal von Mackensen, fresh from his successes in the drive from Galicia to beyond Warsaw, massed 250,000 Austro-German troops and 2,000 heavy guns on her northern frontier. Simultaneously the Entente Powers learned that German and Austrian officers were being appointed to posts on the Bulgarian staff and in the army which Bulgaria was giving Grecianizing Lom, the Serbian eastern border. In October Bulgaria broke relations with the Entente and entered the war on the side of the Central Powers. Meanwhile the Entente had been more successful in their negotiations with the Greek premier, Venizelos. They secured his consent to the landing of British and French troops at Salonica to co-operate with Serbia, and perhaps with Greece, who, in case of an attack by Bulgaria on Serbia, was bound by treaty to come to the assistance of the latter. On 5 Oct. 1915 Allied forces began to arrive at Salonica.

The Austro-German drive under von Mackensen had for object the opening of part of Serbia east of the Morava to Nish and eastward to the Bulgarian frontier. This route is marked by the passage of the Orient Railway from Berlin to Constantinople, by which Germany intended to supply Turkey with war material. The plan of the drive was as follows: The main army under von Mackensen was to march south along the Morava Valley from Belgrade; an Austrian army was to drive eastward along the western Morava, while a third army from Bulgaria was to move westward with Nish as the converging point for all three. A secondary Bulgarian army was to close the Serbian retreat below Nish by moving west by north from Slivnitz in the general direction of Leskovatz. This army would also cut off any Allied aid to Serbia from Salonica or the south. The Serb defense was to hold back the centre, escape the crushing sides, and retreat into the mountains of Montenegro in case no help arrived from the Allies.

On 6 Oct. 1915 the Austro-German under von Mackensen, von Knebes and von Gallwitz crossed the Drina, Save and Danube. Belgrade was occupied on the 9th. Although they fought heroically the Serbs were pushed back mile by mile by forces immeasurably superior to them. On 17 October the Teuton allies were 15 miles south of Belgrade. On the same day the Bulgarians cut the railway line at Vrania, thus isolating Nish (the temporary Serbian capital) from all Allied help from the south. By the 20th the Bulgarians had pierced the line farther south at Kopriti (Veles) and controlled about 100 miles of railway in the heart of Serbia.

The French tried to relieve Serbia by invading Bulgaria between Doiran and Strumitsa north of the Vardar River. The French after stubborn resistance drove the Bulgarians back across the river, but to the north the Bulgarians advanced and on 22 October occupied Uskub, the ancient capital of Old Serbia; another German force crossed the Danube at Orsova and General Bojadzieff led another Bulgarian army across the Timok and northward to Prahovo. The French established communication with the southern Serb army, and after being reinforced by British troops drove the Bulgarians out of Kopriti (Veles) on the 25th and out of Uskub on 27 October. Kopriti was retaken on the 29th and Privet fell to the Bulgarians on the same day. General von Gallwitz with a German army took Milanovac and Krugujevatz on 1 November. The Bulgarians entered Nish on the 5th. Bulgarians, Austrians and Germans pressed on from three sides in north Serbia, but in the south a Franco-British line stretched from Gheverning to Grecianizing Lom the north Serb forces had been driven into Montenegro and Albania and but a small strip of Serbia in the south remained unconquered. The Germans had succeeded in their main object—the opening up of the rail route between Germany and Constantinople through Nish and Sofia.

Mackensen pressed his drive so quickly and the Allies had sent such inadequate forces (about 73,000 under General Sarrail) to aid Serbia that adequate military relief was rendered impossible. Monastir fell to the Bulgars on 2 December and with it went the last point of resistance in the Serbian kingdom. The last sad remnant of Serbia's scattered armies fled over the mountains to the coasts of Albania and Montenegro, hotly pressed by the Austrians and Bulgarians. Thousands perished on this flight and civilian refugees hampered the movements of the military. Mount Lovchen was taken by the Central Powers on 10 Jan. 1916; Cetinje, the capital of Montenegro, fell on the 13th, and Scutari on the 23d. San Giovanni di Medina, the Albanian port, whence many of the Serb refugees had escaped to Corfu, fell on the 25th. During these operations Serbia and Serbia, Montenegro and Albania lay prone under the iron heel of the Central Powers.

The French had taken over the Greek island of Corfu and there the Serbian veterans were recuperated and re-equipped in the summer of 1916 in preparation for the reconquest of Serbia from the south, jointly with the Franco-British forces based on Salonica. While the Serbs were being driven westward these Franco-British forces were being driven down over the Greek frontier by the Bulgarians. The Allied base at Salonica was consolidated, and on 30 Dec. 1915 it was raided from the air by the enemy. On 28 Jan. 1916 the cape and fort commanding the harbor were occupied by the Allies because it was found that Greece wasyielding to the blandishments of the Central Powers. General Sarrail, the Allied commander, replied to the air raid by arresting the Austrian, Turkish, Bulgarian and German consul, placing them on a war vessel and dispatching them to Athens. Salonica was again
raided from the air on 1 Feb. 1916 and among the killed were three Greek soldiers. Greece was still vacillating and matters remained at this pass for several weeks. Finally, on 26 May 1916, Bulgaria, supported by German troops, demanded of Greece the right to occupy the fortress of Rupel from which had held the port and fortress of Kavala. Greece withdrew her garrisons from Rupel without protest. On 3 June the Allies occupied the government bureau in Salonika and proclaimed a state of siege; on 6 June a "passive" blockade of the Greek coast was announced and on the 21st Allied demands were made upon the Greek government for the demobilization of the Greek army, the setting up of a new government, the holding of new elections and the dismissal of pro-German police and other officials. These demands were complied with. On 22 June Bulgarian forces crossed the Mesta in the northeastern corner of Greece. The Greek garrison of Nea Petra withdrew without offering resistance and the fortress of Kavala itself. On 11 August the first Italian contingent arrived at Salonica, followed shortly afterward by the new Serbian army, eager for the reconquest of its native land. The British, however, found that along the Struma; the French were on the Salonica-Belgrade Railway at Doiran and at Florina. The Serbians were placed in the Lake Ostrovo district and soon occupied the city of that name. On 27 August 1916 Rumania declared war on the Central Powers and interest at once shifted to the new war fronts in the Balkans created by this decision. Greece still hesitated, but the national movement, led by Venizelos, on 30 August, established a provisional government at Salonica and set about raising a Greek volunteer army to serve with the Allies and to help drive the hated Bulgars from Macedonia. The king of Greece continued to favor the pro-German elements and the Allies countered with their second naval demonstration. Further pressure was brought on the government by the Entente, and German ships interned in the Piraeus were seized. The Nationalist movement, however, headed by Venizelos, spread rapidly especially on the island of Crete. On 13 November the Greek army corps surrendered to the Bulgars at Kavala without firing a shot, the excuse being that they sought protection from the Allies. In September also interest was revived in the military operations. A Russian contingent was now co-operating with the other Entente forces. On 14 September the French and Serbs stormed Gornichevo and part of the Malka Nidje ridge; on the 15th the Allies took the heights above Florina and the French and Russians entered the town the same day. In the four weeks following the Entente forces had pushed northward to within a few miles of Monastir. The Bulgars, however, were in strongly-fortified positions in front of the town. One of these was driven in on 16 Nov. 1916. At the same time the British crossed the Struma and took several villages on its northern bank. The Allied fleets aided operations in this region by blocking the coasts from the debouchure of the Struma to that of the Medj. The new, the Greek political situation had developed rapidly. Venizelos, as already stated, had announced his provisional government; on 9 October at Salonica he issued a final warning to the king, in which he said he regarded Greece as a democratic state with a king at its head, but with two governments, of which the provisional government alone held a mandate from the people. On 11 October Admiral D'Artigue de Fontenet, commander of the Allied fleet off Athens and the Piraeus, demanded the surrender of the Greek fleet, control of the police, the lifting of the wheat embargo and many other similar measures. King Constantine was planning a coup from Thessaly, but the Allies seized an ammunition train bound thither and the king's scheme died aborning. The Allies granted a subsidy of $2,000,000 to Venizelos to enable him to equip his volunteer divisions which were to co-operate with the Allied forces based on Salonica.

Rumania followed her declaration of war on 27 August by an invasion of Transylvania through the passes of the Transylvanian Alps. The Austro-Hungarian forces caught unawares, retired, and Rumania entered Transylvania into possession of an extensive region including the towns of Hermannstadt, Sepsi Szt. Gyorgy, Kronstadt (Brasso), Petrosény and Kézdí Varșarhely.

The Austro-German Drive against Rumania.—The menace of the Rumanian army had alarmed the Bulgars into the war offered to Bulgaria and Hungary. Germany's allies, caused Germany to make a special and immediate effort to crush this new foe, whose oil-fields and cereal stores formed a much-needed prize. Von Mackensen, conqueror of Poland and of Serbia, was chosen to lead a Bulgars-German army north through the Dobruja. This front was lightly held by the Rumanians whose main forces were maintaining an offensive in Transylvania. Tutrakan, a fortress on the Danube, fell to von Mackensen on 6 September and he took Silistria three days later. The Rumanians, reinforced by some Russians, fell back by 20 September to the Rasova-Tuțza line, a few miles south of the Bucharest-Kustenieck Railway. There in strong positions they were for a time able to hold the Bulgars-German forces and even to push them slightly backward. To make a diversion, at this stage the Russian fleet bombarded Varna, the Bulgarian port on the Black Sea, and threatened to land a division on Mackensen's rear. The Rumanians also on 4 October crossed the Danube at Riahouvo in another attempted demonstration. Both these movements were mere diversions and lacked real force. On 19 October von Mackensen renewed his offensive and pressed forward vigorously. Constanța was evacuated by the Rumanians on 22 October; Rasova fell the next day and Târgoviște on the 25th. Here the great bridge across the Danube had been blown up by the Rumanians. Von Mackensen kept pushing northward on the Dobruja side of the river, but on 3 November it was announced that the Russian General Sakharoff had taken command in the Dobruja and the Russian threat from the western side of the Danube now checked von Mackensen's advance.

Meanwhile the Rumanian campaign in Transylvania came to grief. On 20 September the Rumanian line extended from the Russian left at Dorna Water in Bukowina to the Danube near the Iron Gate of the Danube. The Austro-Hungarians began a counter-offensive
late in September and at this juncture General von Falkenhayn arrived to take command of the Austro-German forces in Transylvania. He pushed the Rumanians back to the mountain passes with little difficulty and on 30 September almost succeeded in cutting off the main Rumanian army at the Roten Thurm (Red Tower) Pass, south of Hermannstadt. By the end of October von Falkenhayn had forced his way through the chief passes and was from 15 to 20 miles within the Rumanian frontier. Rumania, insufficiently prepared and unsupported to the extent hoped and expected from Russia, and unable to resist the sweeping advance of von Mackensen in the southeast and that of von Falkenhayn in the northwest, made a brave and desperate stand, fighting stubbornly for every foot of soil it yielded to the Central armies. Just before the retreat the Rumanian oil fields had been wrecked by a British expedition commanded by Sir John N. Griffiths, but by 1 Jan. 1917 the entire oil-bearing region was in German hands and the Rumanian court and government were fugitives at Jassy in the northeast corner of the country. Von Mackensen entered Bucharest on 6 December—his birthday. Rumania made a brave attempt to hold the northern Dobruja with its rich grain fields in the neighborhood of Braila. The main bridgehead of the Danube fell on 3 Jan. 1917 and the fate of the Dobruja was sealed. Braila fell on 5 January. On the 7th the Germans reached the lower Sereth and on the 8th took Focsani, capturing great numbers of prisoners and guns.

Von Mackensen advanced slowly in the early months of 1917, his attempt to reach Hungary through the Gyimes Pass on 14 January was unsuccessful; on the 20th he captured the Fundeni bridgehead on the Sereth, 25 miles above Galatz. General Gurko arrived in January to take charge of the Russian armies on the Rumanian front; an offensive begun on 1 February in the Bukowina yielded over 1,000 prisoners. To the end of March the fighting flared but the Allies were forced to retreat at losses, being outpressed. In July 1917 the Rumanians cooperated in the offensive led by General Korniloff in Galicia. The Rumanian army had been reorganized by an advance in March of 200,000-250,000 by Great Britain. After the Russian defeat, the Allies fought a successful battle at the crossing of the river, and on 7 May 1918 the Treaty of Bucharest was signed. Under its terms Rumania lost the entire Dobruja. A larger territory than that lost by Bulgaria in 1912 was to be given back to her, the port of Constantza was placed under the dominion of the Central Powers, Rumania being granted certain rights of access. The Transylvanian frontier was rectified in such manner that Hungary retained 2,000 square miles of territory and Austria 920 square miles south of Czernowitz. A clause subsequently added to the treaty wrote off the requisitions of $25,000,000 already made by Germany on Rumania, so that this may be regarded as a species of indemnity. Rumanian state deposits, placed in Moscow early in the war, were transferred to the Central Powers. Rumania was obliged to grant a most-favored nation agreement to Germany and Austria. No export dues were imposed. Control of the railways was to be given to Germany. A new Danubian Commission was to be set up, from which British, French and Italian representatives were to be excluded. The Rumanian army was to be reduced to 300,000 and only 160 rounds of ammunition per rifle were allowed. Rumania never in spirit accepted
these humiliating terms other than as a temporary expedient.

**Greece and Albania in 1918.**—A mutiny fomented by German agents broke out among the Greek troops at Lanna in February 1918 but it was soon suppressed. The Greek army took its place beside the British on the Struma front and on 30 March fought its first major action and won it. It took the enemy position at Skra di Legen, west of the Vardar, with the aid of French artillery. On 6 July 1918 French and Italian troops, with British monitors aiding from the sea, pushed northward along the Albanian coast from Valona, crossed the Vojusa and reached the heights beyond. Other French and Italian troops had worked inland and now threatened Berat from the east. By the 23rd Berat and the whole surrounding region had been occupied. The Austrians, however, received reinforcements and were reorganized by General Pfanzer-Baltin. The Italians, under Ferrero, soon found themselves in difficulties and in August withdrew from the Semeni River to the shore of Sharand. On 16 September until the Serbs and Allies opened Macedonia in September and paved the way for the reconquest of Albania.

**Serbia Reconquered by the Allies.**—Not until 15 September did the reorganized Serbian army and its Allies begin a serious offensive toward Monastir. From the occupation of Monastir in the fall of 1916 there had been no large scale operations on this front. A strong advance involved great difficulty because of the terrain. To reach Uskub, the strategic goal, the only practicable route was by way of Prilep and the Babuna Pass, which was threatened by the Bulgars who held the Selechka range east of Monastir. The plan evolved in the Allied attack of September 1918 was to dislodge the Bulgars by a drive from the east. The French and Serbs on a 16-mile front worked their way through the mountains about Dobropolje to a depth of about five miles and took the ridge of the Sokol, Trnavka, Kovovska and Brumska. On 16 September the Jugo-Slav division occupied the Kosyak massif. The Tcherna River was reached on the 18th. Both Germans and Bulgarians began to give ground and by the 20th they were in full retreat, pursued relentlessly by Serbian cavalry. Greek and British forces east and west of Lake Doiran now created a powerful diversion by striking at the Belasita ridge; at the same time the French sent a new force eastward. The fighting front now extended about 100 miles and over it. The length of the army was in retreat. The French and Serbs had pushed the centre by 23 September about 40 miles to the region about Negotin and had cut the railway which afforded communication to the Bulgars falling back from Monastir and Prilep and those in retreat from Lake Doiran. The French threatened to turn the Babuna Pass by taking Vozarci and Kavadar. By 25 September the Allies held the entire Vardar Valley Railway from Gradsko to Ghevgel. At the extreme eastern end of the front the Bulgars destroyed their stores and hastened to withdraw within their frontiers. The British followed closely, entered Bulgarian territory 26 September on the way to Strumitza, and turned the flank of the Belasita ridge from which the enemy at once retired. The Serbs and French turned the Babuna range with equal success and took Koprul (Velez) and Ishitip on the 26th. These advances threatened to cut off the first and second Bulgarian armies from the forces around Uskub.

Bulgaria was now beaten and angry with her allies who needed not her demands for aid. She was especially angered at the Rumanian settlement and feared Turkish demands for territory. To end a situation fast becoming intolerable she sought a separate peace on 27 September, applying to the Allies for an armistice. The application was referred to Gen. Franchet d’Esperey, Allied commander at Salonica and successor of Sarrai. He refused to cease hostilities but agreed to receive properly accredited representatives. Bulgaria agreed to unconditional surrender and on 30 September her career as a belligerent ended under the terms of an armistice which secured Allied control of her territory. Uskub was at once entered by French troops and the Serb government proceeded to transfer thither its government, residence and political center. Ferdinand of Bulgaria abdicated on 6 October and after a reign of six weeks Prince Boris left Bulgaria which on 4 Nov. 1918 was proclaimed a republic. Austro-German forces continued to offer small resistance to the Serbs and Allies in Serbia after the capitulation of Bulgaria. On 1 October Ferrero led his Italians against Berat. Italian and British warships raided Durazzo which was occupied by Italian troops on 15 October. The Serbs took Dibra, while the French took Focani. A small German force tried to hold Nish but the Serbs advanced rapidly and occupied it on 13 October. The Danube was reached by the Franco-Serb forces on 19 October and on 1 November the Serbs entered Belgrade. Serbia was liberated; her ancient enemy, Austria-Hungary, was fast crumbling away internally, and the age-old dream of a South-Slav state had become possible of realization.

J. B. MCDONNELL.

**Editorial Staff of The Americana.**

11. NAVAL OPERATIONS. Resources and Problems.—In the beginning of the World War Great Britain was the greatest sea power and Germany the second. As to what rank should be assigned to the navies of France, Italy, Russia and Austria-Hungary opinions differ. Taking the battleship as a means of comparison the available statistics would have ranged the great nations thus: Great Britain 60, Germany 33, the United States 30, France 22, Japan 15, Italy 11, Austria-Hungary 9 and Russia 7. In submarines the announced statistics were: Great Britain 75, France 64, the United States 30, Russia 30, Germany 27, Italy 19, Japan 13 and Austria-Hungary 6. So many of these boats were of old type that the statistics are not as valuable as they might be. The total tonnage of the British navy in 1914 was 2,714,106 and the tonnage of the German navy was 1,306,577.

In July 1914, 216 ships, about half the strength of the British navy, assembled in a grand review in British waters before the king. When the international situation became threatening the government, 26 July, ordered the fleet to remain assembled. The result was that when Great Britain declared war
on 4 August, the vessels were at their assigned station, stripped for action and well supplied with stores. From that moment the ships disappeared, so far as the civilian population of Great Britain could see. Admiral Sir John Jellicoe, who had seen many years of service, was commander of the fleet and Mr. Winston Churchill was first Lord of the Admiralty. The French and Russian fleets were considerable, but they did not compare in strength with the British forces, which the Germans had to face in the naval defense of the Allies. As Germany had the chief naval strength on the side of the Central powers, it was left mostly to the British fleet to hold her navy in check and to fight whatever battle would have to be fought against this great antagonist. The French fleet had its main naval base at Toulon, on the Mediterranean, and its chief duty would lie in that sea. Here, also, was the Austrian fleet, with its main base at Pola, on the Adriatic. It became the first purpose of the French fleet, with the help of such British ships as served in those waters, to keep the Austrians shut up in that port. Later on Turkey came into the war and it was necessary to send there her ships which did not come out of the Dardanelles. On 24 May 1915, Italy entered the war against Austria-Hungary, and her fleet, which contained some excellent new ships, was a further aid in keeping the Mediterranean sea open to the ships of the Triple Entente. As for Russia, her navy was divided into two fleets, each in a land-locked body of water. One was in the Baltic, the natural entrance to which, the sound, was treated as territorial water by Denmark and mined. The other was in the Black Sea, the entrance to which was closed by Turkey. With the aid of two strong German ships, the Goeben and the Breslau, the Turkish fleet was able to dispute the Black Sea with the Russian forces there. In the Baltic Germany was vastly stronger than Russia, so that she controlled the sea and maintained uninterrupted communication across it with Sweden and through Sweden with Norway.

These tasks were all of minor importance compared to that assumed by the British navy in the North Sea. This was a triple task. Primarily it was to watch for the German fleet, and encounter and defeat it if opportunity offered. It was also to establish and enforce such a degree of interference with German foreign trade as would reduce her ability to carry on the war. When the British ships disappeared from view at the beginning of the war they were ranged in three fleets, the first, second and third. In each of them there were general squadrons of battleships, cruisers and destroyers, with submarines and mine-sweepers. The first fleet was made up of the most powerful ships, dreadnoughts, superdreadnoughts and powerful battle-cruisers. The three fleets taken together were called the Grand Fleet, or the Home Fleet, and it was cherished by the British people as the first line of defense. Outside of the North Sea when the war began were several fast German cruisers which started immediately to cruise the Grand Fleet, and it became the duty of the British navy serving on the high seas to chase down and destroy these ships, or force them to intern in neutral waters. While on this service the British men-of-war also sunk German merchantmen, with the result that German commerce was driven from the seas. In the two first months of the war 10 per cent of the German and Austrian merchant ships were sunk at sea.

The German fleet was in an excellent condition. Most of the ships were modern and well designed. The service was operated on a spirit of democracy, the officers being taken for the most part from the middle class. German science had been employed freely in developing efficient naval mechanism, and the aptness of the German system of government life had made it possible to supply the navy with admirable sailors. The commander-in-chief, under the kaiser, was Admiral von Tirpitz, a resolute man to whose devotion and energy the development of the German navy was chiefly due. His espousal of the cause of ruthless submarine warfare showed how little he valued humane feeling in war, but such a trait ought not to blind us to his merits as an organizer and administrator.

The actual presence of the British Home Fleet in the North Sea when war began made it necessary for the Germans to give up their long-cherished project of a quick raid in force on the coasts of Great Britain. It also forced them to keep themselves much in their own harbors. They hoped that the opportunity would come to take the fleet out and punish the moment when divided. For this purpose the Kiel Canal was well adapted. Its mouth was protected by mine fields and the well-fortified island rock of Heligoland. It formed a safe passage-way for the greatest ships into the Baltic Sea and permitted them to sally forth at will for any sudden attack that fortune might enable them to make. It was Germany's boast in 1914 that her navy would adopt a stay-inside policy until by single enterprises of fast cruisers and submarines, and by mines, she had reduced the opposing navy to a state of numerical equality and then her High Seas Fleet would go out and defeat its enemy in battle. It was an amateurish boast; for no trained naval man would have thought that the fleet had been preponderantly on the British side in the preliminary stage of picking off ships.

**Fighting in Distant Seas.**—The period of actual fighting was ushered in with a series of minor attacks, which seemed larger in the general course of the war at sea. But a more important affair took place in the Mediterranean. When war began two German ships, the Goe- ben, a battle cruiser with a speed of 28 knots, and the Breslau, a light cruiser of equal speed, were off the coast of Algiers. They fired a few shots at the shore defenses, and turned to escape them, and the Straits of Gibraltar but were headed off by British warships which chased them eastward. They sailed their pursuers and on the morning of 5 August appeared at Messina, where the officers made their wills and deposited their papers with the German consul, and then the vessels sailed.

away, their bands playing ‘Heil dir im Siegerkranz.’ The Goeben and Breslau now turned toward Constantinople, where they arrived in a few days, eluding a British squadron sent to intercept them. These vessels played an important part in the train of events which brought Turkey into the war on the side of Germany. When Turkey openly made war on November 1 these two ships were taken into the Turkish navy, and renamed; they did much to keep the Russian fleet from dominating the Black Sea.

In the southern Pacific Ocean other work awaited the navies of the Entente. Here Germany held several island colonies, with a total area of about 100,000 square miles. To take this territory was especially desired by the inhabitants of Australia and New Zealand. Fitting out expeditions under the care of British and French warships they seized one possession after another, in general without serious fighting. On August 28 German Samoa was taken, on November 6 New Georgia was rendered, on September 13 the Solomon Islands were taken over, and a few days later German New Guinea capitulated. Farther north the Japanese were carrying out the work of conquest at Shantung, completing the task on November 10 with the capture of Port Arthur. The British and French fleets then came to the aid of the British navy as the United States entered the war.

More striking were the careers of the German cruisers Emden and Koenigsberg, which, stationed at Tsing-tau before the war, set out on August 28 and October 19 respectively, for the Pacific Ocean. The Koenigsberg destroyed the Pegasus in Zanzibar Roads, on the east coast of Africa and then took refuge in the Rufiji River, hoping to escape the British cruisers sent against her. Her hiding place was discovered and after an eight months’ blockade she was destroyed by monitors on July 11, 1916. The Kurfürst, another raider, had a brief career of commerce destruction. Her fate was lost in doubt but it has been agreed that she was wrecked in the East Indies. Two converted cruisers, Prinz Eitel Friedrich and Kronprinz Wilhelm, came to Newport News, Va., in the spring of 1916, and while inflicting much damage on Allied commerce. The Kaiser Wilhelm der Grosse was sunk by the British cruiser Highflyer near the Cape Verde Islands. In December 1916, two German raiders, the Moggie and the Sea Tiger, got out to sea and did much damage to commerce. The first returned in a few weeks, but the second continued in the southern Atlantic and Pacific waters. She was finally wrecked at the island of Mopelia, near Tahiti, in the South Pacific. Her crew escaped in a sloop to the Easter Islands, Chilean territory, and were interned until the end of the war.

The experiences of the Emden make a more dramatic story. She left Tsing-tau at the beginning of the war and joined a German squadron under Admiral von Spee in the southern Pacific. A few days later she was detached for separate duty and proceeded to the east coast of Australia. The consternation that ensued was like that caused by the St. George’s Minotaur by the “Alabama” during the American Civil War. In the course of two months the Emden captured 17 ships, most of which were sunk. The total loss amounted to several millions of dollars. Captain Mueller, her commander, proved himself a brave and resourceful man on many occasions. On one occasion he sailed boldly into the harbor of Penang flying a neutral flag, the ship disguised by the erection of a dummy fourth smokestack made of canvas. In the early dawn she entered the harbor unchallenged. A Russian cruiser was anchored by the side of the channel. Two torpedoes and several rounds of shell finished her. Observing that other ships were coming into the harbor Captain Mueller turned to escape. He encountered a French torpedo boat and sunk her with three broadsides. Picking up her survivors he hastened to the open sea, the whole affair having occurred within a half-hour. By this time all the Allied naval ships in the East were searching for the raider, and it was not safe for Mueller to remain in the ordinary sea lanes. Other dangers occurred also in the capture of the Emden’s collier and supply ship in Sumatran waters. Standing out into the Indian Ocean she appeared on November 29 near the Cocos or Keeling Islands, 550 miles southwest of Sumatra. A party was sent to destroy the cable and wireless stations. The operator managed to send a message, "Strange warship off entrance," which brought the Australian cruiser Sydney to the scene. Abandoning his shore party Captain Mueller tried to elude the Sydney in a running battle that had lasted less than two hours, when the Emden was forced on a reef in a sinking condition, her decks covered with dead and wounded. Captain Mueller was taken prisoner along with the other survivors. In her hasty departure from Keeling Island the Emden abandoned her landing party, headed by Lieutenant Mücke. The series of events which marked the homeward journey of this party make one of the most exciting stories of the war. Their first action was to fortify themselves and proclaim martial law. Then fearing the Sydney would return and make them prisoners they took possession of a small schooner and set sail for the Sumatran Coast, where the Dutch authorities gave them a warm welcome and helped them on their way with few supplies. Turning prow westward they finally encountered a small German trading vessel, which was still dodging the British and Japanese patrol on the Asiatic Coast. She took them on board and landed them in Arabia at Hodeidah on the lower part of the Red Sea. They tried to cross the desert to Medina but were opposed by Arabs and forced back to the sea. After many adventures on native boats and fighting against the Bedouins on the shore they at last reached El Ula on the railroad that ran south from Damascus and were thus able to reach Germany by way of Turkey after five months of wandering. Lieutenant Mücke’s exploits in this long trip made him a hero in his own country and won the admiration of many people of other lands.

When the Emden set out on her career as a raider she was detached from a German squadron in the Pacific commanded by Admiral von Spee, and bound for the western coast of South America to destroy the Allied merchantmen as it encountered. Two large and fast armored cruisers, the Gneisenau and Scharnhorst, and three fast light cruisers, the Dresden, Leipzig and Nürnberg, composed the squadron. They found such a welcome in
WAR, EUROPEAN.—NAVAL OPERATIONS (11)

the harbors of Colombia and Ecuador that the British government made emphatic protest to the governments of these countries against the violation of neutrality. Passing down the coast von Spee came to Coronel, a few miles south of Concepción, Chile. Here on 1 Nov. 1914 he encountered a British squadron under Rear-Admiral Sir Christopher Cradock, sent out to protect the trade routes on the two sides of the southern part of South America. The British squadron consisted of two armored cruisers, the Good Hope and the Monmouth, a light cruiser, the Glasgow, and an armed liner, the Otranto. In armament the British ships were inferior, but in speed were superior to the Germans; and Admiral Cradock would have been justified in avoiding an engagement. But he chose to accept battle and allowed the Germans to take position to his east, so that his ships were clearly outmatched for the Germans against the long afterglow of the sunset sky. In two hours the Good Hope and the Monmouth had gone down with their crews, including the commander of the squadron. The Glasgow and the Otranto had been ordered to fall out of line before the battle and escaped to safety. The conflict was really a duel between two British and two German armored cruisers with the advantages of speed, range of guns, thickness of armor and atmospheric conditions in favor of the latter. Probably Admiral Cradock was to blame for failing to recognize these facts. The battle seems to have gone against him from the beginning; for von Spee got the range first and damaged the best guns of the Good Hope before they could be brought into action.

The news of the engagement seemed to show the superiority of German ships and officers, and the pride of the British was touched to the quick. Immediately a squadron of superior strength was sent out under Rear-Admiral Sturdee, consisting of two battle cruisers, the Invincible and the Inflexible, armed with 12-inch guns and capable of a speed of 28 knots, and three armored cruisers, the Carnarvon, Kent and Cornwall. With the Glasgow this squadron was sent south Atlantic by the end of November, whither von Spee had come to escape the Japanese, who were combing the Pacific to discover his whereabouts. By a ruse Rear-Admiral Sturdee enticed him to the Falkland Islands and met him there when he arrived on the morning of 8 December. He came expecting to find an unsupported British warship which was to become an easy prize. To his surprise he saw a superior squadron steam out of a landlocked harbor and fled, Sturdee coming close behind him. At 2 p.m. the British battle cruisers had the range and opened a deadly fire. Von Spee realized that the game was up and turned to fight for his life. The Schärdinhorst and Gneisenau were opposed by the Invincible and the Carnarvon, and sank, the first at 4 p.m. and the second at 6 p.m. The light cruisers, the Nürnberg, the Leipzig and the Dresden did not stand for the battle but turned southward, pursued by the Kent, the Monmouth and the Glasgow. By 9 p.m. the first and second were below the waves, but the Dresden managed to escape in the night. She was sought relentlessly and finally discovered and sunk by the Kent and the Glasgow on 14 March 1915 at Juan Fernandez. In the battle of the Falkland Islands the Germans, like the British at Coronel, fought bravely against a superior force and went down with their ships. But in one respect there was a difference: At Coronel the victors were unable to save any of the defeated crew from the water because of a very heavy sea; at Falkland Islands the British sailors gave themselves to saving life as soon as the defeated enemy vessel hauled down their ensigns. Unfortunately it was a difficult matter. The British sailors did what they could by throwing ropes, logs of wood and mats to the Germans in the sea. But the water was icy-cold and many of the unfortunate ones became numb and relaxed their hold before they could be reached. It is reported, also, that many were attacked by the albatrosses who picked at their eyes. While they fought off these vultures, numbed hands lost their holds and the victims slipped off and were lost. About 200 men were rescued from the waters, but Admiral von Spee and two of his sons were lost. As at Coronel no ship on the victorious side was damaged but a few men were wounded.

Standing Guard in the North Sea.—Although the encounters in remote seas were the most striking thing the belligerent navies were doing in the first months of the war, the work of most importance was keeping the German High Seas Fleet blockaded up in German harbors. For this purpose the British fleet kept constant station. It had to be ready for sudden attacks, sweep up German mines continually and lay mines of its own, and be always on the lookout for submarine attacks. All this was hard work, and few people realized its extent and labors.

Most people in the Entente countries expected a great battle for supremacy, and it is probable that many Germans entertained the same expectation. In fact, it was part of the policy of each side to entice the fleet into battle, either in small encounters or in large engagements, the Germans by raids or by setting traps in which they might throw a superior force against some part of the British fleet. In general the Entente Allies were content to play a waiting game, but at times they tried to draw their enemy out of his mine-protected harbors by sending forward weak squadrons in the hope that they might precipitate a fight and maintain it until the main British fleet came up. Several isolated achievements marked the first work of this war, the major being favorable to the Germans. On 3 September a German mine destroyed a gunboat, the Speedy, in the North Sea. On the 5th the light cruiser Pathfinder was torpedoed by a German submarine off the Scottish Coast, an exploit for which the Germans paid on the 13th when their light cruiser, the Hela, was destroyed by a British submarine in the North Sea. On the 22d three British cruisers were patrolling the Dutch Coast when one of them, the Aboukir, was torpedoed and began to sink. Her companions, thinking she had struck a mine, came up to save the crew. First one, the Hogue, and then the Good Hope, were torpedoed, with the result that all were lost with 680 out of a total of 1,459 officers and men. However, none of these affairs had important influence on the progress of the war.

Few large-scale naval actions were fought
during the war, but one occurred on 28 August in the Bight of Heligoland, and it is typical of the battles in which each side sought the advantage of numbers, with the result that the Germans drew off when it seemed that they would be brought into a general engagement with the British High Seas Fleet. The battle was planned by the British to take advantage of an opportunity to overwhelm the Germans. Having reconnoitred the waters around Heligoland they sent out on the 27th a submarine flotilla to serve as scouts. Next day they sent forward two destroyer flotillas, followed by a battle cruiser squadron, a cruiser squadron, a light cruiser squadron, and all to rendezvous before Heligoland in the morning of the 28th. The submarines with two small destroyers in attendance arrived in front of Heligoland early on the 28th and revealed themselves. Behind them, but out of sight were the other squadrons. The German ships, according to their custom, were behind the island, but seeing the submarines the enemy came out, thinking to make an easy capture. Then followed a sharp battle between two of the British cruisers that quickly arrived and two German cruisers and some destroyers. It developed into a duel between the opposing cruisers, in which the Germans got the worst of the encounter. Meanwhile the heavier British ships were out of sight, and the Germans sent out two additional cruisers, recalling one of the first in the fight because of her severe damages. This led the British to call for help, and about noon Admiral David Beatty arrived with a squadron of five battle cruisers. He found two British light cruisers, the Arethusa and the Fearless, heavily engaged with two German light cruisers, the Mainz and the Köln. About the same time two other British light cruisers, the Falmouth and the Nottingham, arrived and joined in the battle. Beatty might well have suspected the Germans of a ruse by which, if he stood to fight, he might have suddenly found himself outflanked by the superior German fleet. But putting aside any such doubts he went boldly into the battle, where his 13.5-inch guns soon settled the fate of the Mainz, the Köln and the Ariadne. This done he turned his former battleship for the battle of the remaining expedition. The net result was the destruction of three German light cruisers, the serious damaging of another and the destruction of one destroyer and the serious damage of seven others. The British set the stage for the battle of Heligoland and fought it according to their plan. Their lighter craft were sent forward to engage the enemy in the hope that he would be drawn out in such numbers that the superior British ships could cut them off, but this did not happen. The last and going down when they sank. No British ship was sunk, and but one, the Arethusa, was badly damaged.

The next naval event of importance in the North Sea was the German raid on Yarmouth on 2 Nov. 1914. Three German battle cruisers, two armored cruisers and three light cruisers composed the raiding party. They appeared before Yarmouth at eight in the morning and bombarded the place for 15 minutes at a 10-mile range. Little damage was done because of the long range, and on their return to Germany one of the armored cruisers, the York, struck a mine and sank. The purpose of the expedition seems to have been to see if such could be made. From the accounts in the British newspapers the German authorities had a good opportunity to see the effects and to observe in what manner the next attempt could be made at improvement.

The next attempt came on 16 December with a squadron of three battle cruisers, and one armored and one light cruiser under Rear-Admiral Funcke. The expedition reached a point off the coast of England north of Flamborough Head, Yorkshire, in the early morning, the weather being foggy and cold. Dividing into two columns, one proceeded to attack Scarborough and Whitby and the other attacked Hartlepool. At Scarborough the town was shelled for 45 minutes. Many shells were fired at a wireless station in the suburbs, but many others were sent without discrimination into the thickly populated residential sections. Churches, hotels, the gas-works, the water-works, and whatever building was large enough to attract attention became a target. Not only did the attackers plead inability to distinguish objects from a distance; for the shots were directed as much into the residential district when the ships were but 500 yards from the shore as when five miles away. Eighteen persons were killed, most of them women and children, and about 70 were wounded. Passing north the column steamed past Whitby firing all the time and killing five and wounding two persons. The second column opened fire on Hartlepool about eight o'clock. A small gunboat and two destroyers in front of the place were forced to flee from a vastly superior attacking force. A small fort with antiquated guns stood in front of the town, garrisoned by some Territorials, who manned the guns and returned shot for shot, but without effect. One of the attacking ships gave her especial attention to this battery. The other made an indiscriminate attack on the civilian portion of the town. The gas-works and most of the shipbuilding yards was damaged, churches, schools and hospitals were hit, and the streets were severely damaged. The killed numbered 119 and the wounded more than 300. Among those injured were several children on the way to school.

These attacks were evidently made to strike terror in the minds of the British people. They had another effect. To shoot down old men, women and children was horrible and exasperating to the British, who have never prided themselves on their humanity for the defenseless. The story of the attacks of 2 November and 16 December stimulated the war spirit in Great Britain and promoted volunteering. It was an argument for war that the ignorant could understand. Of the four towns assailed in these two raids, only one, Hartlepool, had fortifications of any kind, and the old fort at that place was inconsequential. In delivering the assaults the Germans said that they knew the conditions on shore, showed no desire to distinguish between public losses and losses to be inflicted on private individuals.

The raids were hailed as deeds of heroism
in Germany, as in fact they deserved to be hailed, in so far as it was not concerned with the attacks on civilian non-combatants. The British fleet was keeping a most careful watch, with plans made to destroy whatever German naval force should emerge from the priuans in the areas of their foes. To tally forth and take a turn in the very centre of the enemy's waters was a courageous deed. The second raid came near being a perilous one; for the British fleet was unprepared for such an attack and instantly set out to trap the raiders. As the British came within eight miles of them the fog intervened and gave the Germans an opportunity to escape unscathed.

On 24 Jan. 1915, Rear-Admiral Hipper with three battle cruisers, six light cruisers and a flotilla of destroyers set out from Wilhelmshaven to make a third raid. The British navy seems to have had an inspiration of what was coming. That morning Vice-Admiral Beatty with six battle cruisers, four light cruisers of the "town" class and three others, and a number of destroyers steamed out into the North Sea. About 7 a.m. the Germans were sighted off the Dogger Bank and turned to flee. The British pursued them and having in two hours caught up with them, running, not behind their enemy, for fear of mines, but on a parallel course soon after nine the interval was 10 miles and Beatty, who led in the Lion, opened fire. One of the German battle cruisers, the Bluecher, had a speed of only 24 miles and began to fall behind, and her fate was soon sealed. As the pursuing ships overhauled the Bluecher each took shots at her. Finally a torpedo struck her in a vital part and she turned over and sank. Her crew jumped into the water and boats from a British cruiser began to rescue them, when German aircraft appeared and dropped bombs, probably under the impression that it was a British vessel that was sinking. Meanwhile Beatty's flagship, the Lion, was damaged by a shell so that it had to abandon the fight. He transferred his flag to a destroyer and afterword got aboard a battle cruiser, but for a time the command was with Rear-Admiral Meyer, who decided to keep short the pursuit. He had come within 70 miles of the German mine-fields and believed that Admiral Hipper was trying to lead him into a trap. The escape of the Germans was a great disappointment to the British. In the fight off the Dogger Bank all the advantage of weight, range and speed was against the Germans. The British people, who naturally wanted striking results, thought Hipper should have been surrounded and crushed; but prudence directed that the best ships of the British for speed and offense combined should not be placed too near the mine-fields. The Germans lost the battle cruiser, Bluecher, and had two other battle cruisers severely damaged. The British lost no ship, but the Lion was so badly damaged that it was necessary to tow her, and it was with difficulty that she was taken into a home port. Soon after this battle the German government removed Admiral von Ingenohl and gave the command of the fleet to Admiral von Pölh.

Now there followed a year in which the two fleets had no encounter, the Germans showing themselves still unwilling to come out for battle. As to what efforts the British made to draw them out it is impossible at this time to make a statement. During the interval the enforcement of the blockade of German ports, fighting the submarine by the British and French in the Atlantic, and by the same powers in conjunction with the Americans from the priuans, were the chief features of naval activity in the World War. These were important events and will be taken up in the proper place. It was not until the Battle of Jutland, 31 May 1916, that the world had a chance in the North Sea to note a measuring of strength between the two hostile fleets in the North Sea.

On 30 May the British fleet sailed from its bases on one of its ordinary cruises through these waters. The evidence seems to show that the German fleet was in the habit of making short sallies into the same region, passing through their mine-fields into the region north and west of Heligoland. These sallies were usually made at such times that they did not coincide with the presence of the British in the same waters. But on the cruise of 30–31 May it was the fortune of the two fleets to meet off the coast of Jutland, which forms the western peninsula of Denmark. The British fleet was divided into two sections; one composed of battle cruisers chiefly, but it also contained a squadron of the largest battleships with an enveloping flock of light cruisers, and it was under the command of Admiral Beatty. The other was composed chiefly of battleships, it also contained a squadron of battle cruisers with light cruisers and was under command of Admiral Jellicoe. The two divisions steamed across the North Sea on the morning of 31 May, Beatty taking a course along lat. 50° 30' and Jellicoe along the parallel of 58°. At noon Beatty, finding himself within 50 miles of the coast of Jutland, turned sharply northward and expected to join Jellicoe. The weather was calm and hazy and the sea was as smooth as a pond. At 2:20 p.m. the British light cruiser, Galatea, proceeding on Beatty's eastern flank, signalled "enemy vessels to the east" and five minutes later repeated the information with the statement that the vessels were numerous. The enemy was better sighted, and Beatty ordered his course to south-southwest, intending to get in between him and the base at Heligoland. At the same time he sent out a seaplane which reported at 3:30 p.m. the presence of the German cruiser squadron, consisting of five battle cruisers with the usual number of attendant cruisers and destroyers. Beatty was in slightly superior force and placed his ships in battle line at once and fighting began at 3:48 p.m. He did not doubt that the heavy German fleet was somewhere to the southward, while Jellicoe was two and a half hours away in the north. But he was looking for the German fleet and had found it, and he did not hesitate a moment. It was his duty to go to the attack, and though the two divisions united against him, and to hold them in their position if possible, until Jellicoe arrived and gave them the benefit of his heavy armaments. It was certain that Beatty would place his ships in their position for the time being, but he would have to endure it until reinforced. The engagement began when the two divisions were both sailing southeast, the range being 18,500 yards, about 10½ miles.

The first stage of the battle lasted an hour,
fire and she would drop out of line, but it was impossible to determine how seriously she was damaged. Darkness came about 9 p.m. and throughout the first half of the night intermittent outbursts of firing broke the stillness. During this period the British had reason to beware of submarines, but the destroyers were deployed successfully, all the time the fleets steaming southward. At dawn on 1 June the British fleet was 100 miles north of Helsingoland, but the German had disappeared. Jellicoe and Beatty lay in position until 11 a.m., awaiting the appearance of the foe, and when he did not come they slowly returned to British ports. They had met the enemy and fought in hard battle in which he had escaped severe losses only by reason of the mists and the arrival of darkness.

The moment was now dramatic for the two navies. For years officers and men had looked forward to the day when the strength of one should be measured against the strength of the other, and here side by side off the shores of Jutland were the majority of the capital ships of each, working at work, one against the other. More than two hours of daylight was to be expected in this latitude, and no British sailor present thought that many of the Germans would be aloft when it ended. But here came one of those unexpected turns of the weather which so often favored the Germans on land and sea. The mists thickened and fell down on the surface so that distant objects were no longer visible. Frequently it became so thick that German ships were lost altogether. Lines of smoke screens. Under these conditions a squadron of British cruisers ran between the German and British battleships, which were actively engaged, and only got out with severe losses. In the third stage of the battle the main purpose of the Germans was to escape, but the British had worked around them and stood between them and Heligoland. The closing down of the mists broke up formations and the action resolved itself into a series of small engagements, the Germans using every weapon at their disposal, including the Lutzen, and a light cruiser, the Rostock, concealed at first for political reasons. Against these acknowledged losses were the undisputed
British losses of three battle cruisers, the Queen Mary, Indefatigable and Invincible, three armed merchant cruisers, the Dorsetshire, Duke of Woolerton and Warrior, and eight destroyers, which in tonnage was nearly double the tonnage of the ships mentioned by Germany. Admiral Jellicoe reported that there was every reason to believe the enemy had lost three battlecruisers, one battlecruiser, five light cruisers, six destroyers and one submarine. He based his opinion on testimony taken from his officers and carefully compared. But in his memoirs, published in 1919, he did not repeat this statement. In fact, his general testimony of the low visibility during the action, due to the mists and smoke screens, goes far toward discounting reports of losses his own officers thought they observed in the moment of battle. In his later account he contended himself with pointing out that the Steytlit, a battlecruiser, was injured so badly that she had to be beached, that at least four German battlecruisers were torpedoes, but with what result he did not say, and that all their other capital ships were severely damaged. Other statements by Admiral Jellicoe seem to be important in this connection. He declared that the British battlecruisers were not as well protected by armor as those of the Germans and he said that in several respects their mechanism was not so good as that of the German ships, insomuch so that he ordered improvements made after the battle. It was generally admitted that the German aim was excellent early in the battle. All these things considered, the results can be accounted for by supposing that many German ships, though severally damaged, escaped to their home ports and were thus not placed among the lost. That the German naval power was severely damaged in the battle is unquestionable. Captain Persius, in the Berliner Tageblatt, 18 Nov. 1918, said the "Fleet's losses were severe" in this engagement and that the authorities admitted that the battle must and would be the last. In fact the German fleet did not again leave the protection of the Heligoland region except for a short cruise in August 1916, until it made its tragic journey to Scapa Flow 21 Nov. 1918. Whatever we say about actual losses, the battle of Jutland marks the change of the naval policy of Germany from a series of attempts to lure the British into battle when divided to a quiet stay-at-home policy.

Naval Operations in the Mediterranean.— While the North Sea was the most important field of operations for the naval forces of the Entente Allies, the Mediterranean Sea was not without significance. Here the Austrian fleet had its base, and it was necessary to keep it bottled up in its Adriatic harbor; for if it came out it would have menaced French and Italian communication with Africa and British communication with Egypt, East Africa and India. To keep these fleets in harbor the Allies had the French fleet and such ships as Great Britain could spare from service in the North Sea and from the work of chasing down the few German cruisers that raided their commerce in the beginning of the war. After Italy came into the war against Austria-Hungary, 23 May 1915, her navy gave assistance in this service. The blockade was effective from the beginning. At no time did the Austrians, in whose navy were several modern battlecruisers, dare risk battle in the open sea. As for the little cruiser Goeben and the light cruiser Breslau added to their originally trivial fleet, they did not dare risk battle on the Mediterranean but were content to make raids against Russian ports on the Black Sea. Even in this service they were not very successful; for the Goeben received serious damage in a fight with Russian warships off the Anatolian coast, 18 Nov. 1914. By this time German officers were in control of the Turkish navy and the Goeben was repaired and sent out to raid the oil port of Batum, 10 December, but the Russian squadron drove her back to Constantinople forthwith. By reason of the strength of this squadron the control of the Black Sea was in Russian hands throughout the war. Thus shut up in their harbors the allies of Germany were forced to confine their naval efforts to submarine warfare, of which more anon.

Meanwhile the British admiralty, under the leadership of Mr. Winston Churchill, launched the attack on the Dardanelles to seem to be important in this connection. He declared that the British battlecruisers were not as well protected by armor as those of the Germans and he said that in several respects their mechanism was not so good as that of the German ships, insomuch so that he ordered improvements made after the battle. It was generally admitted that the German aim was excellent early in the battle. All these things considered, the results can be accounted for by supposing that many German ships, though severely damaged, escaped to their home ports and were thus not placed among the lost. That the German naval power was severely damaged in the battle is unquestionable. Captain Persius, in the Berliner Tageblatt, 18 Nov. 1918, said the "Fleet's losses were severe" in this engagement and that the authorities admitted that the battle must and would be the last. In fact the German fleet did not again leave the protection of the Heligoland region except for a short cruise in August 1916, until it made its tragic journey to Scapa Flow 21 Nov. 1918. Whatever we say about actual losses, the battle of Jutland marks the change of the naval policy of Germany from a series of attempts to lure the British into battle when divided to a quiet stay-at-home policy.

Naval Operations in the Mediterranean.— While the North Sea was the most important field of operations for the naval forces of the Entente Allies, the Mediterranean Sea was not without significance. Here the Austrian fleet had its base, and it was necessary to keep it bottled up in its Adriatic harbor; for if it came out it would have menaced French and Italian communication with Africa and British communication with Egypt, East Africa and India. To keep these fleets in harbor the Allies had the French fleet and such ships as Great Britain could spare from service in the North Sea and from the work of chasing down the few German cruisers that raided their commerce in the beginning of the war. After Italy came into the war against Austria-Hungary, 23 May 1915, her navy gave assistance in this service. The blockade was effective from the beginning. At no time did
the sole efforts of the navy, without the cooperation of even a moderate land force. The scheme seems to have originated with Mr. Winston Churchill, First Lord of the Admiralty, who was sure of its feasibility. It appears, moreover, that no technical navy man ventured to point out how difficult it was to destroy strong and well-defended land batteries with naval fire alone.

The attack began on 19 Feb. 1915, and lasted until the middle of April. It falls into three periods: first, the attack on the outer forts, at the entrance of the straits; second, the attack on the Narrows; and third, the period of desultory fighting that followed before the attack was renewed as a land attack with naval cooperation. During the first phase affairs progressed favorably. It was opened 19 February by five British and three French battleships, covered by destroyers, the chief command being with Vice-Admiral Carden assisted by Rear-Admiral Guépratte. After a day's bombardment the Turkish forts were still firing, but the work was renewed on the 25th, after an interval of half a day, for the ships of the British fleet used the super-dreadnought, Queen Elizabeth, just from the hands of the makers, whose eight 15-inch guns made her, with her four companions of the same class, the most powerful fighting engines on the sea. The result was to prove eventually that she had her limitations when fighting against land defenses. But her service was good on the 25th and at the end of the day the outer defenses of the Dardanelles had been silenced. On the 28th the minesweepers were sent into the straits and cleared the waters so that several of the attacking ships went in and bombarded the works along the banks and below the Narrows.

To the people at home it seemed that the task of forcing the straits had begun auspiciously, but the main Turkish defenses at the Narrows had not been reached. When the attacking battleships approached this position they were in a restricted channel and not able to lie dispersed as when they were on the Egean. They were also in the current, and thus huddled together invited attack by mining mines. On 6 March the approach on the Narrows began, and in five days the fortifications just below them were reduced. On 18 March came the main assault. Sixteen battleships, one of them the Queen Elizabeth, were sent into the straits, and a concentrated fire was poured upon the forts on each side of the position. After an hour and a half these did not return the fire. It was concluded that they were destroyed, and a squadron was ordered forward, when all the forts reopened fire. At the same time it was discovered that the current was full of drifting mines, loosened by the Turks at this opportune time when they could hardly fail to find victims. First sunk was the French battleship Bouvet. An hour and a half later the British battleship Irresistible was struck by another mine and sank. Later on the Ocean, another British battleship, encountered a mine and sank in a few minutes. At supper time the French were forced to admit failure and withdrew from the straits. They did not renew the attempt in the same manner, but for a month kept up desultory attacks on such forts as were within range from the Egean and the lower reaches of the Dardanelles. The navy had tried its hand and failed because the task was beyond the power of the navy. The next turn was the army's.

In the later stages of the fighting at Gallipoli the navy rendered important aid in shelling the shore to protect land operations and in sending submarines into the Sea of Marmora to demoralize the Turkish coast defenses. The latter kind of activity were the achievements of the submarines E-11 and E-14, which dived under the Turkish mines and into the Sea of Marmora, sunk three gunboats, three transports and three store ships, and forced the commander of the Turks to bring up his supplies in a roundabout way on the Asiatic side of the straits. An Australian submarine, the AE-2, which attempted a similar work, was sunk in the beginning of the expedition. It was probably these things that prompted the Germans to submarine retaliation, and it came with fatal effect. On 12 May a Turkish submarine sank the battleship Goliath. On the 26th a German submarine appeared and sank the British battleship Triumph, and the Monitor the following day. Against such an attack the big ships of the navy were powerless, and they were ordered home at once, the Queen Elizabeth going with them. Throughout the summer and autumn the navy stood by the futile expedition guarding supply boats and transports and shelling the enemy on shore in aid of some new attempt to go forward in the hopeless task of advancing on Constantinople. When it was evident that the troops must be withdrawn the navy furnished the boats and skillfully handled them; the process of withdrawal being completed with only trivial losses.

The Submarine Campaign.—In the beginning of the war the submarine was considered mainly an instrument of offense against warships. It was so used in the war between Japan and Russia in 1904 and in the first months of the war the submarine was generally spoken of in the same way in German discussions. When, however, it became evident that the German navy was to be shut up indefinitely in harbor by the British fleet, the German mind turned to the submarine as a commerce destroyer. It was the one way Germany had of striking back in the war on the sea.

Elsewhere has been related the origin of the controversy between Great Britain and Germany over the extension of the definition of contraband and blockade. On 26 January the German government took over all the corn and flour in the empire, thus making grain a munition of war. England began at once to seize it as contraband. Germany hastened to declare that she would not use imported grain for military purposes, but that did not change matters, since imported grain only took the place of domestic grain that went to the army. The next step was a notice from Germany that after 18 Feb. 1915, the waters around the British Isles would be held an area of war in which enemy merchantmen would be destroyed by submarines. It was a recognized rule of international law that a cruiser might sink an enemy merchant vessel if it was impossible to put a prize crew aboard and send her to port, but that in such cases the crew and passengers must be placed in safety. Nothing was said to imply that the
vessel must not be sunk if the crew and passengers were not saved, since it would always be possible to save them on a cruiser. As regards the submarine the case was otherwise. It could not take such persons aboard, and in many cases the attack to succeed must be so quick that it would not be safe to wait while boats were being manned. In the absence of any rule on the subject, Germany undertook to make her own rule, and it was wholly in her favor. She torpedoed enemy merchantmen on sight, without warning or waiting to allow the lowering of boats. Declaring the British ports blockaded by submarines, she claimed the right of sinking neutral ships found in the forbidden waters, without examining their papers to see whether they were bound or what they carried. The submarine was a new instrument in warfare, and it was to be expected that Germany would desire some kind of a modification of the rules of naval warfare in regard to its use; but the position she took transcended the ordinary concept of blockade as much as it violated the sense of humanity which is fundamental to the progress of international law.

In the long war that now began between the submarine on the one hand and the naval forces of the Entente Powers on the other Germany and Austria scored their best success at sea. They had found a weapon that their enemies had great difficulty in parrying, and they improved it greatly during the war while they used it most assiduously. It was a difficult warfare to follow, partly because the encounters were isolated and unrelated to one another, and partly because it was the design of each side to keep secret the methods of attack as well as of defense.

Germany's first submarine decree took effect on 18 Feb. 1915. Before that date she had sunk several merchantmen of the Allies, but now sinking became a regular thing. By 31 March she had destroyed 28. Since the British Isles produced but a small portion of the food and raw materials they used, it was Germany's purpose to cut off their commerce and force them to make peace or starve. The small proportion the destroyed ships bore to those that came and went showed how inconsiderable was the strain put upon British industry. On neutrals the effect was more serious, since they ballast the ships from the Norwegian countries and Spain bore the affront with as good grace as possible; for they were too weak to challenge the actions of the great German empire. But all eyes turned to the United States, the one neutral in the world strong enough to dispute Germany's pretension to modify international law. The action of that power, however, was limited by the conduct of the Entente Allies who had also overstepped laws in their blockade, their extension of contraband, and their interruption of American trade with the neutrals in northern Europe. Between the two infractions of international law stood the United States. If they declared war on either nation they would by that act become the unnoted victor. It was a difficult choice; but most Americans felt that if the time came when it must be made the only possible thing would be to oppose the nation that killed American citizens, even women and children, ravaged Belgium, introduced poison gas in warfare, and stood for the domination of the world by a strong military autocracy. An element of this feeling. They considered the United States an unwarlike state and a negligible quantity in the war. Meanwhile President Wilson's policy was to avoid war, if possible. Many a time an American President has found himself in such a position and acted. It was impossible to hold back the popular feeling for war until the resources of diplomacy are exhausted, and in fulfilling such a duty he has become unpopular. In the situation before him Mr. Wilson tried to induce Germany to bring her conduct within the international law rule of cruiser warfare.

The attack on the Lusitania, 7 May 1915, made it hard to restrain public opinion, but the President's course was firm and diplomatically courteous. It took three notes to convince the German government that it must take cognizance of American public opinion. The first indication of a tendency to yield was late in May, when Berlin gave notice that reparation would be made for the damage done. But on 7 August, an American ship which Germany now admitted was attacked by mistake. Unluckily for her purpose this disclaimer was followed close by the news that the Nebraska, another American ship, had been sunk under circumstances equally exasperating, and in respect to this affair Germany was forced to send another apology and offer of reparation. As to the main point of contention, the destruction of Americans aboard the merchant ships of belligerents, she showed no disposition to yield, and on 21 July, President Wilson sent his third Lusitania note insisting that the United States would not yield in any respect the rights of her citizens to travel under the protection of international law and declaring that the repetition of such acts as occurred in the sinking of the Lusitania would be held as deliberately unfriendly. On 19 August the British liner, Arabic, was sunk by a submarine under conditions similar to those of the tragedy of 7 May. The American press clamored for immediate action. Before official cognizance could be taken Germany requested the President to wait for official investigation, and on 1 September she submitted the information that before the Arabic was warning and with full regard to the safety of persons on board, threatening to sever diplomatic intercourse if the assurance was not given. Next day (19 April) President Wilson laid the matter before Congress in a candid speech which was generally
approved. Germany was now face to face with an ultimatum. She decided to yield, and in a note of 4 May 1916, gave definite assurances that merchant ships were to be dealt with under the rules of international law and not sunk without warning and without saving human lives unless these ships attempted to escape after resistance. She added, however, the statement that she expected the United States to induce Great Britain also to observe the rules of international law, which led Secretary Lansing to reply that the United States could not admit that the rights of her citizens were held conditionally. Here the controversy rested until the end of January 1917. In the interval a few ships were sunk in apparent violation of the promise of 4 May, but there were usually some extenuating circumstances, and it was generally accepted that Germany was trying in good faith to live up to her word.

Behind the events just described was a controversy within German governmental circles. Admiral von Tirpitz, head of the naval administration, advised the Chancellor that the United States would hold that all means of distressing the enemy are justifiable. He favored relentless submarine warfare from the beginning. Chancellor von Bethmann-Hollweg took the diplomatist's point of view, and it was his diplomacy that was successful, and he was in conflict with the military authorities in regard to submarine warfare. On 16 March, 1916, von Tirpitz resigned and was succeeded by Admiral von Capelle. Then came an outburst of popular indignation; for the submarine policy was now approved by the German public. They wished to see Britain in any way possible. The political part of the government had the support of the Kaiser for the time being and had its way in the end.

By the end of the year, however, it was evident that Germany was not winning the war and the military party became more than ever insistent on the unrestricted use of submarines. The first was the protest that the statesmen could not withstand it, and on 31 Jan., 1917, the German government announced the immediate resumption of unrestricted warfare. The communication awakened a storm of protest in the United States and left that nation no choice between war and ignorable submission. Germany was prepared for the declaration of war that came on 6 April. She did not believe the United States would be a serious factor in the fighting and she believed that the gain from the destruction of Britain's commerce would more than offset the military damage America could inflict on Germany. Happily in each respect she was to find herself mistaken.

The year following 1 Feb., 1917, was the year of supreme test for the submarine. During the period of restricted use the Germans had been actively engaged in improving this type of craft, making it larger and capable of wider cruising radius and heavier armament. When the war began it was believed that a submarine's cruising range was little more than 300 miles. In February 1915, German submarines were working in the Irish Sea, 1,000 miles from Kiel, and three months later they were in the Mediterranean, 2,500 miles from their bases. In the latter achievement it was believed that they were aided in their progress by supply ships disguised as neutral traders. In July 1916, the world had a still more striking demonstration of the development of the submarine, when the Deutschland, a submarine of commerce, reached Baltimore, Md., a distance of more than 4,000 miles from Hamburg. On 7 Oct. 1916, the German U-53 arrived at Newport, R. I., remained in port a few hours, and sailed for some unknown destination, taking supplies, looting two days near Nantucket where she sank eight vessels, two of them neutrals. When unrestricted warfare began in February 1917, the best German U-boats had an operating radius of 10,000 miles, a surface speed of 25 miles an hour, and carried six-inch guns with a range of 6,000 yards. It is probable that the possession of these improved vessels served to whet the desire for unrestricted use of them.

So confident were the defenders of the policy that they promised the people that three months of it would see the British on their knees suing for peace. How near they came to making good their threat the allied public did not know until the war ended. Admiral Sims is authority for the statement that in April 1917, when he arrived in England to represent the United States, he held that all means of distressing the enemy are justifiable. He favored relentless submarine warfare from the beginning. Chancellor von Bethmann-Hollweg took the diplomatist's point of view. He was his diplomacy successful, and he was in conflict with the military authorities in regard to submarine warfare. On 16 March, 1916, von Tirpitz resigned and was succeeded by Admiral von Capelle. Then came an outburst of popular indignation; for the submarine policy was now approved by the German public. They wished to see Britain in any way possible. The political part of the government had the support of the Kaiser for the time being and had its way in the end.

By the end of the year, however, it was evident that Germany was not winning the war and the military party became more than ever insistent on the unrestricted use of submarines. So great was the protest that the statesmen could not withstand it, and on 31 Jan., 1917, the German government announced the immediate resumption of unrestricted warfare. The communication awakened a storm of protest in the United States and left that nation no choice between war and ignorable submission. Germany was prepared for the declaration of war that came on 6 April. She did not believe the United States would be a serious factor in the fighting and she believed that the gain from the destruction of Britain's commerce would more than offset the military damage America could inflict on Germany. Happily in each respect she was to find herself mistaken.

The year following 1 Feb., 1917, was the year of supreme test for the submarine. During the period of restricted use the Germans had been actively engaged in improving this type of craft, making it larger and capable of wider cruising radius and heavier armament. When the war began it was believed that a submarine's cruising range was little more than 300 miles. In February 1915, German submarines were working in the Irish Sea, 1,000 miles from Kiel, and three months later they were in the Mediterranean, 2,500 miles from their bases. In the latter achievement it was believed that they were aided in their progress by supply ships disguised as neutral traders. In July 1916, the
to the southern coasts of England but a large number of destroyers and light cruisers that were accustomed to raid the fishing fleet and otherwise disturb Allied shipping in the North Sea. If these bases could be closed the destroyers set to watch them could be used against submarines on the ocean lanes and the minefields in the North Sea could be extended so that the region would be free from the craft of the enemy. The ports were well fortified and defended by minefields, but a plan was made to enter them and block their channels and its execution was entrusted to Rear-Admiral Keyes, who had seen good service at the Dardanelles. It involved the sinking at night of ships laden with concrete in the narrow channels. It was believed that once they were sunk the shifting sands of the coast would accumulate around them and make obstructions not easily removed.

The re-assembled expedition consisted of five old cruisers to serve as blockships, a small fighting cruiser, the Vindictive, for attack in the harbor, two ferryboats, and a number of destroyers and motor launches. It sailed for the Belgian Coast on 22 April 1918, its movements timed to arrive at Zeebrugge at dawn. At sea the flotilla divided, three blockships going to Zeebrugge and two going to Ostend. At the latter place the project was simply to take the two vessels into the harbor as far as possible and sink them. At Zeebrugge the work was more difficult; for there was no harbor proper at this place. The canal from Bruges here reaches the sea and to protect it from shifting sand a mole 54 meters wide and more than a mile long was thrown out in front of its mouth. On the mole was a garrison of 1,000 men well supplied with machine guns and small artillery. The plan was to attack the mole from the outer side in order to draw the attention of the defense, while the blockships passed around its end into the harbor and thence into the canal. An old submarine was filled with explosives and sent forward against a portion of the mole near the shore where it became a viaduct in order to allow the wash of the tide to undermine it. The old submarine was set off before she when she was in position, destroy the viaduct, and thus isolate the garrison on the end of the mole. Motor launches and destroyers were to make smoke screens behind which the vessels were to operate. The expedition was timed to arrive at midnight and to finish its work by 1:30 A.M., for the shore batteries had a range of 16 miles and the vessels should be out of their reach when dawn appeared before 3 o'clock.

As the expedition neared Zeebrugge the smoke screen was liberated and the northeast wind carried it toward the shore. Monitors began to shell the shore works, as they had often shelled them before. The garrison, contrary to expectations, deserted their posts on the mole and sought cover on the shore. Then the wind shifted and the line of approaching ships was revealed to the Germans, who sent up star shells and opened a terrific fire. But the six small monitors set off the old submarine and laid her when they were in position by one of the ferryboats on the other side. Bluejackets leaped on the mole and despite the hail of shell that swept it advanced toward the shore, finding no one before them. Meanwhile the old submarine had been steered straight for the viaduct. A mass of German soldiers waited on it, seeming to think she wished to surrender. Her commander drove her between two of the blockships into a button that ignited the fuses, and jumped into a boat with his men and escaped. A minute later she blew up with a great column of flame that made a yawning breach in the viaduct and carried to their deaths the unfortunates who were upon it.

While these things happened the three blockships reached the inner harbor and steered for the mouth of the canal. One of them fouled her propeller in some harbor nets, drifted toward the shore and was sunk by the batteries. The other two entered the canal and were sunk in positions slanting across it effectively barring its passage. The crews of these ships escaped to the destroyers for the most part. This done the signal for re-embarkation was given, when those on the mole who still survived went aboard the Vindictive and the ferryboats, and the flotilla steamed away as rapidly as possible. Many a brave man was slain, but the survivors reached England in a burst of glory. The deed they did showed the value of the project prepared by Drake and Sir Richard Grenville. It raised the navy, in the minds of Englishmen, from the monotony of machine-like routine to the dash- ing adventures of the days of chivalry.

The portion of the expedition that had gone to Ostend did not have the same good luck. Discovered before they entered the outer harbor they became targets for a fierce bombardment and the vessels sank before they found the entrance to the inner harbor. The attempt was renewed on 9–10 May and with better success. The Vindictive, scarred in the first fight, was taken with great boldness into the harbor and sunk in a position that blocked the channel for all but small ships. The expeditions against Zeebrugge and Ostend did not end the warfare of the submarine, but materially restricted it. The Germans made efforts to remove the blockships, but Allied aircraft visited the spots constantly, dropping bombs, driving away the working parties, and object was to expel the apparatus.

All the time the steady work of snaring the submarine went on. Each month the shipyards turned out more destroyers and the munitions works more and more effective depth bombs. The mines grew more powerful and more numerous, so that the barrages were larger and deeper. To get a submarine out of the bases on the German Coast now took the work of minesweepers for eight or nine days. Their trips became more infrequent because of this delay. At the same time the number that fell victims to the destroyers increased, though it was never as large as the public thought. As the process of destruction advanced the trained officers were killed, the sailors began to rebel, and the U-boats that got out to sea showed more timidity about attacking, all of which lessened the efficiency of the service. When the submarines were called in by the German admiralty late in October 1918, the German war ended.
she sent a first instalment of 20 vessels to the designated rendezvous off Harwich, where they were handed over in grim silence. Later on it was found that she had an additional 102 completed and 170 unpainted submarines in her territorial waters, and these also were surrendered. It was estimated that she lost 216 during the war. Tyu passed out of her hands the most successful weapon she used in her naval conflict; a great navy and trained many sailors to serve well. She had used the submarine so skilfully that her conquerors were aghast and did not dare leave in her hands so deadly an implement of destruction.

JOHN SPENCER BASSETT,
Professor of History, Smith College.

12. AERIAL OPERATIONS. The history of what was accomplished by American aviators in the last months of the World War contributes a glorious chapter to the annals of the army. It must, however, be admitted that the credit belongs to the aviators and the race which produced such splendid youth full of the intelligence, courage and hardihood demanded by this branch of the service. The "Army" as a parent body can claim little credit for the work that was done between August and November 1918. French and British Allies supplied both the matériel and the training without which our most brilliant flyers must have remained on the ground. From 1908 to 1916 aviation in the United States army received little assistance from the general staff. In April 1917, the United States had two aviation fields, and 35 airplanes. The National Advisory Committee on Aeronautics having acquired a scientific knowledge of some of the air problems declared 51 of these machines to be obsolete and the other four obsolescent. In the spring of 1917 when the United States entered the World War, the German air offensive had been in progress some 32 months. It is humiliating to American pride to admit that our professional military establishment appears to have learned almost nothing from the conflict abroad, that could be made use of when America joined the Allies in April 1917. The army possessed a general staff and under the direction of that corps of selected experts, the service schools were teaching officers the tactics and strategy of the Civil War. The artillery branch of the service believed its three-inch field piece to be equal to any light artillery weapon ever invented. The potential value of tanks had been demonstrated by an officer of the National Guard more than a dozen years before, but the value of the tank was not recognized by France and ignored at home. The Wright Brothers had been experimenting with heavier-than-air, flying machines for a long time but the United States army had less than 100 qualified flyers when war was declared. It is doubtful whether there was anyone in the military establishment who realized that not one of these flyers was competent to meet in an air duel a war-trained pilot. An aviator able to fly a plane would have been an easy victim of an opponent skilled in the tactics of air fighting which required an ability to execute a variety of maneuvers which were quite unknown in the United States. Air fighting had made more progress between 1914 and 1917 than any other technical service.

At the outbreak of the war the chief use of aeroplanes was in reconnoitring enemy positions and correcting artillery ranges. Some raids were made and some explosives dropped but little more than moral effect was expected from these exploits. But when the United States entered the war a much wider program had been evolved for the air forces. Great air squadrons operated in offensive undertakings with well-planned technique. It was a common practice of the enemy to set an aerial trap by dispatching at a comparatively low altitude several large slow machines such as were used for photographing or bombing which offered an inviting target for Allied attack. When half a dozen Allied planes flew to the apparently easy conquest of an incautious enemy they were liable to fall victims to an unexpected assault by very fast enemy Fokkers which had been flying much higher and waiting for the opportunity to dive down and deliver a raking fire from the rear upon the unsuspecting Allied squadron. The plain flying man would have been the most helpless of victims in such a combat. Only the skilled fighter could hope to convert defeat into victory by the instant execution of the "evasive movement" and a "zoom" which would put him on the enemy tail and in possession of all the advantage of position which a few seconds before had threatened death and destruction.
WAR, EUROPEAN — AERIAL OPERATIONS (12)

Not only were these manoeuvres of air fighting unknown in the United States in 1917 but that country had no machines which would have admitted of their execution. *Pilots, Pilots and Pipe dreams* demanded not only skilled pilots and dependable motors but a strength of structure and materials beyond anything we possessed. Even the French Niueport, a fighting plane much favored before the Spad was developed, often stripped her wings and crashed under the strain of some of these terrific demands.

Prior to the entrance of the United States into the war nothing was scarier in America than the truth. Every Allied effort was heralded as a "great advance" or a most "skilful strategic retirement." Each German attack was widely proclaimed as the Hun's last expiring effort.

Amid all the misinformation published, the news as to aerial conditions was perhaps the most misleading. In the early summer of 1918 the writer crawled into a listening post in front of Bethincourt and was asked by an intelligent American infantryman a question that might have been asked by millions of puzzled American soldiers as to where the truth was apparent. The soldier said, "Major, can you tell me what is the matter with Uncle Sam? I got a two months' old newspaper in the mail from home, and it says the Allies are masters of the air. This morning the Huns came across and shot down three French artillery balloons back of this sector and a few days ago I saw them shoot down four balloons, and they went back safe and sound. Down in the State I come from, folks all thought that some clever Yankees would invent new things that would wind up this war quick and easy, almost as soon as we got started. We've been in the war 16 months now and we can see for ourselves that the papers are just fooling the folks at home." That boy was one of the thousands who gave their lives two months later to win the victory that came to valor if not to genius.

Between May and November 1918 American squadrons trained and equipped by the French came rapidly into the fighting area, where their daring and ability they had no superiors. The American Air Force at the front increased from three squadrons in April 1918 to 45 squadrons in November 1918. When the armistice was signed these squadrons had an equipment of 740 planes. Altogether 2,698 planes were sent to the zone of the advance for American use, and of these 667 were of American manufacture. Of these 2,698 planes dispatched to the front 1,162 remained when the armistice was signed.

At that time we had at the front 20 pursuit squadrons, 18 observation squadrons and seven bombing squadrons with 1,238 flying officers. There were also 23 balloon companies. The first American flyers were the Lafayette Escadrille, an organization of Americans serving in the French army who were transferred to the American service in December 1917.

The most successful American squadron was the famous "Hat squadron" (the "Hat in the Ring Squadron") which was the first to go over the enemy's lines — the first to destroy an enemy machine — and which shot down the last German aeroplane which fell in the war. This squadron boasted eight aces, including Capt. Edward V. Rickenbacker, its commander, American "Ace of Aces." Frank Luke, who was killed after 18 victories in six weeks and Hamilton Coolidge, a brilliant pilot, killed a German shell, which having missed a bombing plane at which it was aimed, struck his fast-flying Spad by accident square under the centre of the engine. Douglas Campbell of the 94th was the first non-pure American ace, having entered the war with the Americans and earned all his victories in that service. He had scored seven victories before being badly wounded. Maj. Raoul Lufbery, with 18 victories to his credit, 17 of which were scored while he was with the Lafayette Escadrille, was killed when he leaped from a burning Spad fired by a flaming bullet from an enemy Albatross which he was attacking near Nancy.

Quentin Roosevelt was a pilot in the 95th squadron and had been made a flight commander shortly before he was killed in a disastrous battle with the most famous of all German squadrons, Baron von Richthofen's "Flying Circus." This enemy unit equipped with red-nosed Fokker planes was manned by the most expert airmen in the German service. Familiar with every trick of aerial combat and flying machines capable of great speed, fast climbing ability and extreme flexibility of movement the Flying Circus was for a long time the terror of the skies from Flanders to Verdun. The Lozeuer Circus was another celebrated German air squadron.

It was the chief glory of the American air service to have finally conquered these most dangerous opponents who represented the utmost in skill, daring and equipment evolved by Germany during the war. A brief description of a battle fought on the afternoon of 10 Oct. 1918 over Dun-sur-Meuse may serve as an example of how these dangerous enemies were finally vanquished. The 94th squadron had been ordered to destroy two enemy balloons, one at Dun-sur-Meuse and the other at Aincreville. On this mission 14 Spads of the 94th squadron flew toward the German lines with eight planes from the 147th squadron to cover the right flank and seven planes from the 27th squadron protecting the left. It was known that along this front north of the Verdun-Argonne sector the Germans had concentrated their best air units including the red-nosed von Richthofen Circus, the yellow-bellied fusilages of the Lozeuer Circus and the checkerboard insignia of the No. 3 Jagstaffel. The Germans also had on this front the new scout machine — the Siemens-Schuckard — driven by a four-bladed propeller and capable of a much faster climb than even the French Spad. This ability to climb fast is a tremendous advantage, as it enables a skilful tactician to gain the ceiling, i.e., secure an overhead position from which to fire or dive upon his opponent. Some new Fokker planes were equipped with four instead of two machine guns and, therefore, were capable of projecting a perfect shower of bullets upon an opponent. Capt. Rickenbacker commanding the 94th squadron assigned to Lieutenants Coolidge and Chambers the task of setting fire to the balloons and directed all of the participants in the surprise raid to
assemble in formations as arranged at 3,000 feet above Montfaucot at 3:40 (15:40 French time) o'clock. With the two balloon Strainers in the lead the entire force were to fly toward the Dunsur-Meuse gas bags, intent upon protecting Coolidge and Chambers from German air forces certain to fly to the defense of their balloons, especially as the afternoon was clear. The ensuing battle is of special interest because the secret intelligence reports conveyed the information that the enemy had gathered here the strongest air force ever concentrated since the beginning of the war.

The American raiders turned from the rendezvous over Montfaucot toward their first objective with the commander flying his Spad several thousand feet above the flotilla to watch its progress. Over the lines they were welcomed by a tremendous outburst of "archie" which, however, failed to injure any of the Americans. Inside German territory the Dunsur balloon was in sight and American raiders were observed flying to its defense from the direction of Stenay. Presently eight more could be seen coming up from Metz and it was evident that although the whole German front was falling back their methods of interception were still most efficient. The 147th squadron under Lieut. Wilbur White of New York was at this time separated from the rest of the Americans by nearly a mile and von Richthofen's men passed under the American commander as they drove on to attack the dislocated unit. Having allowed them to pass, Rickenbacker banked sharply and gaining speed as he came down from the ceiling promptly secured a position close on the tail of the last of the Fokkers. His first stream of shot set fire to the German's fuel tank and the next moment the German aviator leaped from the blazing machine, and due to his equipment with an umbrella parachute settled to safety within his own lines. A similar device might have saved many an American aviator from the torture of roasting to death in a falling plane on fire. The American ace immediately "zoomed" up to regain the advantage of the ceiling and by that time a regiment of German machines was shooting 10 Fokkers and the eight Spads of the 147th squadron. The German leader selected the rear Spad for his own attack, and to protect his comrade Lieutenant White "zoomed" up and with a renversemance rushed to the rescue of the apparently doomed American. White was one of the bravest as well as most skilful of the American airmen and as he completed his manœuvre he made a direct plunge upon the German. Without firing a shot White rammed the Fokker head-on while the two machines were approaching each other at tremendous speed and the mingled débris fell in a heap on the banks of the Meuse far below. By an act of unsurpassed heroism the American commander had saved the life of his subordinate, sacrificed himself and destroyed an enemy. The German squadron having seen their leader killed by this extraordinary attack abandoned the fight. Meanwhile the German balloon company had succeeded in pulling to earth their huge sacs, but Lieutenant Colonel Compton of the 147th squadron "pique"d upon it through a storm of projectiles until a "flaming onion" set fire to his wings and he fell into the German position. At the same moment two Fokkers succeeded in maneuvering into a position on the tail of the Spad flown by one of the most famous of the American air fighters, Lieut. James Meissner. This American ace was saved by the prompt attack of Captain Rickenbacker, whose accurate shooting destroyed one of the Fokkers and drove the other off. Lieutenants Coolidge and Chambers, although failing to get the balloon, each shot down a Fokker, so that on that afternoon the famous 94th squadron added four victims to their score, all from the elite of the German air service.

This battle occurring as it did as part of the Meuse-Argonne offensive, the greatest battle ever fought by American troops, clearly demonstrated the quality of the brave Allied airmen who had fought and died to hold the enemy in check until Americans could be trained and equipped to take up and help complete the task. German airmen were dangerous enemies.

Our brave boys inherited the splendid traditions of both the French and British air services. They knew the story of that great Frenchman, Lieut. George Guynemer, who met his glorious death on 11 Sept. 1917 while engaging five German A.4s. His death was in a battle where 40 German planes were up under the direct command of von Richthofen. At the time of his death Guynemaker had accounted for 53 enemies, of whom 25 had been shot down by the end of 1916 and the other 28 in a little more than eight months of 1917.

Among the stories of British air heroes they remembered that of Lieut. R. A. J. Warneford, V.C., who was killed so long ago as 17 June, 1915, 10 days after he had destroyed a great German Zeppelin raider near London. It would be a cheap folly to attempt to belittle either the skill or the courage of the German flying service, which against the best efforts of French, British, Belgian, Russian, Italian and American airmen maintained a hard struggle for the mastery of the air for more than four years. They met unexpected efficiency and strength in the first days of the war from the few but devoted airmen of Belgium, whose skilful reconnaissance did much to rob the early German offensives of their "surprise" value. Russia, like Germany, had for two years before the war kept strictly secret her aerial development and when the storm broke the tsar's armies were surprisingly well equipped with both men and machines.

The German air service in addition to excellent mechanical equipment had the advantage of a superior co-operation on the part of other branches of the military service. The British and especially the American airmen had demanded a complete separation from bureaucratic army control. The Americans have been almost a unit in declaring that they were prevented from becoming a factor in the war until in France they practically escaped from the paralyzing influence of their own War Department and general staff. It appears to be an undeniable fact that we had never achieved even in the last days of the war any such system of co-operation between our artillery and our air service as that which distinguished the enemy. The German anti-aircraft guns were able by a well-understood system of shell sig-
nals to warn their airmen while far up in the skies of the approach of an enemy and to indicate the altitude at which the foe was flying. Two black puffs characteristic of the German archies breaking in front of one of von Richt-hofen's men were a notice that the observers on the ground had seen the signal followed by another puff 2,000 feet higher the German airman knew that an enemy had been detected flying at an altitude 2,000 feet higher than his own level. Thus warned, the machine in the Fokker could choose a flight while there was still time to make a choice. When the various branches of an army maintain a liaison as close and efficient as that, all are glad to belong to the team. Our army theoretically is all one team entirely committed to teamwork, but in the World War the air service at least seemed like a poor relation dependent entirely upon its own initiative and resources.

In considering the development of aviation in connection with the war we may begin with the estimate that before the war the warring nations had spent about $100,000,000 on air equipment and possessed at the outbreak of hostilities in the aggregate 5,000 aeroplanes and 100 balloons. In the German powers sought aeroplanes, and more especially equipment in the American market with the result that by the end of that year the factories were running to capacity.

At that time military opinion maintained that in view of limited production the air machines were too valuable to be used in actual fighting and were far more useful for reconnaissance and range-finding. A noticeable improvement in the duration of flight indicated increased control and greater reliability and endurance on the part of the newer models. In 1915 the sales of aeroplanes and parts in the United States were estimated at $5,000,000, and large factories were operating in the United States and Canada, including the Curtiss Company in Buffalo; Wright Aeroplane Company, Dayton, Ohio; Glenn L. Martin Company, Los Angeles, Calif.; Sturtevant Aeroplane Company of Seattle, Wash.; Moultrie Company, Marblehead, Mass.; Thomas Company, Itasca, N. Y., besides many smaller concerns.

In the field of war, biplanes and triplanes were being used and military aeroplanes had been so far improved that it was possible for the aviator to take hands and feet from the controls long enough to use a camera, drop a bomb, consult a map or aim and fire a weapon. Congress in 1915 appropriated the small sum of $300,000 for army aeronautics and although American factories were producing much aeroplane matériel very little progress was made in developing personnel. In that year air battles began to be fought between squadrons operating as organized units and the war by many dased single organisms. The opinion began to gain ground that the best way to dispose of an enemy aeroplane was by attack in the air with another plane. Experience had shown that a machine might be repaired by the mechanical miracles and yet not disabled. The French organized aerio squadrons (escadrilles) with bombing planes, gun planes and chasers. France at that time was using Bleriot two-seaters with Gnome motors — Clement-Bayard, Caudron, Henry, Maurice Farman, Morane-Saulnier and Voisin machines. A political-military scandal had led to an early war prohibition of the use of Bleriot, Deperdussin, Nieuport and R. E. P. monoplanes. Later the Nieuport came into very general use, although its wings proved unreliable when subjected to strain of 10 kilogrammes. In 1917 and 1918 American flying cadets were trained largely on Nieuports, and our aviators did their first fighting in these machines. In the summer of 1918 they were first equipped with the much superior Spad.

As early as 1915 the Germans were using huge battle planes equipped with Mercedes engines and two machine guns. Many of the French and German aeroplanes were armored on the bottom to permit low flying. On 16 Feb. 1915, 40 French and British aeroplanes and seaplanes bombarded the German lines in Belgium. In August of that year 32 battle planes attacked and bombed German munition factories at Saarbrücken and later in the same month 62 Allied planes raided Dellingen.

The year 1916 was notable in military aeronautics for improvements in aeroplane engines by both French and American manufacturers. The Germans improved the Mercedes engine and put the Oberursel nine-cylinder air-cooled rotary motor in their Fokker monoplanes. They also used the Benz motors extensively. France developed the Hispano-Suiza which weighed only 242 pounds per horsepower. England at that time had 500,000 people employed in the air service including many non-combatants and it was reported that the British expenditures for the year on the air service reached $250,000,000. In America the Wright-Martin Aircraft Corporation absorbed the Wright Company, Glenn L. Martin Company, and others. The Curtiss Aeroplane and Motor Corporation had been greatly developed. When the United States War Department in November 1916 called for bids for 148 service twin-motor hydro-aeroplanes for coast artillery use, 12 manufacturers submitted proposals, offering both biplane and triplane types. The fixed biplane business was in heavy-thar-air-machines for 1916 amounted to somewhat less than $4,500,000. A much applauded event in American aviation was a successful flight of 12 aeroplanes from Mineola, Long Island, to Princeton, N. J., on the occasion of the Yale-Princeton football game. In December eight aeroplanes flew from Hempstead Plains, Long Island, to Philadelphia.

In England as decided a novelty was the new "Blimp" a combination of dirigible and aeroplane machines. These miniature airships proved very serviceable for scout and patrol duty over the waters of the British Channel where they easily sailed in circles above the fastest training boats and brought help to or to from "Blighty." The Blimps undoubtedly contributed much to the immunity from submarine attack of the ships which ferried armies of men back and forth across the channel. Great were the regret which followed the sinking of the German zeppelins and when the British were enabled to inspect one of those giant raiders, the L-33, forced to earth in England, indications were found that this machine had been developed to a point which would make possible a
non-stop flight of at least 1,500 miles at 60 miles an hour or better with favoring winds.

In 1916 the Germans made more than 30 air raids on England, destroyed considerable property and wounded several hundred people. Thirteen Zeppelins were destroyed.

Formidable fleets of gigantic aeroplanes carrying many tons of high explosives rained destruction on lines of communication and centres of supply far back of the entrenched fronts. Valuable two-ton bombs dropped by hundreds.

In 1918 the aerial operations of both sides reflected the intensity of effort characteristic of the climax of the World War. Both London and Paris suffered severely in air raids, although improved aerial defense systems devised for the protection of both capitals succeeded in destroying a number of the raiding machines.

British aviators raided and bombed German positions in Belgium, affording to a Lorraine, including Mannheim, Treves, Saarbrucken and Thionville. They also bombed Mainz, Stuttgart, Cologne, Coblenz, Freiburg, Zweibrucken and Kaiserlautern, causing fires and explosions in munition plants and motor-works. In a second raid on Saarbrucken in May five German planes were shot down. British naval airmen frequently raided Bruges, Ostend and Zeebrugge, dropping tons of explosives. During the war the air raids on England caused the death of 1,570 people and the injury of 3,941. One hundred and ten raids were carried out by airlships and aeroplanes.

In 1917 and 1918 great progress had been made in both construction and skill in handling aeroplanes in war. Speed, manoeuvring ability and armament had been so far developed that the smaller scouting and fighting machines attained a velocity of 150 miles per hour. The German Gotha biplane and the British Handley-Page biplane carried several men, several guns and from one to two tons of explosives. The Italian Caproni triplane carried three tons of bombs. German battle planes were armed with guns which used four kinds of bullets—ordinary, perforating, incendiary and explosive.

On 25 May 1917, President Wilson signed an aeronautical appropriation bill amounting to $60,000,000. During the year specifications for aircraft construction and materials were formulated by the International Aircraft Standard Board of the Advisory Commission of the Council of National Defense.

The various American manufacturers combined in an organization called the Manufacturers Aircraft Association, Incorporated. The Aircraft Board was established.

This protection afforded to military inefficiency by the military censorship practically eliminated criticism of conditions abroad by labeling as a traitorous pro-German any writer who might try to communicate undesired facts. Nevertheless in the spring of 1918 the American public was rudely awakened from the dream that all was well by news which managed to reach home, largely because of the critical situation which developed when the reinforced German attacks so nearly drove a wedge between the British and the French.

The news was that American armies at last arriving in greater strength were proceeding to the firing-line deficient in aircraft. After the rosy, boastful announcements issued in 1917 from government sources Congress was shocked to learn that the American aviators in France lacked aircraft, both for training and for fighting. On 21 May 1918 a reorganization was effected of the air service previously under the Signal Corps of the army. The public in general was both uneasy and resentful and the President requested former Justice Charles E. Hughes to conduct an investigation. The charges were that early in the year $691,851.- 866.47, appropriated by Congress for the fiscal year ending 30 June 1918, had been expended with practically no results. It was alleged that members of the Aircraft Board had been financially interested in contracts. German and disloyal influences had retarded work. Graft had been permitted. On 25 Oct. 1918 the Hughes report was submitted and showed that investigations had been conducted in most of the larger plants having government contracts. Nearly 300 witnesses had been examined and 17,000 pages of testimony taken.

The report showed that of the $691,851.- 866.47 appropriated the actual amount disbursed for aviation purposes up to 30 Sept. 1918 was $139,186,661.33, not subject to a considerable reduction for salvage.

Responsibility for inefficiency and delay in organization and work was placed upon responsible officers in the Signal Corps and Justice Hughes pointed out that the provisions of the criminal statutes do not reach inefficiency. The investigation as to personal interests disclosed reprehensible conditions exposed at great length and it was recommended that officers found to have had transactions in behalf of the government with corporations in whose profits they had an interest should be prosecuted under the Criminal Code. Subsequently it was announced that as no benefit had been gained by the relations found to exist between the officials and the contractors the officers criticised in the report, Lieut.-Col. G. W. Mixter and Lieutenant-Colonel Vincent were pardoned by the President prior to any prosecution.

The aircraft program delay was attributed to the reason that plans adopted had failed, but the subsequent appointment of civilians J. D. Ryan and W. C. Porter to take charge of aircraft production led to better organization and progress. In the selection of contractors and distribution of work, methods had been so poor that one part of the government program impeded another.

The report discussed misleading public statements made by official authority, but arrived at no definite conclusion. Causes of delay were attributed largely to lack of knowledge and capacity in the Signal Corps. Contractors' profits were discussed and the employment of German sympathizers was regarded as unavoidable because of great scarcity of skilled labor.

Equipment of the army was reported as follows. The American Expeditionary Force between 12 Sept. 1917 and 16 Nov. 1918, received from all sources:

The Liberty engine intimately connected with the effort to develop efficient aeroplanes in the United States was developed in 1917 and put in quantity production in 1918. By autumn of the latter year the monthly output had reached 3,376, by the various factories engaged in its manufacture. By the time various difficulties and defects had been overcome and remedied this engine in its final 12-cylinder type combined high power with lightness and reliability.

Two months after the armistice was signed the War Department announced that the Loening two-seater monoplane in recent tests at Dayton, Ohio, had developed a speed of 145 miles an hour with a full military load including four guns. In these tests the Loening plane carrying two passengers climbed 25,000 feet. This monoplane is American designed and American built. It is driven by an eight-cylinder 300-horsepower Hispano-Suiza engine and carries fuel for three and one-half hours’ flight. In September 1919 Maj. R. W. Schroeder at Dayton, Ohio, climbed 31,800 feet in 68 minutes in a Le Père biplane. In connection with the general discussion of the scandals covered by the Hughes report it may be as well to refer here to the controversies regarding the air service in the United States army which were widely discussed in Congress and elsewhere through the latter part of 1919 after the return of the majority of the forces from abroad.

Under the leadership of Maj. (formerly Brig.-Gen.) B. D. Poulois, chief of air service, American Expeditionary Forces, the airmen seemed to be unanimous in demanding the consolidation of every aircraft activity now in existence in the United States under one central department of government and under one responsible head. This proposition for the creation of a Department of Aeronautics met strong opposition from the War Department which showed a determination to retain active control of all military organizations.

The airmen point to the woeful record of War Department control from 1908 to 1918. The military aviation is the only soldier required to risk his life in the pursuit of peace time duties and therefore demands such control of equipment and organization as will reduce to a minimum the risk of life and limb. He asks that those who control his destiny shall be detached from the habit of making the air service as safe and efficient as the nature of the work will admit.

The statistical summary of the war with Germany published in 1919 by the general staff says that the expenditures for the air service up to 30 April 1919 amounted to $889,291,000—6 per cent of army war expenditure. In November 1919 Major Poulois published a statement that if the United States were called upon to fit out an expedition for service in Mexico it would take at least six months or a year to equip efficiently such an expedition with up-to-date aircraft.

As these two statements, one by the general staff as to expenditures and the other by the late chief of air service in France as to post-war conditions, may both be assumed to be correct, it would appear needful that some competent authority should tell why, immediately after spending $889,291,000, the country has nothing to show for it except a dozen aviation fields and the memory of a great corps of trained airmen disbanded and lost.

This situation is important because all military authorities predict that future wars will be fought out increasingly in the air. For the first time in England’s history her fleet was unable to protect English homes from enemy attack in this war. It is certain that even an ocean will not suffice to protect the American seaboard cities from aerial attack in future wars. Control of the air is the only sure safeguard.

**Statistics of the Air Services. Balloons:**
Before the armistice, America produced 642 observation balloons and received 20 from the French. Forty-three of our balloons had been destroyed and 45 given to the French and British. At the end of the war we had remaining 574 balloons. At that time the Belgian army had six, British 43, French 72, and the Germans 170 on the Western Front. Thus the American army had at the end of the war nearly twice as many observation balloons as the enemy and the Allies combined had at the front.

**Air Squadrons.** In addition to purely American operations two full squadrons were attached to the British Royal Air Force in March and June 1918 and remaining with the British throughout the war participated in the following engagements: Flying the day of the Somme, Vernon, Noyon-Montdidier, Vielliers, Bray-Rosieres-Roye, Arras, Bapaume, Canal du Nord, and Cambrai.

Strictly American operations began in the middle of March 1918, when an American pursuit squadron using French Nieuport planes took up patrol duties on the front from Villeneuve-les-Vertus.

By May several squadrons representing all types of service—pursuit, observation, bombing—were in active service using foreign-built planes.

In November there were 45 American squadrons on duty at the front with 740 planes. Of the total number of planes (2,698) sent for American use to the zone of advance only 667 or one-quarter were of American make. Of the 2,031 planes from foreign sources nine-tenths were French.

The planes sent to the zone of the advance were about two-thirds of the service planes received by the British and French services. The other one-third were used in back areas. The American Service bore a prominent part in the three major American operations of the war.

WAR, EUROPEAN — AERIAL OPERATIONS (12)

Chateau-Thierry (July 1918).— The Germans at the start had a decided superiority in the air, but the American squadrons, comprising four pursuit, three observation and two balloon companies, rendered valuable service. Contact was established with German airmen three to 10 miles within the enemy lines and photographs were taken showing the entire front as well as the deep rear terrain. The German concentration for the attack of 15 July was reported in detail including the location of their reserves. The Allied concentration for the counter-attack was so well covered that the enemy was surprised.

Saint Mihiel (September 1918).— In this operation the American first army was aided and protected by the largest concentration of air force ever made, of whom about one-third were American and the other two-thirds were French, British and Italian squadrons operating under American control.

The air force consisted of 12 pursuit squadrons, 12 observation and three bombing squadrons with 15 balloon companies. American service planes recorded 4,000 flying hours during the week of the Saint Mihiel offensive.

Enemy back areas were kept under bombardment day and night. Their reserves and ammunition dumps were located for American long range artillery. Propaganda was dropped. Photographic records were made showing every movement in the enemy lines and of his reserves, and the finished photographs showing these movements were frequently delivered to headquarters within half an hour of the occurrence. Fast pursuit planes armed with machine guns flew low over the German lines firing directly into their infantry. The fog lying low in the Meuse valley compelled the day bombers and the artillery observers to fly very low.

Meuse-Argonne (September to November 1918).— In this great final battle of the war the Germans had effected a very thorough redistribution of strong air forces along the southern sector of the front and it was not possible to effect against them so heavy a concentration as that made at Saint Mihiel. Less assistance was rendered and British and French airmen but the American force was considerably larger.

During the six weeks' struggle heavy losses were suffered but replacements were brought forward so promptly that in the final stage of the conflict the available American strength was greater than at the start.

Summary.— When the United States entered the war the Allies furnished the designs of their planes and between that time and the end of the war supplied us with 3,800 service planes. Aviation training schools in the United States graduated 8,602 from elementary courses and 4,028 from advanced courses. More than 5,000 pilots and observers were sent overseas.

The total personnel of the air service, officers, students and enlisted men increased from 1,420 at the outbreak of the war to nearly 200,000 at the close. Up to 30 Nov. 1918 more than 8,000 training planes were made in the United States. Three thousand two hundred twenty-seven De Haviland Four observation and 1,900 Pursuit planes, and 1,583 balloons were shipped overseas. Thirteen thousand five hundred seventy-four Liberty engines were completed and 4,435 shipped to the American Expeditionary Forces and 1,025 delivered to the Allies.

In November 1918 Germany's air force consisted of nearly 2,700 machines divided as follows: bombing machines, 200; for infantry liaison, 250; for reconnaissance and artillery observation, 1,100; for light, 1,100.

American Air Casualties.— Revised figures issued by the United States War Department show that the American flying forces at the front sustained 583 casualties during the war. The figures show the number of casualties among the aviators in each branch of the air service and also among American flyers serving with the Allied armies. The figures include the killed and injured in flying accidents at aerodromes in the zone of advance. The casualties were distributed as follows:

<table>

French Air Casualties.— The total casualties to pilots, observers and gunners killed, wounded, taken prisoners and missing amounted to 7,555, 63 per cent, out of a total of 12,000 pilots, observers and gunners.

List of Aces, United States.— An official report by the War Department showed there were 63 4 4Aces 4 men downing five or more enemy machines—in the American army when the war ended.

American Aces

Captain Edward V. Richenbacher, of Columbus, Ohio, premier "Ace" of the American air force, 26 victories.

First Lieutenant Frank Luke, Jr., of Phoenix, Ariz., who was killed in action, was second on the list of "Aces" with 18 victories.

Major Victor Roan Laffey, of Welland, Conn., who was also killed in action, was third with 17 victories.

Captain Reed G. Lindell, of Chicago, and First Lieutenant David E. Putnam, of Brookline, Mass., who was killed in action, had 12 victories each.

Lieutenant Fields Kinley, Gravette, Ark. 10

Lieutenant C. A. Vaughn, Jr., No. 441 Washington Avenue, Brooklyn. 10

Lieutenant J. M. Swag, Philadelphia. 10

Lieutenant Thomas G. Camsay. 9

Lieutenant C. E. Wright, Cambridge, Mass. 9

Lieutenant W. P. Erwin, Chicago. 9

- Downed 13 in one day.

* French Aces is incomplete. It is understood that the official Air Record while in transit from Field Headquarters to the War Office in London was destroyed by enemy action at sea. Efforts to reconstruct the record from accounts of survivors, field reports, etc., will probably never adequately replace the records destroyed.

**German Aces.**

The *Berliner Zeitung am Mittag* on 24 April 1918 stated that of the 41 German aviators who had shot down 15 or more opponents from the beginning of the war, that date 19 had been killed in action and two had been reported missing. The list of the fallen aces with year of their death and the number of their victims follows:

- Capt. von Richthofen (d. 1918), 117
- Lieut. Boss (d. 1917), 33
- Capt. Blender (d. 1916), 13
- Capt. von Gontnermann (d. 1917), 32
- Capt. von Macleavy (d. 1918), 12
- Capt. von Krauss (d. 1917), 12
- Capt. von Allen von Tutschek (d. 1918), 27
- Lieut. von Boelke (d. 1917), 34
- Lieut. von Bacht (d. 1917), 6
- Lieut. von Rahn (d. 1917), 12
- Lieut. von Frankl (d. 1917), 12
- Lieut. von Wintergarten (d. 1916), 18
- Lieut. von Baldemus (d. 1917), 18
- Lieut. von Hess (d. 1917), 17
- Lieut. von Immlenmann (d. 1916), 15
- Lieut. von Dosenbach (d. 1917), 10
- Lieut. von Schneck (d. 1917), 17
- Lieut. von Menck (captured October 1918 by Lieut. de Vore, 95th Squadron).

The two aviators reported missing were:
- Lieut. von Blasow
- Capt. Dosterl

In March 1918 Germany claimed 102 aviators each of whom had shot down more than seven aeroplanes or balloons in battle, and that the total number of their victims up to May 1918 was 1,698. In the same period 43 of these aces had been killed and three were missing. Several others had been disabled and retired from the air service.

**EDWIN W. DAYTON, Major, Infantry, R. L.**

**13. THE ARMISTICES.** Bulgaria. — Bulgaria was the first of the Central Powers to confess her complete war exhaustion. Her surrender to the Entente was the first of the closing scenes of the end of the World War. Gen. Franchet d'Esperey in command of French, British, Italian, Greek, Serbian and Slavic forces carried out a brilliant offensive in the fall of 1918, opening the road to Sofia. The Bulgarians sued for a separate armistice and one containing terms of unconditional surrender was granted on 30 Sept. 1918, when fighting ceased.

The armistice terms, all of which were of a purely military nature, were substantially as follows:

- Bulgaria to evacuate all Allied territory, demobilize her army as rapidly as possible; all rolling stock and other means of transport to be turned over to the Allies.

The Allies to be allowed to pass through Bulgaria if necessary to future military operations.

Control of the Danube and Bulgarian merchant marine on that waterway to be given to the Allies.

All important strategic points to be occupied by the Allies if they wished.

In case part of Bulgaria is occupied this to be done by French, English and Italian troops. Parts of Greece and Serbia evacuated by the Bulgars to be occupied by Greek and Serbian forces respectively.

The armistice to continue in operation until the conclusion of a general peace. See The Peace Treaties in this series.

Turkey. — Turkey was the next power of the Central Alliance to surrender to the Allies. Her army was routed in Palestine by Allenby. Aleppo, the main base of supplies, fell on 20 October and utter resistance faced Turkish arms. On 14 Oct. 1918 the Spanish
WAR, EUROPEAN — THE ARMISTICES (13)

Ambassador at Washington, D. C., presented to Secretary of State Robert Lansing a note from the Turkish chargé d'affaires at Madrid, asking the President of the United States to initiate immediate negotiations for an armistice. In their note the Turkish government declared that it "accepts as a basis for the negotiations the program laid down by the President of the United States in his message to Congress of 8 Jan. 1918, and in his subsequent declarations, especially the speech of 27 September. In order to bring about an immediate end to the war, and to accomplish the object of the Turkish government, the imperial Ottoman Government requests that steps be taken for the immediate conclusion of a general armistice on land, on sea, and in the air."

The Turks sent General Townsend, the British general captured at Kut-el-Amara early in the war, to Vice-Admiral Cathorp, Allied commander of the Aegean fleet, to ask for terms. Accredited agents were sent by both sides to the island of Lemnos and after a discussion, lasting three days, the terms of an armistice were agreed to and sent to the Turks. The latter accepted these terms on 30 Oct. 1918 and the armistice went into effect the next day. The terms were as follows:

**TERMS OF ARMISTICE GRANTED TO TURKEY BY THE ENTENTE**

The terms of the Allies' armistice to Turkey, as given out by London 1 Nov. 1918 were as follows:

II. The positions of all mine fields, torpedo tubes and other obstructions in Turkish waters are to be indicated and assistance given to sweep or remove them, as may be required.

III. All available information concerning mines in the Black Sea is to be communicated.

IV. All Allied prisoners of war and Armenian interned persons and prisoners are to be in Constantinople and handed over unconditionally to the Allies.

V. Immediate demobilization of the Turkish army, except such troops as are required for surveillance on the frontiers and for the maintenance of internal order. The number of effective troops and their disposition to be determined by the Allies after consultation with the Turkish government.

VI. Surrender of all vessels in Turkish waters or waters occupied by Turkey. These ships will be interned in such Turkish port or ports as may be designated, except such vessels as are required for police and similar purposes in Turkish territorial waters.

VII. The Allies have the right to occupy any strategic points in the event of any situation arising which threatens the security of the Allies.

VIII. Allied ships of all ports and anchorages now in Turkish occupation and denial of their use by the enemy. Similar conditions are to apply to Turkish mercantile shipping in Turkish waters for the purpose of trade and the demobilization of the army.

IX. Allied occupation of the Taurus tunnel system.

X. Immediate withdrawal of Turkish troops from northern Persia to the border of the Russian front. This order has been ordered and will be carried out.

XI. The part of Transcaucasia already been ordered to be evacuated by Turkish troops. The remainder to be evacuated if required by the Allies after they have studied the situation.

XII. Wireless, telegraph and cable stations to be controlled by the Allies. Turkish government messages to be intercepted.

XIII. Prohibition against the destruction of any naval, military or commercial material.

XIV. Facilities are to be given for the purchase of coal, oil, fuel and naval material from Turkish sources after the requirements of the country have been met. Netherlands and British sources are to be expected.

XV. The surrender of all Turkish officers in Tripolitania and Cyrenaica to the nearest Italian garrison. Turkish government to supply all officers and communicate with these officers if they do not obey the order to surrender.

XVI. The surrender of all garrisons in Hedjaz, Arabia, Yemen, Syria and Mesopotamia to the nearest Allied commander, and withdrawal of Turkish troops from Galicia, except those necessary to maintain order, as will be determined under Clause 6.

XVII. The use of all ships and repair facilities at all Turkish ports and arsenals.

XVIII. The surrender of all ports occupied in Tripolitania and Cyrenaica, including the port of the nearest Allied garrison.

XIX. All German and Austrian, naval, military or civilian, to be evacuated within one month from Turkish dominions, and those in remote districts as soon after that time as may be possible.

XX. Compliance with such orders as may be conveyed for the disposal of equipment in communication, including the transport of that portion of the Turkish army which is demobilized under Clause 5.

XXI. An Allied garrison, attached to the Turkish Ministry of Supplies in order to safeguard Allies' interests, this representative to be furnished with all aid necessary for this purpose.

XXII. Turkish prisoners are to be kept at the disposal of the Allied Powers. The release of Turkish civilian prisoners and prisoners over military age is to be considered.

XXIII. An obligation on the part of Turkey to cease all relations with the Central Powers.

XXIV. In case of disorder in the six Armenian vilayets the Allies reserve to themselves the right to occupy any part of them.

XXV. Hostilities between the Allies and Turkey shall cease from noon, local time, Thursday, 31 Oct. 1918.

**Austria—With Bulgaria and Turkey out of the war the surrender of Austria was rendered inevitable. In the great Italian offensive in Oct.-Nov. 1918 63 Austrian divisions were exhausted. On 4 Nov. 1918 the war office at Rome reported: "The Austro-Hungarian army is destroyed. It suffered heavy losses in the fierce resistance of the first days of the struggle, and in pursuit it has lost an immense quantity of material of all kinds, nearly all its stores and depots, and has left in our hands about 300,000 prisoners, with their commands complete, and not less than 5,000 guns." On 29 Oct. 1918 Austria-Hungary sent a note to the Secretary of State of the United States requesting an immediate armistice on all fronts and the commencement of peace negotiations, stating: "Immediately after having taken direction of the Ministry of Foreign Affairs, and after the dispatch of the official answer to your note of 18 Oct. 1918 by which you were able to see that we accept all the points and principles laid down by President Wilson in his various declarations, and are in complete accord with the efforts of President Wilson to prevent future wars and to create a lasting peace, we have taken preparatory measures, in order that Austrians and Hungarians may be able, according to their own desire and without being in any way hindered, to make a decision as to their future organization, and to rule it. Since the accession to power of Emperor Charles his immovable purpose has been to bring an end to the war. More than ever this is the desire of the sovereign of all the Austro-Hungarian peoples, who acknowledge that their future destiny can only be accomplished in a pacific world, by being freed from all disturbances and in the parrows of war. This is why I (Count Andrassy, the new Foreign Minister) address you directly, Mr. Secretary of State, praying that you will have the goodness to intervene with the President of the United States, so that it may be expected that American statesmanship will be of the interest of humanity, as in the interest of all those who live in Austria-Hungary, an immediate armistice may be concluded on all fronts, and for an overture that immediate negotiations for peace will follow."

In a note explaining to the Austrian people...
WAR, EUROPEAN — THE ARMISTICES (13)

All military and railway equipment of all kinds, including coal belonging to or within those territories, to be left in situ and surrendered to the Allied authorities, according to special orders given by the Commander-in-Chief of the forces of the associated powers on the different fronts. No new destruction, plunder, or requisition is to be done by enemy troops in the territories to be evacuated by them and occupied by the forces of the associated powers.

IV. The Allies shall have the right of free movement over all road and rail and water routes in Austro-Hungarian territory and of the use of the necessary Austrian and Hungarian means of transportation. The armies of the associated powers shall occupy such strategic points in Austria-Hungary as they may deem necessary to enable them to conduct military operations or to maintain order.

They shall have the right to requisition as payment for the troops of the associated powers wherever they may be.

V. Complete evacuation of all German troops within fifteen days, not only from the Italian and Balkan fronts but also from all Austro-Hungarian territory. Internees of all German troops which have not left Austria-Hungary within the date.

VI. The administration of the evacuated territories of Austria-Hungary will be intrusted to the local authorities, under the control of the Allied and associated armies of occupation.

VII. The immediate repatriation without reciprocity of all Allied prisoners of war and with resettlement of the civil populations evacuated from their homes, on conditions to be laid down by the Commander-in-Chief of the forces of the associated powers on each front. Sick and wounded who cannot be removed from evacuated territory shall remain under the protection of the Allied and Hungarian personnel who will be left on the spot with the medical material required.

Naval Conditions.

I. Immediate cessation of all hostilities at sea and in the territorial waters of all Austro-Hungarian submarine bases, to be made to neutrals that freedom of navigation in all territorial waters is given to the naval and merchant marine of the Allies and that all questions of neutrality being waived.

II. Surrender to the Allies and the United States of fifteen Austro-Hungarian submarines completed between the years 1910 and 1918, and of all German submarines which are in or may hereafter enter Austro-Hungarian territorial waters. All other Austro-Hungarian submarines to be paid off and completely disarmed and to remain under the supervision of the Allies and the United States.

III. Surrender to the Allies and the United States with their complete armament and equipment of three battleships, three light cruisers, nine destroyers, twelve torpedo boats, six Danube monitors, to be designated by the Allies and the United States of America. All other surface ships and river craft, to be concentrated in Austro-Hungarian naval bases to be indicated by the Allied and associated authorities, to be supplied with all the shops, supplies, and materials of all the United States of America, and are to be paid off and completely disarmed and placed under the supervision of the Allies and the United States.

IV. Freedom of navigation to all warships and merchant ships of the Allies and associated forces to be given in the Adriatic and up the River Danube and its tributaries in the territories of Austria-Hungary. The Allies and associated powers shall have the right to sweep up all mine fields and obstructions, and the positions of these are to be indicated. In order to secure the freedom of navigation on the Danube, the Allies and the United States of America shall be empowered to occupy or to dismantle all fortifications or defense works.

V. The existing blockade conditions set up by the Allies and associated powers are to remain unchanged, and all Austro-Hungarian merchant ships found at sea are to remain liable to search and to be seized which may be made by a commission nominated by the Allies and the United States of America.

VI. All naval aircraft are to be concentrated and impounded in Austro-Hungarian bases to be designated by the Allies and the United States of America.

VII. Evacuation of all the Italian coasts and of all ports occupied by Austria-Hungary outside their national territory and the ports of Brenta, Selle, Ubo, Scherda, Mann, Pag and Panturredia, in the province of Tuscany. In the Province of Emilia-Romagna, Santandrea, Busi, Luna, Leno, Torcello, Cuzola, Lagoa and La Vara, as well as the neighboring towns and inlets and passages, as indicated by the Allied authorities. Great and Small Zirone, Bus, Solta and Brazza.

Any territory thus evacuated shall be occupied by the forces of the Allied and United States of America.
X. No destruction of ships or of materials to be permitted before evacuation, surrender or restoration.

XI. All naval and mercantile marine prisoners of the Allied and associated powers in Austro-Hungarian hands to be returned without reciprocity.

Germany.—Germany, the greatest and most powerful member of the Central Powers, was the last belligerent to lay down her arms on the terms set by the Allied and associated powers. On 5 October negotiations began between the United States and Germany. These negotiations were brought to an end on 5 November when President Wilson informed the German government that Marshal Foch had been authorized by the Allies to open negotiations with the properly accredited representatives of Germany. have not left the above-mentioned territories within the period fixed will become prisoners of war. Occupation by the Allied and United States forces locally will keep pace with evacuation in these areas. All movements of evacuation and occupation will be regulated in accordance with a note annexed to the stated terms.

III. Repatriation, beginning at once, and to be completed within fourteen days, of all inhabitants of the countries above enumerated, including hostages and persons under trial or convicted.

IV. Surrender in good condition by the German armies of the following war material: Five thousand guns (2,500 heavy, 2,500 field), 30,000 machine guns, 3,000 minewavers, 2,000 airplanes (fighters, bombers—firstly, all of the D. sevens and night bombing machines). The above to be delivered in situ to the Allied and the United States troops in accordance with the detailed conditions laid down in the note (Annexure No. 1) drawn up at the moment of the signing of the armistice.

On 7 November came the announcement that Germany’s representatives had been appointed and were about to start from Spa, Belgium, the location of German general headquarters. On 8 November they received at Marshal Foch’s headquarters the terms of an armistice of 35 clauses, the most severe and drastic ever demanded from a great power. After several days of delay and parley the German representatives accepted the terms and signed the armistice at 5 A.M. (Paris time) on 11 Nov. 1918.

The terms of the armistice follow:

I. MILITARY CLAUSES ON WESTERN FRONT.

1. Cessation of operations by land and in the air six hours after the signature of the armistice.

II. Immediate evacuation of invaded countries: Belgium, France, Alsace-Lorraine, Luxembourg, so ordered as to be completed within fourteen days from the signature of the armistice. German troops which evacuation by the German armies of the countries on the left bank of the Rhine. The countries on the left bank of the Rhine shall be administered by the local troops of occupation under the control of the Allied and United States armies of occupation. Occupation of these territories is to be determined by Allied and United States garrisons holding the principal crossings of the Rhine—Mayence, Coblenz, Cologne—together with the bridgeheads at those points of a thirty-kilometer radius on the right bank and by garrisons similarly holding the strategic points of the region. A neutral zone shall be reserved on the right of the Rhine between the stream and a line drawn parallel to the bridgeheads and to the stream and at distance of ten kilometers from the frontier of Holland up to the frontier of Switzerland. The evacuation by the enemy of the Rhine lands (left and right bank) shall be so ordered as to be completed within a further period of sixteen days—in all, thirty-one days after the signing of the armistice. All movements of evacuation and occupation are regulated by the note (Annexure No. 1) drawn up at the moment of the signing of the armistice.

IV. In all territories evacuated by the enemy there shall be no evacuation of inhabitants; no dam-
III. Clause Concerning East Africa.

XVII. Evacuation by all German forces operating in East Africa within a period to be fixed by the Allies.

IV. General Clauses.

XVIII. Repatriation, without reciprocity, within a maximum period of one month, in accordance with detailed conditions hereafter to be fixed by the Allied or associated powers. All German citizens, including hostages under trial or convicted, belonging to the Allied or associated powers other than those enumerated in Annexure No. 4, shall be subject to the reservation that future claims and demands of the Allies and the United States of America remain unaffected.

XIX. The following financial conditions are required:

1. Reparation for damage done. While such armistice lasts no public securities shall be removed by the enemy which can serve as a pledge to the Allies for the recovery or reparation for war losses. Immediate restoration of the cash deposit in the National Bank of Belgium, and in general immediate return of all documents, specie, stocks, shares, paper money, negotiable securities, with plant for the production of public or private interests in the invaded countries. Restitution of the Russian and Rumanian goldoyd taken by Germany or taken by that power. This gold shall be delivered in trust to the Allies until the signature of peace.

V. Naval Conditions.

XX. Immediate cessation of all hostilities at sea and definite information to be given as to the location and movements of all German warships. Notification to be given to neutral powers that freedom of navigation in all territorial waters is given to the naval and merchant ships of all nations, with all questions of neutrality being waived.

XXI. All naval and military personnel and all prisoners of the Allied and associated powers in German hands to be returned without reciprocity.

XXII. Surrender of all German and associated forces in the United States of America to the Allied forces in the United States of America.

XXIII. German surface warships, which shall be designated by the Allies and the United States of America, shall be immediately disarmed and thereafter interned in neutral ports, or for the want of them, in allied ports, to be designated by the United States of America. They will there remain under the surveillance of the Allies and the United States of America, only caretakers and ordnance officers to be permitted on board. The following warships are designated by the Allies: six battle cruisers, ten battle ships, ten destroyers, including two mine layers, fifty destroyers of the most modern type. All other surface warships (including river crafts) are to be concentrated in German naval bases to be designated by the Allies and the United States of America, and are to be completely disarmed and placed under the supervision of the Allies and the United States of America: The military armament of all ships of the auxiliary fleet shall be put on shore.

XXIV. The Allies and the United States of America shall have the right to sweep up all minefields and obstructions laid by Germany in territorial waters and the positions of these are to be indicated.

XXV. Freedom of access to and from the Baltic to be given to the naval and mercantile marine of the Allied and associated powers. To secure this the Allies and the United States of America shall be empowered to occupy all German ports, fortifications, batteries and defense works of all kinds in Germany and in the territories of Rumania and Russia (as defined on August 1, 1914). The renunciation of the treaties of Brest-Litovsk and of analogous treaties.

XVI. The Allies shall have free access to the territories of Germany and of their eastern frontier in order to convey supplies to the populations of those territories and for the purpose of maintaining order.
are to remain liable to capture. The Allies and the United States of America shall give consideration to the provision of Germany during the armistice to the extent recognized as necessary.

XXVIII. All naval aircraft are to be concentrated and immobilized in German bases to be specified by the Allies and the United States of America.

XXIX. In evacuating the Belgian coast and ports, Germany shall abandon in situ all merchant ships, tugboats, launches, and all other harbor vehicles, all materials for inland navigation, all aircraft apparatus, materials and stores, all arms and armaments, and all stores of all kinds.

XXX. All Black Sea ports are to be evacuated by Germany; all Russian war vessels of all descriptions seized by Germany in the Black Sea are to be handed over to the Allies and the United States of America; all neutral merchant vessels seized are to be released; all warlike and other materials of all kinds seized in those ports are to be returned, and German materials as specified in Article Twenty-eight are to be abandoned.

XXXI. All merchant vessels in German hands belonging to the Allied and associated powers are to be restored in ports to be specified by the Allies and the United States of America without reciprocity.

XXXII. The German government will notify the neutral governments of the world, and particularly the governments of Norway, Sweden, Denmark and Holland, that all restrictions placed on the trading of their vessels with the Allied and associated countries, whether by the German government or by private German interests, and whether in return for specific concessions, such as the export of shipbuilding materials or the immediate cancellation.

XXXIII. No transfers of German merchant shipping of any description to any neutral flag are to take place after signature of the armistice.

VI. DURATION OF ARMISTICE.

XXXIV. The duration of the armistice is to be thirty days, with option to extend. During this period, if its clauses are not carried into execution, the armistice may be denounced by one of the contracting parties which must give warning 48 hours in advance. It is understood that the execution of Articles Twenty-eight and Eighteen shall not warrant the denunciation of the armistice on the ground of insufficient execution within the period fixed except in the case of bad faith in carrying them into execution. In order to assure the execution of this convention under the best conditions the principle of a permanent international armistice commission is admitted. This commission will act under the authority of the Allied military and naval commanders in chief.

VII. THE LIMIT FOR REPLY.

XXXV. This armistice to be accepted or refused by Germany within seventy-two hours of notification. It has been signed the Eleventh of November Nineteen Eighteen, at 5 o'clock (a.m.) French time.

F. Foch.
R. E. Weizmann.
Eckersberg.
A. Oessembling.
Witthausfeld.
Von Bialow.

On 14 December the armistice terms were renewed for the period ending 17 Jan. 1919, during which the conditions that were fulfilled were to be completed. To the general terms as given above was added the following provision: "The Allied High Command reserves the right to be understood, if it thinks wise in order to assure new guarantees, to occupy the neutral zone on the right bank of the Rhine to the north of the bridgehead of Cologne, up to the Dutch frontier. This occupation will be respected. In evacuating all naval aircraft High Command by giving six days' notice."

Meanwhile from 12 November the International Armistice Commission was in daily session at Spa, Belgium, in the former seat of the Great German Headquarters. Representatives of the United States, Great Britain, France and Germany attended. Maj. Gen. Charles D. Rhodes and staff represented the United States; with Maj. Gen. Sir Richard C. Haking and staff for Great Britain, and General Nudant and staff for France.

The Germans complied to the letter in the surrender of the stipulated war vessels and gave up every submarine, the total number being 122. These vessels were interned at Harwich, England, while the great vessels of war were interned at Scapa Flow. Further drastic conditions were demanded by the Allies and associated powers in January in renewing the armistice for the month ending 17 Feb. 1919. They included retribution for cruelty by Germans to prisoners of war, restoration of machinery and goods taken from the invaded portions of France and Belgium, the placing in a safe place of German gold then stored in Berlin, German ships to be given over to carry food supplies to European countries, and all submarines on the stocks to be surrendered.

A further revision occurred one month later. The new agreement was signed on 16 Feb. 1919 and provided (1) that Germany must complete the terms of all previous agreements; (2) the armistice can be denounced by the contracting parties on three days' notice; (3) it is renewed for an indefinite period; (4) a large part of Posen is relinquished by Germany to Poland; (5) all aggressives against Poland must be abandoned. Further provisions regarded the demobilization and disarmament of German forces, upon completion of which certain features of the blockade would be released. For further details of the armistice period see the Events Subsequent to the Signing of the Armistices immediately following.

14. EVENTS SUBSEQUENT TO THE SIGNING OF THE ARMISTICES. The German Armistice Extended.—When the armistice was signed on 11 Nov. 1918 several things that grew out of the war between the Teutonic Allies and the Entente Allies were unsettled and had to run their course. Most of them were connected in one way or another with the sad state of affairs in Russia, while others had to do with the terms of the armistice itself, and still others grew out of the long delay in completing the ratifying them accepted by the nations that were parties to the conflict. It now remains to examine these later phases of the war. They should be regarded as the lingering upfiring of the fierce conflagration whose flames had run through hidden piles of national prejudice into the surrounding stubble and threatened at times to bring about renewal of the catastrophe the rest of the world had done so much to suppress. The armistice contained not only certain advanced statements of the terms of peace that were to be incorporated in the treaty and certain acts of submission that Germany was required to make, as the surrender of materials of war and railroad equipment, but it embodied, also, temporary arrangements for the government of occupied regions in Germany, the distribution of food there, and administrative action in carrying out the various agreements of surrender and repARATION. Thus the armistice was to a large extent an administrative instrument; and its importance may be understood by remembering that under it the international relations of the chief nations
of Europe and America, with the exception of Russia, were carried on for more than a year. To execute so large and complicated an agreement was not an easy task. In the first place, Germany was suspected of bad faith at every point. She had only herself to blame; for she had used bad faith as a weapon of war so freely that no one trusted her when she said that she was unable to go further. Was not her republican revolution only a pretense? Many excellent people thought that German rulers had their people so well in hand that they would have them go through the form of a revolution and then change back to the autocracy at the will of the leaders. Against this widespread distrust the Allied leaders could not appeal to their people without producing the impression of being too lenient with the enemy, or something still worse. It was also evident that many Germans felt they had not been beaten, and it was not desirable from the Allies' point of view to have them continue in that opinion. The best assurance that they did not try the same thing again was to make them feel that they did not pay. How to carry the situation through successfully from this point of view was most important.

Still more perplexing was the execution of the terms in the armistice which had been adopted as a means of penalizing Germany for her damages to Belgium and France. She had been required to surrender at once 2,500 heavy and 2,500 field guns, 25,000 machine guns, 3,000 minenwerfer, and 1,700 airplanes. This was in the nature of drawing the fangs. She also promised to evacuate France, Belgium, Luxemburg and Alsace-Lorraine at once, to withdraw from the west bank of the Rhine, to place the important military centres of Cologne, Coblenz and Mayence in Allied hands with the region east of the river 30 kilometers from each of the towns. The first came to be occupied by British troops, the second by Americans, and the third by French troops. She was required to hand over in 31 days 5,000 locomotives and 150,000 freight cars in good working order, and 5,000 motor lorries in 30 days. She was to repatriate at once all without reciprocity all prisoners of war and persons taken away from occupied districts to work, she was to withdraw her troops from Rumania, Turkey, Austria-Hungary and Russia and she was to renounce the Treaty of Brest-Litovsk and the supplementary treaties. She was required to surrender 10 battleships, six battle cruisers, five light cruisers (including two mine-layers), 50 destroyers of the most modern type, and to surrender within 14 days all her submarines that were ready for sea and the others as soon as possible. There were many other minor conditions looking to the end of the war; but two provisions made it clear that the war was not to be considered as finished. It was declared that the existing blockade of Teutonic countries was not to be lifted until the Allies might determine in order to save life from starvation, and it was agreed that the armistice was to expire in 30 days, that it might be renewed, and that either party could denounce it for non-fulfillment on giving forty-eight hours' notice. The general nature of an armistice is to suspend hostilities; the relative strength of the combatants to be left as it is, while the diplomats meet to see if a treaty can be made. The armistice of 11 Nov. 1918 went further than this. In demanding the surrender of war materials and the occupation of the west bank of the Rhine it went beyond the ordinary function of creating a suspension of hostilities without prejudice to either side. It became a sort of surrender by Germany; for she gave up all when she gave up her artillery, fleet, and admitted the Allies to the east bank of her Rhine River. The armistice did not provide for German demobilization. That was not necessary; for the weary soldiery were going home as fast as they could and the new government was but too glad to reduce an army it could neither pay nor control.

The execution of the armistice was a military matter and fell under the jurisdiction of the Supreme War Council at Versailles, at the head of which was Marshal Foch. He was not disposed to take a sympathetic view of Germany's difficulties. In fact, no Frenchman felt disposed to be generous to a foe who had reduced France to the last stage of exhaustion. Germany was in sore distress, no doubt, but her factories were intact: her population and credit were badly smitten, but so were the population and credit of France. It had been Germany's deliberate purpose in the war to reduce French industry to such a state that it could not recover in time to get into the race before Germany had far outdistanced her. Should this design be allowed to have its sway? France and her Allies now had the whip hand: they would be less than human if they did not use the opportunity to reduce the high-handed German plans. The French people demanded firm assurances against the overtopping industrial power of Germany. Thus it happened that when the armistice period of 31 days came to an end there was a demand that it should not be renewed on the understanding that feeling predominated and the terms were not changed materially when the period was extended to 17 Jan. 1919.

By the end of another month, however, the dissatisfaction in France was greater and they demanded that Germany be forced to agree to hand over to France 58,000 agricultural machines of various kinds and to allow the Allies to hold that part of the fortress of Strassburg that lies on the east bank of the Rhine with the adjacent territory. In discussing these matters Erzberger, the head of the German commissioners, demanded of the Allied commissioners that a preliminary treaty should be made out and submitted to his country, which, he said, had demanded such a treaty six times already. The request was not granted and the German commissioners returned to Berlin feeling that new demands, they knew not how severe, might be made on them when the next day of renewal arrived on 17 February.

By this time the position of France in the negotiations was well defined. She looked for protection against future attacks by Germany; for with the time-honored Franco-Russian alliance gone, she naturally desired protection against a foe in whom was great power of recuperation. She also was keen for getting as
reparation every possible concession out of Germany. The reply to her demand was that if German industry was prostrated to benefit French industry Germany could not be expected to raise reparation for the damage done. Perhaps in the French demand there was a disposition to render German industry so weak that it would no longer be a formidable competitor of French industry; and the French demand that the Saar coal fields be given to France and the Silesian fields to Poland seemed to support such a theory. To the American and British delegates this went beyond the principle of a just peace, and they began to act together for restraining France. The agreement of 17 January just mentioned was allowed by them, partly because it seemed wise to satisfy the demand of the French farmers for machinery with which to begin their spring work, and partly because it seemed but a good precaution that if France held Strassburg west of the Rhine the opposite region should be clear of German soldiers. Beyond this they were unwilling to go at that time. It was evident that as long as the armistice was in the hands of military men it would tend to make French Marshal Foch wish to attain his end by military means. Matters came to a crisis when on 8 February in a meeting of the Supreme Military Council, President Wilson moved the creation of a Supreme Economic Council to deal with the purely economic matters affecting the relations of the Entente and Teutonic Allies, the council to contain not more than five members from each of the interested states. The suggestion had the approval of the British and not being opposed by the other delegates it was adopted. The Supreme Military Council also voted to add two economic experts to the permanent commission which had the supervision of the execution of the armistice. At a conference held on the same day and at the same place it was agreed that 4,000,000 tons of German merchant ships, passenger and freight, should be placed at the disposal of the Allies under a commission headed by E. N. Hurley to put them in the ports of the United States and to take food back to Europe. This was in accordance with the feature of the armistice by which the Allies undertook to send food into Germany, if it was found to be needed there. Allied experts had been through Germany by this time and reported that while there was sufficient food in the areas behind the former German army, there was great want in the interior, where the inhabitants showed the effects of the blockade very plainly.

The proposition to allow the German ships to take food to Europe brought up the question of payment. It was the purpose of the Allies to allow the Germans to buy food in Allied markets. But where were they to get the money for payment? The thrifty French saw at once that to pay money for food would be to reduce the funds that could be used immediately for reparation purposes, and they objected to such proceedings. At this time the American Government was considering a bill to make available a fund of $100,000,000 to furnish food to the European countries that needed it. It was supposed at first that a part of the fund could be used to aid the Germans and Austrians, but an amendment was added providing that none of the money appropriated should be used in aiding the enemies of the United States. This halted the negotiations where they stood. On 17 February President Wilson, with the support of Lloyd George, stood on the other. The French press was bitter against President Wilson, and it was evident that it got its stimulus from the government. So tense was the situation that President Wilson was reported to urge the removal of the conference from Paris. It was not within the French plan to carry their agitation too far, and at this point Clemenceau agreed to a compromise. It was decided in the Supreme War Council on 12 February that the American representatives should assist in demobilizing their army to such a number that it would not be feared by the Allies in their demobilized condition, and that they should cease their military operations in Posen against the Poles. On the 17th this decision was submitted to the German delegates. Erzberger, speaking for them, said that the German army was already reduced to 200,000 men. As for the fighting in Posen, he said that the Poles under the Fourteen Points claimed lands that were never Polish and tried to seize them, forcing the Germans to a defensive war. Their protest made no impression, however, and they were compelled to sign a renewal of the armistice on the terms of the Allies. It was some gain that the period was to be indefinite and it could be denounced by either party on three days' notice. They were given the assurance informally that if the armistice was executed the blockade would be lightened. The surrender of Aueilian troops was agreed to and it was suggested that the Germans allow the seized German property in the United States to be sold in payment for the food taken to Germany. Erzberger replied that the German government had no power to take and hand over the property of individuals; that would be Bolshevism. As nothing was done about the shipping at this meeting, the matter came up on 6 March 1919, before the Allied Economic Commission at Spa. Again the Germans refused to give up the blockades, and it was assured that food would be brought back to their own ports. As for payments, they offered to give any security that was demanded. Here the French objected to any pledges which would weaken Germany's ability to pay money in the reparation account. It was the same old impasse, but the French showed their hand when they suggested that the United States advance the food and take long-term obligations in payment. It was a feature of the Paris negotiations to live down the idea that they were in the affair to play the part of generous god-mother to suffering nations. When the French realized that no such part
would be taken in the existing crisis they consented to a compromise; but it was not until the commission had adjourned at Spa and the matter came up before the Council of Ten in Paris on 8 March. It was then agreed that Germany could obtain 300,000 tons of food a month and that she was to pay in potash or in some other such product of her country, or by using her surviving credit in neutral countries, or in extreme necessity by dipping into her gold reserve then in Germany. Mr. Herbert Hoover, whose management of food distribution in Belgium and in the United States had made him one of the distinguished men of the day, was placed in charge of the distribution of the food when it arrived on the Continent. The rationing of Austria was held up by Italy in the same way that France interfered in Germany and the affair was adjusted in a similar manner. At the time popular discontent was apparent in most European countries, and it was generally believed that if food was not obtained the people would turn to Bolshevism.

The Revolution in Germany.—The German Empire of Bismarck's making ended with the abdication of the kaiser during the night of 9-10 Nov. 1918. At the same time the king of Württemberg renounced the throne and within two or three days the kings of Bavaria and Saxony were deposed. In rapid succession every other hereditary ruler in Germany passed off the political stage, the former kaiser capturing the process when on 21 November he renounced the royal crown of Prussia. In their places were organized revolutionary governments, in which the leaders of the Socialist party played active parts. In imperial affairs the lead was taken by a cabinet with Frederick Ebert for Prime Minister, a leading Socialist who had been placed in the position of chancellor in the last months of the old régime. But the time was too feverish for a quiet transition from a monarchy to a republic.

As the new republican and democracy were several different groups, each with its ideal for the government of the country. The example of Russia was before them. In fact, Russian influence had played a considerable part in precipitating the crisis in Germany, and one of the first things was to organize a Soldiers' and Workmen's Council, which proceeded to form a soviet in Berlin. Then came Dr. Karl Liebknecht and Rosa Luxembourg, extreme communists, creating a following who called themselves Spartacists, in alliance to Spartacus who led the Roman slaves in a crusade for freedom. For two weeks the political pot boiled violently. Then good sense began to prevail. On 25 November it was agreed that the Soldiers' and Workmen's Council should be the repository of supreme power provisionally, and it took up the work of organizing the forces of government in a deliberate way, thus showing how much better trained for self-government were the workers of Germany than the workers of Russia. State councils of soldiers and workmen were called on to send deputies to a grand conference at Berlin on 16 December, which, when it met, ordered general election to choose delegates to the constituent convention, the date of election being 16 Jan. 1919. Here was the first step out of the welter of struggling parties. Probably the second was in appointing Gustave Noske to command the military forces of the new government, a man who was true to the government then existing and willing to use the forces of law and order at peril to his own popularity.

The evident trend of things toward a conservative revolution alarmed the Spartacists, who continued to agitate for a Bolshevist régime. Eichhorn, the commander of the Berlin police, was of their party and facilitated their designs. Finally the government felt strong enough to order his dismissal. This was the occasion of a general revolt by the Spartacists. Great processions appeared in the streets, armed and threatening the government. Soldiers were called out and conflicts began on 6 Jan. 1919. The Spartacists were well armed and seized a number of important strong buildings, which they converted into forts. For nine days the city was in a state of actual war, many of the best buildings were looted and otherwise damaged, and it was at this time that 1,300 fell on the side of the rioters. On 15 January Dr. Liebknecht and Rosa Luxembourg were arrested in their hiding places. Mobs assailed them in the street and both were killed. Liebknecht, it was reported, by soldiers while trying to escape his guard, and Rosa Luxembourg by a mob of reactionaries who beat her down in the streets and carried off her body. After this the city returned to a state of comparative order.

Next day came the elections. In the brief period of discussion that had intervened six parties had developed, partly as continuations of older groups. The two Socialist factions, majority and independent, continued to exist, and by their sides arose a group calling itself democratic, persons who wished a democratic government without Socialism. Another group was the Catholic Centre. Two others were the German Nationalists and the People's Party, including in one or the other the wealthy bourgeois, the aristocracy and the landed. The third could be relied upon to support a republic against monarchy, the last two would favor the old régime, and the attitude of the fourth on such a question was doubtful. Under the circumstances the world waited with anxiety the announcement of the results of the voting. It came after much delay, showing that the Majority Socialists had 166 seats in the Constituent Assembly, the Independents 22, the Democrats 75, the Centrists 93, the German Nationalists 37 and the People's Party 23, with five irregulars, whom the conservative press called "the wild ones." Thus the cause of republicanism had 263 out of the 421 delegates, a clear majority. The election returned also, that it had the support of about 19,000,000 out of the total of 28,000,000 voters. The call for the elections had adopted universal suffrage, which swelled the total number of votes to nearly half of the population and resulted in the choice of 28 delegates who were women.

The Constituent Assembly met at Weimar on 6 Feb. 1919, in the celebrated court theatre altered to serve the occasion. The Spartacists and their sympathizers had demanded that the place be Berlin, but the prospect of centralized power for the quiet de-
chosen. At the first meeting 397 delegates were present. Dr. Eduard David, a prominent leader in the old Social Democratic party, was selected for president of the body. The chancellor under the existing government, Herr Ebert, made an address in behalf of the government. Germany, he said, was forever with princes and nobles by the grace of God, and the sentiment was cheered by most of the members. When he referred to domestic problems he was interrupted by the independents, who had come to believe that the sentiment in the Assembly was to ignore extreme Socialist ideas. On matters connected with the foreign situation, as the armistice and the terms of the coming treaty of peace, there was not the same division of opinion, and it behooved the speaker to dwell on them. Cheers greeted his demand for the immediate release of the 800,000 Germans held prisoners by the Allies and his allusion to the proposed union of Germany and Austria. We turn, he said, to all the people of the world for justice and mercy. We ask that our economic life be not destroyed. The German people have fought for inner self-determination. It cannot be perfected from the outside. There can be no doubt that the German people be saved since it is true that it was a breach to weaken Germany's economic life. If we could forget the sad havoc their government had played with the economic life of the rest of the world we might share their opinion. In the hour of subjection they insisted that it was not the German people but the militarists who brought ruin on the world, forgetting that in the first months of the war German professors, German newspapers, German political parties, and even the Socialist party gave the world the most solemn assurance that Germany stood as one man for the war.

On 8 February a provisional constitution, prepared by the Ebert cabinet, was offered in the Assembly and on 11 February it was passed unanimously, to be in force until a permanent constitution was adopted. It provided for a legislature of two houses and a chief executive to be known as the "Provisional State President." An attempt to have a re-organized army accomplished proved a failure, as the form was nevertheless republican. Next Herr Ebert was chosen President, and immediately the ringing of bells announced to the world that Germany's first ruler elected by her own people had taken the reins of authority. Of the man himself Theodor Wolff, the journalist, said: "Ebert is no shining light, nor has he studied as much as some others, but he is the incorporation of good common sense. When after a day's work he sits behind a good bottle of wine, his hands folded on the table, this natural wisdom shows to the best advantage." It was common sense that had brought Frederick Ebert, the saddler, from low rank to the leadership of his party in time of crisis. At this time of his firm mind, in office his record was clear of notable errors, and he had carried the German government safely through a period of unusual turbulence.

When the Spartacists realized that the Constituent Assembly was overwhelmingly opposed to the rule of the proletariat they resorted to overthrow it. The Berlin Council of Soldiers and Workmen appealed to the state councils of soldiers and workmen, urging them to demand a national soviet on the Russian model. They threatened to call a national congress of soviets as a rival to the Constituent Assembly. The most immediate result of their agitation was the outbreak of workmen's riots in many parts of Germany. In Bremen, Magdeburg, Hamburg, Kiel, Berlin, and other places in Saxony and elsewhere out-breaks occurred, beginning as political protests but generally resulting in looting. The most notable disturbance, however, was in Bavaria, where Kurt Eisner, an Independent Socialist, had made himself the chief authority in November, when the king of Bavaria was forced out of his royal office. He was a fearless man of ability and good sense, probably the most capable of the leaders of the radicals in this period of violent opinion and action. He gave mortal offense to the defenders of the old régime when in a speech at a Socialist congress in Berne he charged that the militarists brought on the war, and in another speech announced the origin of the war camps as cruel to the inmates. On 21 Feb. 1919 he was assassinated by a young lieutenant of the former privileged class as Eisner walked through the streets. The radicals seized the opportunity to get a man into power. They shot Auer, Minister of the Interior, as he was about to inform the Diet of the death of Eisner, whom he, as a Majority Socialist, had opposed on various occasions. The disorders continued several days, but were suppressed by the authorities. A Socialist government emerging from the disorders with Herr Hoffmann at its head.

Now followed three months of critical existence for the existing form of society in central Europe. Germany's Socialism was only skin deep. After it had been three months in power and had progressed far enough in practical politics to begin to make a constitution it became evident that it did not mean to overthrow private ownership nor adopt state control of industry, at least so far as the constitution of the new Germany was concerned. The Socialists had taught the masses to believe that capitalism was the basis of their misery and they could hardly be turned against them and followed the fervid preachers of communism. Thus came the feverish springtime of 1919. Fortunately Berlin had the first outbreak, early in March, and suppressed it through the stern measures of Noske, who sent 50,000 soldiers into the city and used cannon freely against the fortified places of the rioters. Five hundred persons were said to have been killed in the fighting that lasted from the 7th to the 14th of March, and many of them harmless bystanders. The bitter nature of this conflict showed the government how to deal with the insurgents, and the soldiers remained true to it. Soldiers usually follow a capable government that knows its duties, and in office his record was clear of notable errors, and he had carried the German government safely through a period of unusual turbulence.

When the Spartacists realized that the Constituent Assembly was overwhelmingly opposed to the rule of the proletariat they resorted to overthrow it. The Berlin Council of Soldiers and Workmen appealed to the state councils of soldiers and workmen, urging them to demand a national soviet on the Russian model. They threatened to call a national congress of soviets as a rival to the Constituent Assembly. The most immediate result of their agitation was the outbreak of workmen's riots in many parts of Germany. In Bremen, Magdeburg, Hamburg, Kiel, Berlin, and other places in Saxony and elsewhere out-breaks occurred, beginning as political protests but generally resulting in looting. The most notable disturbance, however, was in Bavaria, where Kurt Eisner, an Independent Socialist, had made himself the chief authority in November, when the king of Bavaria was forced out of his royal office. He was a fearless man of ability and good sense, probably the most capable of the leaders of the radicals in this period of violent opinion and action. He gave mortal offense to the defenders of the old régime when in a speech at a Socialist congress in Berne he charged that the militarists brought on the war, and in another speech announced the origin of the war camps as cruel to the inmates. On 21 Feb. 1919 he was assassinated by a young lieutenant of the former privileged class as Eisner walked through the streets. The radicals seized the opportunity to get a man into power. They shot Auer, Minister of the Interior, as he was about to inform the Diet of the death of Eisner, whom he, as a Majority Socialist, had opposed on various occasions. The disorders continued several days, but were suppressed by the authorities. A Socialist government emerging from the disorders with Herr Hoffmann at its head.

Now followed three months of critical existence for the existing form of society in central Europe. Germany's Socialism was only skin deep. After it had been three months in power and had progressed far enough in practical politics to begin to make a constitution it became evident that it did not mean to overthrow private ownership nor adopt state control of industry, at least so far as the constitution of the new Germany was concerned. The Socialists had taught the masses to believe that capitalism was the basis of their misery and they could hardly be turned against them and followed the fervid preachers of communism. Thus came the feverish springtime of 1919. Fortunately Berlin had the first outbreak, early in March, and suppressed it through the stern measures of Noske, who sent 50,000 soldiers into the city and used cannon freely against the fortified places of the rioters. Five hundred persons were said to have been killed in the fighting that lasted from the 7th to the 14th of March, and many of them harmless bystanders. The bitter nature of this conflict showed the government how to deal with the insurgents, and the soldiers remained true to it. Soldiers usually follow a capable government that knows its duties, and in office his record was clear of notable errors, and he had carried the German government safely through a period of unusual turbulence.

When the Spartacists realized that the Constituent Assembly was overwhelmingly opposed to the rule of the proletariat they resorted to overthrow it. The Berlin Council of Soldiers and Workmen appealed to the state councils of soldiers and workmen, urging them
taking refuge in France and the United States. Returning to his country as the World War came to its end he raised a revolt against the Hapsburgs. The people accepted him as one who stood well with the victors and who was, therefore, able to soften the expected punishment. They placed him at the head of their government, republican in form, and he formed a cabinet in which the prevailing opinion was moderate Socialism. As an administrator he was weak, and it was soon evident that he could not stay off the dismemberment of Hungary. On 19 March the Allies demanded to be allowed to place troops in the neutral belt set off in the armistice between Hungary and Rumania, the inhabitants of which were almost entirely Magyars. The demand destroyed the prestige of Count Karolyi and placed him in despair so that he resigned, passing the government over into the hands of the Socialists. The new cabinet was mostly inefficient, but among them was Bela Kun, formerly a secretary of Lenin, who was a communist and a man of action. He became Minister of Foreign Affairs, dominated the situation, and formally established a soviet government, announcing that it was in military and spiritual unity with Russian Bolshevism. The movement made rapid progress and by the 24th Bolshevism was established in most Hungarian towns.

This revolution had a stimulating influence over the German radicals and they boasted that their own country would follow in the footsteps of Hungary before the end of the year. Strikes were occurring daily, city after city broke into rioting, now Dresden, now Düsseldorf, now Nuremberg, and after them, many others. One week news came that all Saxony was on the point of revolt, later came assurance that Brunswick was in the hands of the radicals. It was estimated that one-third of the workers of Germany were communists, and their feeling was being stimulated by many agents from Russia, well supplied with funds by the Bolshevist government there. All this came when the Peace Conference was passing through its darkest days, just at the time when President Wilson threatened to leave Paris if the nations at the peace conference did not abate their demands for spoils. Moreover, the pinch of hunger was at its highest pitch in these early months of the year when the stocks of the preceding scant harvest were lowest. Many a wise man of the day thought it impossible to keep Bolshevism from sweeping over central Europe from the Danube to the Rhine.

That the tide was stayed was due to the Weimar government under the newly-chosen President, Frederick Ebert. Confident that it had the support of a majority of the people, it did not hesitate to use force to put down the local revolts. Its most notable task of this nature was at Munich, where the leaders of dissatisfaction had burned since the death of Kurt Eisner. He was not a communist, but the radicals could point to his assassination as an act of perfidy on the part of the capitalist faction. Early in April Bela Kun arrived in the city from Hungary to plead the cause of the soviets. The next day a new soviet republic was proclaimed by the radicals and it was announced that relations would be established with Russia and Hungary. The Hoffman government moved to Bamberg. To these two governments in Bavaria was added a third a few days later when the communists in the city rose, drove out the soviet government and set up a Council of Ten to rule in true revolutionary fashion, a revolutionary tribunal, according to the newspapers, being set up to try persons suspected of opposing the government. This move was met by the Weimar government with the announcement that it would reduce the communists and restore the Hoffman government. After some delay the troops appeared before the city, led by Noske himself. On 30 April the red army offered to parley, but the only terms offered were unconditional surrender. They hesitated, but 2 May Noske forced the battle and took the city without much resistance, capturing the red leaders, several of whom were shot summarily. It was reported that 3,000 persons were arrested for complicity in the revolt. This course terrified the communist's leaders in Germany. The government had showed ability and determination to enforce order and comparative quiet began to return to the distressed country.

Meanwhile Hungary in Bolshevism that was undisturbed. No power existed in Hungary to put it down, and it might have been left to its own course but for its relation to the territorial question. The subcommission of the Peace Conference of Hungarian boundaries interpreting the principle of racial self-determination, reported that Rumania on the east, Yugoslavia on the south, and Czechoslovakia on the north and northwest should have important parts of what had been Hungary. The kingdom had been a series of different races held together by the politically superior Magyars, and now the non-Magyar elements were about to be cut off and Hungary left with nothing more than the rich Danubian Plain. The three states that benefited by the report did not await the action of the Peace Conference, but making the establishment of Bolshevism a pretext massed troops to march into the territory they expected to receive. The diplomats in Paris were in no condition at that time to preserve the status quo and they were led to Budapest to try to make a compromise. His efforts failed and Rumanian, Serbian and Czech armies crossed into Hungary on 25 April. To save its face the conference sent Gen. Franchelet d'Esperey to take command in the name of the Allies, but he seems to have exerted little authority over the Rumanians, who marched quickly to the Theiss River and threatened to enter the capital. Bela Kun was thoroughly alarmed and offered to make peace by recognizing the territorial claims of the invaders. At the same time he offered to send representatives of the prominent citizens as hostages. In the Rumanian army, led by its king, were many Magyars whose efforts gave the Rumanian invasion the character of a counter-revolution. Bela Kun's soldiers were untrained and unmotivated, and he asked for an armistice in those terms. The Rumanians demanded that the communist army be disarmed, war material be surrendered and the hostages be given up, the Rumanians to be left in possession of the right bank of the Theiss for a depth of 12 miles. The Hungarians re-
fused these terms and decided to fight for their existence. At the same time the Peace Conference, not wishing to start a war in Hungary which might lead to problems that could not be induced the invaders to stop where they were and imposed a blockade on the Hungarian Bolshevists. They even invited Bela Kun to send an agent to Paris that he might talk over the situation with the view of adjusting all differences. On 24 June 1919 there was a revolt of the conservative wing in Budapest, but the communists suppressed the uprising, taking many prisoners. Up to this time Bela Kun had ruled without bloodshed, but now he became severe. He had taken 50 cadets of the military academy who resisted in the telegraph office until they were induced to surrender, and 40 of them were executed summarily. As July passed the effects of the blockade were plainly felt. The hungry inhabitants feared they would not make peace with their Bolshevist government and murmurs became louder. Finally Bela Kun bowed to the storm and resigned on 31 July, receiving the promise of a safe conduct out of the kingdom. A moderate Socialist cabinet was formed to succeed him.

Then affairs took an alarming turn. The Rumanian army marched on the capital, despite the orders from Paris to keep away, and occupied the city 30,000 strong. The Allies ordered it to withdraw, but it stood in its tracks. On 7 August the Archduke Joseph proclaimed himself governor of Hungary and organized a coalition ministry, and a week later he formed a cabinet out of the friends of the old regime. To most people it seemed that he was taking the country headlong into a Hapsburg restoration and the Hungarians were as much alarmed as the Allies. On 23 August a messenger from the Allies appeared with a peremptory order to the archduke, giving him two hours to resign his assumed governorship, with the alternative of having the order published in Budapest. He yielded with as good grace as possible and the government passed over to a Moderate Socialist cabinet. It then proceeded to get rid of the Rumanians. By some fancy they had formed a scheme for joining Rumania and Hungary in an economic union and King Ferdinand had come to the city as a conqueror. It was afterward explained that he came incognito. But the pressure of the Allies was not to be ignored. Rumania was given to understand that she would be subjected to economic pressure if she refused to leave the city, and on 14 August she gave notice that she would withdraw. At this time the Allies sent a commission of interallied generals to Budapest, with orders that they should command in rotation. Finally on 7 September the Rumanian army at last began to leave the city and a week later it was announced that British troops would take their places. Thus ended the troubles that were closely related to the Bolshevist revolution in Hungary. In Bela Kun's day the soviet system was established throughout the country. The lands were nationalized, and the government of the proletariat was established. The leader was an honest devotee to the system of Lenin, and tried hard to make his plan work. The opposition from the outside, with the presence of hunger, was too much for him. But his fall did not overthrow all that he had set up.

While these commotions shook Germany, the Constituent Assembly continued its work of making a constitution. On 31 July 1919 the completed constitution was laid before the Constituent Assembly, which had changed its name to the National Assembly, and was adopted by a vote of 262 to 76; the negative votes coming from the German National and the German People's parties on the one hand and from the Independent Socialists on the other, both extremists. The affirmative votes came from the middle groups and represented the strength of the supporters of republicanism.

The constitution itself is far removed from the old form of government. Though German in character it is essentially republican and in its first part of the constitution the word Reich is used to name the government. In the draft itself the legislature was called the Reichstag, but a protest was made against the name after the constitution was adopted and it was announced that it would be dropped. The members are to be chosen by the people for a term of four years. There is a President elected by the people for seven years. He represents the government under international law, makes treaties and receives and sends diplomatic agents. He may use the armed forces of the country to preserve order or use them against a defiant state, but in each case his power is subject to a veto by the legislature. He has the pardoning power, but not the right to proclaim amnesty. His orders are to be countersigned by the chancellor or by the ministers whose departments are affected. The chancellor in some respects is a kind of vice-president, but he is also the responsible head of the ministry. He and the other ministers are appointed by the President, in the same way as British ministers are appointed by the king. The chancellor has charge of foreign policy. The legislature, that is the Reichstag, may remove by impeachment the President, the chancellor, or ministers whose appointment has been brought by a petition signed by 100 members. There is an imperial council in which each state has a representative for each million inhabitants it contains; but each state has at least one representative, and no state can have more than two-fifths of the whole number. Thus the overwhelming influence of Prussia is reduced, and to guard against too much power in the hands of the Berlin voters it is provided that one-half of Prussia's representatives must come from the provinces. Ordinarily the council must consent to all bills introduced into the legislature, but the government may introduce bills known to be disapproved by the council, and laws may be submitted by a plebiscite if the President desires it. A majority vote in the legislature will repeal a law. The constitution may be changed by a two-thirds vote of the legislature, but for this purpose there must be a quorum of at least two-thirds of the members.

The federal character of the German government is preserved, but the powers of the individual states are much reduced. A very large number of powers are specifically assigned
to the central government, as the control over foreign affairs, citizenship, colonies, immigration, customs, posts, telegraphs, railroads, shipping, coinage, weights and measures, motherhood, repopulation, labor conditions, price fixing, the socialization of national resources, patents and manufacture, theater and education. The states must have liberal forms of government and grant the suffrage to all men and women in the election of their legislatures. It was specifically provided that an imperial law should be superior to a state law. A citizen of a state is to be a citizen of the empire with equal rights in all other states.

There are many provisions relating to the rights and status of person. Privileges of birth are abolished but titles may be used merely as parts of the names of individuals, and no more titles of nobility are to be conferred. All titles that are created in the future will refer to the occupations of the recipients, but academic titles will be awarded as in the past. Freedom of worship is guaranteed and attention is given to the protection of motherhood, and it is provided that illegitimate children shall have the same moral and social protection as legitimate children. No state church is to exist but all people are to have freedom of belief. Compulsory education is required for all children for eight years with continuation schools in technical, professional or occupational subjects as the ability of the pupils may warrant, but in this connection no distinction is to be made on account of social status or religion. Pupils are to be taught civic ideals in the spirit of popular Germanism and of international reconciliation. It was probably by design that the supremacy of international law was specifically recognized.

Under the circumstances it was inevitable that the constitution should contain socialist doctrines; but they are moderate in nature. Private property is safeguarded by the constitution and the right of inheritance is guaranteed. Confiscation is not to occur without due process of law and without compensation. Entails are dissolved. Private economic enterprises may be taken by the state, but only with compensation, and it can be arranged that when the state takes over the business, the employees shall participate in their administration under the supervision of the state. Elaborate regulations are made for the protection and functioning of labor. The right of laborers to organize and to bargain is recognized, and a national economic council is created and is to be consulted in making laws affecting labor. These provisions are far short of the ideals of the radical Socialists. It remains to be seen to what extent the government will undertake to carry them into practice. The fact that they are mostly permissive seems to indicate that the constitution makers were not willing to endanger the revolution by attempting to establish an out-and-out socialist régime.

Under this constitution Herr Ebert became the first President of the imperial republic of Germany. He was inaugurated 21 Aug. 1919 in the court theatre at Weimar, where the sessions of the National Assembly had been held. A large audience witnessing the ceremony. Only the seats of the Independents and the German Nationalists were vacant. It is a thorny office, said the president of the assembly in inducting him into office, which in the hardest times, the Fatherland has laid upon your shoulders, but with an easy conscience you can claim to be free from all blame or responsibility in the country's wretched position. It was a true fact that the President is severe. National bankruptcy threatens, the obligations of the peace treaty must be met, and precautions against a counter-revolution must be taken. The hope of the future for Germany is in the common sense of the German people and their leaders.

One of President Ebert's first difficulties was the withdrawal of the army of General von der Goltz from the Baltic provinces, where it had remained under the pretext of keeping the Bolsheviks back. Its commander was one of the best leaders of the Junkers, and it was believed that his force was but a rallying point for monarchists in anticipation of the time when he would proclaim a restoration of the Hohenzollern dynasty. To the latter end of agreement at Paris little attention was paid. Finally they became insistent and announced that they would restore the blockade against food for Germany if the troops were not recalled. The threat proved effective and on 4 Oct. 1919 the troops began to leave the provinces. They had numbered about 40,000 and President Ebert was probably as pleased as the Allies themselves to see them demobilized.

Another incident that aroused feeling between the Allies and Germany was the demand that Germany should make restitution for sinking the German naval ships at Scapa Flow as the treaty of peace was about to be signed. The British found in the cabin of one of the ships when she was raised to the surface a letter from the government which seemed to authorize the admiral in command to sink the ships. As they were surrendered as paddins of war the Allies demanded that a specified amount of tonnage in merchant ships should be surrendered. After many protests an arrangement was made by which Germany promised to surrender merchant tonnage in satisfaction of the claim. The acceptance of the terms removed the last obstacle to exchange of ratifications, and that last act of the peace of Versailles was consummated at Paris 10 Jan. 1920, when Germany, Great Britain, France, Italy, Japan and many small nations exchanged ratifications and brought their war to an end. The United States was not represented at the ceremony since the treaty was still under consideration in the Senate.

The Bolshevik War in Russia.—The Russian Bolshevik government concluded an armistice with Germany 15 Dec. 1917 and accepted the treaty of Brest-Litovsk 3 March 1918. Lenin, its guiding mind, accepted the terms reluctantly and it was understood that he would not carry them out if he could help it. But time was needed to organize the revolution, and the peace, bad as it was, gave him time. The empire was crumbling at the edges and it was freely predicted that it would break up into small states. Finland, the Baltic provinces, Poland and the Ukraine seemed assured of separate existence in the European part of the old empire, and it was freely predicted what would happen with Siberia. But the main
portion of European Russia, was in the hands of the Bolsheviks, a minority of the population, and they were striving hard to retain the authority they had assumed. A social and industrial class well organized under the repression of the old government, supplied with a trained and devoted corps of leaders, and convinced of its purposes, they had the advantage of being the only authority that commanded obedience.

The outside world had some difficulty in discovering just what kind of a government they were setting up. That it was driving along in the same course that the French revolution followed was clear and as reports came of terror after terror in "Darkest Russia" the outside world became horrified. The former tsar was executed 17 July 1918 and his immediate family is said to have been killed soon afterward. There is good evidence that the horrors were not all on one side. Stories from the returned agents of other governments indicate that some of the severest repressions was committed by the anti-Bolsheviks in the towns they took away from the Bolsheviks. It was class war in its worst form, and to most non-Russian people it was horrible — so horrible that time is necessary to discover its real nature.

At home the system rests on the soviet, the unit of the organisation. Each factory or shop had its organization of workers before the revolution, with central organization, and they had come to look upon themselves as a kind of invisible government organized and ready to spring into life when opportunity offered. Strong leaders went and came among them, and when they proved themselves too strong for their own safety they fled to neutral countries. The revolution of 15 March 1917 opened the doors for their return, and once back they made their plans to seize the government. There is reason to believe that they had honeycombed the old army with invisible organization. They believed it was the revolution and struggled to keep it from passing into the hands of the bourgeois, whom they considered their enemies. Thus the soldiers and workers, organized by soviets, became the governing portion of society. When the tsar was overthrown the revolution was two months old. They found the peasants, a large majority of the population, in possession of the landed estates and extremely fearful lest a counter-revolution disposese them. With the peasant they formed a kind of bargain, allowing them representation in the central soviets at a rate unequal with the workmen. Against the upper classes they waxed consistently. To vote one must be a member of the soviet, and to join one must be a workingman. The lack of food aided Lenin. There was, he announced, a certain amount of food and he allotted it to the workers first. If a rich man would not work he might die of starvation. Another thing that helped Lenin was the fact that his enemies, Russia and her agents by foreign powers was being routed by France and Great Britain in particular.

These two states had loaned Russia vast sums before and during the war. They were now fighting, said the Bolsheviks, in order that there might be no sacrifice. According to their philosophy the war was fought by these two countries to save the investments of rich men through sacrificing the lives of poor men. They also had an advantage in the existence of many political parties in Russia, small organizations that had sprung up in the early days of the revolution, each with an idealistic or social raison d'être that made it difficult to obtain union against the common foe.

It was 26 Jan. 1918 when the Bolsheviks dissolved the Constituent Assembly and made Petrograd, met to make a constitution, and took the direction of affairs. At that time no armed opposition to the government existed. The Tsarists, largely an officer class, had made no attempt against the revolution. But opposition to the Bolsheviks appeared in several quarters. In the first place, the suppressed races on the western border, Poles, Finns and Baltic people, had assumed independence and were in arms to defend themselves against reconquest. They were not anti-Bolshevik so much as anti-Russian, but they served to weaken the Bolsheviks while others were fighting them. Elsewhere the Bolsheviks were opposed by three large groups of armies who fought the anti-Bolsheviks. In them were various kinds of Russians, some of them supporters of the Duma, the republican government which sprang up after the tsar was forced to abdicate. Some were defenders of the old bureaucracy, and others were Bolsheviks who rejected the communism of the Bolsheviks. Between these widely different elements was at first a tendency to subordinate differences and give all their efforts to the one aim of defeating Lenin. But in time jealousies grew up and seriously weakened the efforts that were put forth.

The strongest of these forces was that which Admiral Kolchak commanded in Siberia. When the revolution occurred a Socialist government was set up in Siberia, but after the fall of Kerensky it was replaced by a Bolshevik government, which might have continued to exist but for the appearance of the Czechoslovaks. These people were a body of prisoners taken by the Austrians in the last days of the old Russian régime against Austria, whom they hated. When the Russian front gave way they were left to their own resources. They dared not go back to Austria, where they had left relatives, and they were opposed to the Bolsheviks and were attacked by them. Defending themselves they moved into the region east of Moscow and finally were promised that they might go through Siberia to Vladivostok and thence by water to Italy, where they would be thrown against Austria, their most hated enemy. The Bolsheviks soon repented of this promise and opposed their departure, so that the Czechoslovaks had to cut their way out of Russia in Europe. They managed to capture $280,000,000 in gold from the Bolsheviks at Kazan and carried it with them to Omsk. While they were falling back a meeting of anti-Bolshevik factions was held 24 Sept. 1918 at Ufa and an All-Russian Anti-Bolshevik government was set up by France and Great Britain in particular.
plie of the old army. The natural result was a clash and on 28 November a group of Cossack officers arrested the leading directors and declared the government non-existent. In their place they placed Admiral Astrakhank and Prinz von Edel impressing on the Cossack Regent. This excellent officer had come to Omsk from Vladivostok and thrown in his fortunes with the Omsk government. He soon showed good organizing ability and for a time was the hope of the anti-Bolshevists in Siberia. He was, however, essentially a military man. Although he promised the people who supported him a constitutional form of government, he did not keep his word for many months. He accordingly was distrusted as a reactionary and eventually lost the cordial support of many of his own followers. He took no steps to settle the land question, probably because to do so would alienate either the landlords or the peasants, both of whom he needed as supporters. Nor did he call a Constituent Assembly, probably for the same reason. He did, however, declare for universal suffrage, but it was evident that the Constituent Assembly would not be bound by such a declaration. For over a year after his elevation he ruled effectively. He received large quantities of supplies from the Allied Powers, and the Czechoslovak forces were ordered by the Allies to stay where they were and keep the Trans-Siberian Railroad safe from local Bolshevists, while a joint Japanese-American force that was landed in Vladivostok kept the port open for communication with the outside world. A force of American engineers under Mr. John P. Stevens kept the trans-continental railroad in repairs. Kolchak's government conscripted the men of fighting age or received them as volunteers, and British and French officers trained them into an army. In the spring of 1919 he began an advance into European Russia and nearly reached Samara, where the railroad crosses the Volga, less than 600 miles from Moscow and more than 1,000 miles from Omsk. While he was advancing, other anti-Bolshevik forces were also pressing back their foes, so that he seemed to be on the verge of victory. But it was impossible to conduct a campaign against a numerous enemy with only one railroad to break up supplies more than 1,000 miles away and in a narrow region having anti-Bolshevik forces were also pressing back their foes, so that he seemed to be on the verge of victory. But it was impossible to conduct a campaign against a numerous enemy with only one railroad to break up supplies more than 1,000 miles away and in a narrow region having to the Volga, where the railroad is long, held by posts. In October this line became active at two points and for a time such rapid gains were made that the Allied press jubilantly predicted the imminent collapse of Bolshevism. The first was on the Baltic front, where thousands of Russian, Letts, Estonians and Lithuanians under General Yudenitch, operating between Dvinsk and Gatchina. On 13 October Yudenitch began a quick advance on Gatchina and took it, bringing his forces within 70 miles of Petrograd on its south side. At the same time Deniken was more than ordinarily active in the region
south of Moscow, taking Orel about 400 miles from that city. Both actions seem to have taken the Bolsheviks unaware, with the result that they offered little resistance. The anti-Bolsheviks took this to mean that their enemy was demoralized, and they formed rosy hopes of his speedy collapse. Predictions ran that Yudenitch would take Petrograd and Denikin would take Moscow in short order.

In fact Yudenitch arrived at Tsarskoe-Selo and Tavlovka, 17 and 15 miles respectively from Petrograd. But after a week of fighting he found the resistance stiff. Trotsky had arrived in Petrograd and put new courage in the defenders. A few days later the Bolsheviks brought up heavy reinforcements, outflanked Yudenitch and forced him back into the boundaries of Estonia. Yudenitch's army was greatly diminished by desertions to the Bolsheviks.

At the same time the tide turned in the south. Denikin's advance toward Moscow was suddenly interrupted and he was forced back, his soldiers left him for the Bolsheviks in large numbers, and his demoralists bungled the counter-movement, which by 10 Jan. 1920 had carried them to the Sea of Azof at Rostof-on-the-Don, thus cutting Denikin's forces into two parts. At the same time they threw a column around his eastern flank, and it was reported that they had taken Krasnovodsk, on the eastern shore of the Caspian, opposite Baku, and the point from which a railroad runs to the Persian border at a distance of 300 miles. It was further reported that Bolsheviks, within 20 miles of the Afghan frontier, was also in their hands. In the trans-Caspian region they seem to have encountered little opposition; but they won a position of great danger to the British in India, where there was already great unrest. Nor was this the limit of their successes. In Siberia Bolshevik pressure was applied against Kolchak, already weakened by the dissatisfaction his incompetence in administration was producing. While the Bolsheviks crossed the Ural Mountains his troops deserted by the thousand. He swore stoutly that he would never give up Omsk, where he had a vast store of supplies and railroad material. But almost immediately he was forced to flee or be surrounded by the active Bolshevik cavalry. Turning eastward he carried what supplies he could but had to abandon large quantities. He lost 39,000 of his men as prisoners, 5,000 loaded railroad cars and 73 locomotives. His objective was Tomsk, 600 miles east of Omsk, but he was not able to stand there and continued to Krasnoyarsk, 375 miles farther east. On 9 January it was reported that he had been forced out of this position and was in retreat on Irkutsk, on the west shore of Lake Baikal and 1,562 miles east of Omsk, where his retreat began. Meanwhile his civil government had undergone a revolution, for which his ruthless violations of personal liberty were responsible. Kerensky, in Paris, declared that his administration was a shameless and unpunished system of pillage. The Czechoslovaks in Vladivostok revolted against him, but were put down by one of his own representatives, with the passive assistance, it seems, of the Japanese. Of these Oriental people 80,000 were said to be in the region around Vladivostok. The government of the United States had viewed their possible active intervention in Siberia with great concern, and for this reason chiefly, the Japanese had played a waiting game. Siberia itself was made to look at the approach of the Bolsheviks along the transcontinental railroad was a threat at their own safety; and they announced that they would not idly see Bolshevism planted in Manchuria.

At the same time they declared that they would not appropriate any territory they might occupy in eastern Siberia. It was assumed that they would meet the Bolshevik advance at Lake Baikal and try to halt it there.

Thus, at the beginning of the year 1920 the fortunes of Bolshevist Russia were good. On the southeast and east her enemies were all but crushed. On the west the Baltic states were ready to give up the struggle. Estonia held a conference with them at Dorpat in December, in which a treaty of peace was all but made on the basis of mutual recognitions of independence and the renunciation by Estonia of her alliance with the Western powers. The negotiations broke off, however, when the Bolsheviks demanded that they be recognized as the Government of Estonia. The Western powers insisted that this army be left where it was in order that it might at least serve to hold Bolshevik troops in the west who might otherwise be sent into the southeast. Representatives of Latvia, Lithuania, Poland, and Finland were at Dorpat informally, and it was believed that they would have to drop that idea. But to Estonia, if it could have been accepted. Early in January 1920 the Estonians made an armistice with Bolshevist Russia, and it was announced that Yudenitch's army would be sent by water to join the anti-Bolshevists in southern Russia.

With established peace on their western border and victories won in the Far East, Russian Bolshevism presents itself as one of the most important results of the World War. So far it seems to have succeeded in uniting the Russian Empire, except for the Baltic states and Poland, which in 1917 was considered a difficult thing to do. It has been strengthened at home by the political incompetence of the anti-Bolshevik Russians and by the fact that it was the most promising force in Russia for national unity. It is not a democratic form of government: in its present state it is as autocratic as the government of the tsar. It sets out to force every man to become a proletarian, and then it means to keep him a proletarian until all men choose to remain in that state. If that condition is reached the coercion of the leaders may be relaxed, and Bolshevism may become democratic. It remains to be seen how it can swing itself into that possible moment for self-government which has been the underlying force in political development for the past seven centuries. At present that seems to be the most serious problem of the Bolshevists.

15. DIPLOMATIC NEGOTIATIONS BY THE VARIOUS NATIONS DURING THE WAR. United States.—On 4 Aug. 1914, seven days after Austria-Hungary had declared war on Serbia, President Wilson
issued a formal proclamation of American neutrality. In this document he summed up the laws and principles of international law which persons residing in the United States must observe. If a neutral power gives up its neutrality, as on the other hand, warned the belligerent powers not to infringe upon the rights of neutral peoples. Citizens of the United States were prohibited from originating a military force in aid of a belligerent, and were warned that while they might obtain ammunition and arms within the United States arms and munitions of war, they must not transport such articles upon the high seas for the use of a belligerent.

On the subject of wireless communication President Wilson issued a special proclamation on 5 August. It is now ordered, he said, by virtue of authority vested in me to establish regulations on the subject, that all radio stations within the jurisdiction of the United States of America are hereby prohibited from transmitting or receiving for delivery messages of an unneutral nature, and from in any way rendering to any one of the belligerents any unneutral service during the continuance of hostilities.

These proclamations were followed by another on 18 August appealing to the American people for a broad observance of the spirit of neutrality. The effect of the war upon the United States will depend upon what American citizens say or do. Every man who really loves America will act and speak in the true spirit of neutrality, which is the spirit of impartiality and fairness and friendliness to all concerned. The spirit of the nation in this critical matter will be determined largely by what individuals and society and those gathered in public meetings do and say, upon what newspapers and magazines contain, upon what our ministers utter in their pulpits and men proclaim as their opinions on the streets.

In the first days of the war the firm of J. P. Morgan and Company was approached upon the subject of financing a loan of $100,000,000 to the French government, the proceeds of which would be used exclusively to establish a credit for the purchase of American goods by the French people. The transaction was interrupted, however, by the announcement of Secretary Bryan, on 15 August, that loans by American banks would be used exclusively to purchase goods in the country at war and that the Executive had the power to do so. If Germany and Austria-Hungary cannot import contraband from this country it is not, because of that fact, the duty of the United States to close its markets to the Allies. The markets of this country are open upon equal terms to all the world, to every nation, belligerent or neutral.

Neutral Trade.—The war from the outset involved the United States in a diplomatic struggle for the preservation of its rights as a neutral. It became the purpose of Great Britain to prevent Germany from obtaining supplies of a warlike character from overseas countries. In this she could not fail to run counter to the interests of the United States, as that country was the great storehouse to which Europe must turn for everything it needed during the herculean struggle. In fact the situation was in many ways analogous to that during the preceding War of 1812, when the United States suffered severely from the British Orders in Council and the commercial decrees of Napoleon Bonaparte.

The Declaration of London, signed by the
representatives of 10 leading powers in 1908, was intended to supply an international code relative to the matter of blockade, contraband, captures, convoy, neutral commerce, and indemnity for seizure. The declaration contained specific schedules of contraband and also a list of articles which should never be classed as contraband, this list to include cotton, rice, metallic ores and other raw materials. Unfortunately, however, it was ratified by only one power—the United States.

At the outbreak of war the American government directed its representatives to inquire of the various belligerent countries whether they would agree that the Declaration of London be applicable to naval warfare during the conflict. Austria-Hungary and Germany assented, but Great Britain decided to adopt generally the rules and regulations in question, subject to certain modifications and additions. These additions were found to contain a new list of contraband, much more extensive than that agreed upon by the delegates of the London conference. As the terms of the declaration required its acceptance as a whole, the American government then withdrew its suggestion and announced that it would insist that its rights be defined only by the existing rules of international law and the treaties of the United States with the belligerents.

The problem for Great Britain was how to control trade to her enemies through neutral countries. The extent to which she could injure the Central Powers depended upon her ability to prevent transshipment of goods sent from overseas countries to Holland, Denmark, Italy and other neutral powers. On 30 October 1914 she ruled that conditional contraband consigned to a neutral port was liable to seizure when the ultimate destination was plainly the enemy.

On the list of conditional contraband was placed foodstuffs, and over this there soon developed a controversy with Holland and the United States. The British government claimed also the right to prevent the Germans from being fed through Holland by holding up shipments of food in excess of Dutch needs. Her attitude in regard to other conditional contraband was similar.

Late in September two cargoes of copper were seized and retranshipped by Great Britain. In October three more shipments consigned to order in Italy were detained at Gibraltar. This was followed by the seizure of three American tankers, the John D. Rockefeller, the Brindilla and the Plataeria.

Commerce was further endangered by the planting of mines by the various belligerents. Great Britain abstained entirely from the use of mines in neutral waters during the first two months of the war, but found it necessary to adopt counter-measures in order to cope with the German policy of mine-laying. On 3 Nov. 1914 the British admiralty declared the whole North Sea a military zone. "Within this area merchant shipping of all kinds, traders of all countries, fishing craft and all war vessels will be exposed to the gravest dangers from mines which it has been necessary to lay and from warships searching vigilantly by night and by day for suspicious craft." In justification of this it was declared that the Germans had scattered mines on the main route from the United States to England and that peaceful ships had already been blown up by this agency.

Injury to the commerce of the United States by the policy of Great Britain finally brought forth, 26 Dec. 1914, a protest from the government. It viewed with concern, it said, "the large number of vessels laden with American goods in our ports which have been seized on the high seas, taken into British ports, and detained sometimes for weeks by the British authorities." On 7 Jan. 1915 a preliminary reply was sent. His Majesty's government concurred, it said, in the principle that neutrals should not be interfered with by a belligerent save when absolutely necessary to protect its safety, but claimed the right to interrupt contraband destined for an enemy country. As to the extent of British interference there had been much misconception. Exports from New York to Denmark, Sweden, Norway, Italy and Holland for the month of November 1914 were more than twice as great as for November 1913. That the total amount that in any case has had a very adverse effect upon certain great industries, such as cotton, is obvious; but it is submitted that this is due to the general cause of diminished purchasing power of such countries as France, Germany and the United Kingdom, rather than to interference with trade with neutral countries. The British government pointed out that the exports of copper and foodstuffs to neutral powers adjacent to the Central nations had increased rapidly and that the presumption was clear that the bulk of the shipments were intended not for their own use, but for belligerent peoples.

"We are confronted with the growing danger that neutral countries contiguous to the enemy will become on a scale hitherto unprecedented a base of supplies for the armed forces of our enemies and for materials for manufacturing armament." The German government now took a step which further complicated the problems of neutrals. On 20 Jan. 1915 the government proclaimed the nationalization of food supplies, and seized all stocks of corn, wheat and flour. Although the government gave formal assurance that foodstuffs imported from the United States would not be used for military or naval purposes, the effect upon British policy was inevitable. On 22 January the Wilhelmina, loaded with flour, grain and other foodstuffs, cleared from New York for Hamburg. "The new German decree creates a novel situation," declared the British foreign office in a statement issued 4 Feb. 1915, "and it is probable that if the destination and cargo of the Wilhelmina are as supposed, the cargo will, if the vessel is intercepted, be submitted to a prize court in order that the new situation created by the German decree may be examined and a decision reached upon it after full consideration." The Wilhelmina, under stress of weather, entered Falmouth Harbor 9 February where she was seized and her cargo held for the prize court.

Germany now took a step of the utmost importance to neutrals. Feeling her helplessness against the British battle fleet, she deliberately determined to wage against her shipping a war
of extermination with submarines. On 4 Feb. 1915 she established a war zone about the British Isles. "The waters around Great Britain, including the whole of the English Channel, are declared hereby to be included within the zone of war, and after the 18th inst. all enemy merchant vessels encountered in these waters will be destroyed, even if it may not be possible always to save their crews and passengers. Within this war zone neutral vessels are exposed to danger since, in view of the misuse of the neutral flags ordered by the Government of Great Britain on the 31st ultimo and of the hazards of naval warfare, neutral vessels cannot always be prevented from suffering from the attacks intended for enemy ships.

A few days later Great Britain submitted a second note to the United States concerning trade restrictions. Touching the important matter of foodstuffs, it said, "An elaborate machinery has been organized by the enemy for supply of foodstuffs for the use of the German population. In these circumstances it would be absurd to give any definite pledge that in cases where the supplies can be proved to be for the use of the enemy forces they should be given complete immunity by the simple expedient of dispatching them to an agent in a neutral port. The reason for drawing a distinction between foodstuffs intended for the civil population and the armed forces itself disappears. In any country in which there exists such tremendous organization for war as now obtains in Germany, there is no clear division between those whom the Government is responsible for feeding and those whom it is not."

In the meanwhile Germany hastened to urge the United States to defend its right to ship foodstuffs to belligerents for civilian use, by protesting against the seizure of the Wilmelmina. Should Great Britain use her naval supremacy to cut off all overseas supplies, the effect upon the Central Powers would be most serious. The British Chargé d'Affaires at Washington, she offered assurance that the imported foodstuffs would be consumed by the civilian population exclusively. On 15 Feb. 1915 the Ambassador presented a note in which Germany offered to rescind from the submarine campaign in return for the strict adherence of Great Britain to the rules of the Declaration of London. The United States promptly transmitted this note to the British Ambassador.

Sir Edward Grey replied in a note of 19 Feb. 1915. Pointing out that the brutal treatment accorded the Belgians by Germany, the destruction of merchant ships and innocent lives by the German mines, the firing on undefended British towns by German cruisers, the bombing of cities by airships, he declared it right for England "to take retaliatory measures even if such measures were of a kind to involve pressure on the civil population."

On 20 Feb. 1915 the United States addressed to Great Britain and Germany identical notes suggesting a basis of settlement founded on expediency rather than on international law. It was proposed that neither should sow floating mines on the high seas, or in territorial waters, that neither plant on the high seas anchored mines save within range of harbors; that neither use submarines to attack merchantmen save for the purpose of visit and search; that each forbid its merchant ships to use neutral flags as a ruse de guerre. Germany was to promise that foodstuffs imported from the United States should be consigned to agencies designated by the American government which should have entire control of their distribution and that such foodstuffs were not to be requisitioned by the German government. Great Britain was to agree not to make foodstuffs absolute contraband and not to interfere with them when consigned to American agencies in Germany.

The German government replied that it was prepared to agree to the proposal concerning floating mines, but would not renounce the use of anchored mines for purposes of offense. It practically accepted the provision concerning submarines, but insisted that the merchant vessels attacked must be unarmed and not resist by force. The regulation of importation of food seemed to be in general acceptable, but Germany insisted that enemy governments must allow also the admission of the raw materials on the list of the Declaration of London.

That the American compromise was entirely unacceptable to Great Britain was made clear by an announcement which she issued jointly with France, concerning the German war zone decree, and the retaliatory measures decided upon. The German declaration subdues indiscriminate submarine attacks, neutralized captures. Germany has adopted this method against the peaceful trader and the non-combatant, with the avowed object of preventing commodities of all kinds, including food for the civilian population, from reaching or leaving the British Isles or northern France. Her opponents are, therefore, driven to frame retaliatory measures in order in their turn to prevent commodities of any kind from reaching or leaving Germany. These measures will, however, be enforced by the British and French governments without risk to neutral ships or neutral non-combatant lives, and in strict observation of the dictates of humanity. The British and French governments will, therefore, hold themselves free to detain and take into port ships carrying goods of presumed enemy destination, ownership or origin. It is not intended to confiscate such vessels or cargoes unless they would otherwise be liable to confiscation. Vessels with cargoes which sailed before this date will not be affected."

The word blockade was purposely omitted from the note, but the measures announced were plainly a blockade of the German coast.

This measure, which threatened to end all direct commerce between Germany and overseas countries, caused great dissatisfaction in the United States. On 5 March Secretary Bryan addressed a note to Great Britain and France asking how the embargo on German trade was to be enforced and opposing their use of neutral flags to seize ships trading with Germany. If neither vessels nor cargoes were to be confiscated unless otherwise liable to condemnation, which provided a certain amount of action as if no blockade existed. In his reply of 13 March 1915 Sir Edward Grey ad-
mitted that his government proposed "to establish a blockade to prevent vessels carrying goods for or coming from Germany." The failure to claim the right to confiscate ships or cargoes was due only to reluctance to exact formal denial to all the penalties of a breach of blockade.

At the same time a long memorandum was handed Ambassador Page, containing Great Britain's reply to the American suggestions concerning a basis of German government, it said, had not accepted the proposals, and it might appear that to point to this fact would be for Great Britain a sufficient answer. But it desired to make a fuller statement of its whole position. Great Britain, in her conduct of the war, had observed strictly the rules of international law and the dictates of humanity. Germany, on the other hand, had been guilty of many grievous offenses; it had maltreated the civilian population of Belgium and northern France; it had been cruel to British prisoners, it had bombardé open coast towns, it had bombed aircraft places of no military importance, Germany as well as the Allies had declared a blockade. The difference between the two countries is, however, that while our object is the same as that of Germany, we propose to attain it without sacrificing neutral ships or non-combatant lives, or inflicting upon neutrals the damage that must be entailed when a vessel and its cargo are sunk without notice, examination, or trial.

Great Britain was unquestionably within her rights in stopping direct trade with Germany, but an attempt to blockade trade with neutral countries to prevent possible access to German territory was a far more dubious matter. Stirred to action by a guarded reference in the order to the possible necessity of blockading neutral ports the United States government, in a note of 30 March, took occasion to enter a new protest. "Such a blockade," it said, "would constitute, were its provisions to be actually carried into effect as they stand, a practical assertion of unlimited belligerent rights over neutral vessels within the whole European area, and an almost unqualified denial of the sovereign rights of the nations now at peace."

The novel feature of the blockade is that it embraces many neutral ports and coasts, bars access to them, and subjects all neutral ships to approach them to the same penalties as vessels bound for enemy ports. Such limitations on ships of a neutral nation were a distinct invasion of its sovereign rights.

In the meanwhile the enforcement of the blockade order brought serious loss to American shippers. During the month of March 73 vessels carrying American cargoes, almost all of which were bound for neutral ports, were diverted to the port of Kiel. At the time of the blockade, moreover, were compelled to pay storage, harbor and other charges in advance of judicial determination of the validity of the seizures. To preserve the rights of American citizens in proceedings in the British prize courts, the United States government served on Great Britain a formal caveat against the substitution of her own enactments for international law. "The Government of the United States," it said, "will insist upon their rights under the principles and rules of international law, as hitherto established, governing neutral trade in time of war, without limitation or impairment by orders-in-council or other municipal legislation by the British Government, and will not recognize the validity of prize-court proceedings taken under restraint imposed by British municipal law in derogation of the rights of American citizens under international law."

Despite this warning the United States government permitted the blockade to continue and even refused for months to renew its protests. Damage to American shipping continued to be extensive, and pro-German interests in America brought pressure on the administration to take action. The government, however, felt disinclined to hold Great Britain to strict accountability while it was suffering so grievously from wrongs at the hands of Great Britain's arch enemy, Germany. It held that the defense of trade rights was of less importance than the protection of American lives from the deadly activities of the German submarines.

Submarine Warfare.—The German war zone decree went into effect on 18 Feb. 1915, and a capital ship of the German submarine, Prince Eitel Friedrich. Despite its unlawful act this vessel entered Newport News 10 March, for protection against British warships. The United States promptly presented a claim for damages amounting to $226,095.44. Herr von Jagow, the German Foreign Secretary, maintained that the sinking of the Frye was quite in accordance with the principles of international law, since it was not possible to take the prize into a German port, but because of the Prussian-American treaty of 1799, the owners of the ship and the cargo would be compensated even if the court decided that the cargo was contraband.

On 1 May 1915, the following notice appeared in a number of American newspapers:

"Notice: Travelers intending to embark on the Atlantic voyage are reminded that a state of war exists between Germany and her allies and Great Britain and her allies: that the zone of war includes the waters adjacent to the British islands, and in accordance with formal notice given by the Imperial German Government, vessels flying the flag of Great Britain, or of any of her allies, are liable to destruction in those waters and that travelers sailing in the war zone on ships of Great Britain or her allies do so at their own risk.

"Imperial German Embassy.

"Washington, D. C., April 22, 1915.""

This notice was published in accordance with wireless orders from the Berlin Foreign Office as a warning to all persons confined on the Cunard liner Lucania which sailed from New York the same day. It was inserted in the newspapers under the notice of the sailing of the Lucania, and shows that that great vessel had been deliberately singled out for destruction.

A week later (7 May 1915) the Cunarder was attacked without warning by a German submarine off the Irish coast, and went down with no less than 1,153 persons. Of the 18 Americans on board, 114 perished. A cry of
WAR, EUROPEAN — DIPLOMATIC NEGOTIATIONS (15) 479

horror went up from all parts of the United States. American citizens had been sent to their death by the deliberate action of the German government. From all sides pressure was brought upon President Wilson to demand prompt reparation for the outrage. Had he so wished, he might have brought the country into the war at once upon the tide of popular indignation caused by this event. The feeling of resentment was increased by the undignified slaying of the German people at the sinking. The news was received in the consulate at Philadelphia with cheers. Throughout the German Empire it was celebrated as though it had been a great victory. Cities were decorated, school children were given a holiday, and a medal was struck to commemorate the event. Dr. Dernburg, the kaiser’s spokesman in America, immediately tried to allay indignation in America by a published defense of the sinking. "We have done and will do the best we can to avoid such trouble," he said; "but we cannot allow Americans to be used as shields to get arms. The death of more than 2,000 Americans may have been avoided if our warning had been heeded. We put in advertisements and were careful to put them in next to the advertisements of the Cunard line’s sailing next month.

A few days later the German Foreign Office sent a note which was delivered to Secretary Bryan. "The German Government," it said, "desires to express its deepest sympathy at the loss of lives on board the Lusitania. The repudiation of responsibility by the British Government, which, through its plan of starving the civilian population of Germany, has forced Germany to resort to retaliating measures. In spite of the German offer to stop the submarine war in case the starvation plan was given up, British merchant vessels are being generally armed with guns, and have repeatedly tried to ram submarines, so that a previous search was impossible."

On 11 May, President Wilson delivered an address in Philadelphia before an audience of 10,000 people. That the occasion would be utilized by the President to give an intimation of the policy to be followed by the government was anticipated by everyone. Although not mentioning the Lusitania by name, he made an statement which all the world accepted as an indirect reference to the sinking. "The example of America," he said, "must be a special example. The example of America must be an example not of peace because it will not fight, but of peace because it cannot fight. And the world is not.

There is such a thing as a man’s being too proud to fight. There is such a thing as a nation’s being so right that it does not need to convince others by force that it is right.

The German government knew that these words did not foreshadow the policy of the administration toward Germany. He was defining only a personal attitude. However, many both in the United States and Germany still believed that under no circumstances would the government permit the submarine sinkings to lead to war.

On 13 May 1915, the first Lusitania note was made public. The recent violation of American rights on the high seas, it said, formed a series of events which the government of the United States had observed with growing concern, distress and amazement. It was loath to believe that these acts, so contrary to the rules and practices of modern warfare, could be sanctioned by the German government. The United States could not accept the creation of a war zone, or admit "the adoption of such measures or such a warning of danger to operate as in any degree an abbreviation of the rights of America merchant mariners or of American citizens bound on lawful errands as passengers on merchant ships of belligerent nationality; and that it must hold the Imperial German Government to a strict accountability for any infringement of those rights, intentional or accidental."

Secretary Bryan, on 31 May, made public the reply of von Jagow. The United States was wrong in assuming that the Lusitania was an unarmed merchantman, he said. In reality it was one of the largest and swiftest of the British auxiliary cruisers, carrying cannon concealed below decks, and contraband "including no less than 5,400 cases of ammunition intended for the destruction of the brave German soldiers." Germany had a right to destroy this ammunition intended for the enemy. For the loss of American lives the British company was responsible by attempting to use neutral citizens as protection for explosives. Had it not been for the firing of these explosives the vessel would not have sunk so quickly and many lives would have been saved.

This answer did not satisfy the American people. With the exception of the German American papers, the press was almost unanimous in its criticism. It was agreed that the note was evasive, unconvincing and in no way met the demands of the American government.

While a second Lusitania note was in preparation Secretary of State Bryan resigned from the Cabinet, at the same time giving to the press a statement of differences of opinion with the President which had led to this action. There were two chief points upon which agreement had been impossible. Mr. Bryan had advocated the submission to an international commission of the disputes with Germany, and he was in favor of "warning Americans against travelling on belligerent vessels or with cargoes of ammunition." "Why should an American citizen be permitted to involve his country in war," he said, "by travelling upon a belligerent ship when he knows that the ship will pass through a danger zone?"

The resignation of Mr. Bryan had little effect upon public opinion in the United States, but it created the impression in Germany that American councils were divided and that a large faction in the country were opposed to war under any circumstances.

The second Lusitania note was made public 11 June. The German government, in explaining the sinking of the Falaba, had contended that an attempt on the part of a merchant vessel to escape attack and secure help released the commander of the attacking submarine from all obligation to respect the lives of those on board, even after the attempt had been relinquished. This contention the United States government vigorously combatted. "Nothing but actual forcible resistance," it said, "or continued efforts to escape by flight when
ordered to stop for the purpose of visit on the part of the merchantman has ever been held to forfeit the lives of passengers and crew.9

In regard to the Lusitania, the German note had stated that the United States government must have been unaware of the fact that the vessel had carried masked guns, trained gunners and ammunition. "Were these statements true," the note replied, "the Government of the United States would have been bound to take official cognizance in performing its recognized duty as a neutral power and in enforcing its national laws. It was its duty to see to it that the Lusitania was not armed for offensive action, that she was not serving as a transport, that she did not carry a cargo prohibited by the statutes of the United States, and that if, in fact, she was a naval auxiliary of Great Britain, she should not receive her clearance as a merchantman, and it performed that duty and enforced its statutes with scrupulous vigilance through its regularly constituted officials." The government of the United States was able, therefore, "to assure the Imperial German Government that it has been misinformed. . . . Moreover be the other facts regarding the Lusitania, the principal fact is that a great steamer, primarily and chiefly a conveyance for passengers, and carrying more than a thousand souls who had no part or lot in the conduct of war, was torpedoed and sunk without so much as a challenge or warning and that men, women and children were sent to their deaths in circumstances unparalleled in modern warfare."

"The Government of the United States is contending for something much greater than mere rights of property or privileges of commerce. It is contending for nothing less high and sacred than the rights of humanity which every government honors itself, in respecting and which no government is justified in resigning, on behalf of those under its care and authority. . . ." The Government of the United States, therefore, deems it reasonable to expect that the Imperial German Government accept the measures necessary to put these principles into practice in respect to the safeguarding of American lives and American ships, and asks for assurances that this will be done.9

The German note in reply, which was published in America 8 July 1915, was neither conciliatory nor convincing. It once more tried to place the blame for submarine frightfulness upon Great Britain. The case of the Lusitania, it said, showed with horrible clearness to what jeopardizing of human lives the misdeeds of the Allies were leading. All distinction between merchant vessels and war ships had been done away with by the arming of British merchantmen and the ramming of submarines. If the commander of the German submarine which destroyed the Lusitania, the note continued, "had caused the crew and passengers to take to the boats before firing a torpedo this would have meant the sure destruction of his own vessel. After the experiences in sinking much smaller and less seaworthy vessels, it was to be expected that a mighty ship like the Lusitania would remain above water long enough even after the torpedoing to permit passengers to enter the ship's boats. Circumstances of a very peculiar kind, especially the presence on board of large quantities of highly explosive materials, defeated this expectation. In addition, it may be pointed out that if the Lusitania had been spared, thousands of cases of munitions would have been sent to Germany's enemies and thereby thousands of German mothers and children robbed of bread winners."8

In America the note was bitterly condemned. "The fact that the Germans have thrice responded to the demands of the United States with evasive negations," said an American, "that they have with such scant courtesy as to border upon insult neglected the demands of the United States for reparation for the Lusitania incident, and have offered nothing as to the future protection for American interests which the United States can consider with dignity or safety, has not failed to impress itself upon the American mind."

President Wilson replied in a note of 21 July 1915. He declared the German note "unsatisfactory because it fails to meet the real differences between the two governments, and indicates no way in which the accepted principles of law and humanity may be applied in the grave matter it proposes, on the contrary, arrangements for a partial suspension of those principles which virtually set them aside. . . ."

"Illegal and inhuman acts, however justifiable they may be thought to be against an enemy who is believed to have acted in contravention of law and humanity, are manifestly indefensible when they deprive neutrals of their acknowledged rights, particularly when they violate the right of life itself."

The note closed with a warning. "Friendship itself prompts this government to say to the Imperial German Government that repetitions by the commanders of German naval vessels of acts in contradiction of those rights must be regarded by the Government of the United States, when they affect American citizens, as deliberately unfriendly."

While the relations between the two nations were thus strained, news reached America that the British steamer Lusitania, which had left New York for Liverpool, had been sunk by a German submarine off the coast of Ireland, and had gone down with a loss of 44 persons, two of whom were American citizens. Since the vessel had not been warned, since it carried no ammunition, the sinking seemed clearly to come within the President's definition of an act "deliberately unfriendly to the United States. Many people expected that diplomatic relations would be broken off without further delay.

After a careful investigation of the incident Ambassador Page made a report to the government at Washington. From the evidence at hand it appeared that the Arabic had made no attempt to escape, had offered no resistance, had not tried to ram the submarine, and that the torpedo had been discharged without warning. The seriousness of the issue seems at last to have alarmed the German government and a decision was reached to modify the submarine campaign to conform it to the President's wishes. On 1 September Ambassador von Bernstorff sent Secretary of State Lansing a note foreshadowing Germany's action. "With reference to our conversation this morning," he said, "I beg to inform you that my instructions concerning our answer to your last Lus-
tavia note contains the following passage: 'Lines will not be sunk by our submarines without warning and without safety to the lives of non-combatants, provided that the lines do not try to escape or offer resistance.' Although I know that you do not wish to discuss the Lusitania question until the Arabic incident has been definitely and satisfactorily settled, I desire to inform you of the above because this policy of my Government was decided on before the Lusitania incident occurred.

Despite this assurance, the German government, after an inquiry of its own into the sinking of the Arabic, refused to admit any obligation or grant any indemnity in the matter. The report of the commander of the submarine showed that the Arabic had apparently attempted to ram his vessel and that he had discharged the torpedo without warning to escape being himself sunk. But, continued the note, 'the German Cabinet, however, to acknowledge any obligation to grant indemnity in the matter, even if the commander should have been mistaken as to the aggressive intentions of the Arabic.'

On this position, however, the Imperial government soon retreated, and on 5 Oct. 1915, Count von Bernstorff informed Secretary Lansing that such stringent orders had been issued to submarine commanders as to make a recurrence of cases similar to that of the Arabic out of the question. In regard to the Arabic sinking itself, Germany regretted and disavowed the act, had so notified Captain Schneider, the commander of the submarine, and would pay indemnity for the loss of American lives. On 7 Nov. 1915, the situation was complicated by the sinking of the Ancona, an Italian liner, by an Austrian submarine. The Ancona attempted to escape, but when fired upon and hit, stopped her engines. The vessel sank quickly and over 200 persons were lost, amongst them being nine Americans. Secretary Lansing made a demand for reparation and disavowal. Information at hand showed, he said, that after the vessel had stopped and before all the crew and passengers could take to the boats she had been torpedoes and shelled, and that by drowning and gunfire American citizens had lost their lives. The conduct of the submarine commander could only be characterized a wanton slaughter of defenseless civilians. The United States therefore demanded that the officer be punished and that reparation be made for the American citizens killed or injured.

The Austro-Hungarian government replied 15 Dec. 1915. The note was evasive, and in tone calmly insolent. The United States government had blamed the submarine commander sharply, it said, but had failed to specify upon what evidence it based its conclusions. Austria-Hungary was in no way concerned with the attitude of the United States in regard to submarine warfare as expressed in its notes to Germany, and could not be expected to shape its policies in conformity thereto. No reference whatever was made to the demand for reparation and punishment for the submarine commander.

Secretary Lansing, on 19 Dec. 1915, answered this note. Baron Zwiedinek, he said the Austrian Chargé d'Affaires, had transmitted a report of the Austro-Hungarian Admiralty itself on the sinking. In this report it was admitted that the vessel had been torpedoed after it had come to a stop and while passengers were still on board. This admission was enough to fix on the commander of the submarine the responsibility for having violated willfully the laws of nations. The German government of the United States therefore finds no other course open to it, but to hold the Imperial and Royal Government responsible for the act of its naval commander and to renew the definite but respectful demands made in its communication of the sixth of December.

The Austro-Hungarian government, probably inspired from Berlin, now surrendered, and in a note of 29 December, agreed that hostile private ships, in so far as they did not flee or offer resistance, 'may not be destroyed until the persons on board have been placed in safety,' and announced that the officer who had sunk the Ancona had been punished, and promised indemnity.

On 24 March 1916, the Sussex, a French passenger steamer, was torpedoed without warning in the Channel, and although she kept afloat, some 90 persons were killed or wounded. The Sussex had never been used as a troop ship and carried no armament. An examination of the hull of the vessel by American officials established the fact that it had been a German made torpedo and not a mine that had caused the explosion.

In a note touching upon this affair the German government admitted that a strange vessel had been torpedoed in the Channel on 24 March, but contended that it was not the Sussex but a war vessel. The commander of the submarine had made a sketch of the ship, and the lines were those of a cruiser or mine-layer, not of a passenger ship.

On 19 April 1916, President Wilson's reply to the German note was printed in the newspapers. It was pointed out that all the circumstances of the case mentioned in the German note corresponded exactly to the case in point, except the difference between the sketch and the lines of the Sussex, which was undoubtedly due to the inaccuracy of the drawing. The Government of the United States, the President continued, 'is forced by recent events to conclude that it is only one instance, even though one of the most extreme and most distressing instances, of the deliberate method and spirit of indiscriminate destruction of merchant vessels of all sorts, nationalities, and destinations.'

The Government of the United States has been very patient. But the time had now come for definite promises. Unless Germany *should now immediately declare and effect an abandonment of its present methods of submarine warfare against passenger and freight-carrying vessels, the Government of the United States can have no choice but to sever diplomatic relations with the German Empire altogether.

The German reply was handed to Ambassador Gerard on 4 May. It contained a definite promise in regard to the future conduct of the U-boat campaign. The German Government notifies the Government of the United States that the German naval forces have received the following orders: 'In accordance with the general principles of visit and search and destruction of merchant vessels recognized by international law, such vessels,
both within and without the area declared as a naval war zone, shall not be sunk without warning and without saving human lives, unless the ships attempt to escape or offer resistance.

"The German Government is confident that, in consequence of the new orders issued to its naval forces, the Government of the United States will now also consider all impediments removed which may have hindered in the way of a mutual co-operation towards the restoration of the freedom of the seas during the war as suggested in the note of 23 July 1915, and it does not doubt that the Government of the United States will now demand and insist that the British Government shall forthwith observe the rules of international law universally recognized before the war as they are laid down in the notes presented by the Government of the United States to the British Government on 24 Dec. 1914, and 5 Nov. 1915. Should the steps taken by the Government of the United States not attain the object it desires to have the laws of humanity followed by all belligerent nations, the German Government would then be facing a new situation, in which it must reserve itself complete liberty of action."

On 8 May, Secretary Lansing replied, accepting Germany's abandonment of the policy which had so menaced the good relations between the two countries, but expressly rejecting the attached condition. "The Government of the United States feels it necessary to state that it takes for granted," he said, "that the Imperial German Government does not intend to imply that the maintenance of its newly announced policy is in any way contingent upon the course or result of diplomatic negotiations between the Government of the United States and any other belligerent Government, notwithstanding the fact that certain passages in the Imperial Government's note of the fourth instant appear to be susceptible of that construction."

"In order, however, to avoid any possible misunderstanding, the Government of the United States notifies the Imperial Government that it cannot for a moment entertain, much less discuss, a suggestion that respect by German naval authorities for the rights of citizens of the United States upon the high seas should in any way be made contingent upon the conduct of any other Government affecting the rights of neutrals and non-combatants."

Thus in victory for the United States ended, for the time being the long diplomatic quarrel over unrestrained submarine warfare. President Wilson had forced Germany to acknowledge the principle of visit and search, had wrung from her a promise not to sink merchant vessels without warning, unless those vessels attempted to escape. It was a great step forward in the fulfillment of the principles of humanity and for moderation in warfare. It now remained to be seen how far Germany would adhere to her promises.

Peace Notes and America's Entry into the War. On 15 November, Bethmann-Hollweg announced that Germany was ready for peace. This was accepted by the belligerent powers as an invitation to a general discussion of peace terms, and in fact it was followed by a series of speeches and dispatches by the statesmen on both sides, but so profound was the distrust that in the end the discussion came to nothing. Exactly a year after his first suggestion the chancellor again announced to the Reichstag that the Central Powers were ready to enter into peace negotiations. The emperor, he said, "in his personal and religious sense of duty toward his nation and, beyond it, toward humanity, considered that the moment had come for official action toward peace. The official German note, which followed on 12 December, declared that the war was having been forced on the Central Powers, boasted of their success in recent military operations and the impregnable situation they then occupied. Yet they made the proposal to enter forthwith into peace negotiations. Their aims they declared were not to shatter or to annihilate their adversaries.

This proposal was received with coldness in all the Allied countries. It was generally regarded as an attempt to reap the benefit of successes that had reached their climax and to come to terms before the tide of war turned. Premier Briand spoke of the proposal as a "crude trap." In every Allied country speeches by responsible statesmen revealed the conviction that no good could come from overtures that made no guarantee against a repetition of aggression, that contained no hint of reparation. Lloyd George stated that Great Britain would continue the struggle until she could secure a complete restitution, full reparation, effectual guarantees.

It was in the midst of this unpromising situation that President Wilson, on 18 December, presented his peace proposal. Identical notes were telegraphed to each of the belligerent capitals suggesting that "an early occasion be sought to call out from all the nations now at war such an avowal of their respective views as to the terms upon which the war might be concluded and the arrangements which would be deemed satisfactory as a guaranty against its renewal or the kindling of any similar conflict in the future, as would make it possible frankly to compare them." The President pointed out that the "subjects which the statesmen of the belligerents on both sides have in mind in this war are virtually the same, as stated in general terms to their own people and to the world," and that "in the measures to be taken to secure the future safety of Europe and the world, the Government of the United States are as vitally and as directly interested as the Governments now at war."

It was stated that the President "has long had it in mind to offer the suggestion for peace, which was in no way associated with the recent overtures of the Central Powers.

Three days laterSecretary Lansing, in explaining the reasons for sending the note, said: "It is not our material interest we had in mind when the triumph of the belligerent powers on both sides have in mind in this war are virtually the same, as stated in general terms to their own people and to the world," and that "in the measures to be taken to secure the future safety of Europe and the world, the Government of the United States are as vitally and as directly interested as the Governments now at war."

It is stated that the President "has long had it in mind to offer the suggestion for peace, which was in no way associated with the recent overtures of the Central Powers.

The Central Powers replied in practically identical notes on 26 December. They declared their peace terms, but proposed an immediate meeting of the delegates of the belligerent
WARS, EUROPEAN—DIPLOMATICAL NEGOTIATIONS (15)

American co-operation in guaranteeing peace must depend on the nature of the settlement itself. Since both sides had stated that it was not their intention to crush their antagonists, it must be a peace between equals. It must be a peace founded upon an equality of rights among the nations, irrespective of their size or strength; it must be a peace based upon the principle that governments derive all their just powers from the consent of the governed. The acceptance of this principle, he said, would imply the inviolable security of life, of worship, and of industrial and social development to all the peoples who have hitherto lived under governments not responding to their wishes. Every great people should be assured of direct access to the sea. Freedom of the seas should be assured. There must be limitations of armaments, military and naval.

The mass of discussion which this address called forth in Europe and America was interrupted by a note from Germany on 31 Jan. 1917, announcing the immediate resumption of ruthless submarine warfare. This note took cognizance of the President’s address, and Germany declared herself ready to accept self-government and equality of rights for all nations, the freedom of the seas, the open seas, and the repudiation of compelling alliances. But since the attempts of the Central Powers to bring peace had not succeeded, it was now necessary to fight to the bitter end. Thus forced to fight for existence, the Imperial government could not neglect the full employment of all the weapons which were at its disposal.

Two memoranda accompanied the note. “Germany will meet the illegal measures of her enemies,” said the first, “by forcibly preventing after 1 Feb. 1917, in a zone around Great Britain, France, Italy and the eastern Mediter- ranean, all navigation, that of neutrals included, from and to England, from and to France, etc. All ships met within that zone will be sunk.” The other memorandum defined the boundaries of the barred zones, and the open routes through them and stated the rules for the guidance of American shipping.

This note threw down the gauntlet to the United States. That diplomatic relations would be severed at once was considered certain. Either the President must act, or make a complete surrender of all he had gained through long months of patient diplomatic endeavor. In fact on 3 Feb. 1917, Mr. Wilson announced to Congress that relations with Germany had been severed. “I think you will agree with me,” he said, that, in view of this declaration, which suddenly and without prior intimation of any kind, deliberately withdraws the solemn assurance given in the Imperial government’s note of the 4th of May 1916, this government has no alternative consistent with the dignity and honor of the United States but to take the course which, in its note of the 18th of April 1916, it announced that it would take in the event that the German government did not declare and effect an abandonment of the methods of submarine warfare which it was then employing and to which it had recourse to again resort. I have, therefore, directed the Secretary of State to announce to his Excellency the German Ambassador that all diplomatic relations between the United States and the German Empire are severed, and that the
American Ambassador at Berlin will immediately be withdrawn; and, in accordance with this decision, to hand to his Excellency his passports.°

The President still trusted that the German authorities would not go so far as to destroy American ships and take American lives on the high seas. Should this, however, happen, he would take the liberty of coming again before Congress to ask that authority be given him to use any means necessary for the protection of American seamen and other citizens.

Germany, meanwhile, had actually begun the sinking of merchant vessels without warning. But the damage done to American shipping was more in apprehension than in fact, as the fear of sinking had kept hundreds of vessels in harbor. President Wilson, therefore, appeared again before Congress and requested that the authority be given him to supply merchant ships with defensive arms. This request met with vigorous opposition from a small group of senators, and by an active filibuster, was held up for some days. In the end it was passed by an amendment of the Senate's rules which provided that by a two-thirds vote a measure might be brought to an immediate vote.

In the meanwhile the country was further aroused against Germany by the publication by the Associated Press of a plan to embroil the United States in war with Mexico and Japan. On 19 Jan. 1917, the German Minister to Mexico had been instructed by Foreign Minister Zimmerman to propose an alliance with Mexico against the United States.

"On the first of February," the instructions said, "we intend to begin submarine warfare unrestricted. In spite of this, it is our intention to endeavor to keep neutral with the United States of America. If this attempt is not successful, we propose an alliance on the following basis with Mexico: That we shall make war together and together make peace. We shall give general financial support and it is understood that Mexico is to reconquer the lost territory of New Mexico, Texas and Arizona. The details are left for settlement."

"You are instructed to inform the President of Mexico of the above in the greatest confi-
The President's address to the Congress follows:

"I have called the Congress into extraordinary session because of the ... and other policy devices, and made, and made immediately, which it was neither right nor constitutionally permissible that I should assume the responsibility of making public.

"On the 3d of February last I officially laid before you the executive message on the subject of war. ... The German Government that on and after the first day of February it was its purpose to put aside all restraints of law or of humanity and use its armed forces at sea in the manner and in the places and in the direction and with the effect that our national laws and policy and our national honor and the principles and purposes of law and policy would be nullified.

"This was the only way out. It was the only way to prevent; it was not only the only way to prevent; it was practically certain to draw us into the war without either the rights or the power to do so. There is one choice we cannot make; we cannot be incapable of making it; we will not choose the path of submission and the path of fear. The most sacred rights of our sovereign rights; those that are coveted may be disregarded or ignored. The rights against which we now array ourselves are no common wrongs; they cut to the very roots of human life.

"With a profound sense of the solemn and even tragic character of the step I am taking and of the grave responsibilities which it involves, but in unhesitating obedience to what I deem my constitutional duty, I advise that the Congress declare the recent course of the Imperial German Government to be just waging less than war against the Government and people of the United States; that it formally accepts the status of belligerent which has thus been thrust upon it; and that it take immediate steps not to further the war, but to bring about peace and the restoration of international harmony.

"This what this will involve is clear. It will involve the utmost practicable cooperation in credit, in trade, in action with the governments now at war with Germany, and, as an incident to that, the extension to those governments of the most liberal financial credits, in order that our resources may be made the more possible to be added to theirs.

"It will involve the organisation and mobilisation of all the material resources of the country to supply the materials of war and serve the incidental needs of the nation in the most abundant and yet the most expeditious manner possible.

"It will involve the immediate full equipment of the armies in all respects, but particularly in supplying it with the best means of dealing with the enemy's submarines.

"It will involve the immediate organisation of the armed forces of the United States, already provided for by law in case of war, of at least 500,000 men, by legislation, and, if the case shall so require, the immediately necessary and the more permanent. It will also involve the organisation of subsequent additional increments of equal force so soon as they may be needed and can be handled in training.

"It will involve also, of course, the granting of adequate credits to the government, sustained, I hope, so far as they can equitably be sustained by the present generation, by well-conceived taxation.

"I say sustained so far as may be equitable by taxation, because it seems to me that it would be most unwise to tax the credits, which will now be necessary to employ the whole credit of the nation, to be employed in this kind of employment.

"It is a war against all nations. American ships have been sunk, American lives taken, in ways which it has stared as very deeply to learn of, but the spirit and people of other neutral and friendly nations have been sunk and overwhelmed in the ways to the same way. There has been no discrimination.

"The challenge is to all mankind. Each nation must decide for itself how it will meet it. The choice we make for ourselves must be made with a moderation of counsel and a temperateness of judgment befitting our character and our motives as a nation. We must put up our fears and our aversion to the thought that we may have to fight in a war that will have been fought.

"When I addressed the Congress on the 26th of February last, I observed the question before us as a war with arms, our right to use the seas against unlawful interference, our right to keep our people safe against unlawful interference, our right to keep our trade safe, our right to have our rights as we are able to protect them. Because submarines are in effect outlawers, when used as submarines, as a weapon of war, the merchant shipping, it is impossible to defend ships against their attacks. The law of nations has assumed that other nations have the power to use this means against all nations.

"The President of the German government denies the right of neutrals to use arms at all within the areas of the sea which it has pro-
people. We have seen the last of neutrality in such circumstances. We are at the beginning of an age in which it will be insisted that the same standards of conduct and of responsibility should prevail. Wrongdoing shall be judged not by the standards of the governments that are observed among the individual countries of civilized states.

"We shall have no quarrel with the German people. We have no feeling toward them but one of sympathy and friendship. If we could persuade them, with the help of their government, to enter this war, it was not with their previous knowledge or approval. It was a war determined upon as wars usually are determined upon in times of old, unhappy days, when peoples were nowhere consulted by their rulers and wars were entered upon and waged for the interest of dynasties and little groups of ambitious men who were accustomed to use their fellow men as pawns and tools.

"Self-governed nations do not allow their neighbors' states with spies or set the course of intrigue to bring about some critical postures of affairs which will give them an opportunity to strike and make conquest. Such designs can be successfully worked out only under cover and where no one has the right to ask questions. Cunningly contrived plans of deception or aggression, carried, it may be, from generation to generation, can be worked out and kept from the light only within the privacy of courts or behind the carefully guarded confidences of a narrow and privileged class. They are hard to imagine where public opinion comes into the picture, and insists upon full information concerning all the nation's affairs.

"A steadfast concert for peace can never be maintained except by a partnership of democratic nations. No autocratic government could be trusted nor relied upon to observe its covenants. It must be a league of honor, a program of peace, instead of the disastrous end that would be its vital aspect in the plotings of inner circles who could plan what they would and render account to no one but would be a corruption seated at the heart. Only free peoples and the honor steady to a common end and prefer the independence of character to the interest of their own.

"Does not every American feel that assurance has been added to our hope for the future peace of the world by the wonderful things that have been happening within the last few weeks in Russia? Russia was known to us before her best to be too long out of fact democratic at heart in all the vital habits of her thought, in all the intimate relationships of her people that spoke their naturalness and their habitual attitudes toward life. The autocratic crown that crowned the sumptuous of her political structure, long as it has been blank, a blank that is a reality of its power, was not in fact Russian in origin, character, or purpose; and now it has been shaken off and the great, genuine Russian people have been added, in all their native majesty and might, to the forces that are fighting for freedom in the world, for justice, and for peace. Here is a fit partner for a League of Honor.

"One of the things that has served to convince us that the Prussian autocracy was not and could never be our friend is that from the very outset of the present war it has filled our unenlightened communists and even our spokesmen of government, with spies and set criminal intrigues everywhere slyly against our national unity of counsel, our peace within and without, order in our streets and our counsels; indeed, it is now evident that its spies were here even before the war began; and it is unhappily a fact that the very nature of this war has been established as a fact proved in our courts of justice, that the intrigues which have more than once come perilously near to disturbing the peace and disorganization of our community, have been carried on at the instigation, with the support, and even under the personal direction of the agents of the Imperial Government in that of the Government of the United States.

"Even in checking these things and trying to exterminate them we have sought to put the most generous interpretation possible upon them because we knew that their source lay, not in any hostile feeling or purpose of the German people toward us (who were, no doubt, as ignorant of them as we ourselves were), but only in the selfish designs of a government that did what it pleased and told its people nothing. But they have played their part in serving to convince us at last that that government entertains no real friendship for us, and designs to act against our peace and security at its convenience. That it means to stir up enemies against us at our worst. The note to the German Minister at Mexico City is eloquent evidence.

"We are accepting this challenge of hostile purpose because we believe the Government, following such methods we can never have a friend; and that in the presence of its own conduct we are being in wait to accomplish its purpose, we know not what purpose, can be assured security for the democratic government of the world. We are now about to accept the challenge of this war, but it is not likely that we shall, if necessary, spend the whole force of the nation to close the eyes of the government and its power. We are now, so far as we know, the facts, no veil of false pretense about them, to fight thus for the ultimate peace of the world and for the liberation of its peoples, its larger freedom, of which the rights of nations, great and small, and the privilege of men everywhere to choose their way of life and of obedience.

"The world must be made safe for democracy. Its peace must be planted upon the tested foundations of political liberty. We have no selfish ends to serve. We desire no conquest, no dominion. We seek no indemnities for ourselves, no material compensation for the sacrifices we shall have made. We desire to see mankind made free and to see all nations made secure. This is the object of the liberty of which we are the champions. This is the faith in man which is at the base of our union. We have no selfish ends to serve. We desire no place among the powers of the world. We seek no dominion. We will生活。We seek no indemnities for ourselves, no material compensation for the sacrifices we shall have made. We desire to see mankind made free and to see all nations made secure. This is the object of the liberty of which we are the champions. This is the faith in man which is at the base of our union.
WAR, EUROPEAN—DIPLOMATIC NEGOTIATIONS (15)
an undoubted security of life and an absolutely un molested opportunity of autonomous development, and the Dardanelles should be permanent, open to all, and commerce of all nations under international guarantees.

"13. An independent Polish State should be erected which should include the territories inhabited by indisputably Polish populations, which should be comprised in a free state, and whose political and economic independence and territorial integrity should be guaranteed by international covenant.

"14. A general association of nations must be formed under specific covenants for the purpose of affording mutual guarantees of political independence and territorial integrity to great and small States alike."

Secret Treaties.—When the World War broke out in the summer of 1914, Italy, although a member of the Triple Alliance, declared her neutrality. Her interests lay counter to, rather than in accord with, those of Austria-Hungary and Germany. Moreover, under Article VII of the Alliance, she put forth a claim at the Austrian front that territorial compensation contingent upon the invasion of Serbia. This claim was vigorously resisted, but on 20 Dec. 1914, Count Berchtold yielded the principle. The Italian Foreign Minister Sonnino next proceeded to demand that the compensation should be made from Austro-Hungarian territory itself. He made it clear that what was wanted was the Trentino and Trieste. After long negotiations, Baron Burian, who had succeeded Count Berchtold as Minister of Foreign Affairs, intimated that any cession of Austro-Hungarian territory was impossible, and countered with demands for compensation because of the Italian occupation of the Dodecanese Islands during the war with the Ottoman empire. Whereupon Italy withdrew her former proposals and served notice on Austria-Hungary that she would regard an invasion of Serbia as a violation of the stipulations of the Triple Alliance.

Germany here intervened to prevent war, and Austria-Hungary was persuaded to agree to the principle of cession of territory. Since, however, Italy insisted upon immediate cession and Austria-Hungary resisted this demand, Germany offered to guarantee that the cession should be made at the conclusion of peace. This Sonnino refused, and 24 March 1915, Burian agreed to a cession of territories in the southern Tyrol, including the city of Trent. Sonnino replied that the offer was inadequate. On 8 April 1915, Sonnino made his final demands. Italy must have all the Italian Trentino and a part of Istria. Trieste was to be constituted a free state. In return Italy was to pay 200,000,000 lire in gold, and guarantee neutrality during the war.

The refusal of Count Burian was a foregone conclusion, and Italy immediately came to terms with the Allies in a secret treaty signed at London. According to this agreement, Italy was to enter the war on the side of the Allies, and in return for this, there was allotted to her, if she could conquer it, a mass of Austro-Hungarian territory on the coast of the Adriatic, including all of Gorizia, Gradisca and Istra, with the city of Trieste, together with the coastal province of Dalmatia as far as a line just north of Spalato. In addition she was to receive most of the Dalmatian islands, and practically all of the Trentino. On 3 May 1915, Italy declared herself no longer bound by the Triple Alliance and passed into a state of war with Austria-Hungary.

Immediately after the outbreak of the World War the late King Carol of Rumania announced to his advisers his desire to align the country with the Central Powers. The majority of the council refused, and on 23 May, Rumania remained neutral. Italy's declaration of war against Austria-Hungary was generally believed to presage the entrance of Rumania upon the side of the Allies, and in fact conversations between Italy and Rumania on the subject had actually taken place. They were without avail, however. In April and May 1916, arrangements were entered into with Germany and Austria-Hungary for the purchase and shipment of Rumanian grain which seemed to foreshadow an alignment of those powers. This also proved to be unfounded, and on 17 Aug. 1916, Rumania signed a secret treaty with the Quadruple Alliance by which she agreed to enter the war on the side of the Allies.

It was stipulated in this treaty that France, Great Britain, Italy and Russia should guarantee the territorial integrity of the kingdom of Rumania in the whole extent of its frontiers; that Rumania should engage to declare war on Austria-Hungary under the conditions stipulated in an accompanying military convention; that Rumania should cease to make economic and commercial exchanges with the enemies of the Allies; that France, Great Britain, Italy and Russia should recognize Rumania's right to annex certain territories in Austria-Hungary, chiefly occupied by Rumanian populations; that both Rumania and the Quadruple Alliance should agree not to make peace separately. The military convention stipulated that Rumania was to attack Austria-Hungary on 28 August; that the Russian army was to aid by vigorous action, especially in Bukowina; that the Russian fleet should guard the Rumanian coast, having the right to use the port of Constanza; that Russia was to send two divisions of infantry and one of cavalry to aid Rumania against the Bulgarians; that the Allies should make an offensive immediately from Salonic; and that Rumania was to receive munitions and war materials from the Allies by way of Russia.

When the United States seemed likely to enter the war, Japan feeling it wise to insure her reward for her participation in the operations against Germany, sought certain definite promises from the Allies. Viscount Monoto, the Japanese Minister of Foreign Affairs, took the matter up with the British Ambassador at Tokyo early in 1917. On 16 February, the Ambassador replied:

"My dear Excellency: With reference to the subject of our conversation of the 27th ultimo, when your Excellency informed me of the desire of the Imperial Government to receive an assurance that on the occasion of a peace conference his Britannic Majesty's Government will support the claims of Japan in regard to the disposal of Germany's rights in Shantung and possessions in the islands north of the equator, I have the honour to transmit to your Excellency the communications received from his Britannic Majesty's principal Secretary of State for Foreign Affairs
to communicate to you the following message from his Britannic Majesty's Government:

"His Britannic Majesty's Government accede with pleasure to the request of the Japanese Government for an assurance that they will support Japan's claim that the disposal of Germany's rights in Shantung and possessions in the islands north of the equator on the occasion of the peace conference; it being understood that the Japanese Government will in no way treat in the same spirit Great Britain's claims to the German islands south of the equator."

To a like inquiry addressed to France, a favorable reply was received. "The Government of the French Republic is disposed to give the Japanese Government its accord in regulating at the time of the peace negotiations questions vital to Japan concerning Shantung and the German islands in the Pacific north of the equator. It also agrees to support the demands of the Imperial Japanese Government for the surrender of the rights of Germany possessed for the war in this Chinese province and these islands."

The Russian Ambassador wrote briefly to Vienna, March 1, 1918, committing Russia to support the Japanese claims, while Italy gave her promise after negotiations conducted at Rome.

The Debacle in 1918—On 25 Jan. 1918 Count von Hertling, Imperial German Chancellor, and Count Czernin, Austro-Hungarian Foreign Minister, made answer to the statement of war aims set forth by Premier Lloyd George and President Wilson. The reply of the former was equivocal and most unsatisfactory because of the latter went far to meet Mr. Wilson's demands. Czernin, however, refused to discuss the principle of self-determination for the peoples of Austria-Hungary, holding that to be a matter of domestic policy for his government.

On 11 Feb. 1918 President Wilson in an address to the Congress laid down four principles: (1) Each part of the final settlement to be based on the justice of that particular case; (2) peoples and provinces not to be bartered as chattels from one sovereignty to another; (3) territorial settlements to be made in accord with the aspirations of the populations concerned; (4) national aspirations to be satisfied as far as possible without perpetuating or sow ing seeds of discord.

About this time the Lichnowsky Memorandum (q.v.) was made public and created a profound impression in Allied and neutral countries since it proved from an enemy source England's conciliatory attitude in the summer of 1914 and Germany's encouragement of Austria's attack on Serbia. In June there followed the revelations of Dr. Wilhelm Mühlen, a director of the Krupp works at Essen. In his book, 'The Devastation of Europe,' he wrote: "People blame our diplomats for muddling the war. My opinion is that these diplomats have been handicapped by the power, the vacillating character, and the continued interference of the kaiser in their work. Only men who would dance to his piping could remain in office."

On 24 June 1918 the German Foreign Min-

ister, von Kuhlmann, stated that the war could not be won by arms alone and that peace would come only through negotiation. In the weeks following this statement it became apparent that a fast-growing number of Germans saw the hopelessness of victory on the field, and there was an ever-increasing public opinion in favor of a peace by negotiation. On 4 July President Wilson in an address at Mount Vernon reaffirmed the war aims of the United States and declared that there could be no compromise. "What we seek is the reign of law based upon the consent of the governed and sustained by the organized opinion of mankind."

Dissension among the Central Powers had now become evident. Bulgaria's aims conflicted with those of Turkey and Hungary became estranged from Austria. In August the United States after much discussion arrived at an agreement with Japan in regard to joint intervention in Siberia. In September, the Austrian government sent a note to all other governments proposing a conference to discuss peace terms but not in a binding manner; Germany proposed to Belgium to restore her economic and political independence on certain conditions, one of which involved the restoration of the German colonies. The result of these peace efforts was negligible; in the field the offensive had now passed to the Entente and the will to conquer had seized hold of their peoples. The prospect of defeat, very apparent in October 1918, accentuated the differences between Germany and her Allies. On 30 September von Hertling resigned the chancellorship and von Hintze, von Kuhlmann's successor, resigned the portfolio of Foreign Affairs. Prince Max of Baden, a moderate in politics, became chancellor on 2 October and Dr. Solf was made foreign secretary. Scheidemann and Bauer, Socialists, and Erzberger and Groebner, Centrists, became members of the new ministry which set about making radical changes in Germany's political system. On 5 October Prince Max's message of peace to President Wilson was made public in the United States. The note, which proved the first step which led to the conclusion of hostilities, included a proposal for peace the program laid down by the President in the "14 Points" message of 8 Jan. 1918, and in his address of 27 September at New York, in which the President had restated the purposes of the war. In the American reply dispatched 8 October, the President said: "The good faith of any discussion would manifestly depend upon the consent of the Central Powers immediately to withdraw their forces everywhere from invaded territory."

"The President also feels that he is justified in asking whether the imperial chancellor is speaking merely for the constituted authorities of the empire who have so far conducted the war. He deems the answer to these questions vital from every point of view."

Dr. Solf, the German Foreign Secretary, replied on 12 October, saying the chancellor spoke "in the name of the German government and of the German people."

Dr. von Hübner replied on the 14th to the effect that the conditions of an armistice must be left to the military authorities. Dr. Solf replied on 21 October accepting the proposal to evacuate occupied territories and stating that U-boat command had been enjoined from torpedoing passenger ships.
On 27 October Germany requested proposals for an armistice and was referred to Marshal Foch. Meanwhile, Bulgaria had capitulated and Austria had initiated separate proposals for an armistice. Hostilities ceased on the Austrian front on 1 November, and a few days later German delegations arrived at French Grand Headquarters to receive the terms of the armistice, which they signed at 5 A.M. (French time) on 11 Nov. 1918. See The Armistices in this section.

Assistant Professor of History and Politics, Princeton University.

16. FINAL REPORT OF GEN. JOHN J. PERSHING. General John J. Pershing, Commander-in-Chief of the American Expeditionary Forces in Europe, submitted his final report to the Secretary of War, Newton D. Baker, late in November and it was made public 13 Dec. 1919. The complete report follows verbatim:

GENERAL HEADQUARTERS AMERICAN EXPEDITIONARY FORCES

To the Secretary of War:

SIR:—I have the honor to submit herewith my final report as Commander-in-Chief of the American Expeditionary Forces in Europe.

PART I.

Period of Organization.—I assumed the duties of this office on May 26, 1917, and, accompanied by a small staff, departed for Europe on board the S. S. Baltic on May 28. We arrived at London on June 9 and, after spending some days in consultation with the British authorities, reached Paris on June 15.

Following the rather earnest appeals of the Allies for American troops, it was decided to send to France, at once, 1 complete division and 9 newly organized regiments of Engineers. The Division was formed of regular regiments, necessary transfer of officers and men were made, and recruits were assigned to increase these units to the required strength.

The offer by the Navy Department of one regiment of Marines to be reorganized as Infantry was accepted by the Secretary of War; and it became temporarily a part of the First Division.

Prior to our entrance into the war, the regiments of our small army were much scattered, and, in consequence, no organized units, even approximating a division, that could be sent overseas prepared to take the field. To meet the new conditions of war, an entirely new organization was adopted in which our Infantry divisions were to consist of four regiments of Infantry of about 850 officers and men, three regiments of Artillery, 14 machine-guns companies, one Engineer regiment, one Signal battalion, a troop of Cavalry, and other auxiliary units, making a total strength of about 28,000 men.

Military Situation.—In order that the reasons for many important decisions reached in the early history of the American Expeditionary Forces may be more clearly understood and the true value of the American effort more fully appreciated, it is desirable to have in mind the main events leading up to the time of our entry into the war.

1914.—Although the German drive of 1914 had failed in its immediate purpose, yet her armies had made very important gains. German forces were in complete possession of Belgium and occupied rich industrial regions of northern France, embracing one-fourteenth of her population and about three-fourths of her coal and iron. The German armies held a strongly fortified line 468 miles in length, stretching from the Swiss border to Nieuport on the English Channel; her troops were within 46 miles of Paris and the initiative remained in German hands.

Division of the Russian mobilization forced Germany, even before the Battle of the Marne, to send troops to that frontier, but the close of 1914 found the Russian armies on the Rhine and driven back on Warsaw.

The situation prior to the war, because of the moral effect upon the Moslem world and the immediate constant threat created against Allied communications by the Turks, the war effort of the Allied governments, and the administrative and military strength of the Allies in the direction of the Dardanelles.

1915.—Italy joined the Allies in May and gave their cause new strength, but the effort was more or less offset when Bulgaria entered on the side of the Central Powers.

The threatening situation on the Russian front and in the Balkans was still such that it compelled to exert an immediate offensive effort in those directions and to hold the U. S. line on the western front. German arms achieved a striking series of successes in the vicinity of the Marzurian Lakes and in Galicia, capturing Warsaw, Brest-Litovsk, and Vilna. The Central Powers overran Serbia and Montenegro. Meanwhile, the Italian armies forced Austria to use approximately one-third of her strength against them.

In the west, the French and British launched offensives which cost the German armies considerable loss; but the objectives were limited and the effect was local.

The Dardanelles expedition, having failed in its mission, was withdrawn in January, 1916. The Italian operation had been successful although the British fleet had established its superiority on the sea, yet the German submarine blockade had developed into a serious menace to Allied shipping.

1916.—Germany no doubt believed that her advantage on the eastern front at the close of 1915 was an offensive in the west, and her attack against Verdun was accordingly launched in the spring of 1916. Russia was not yet beaten and early in June, aided by the same time by the threat of an Italian offensive in the west, she began the great drive in Galicia that proved so disastrous to Austria.

Rumania, having entered on the side of the Allies, undertook a promising offensive on the western front. The British and French Armies attacked along the Somme. Germany quickly returned to the defense in the west, and in September initiated a campaign in the east which, before the close of 1916, proved unfortunate for Russia as well as Rumania. Retaining on the eastern front the forces sufficient for the final conquest of Russia, Germany prepared to aid Austria in its attack on Italy. Meanwhile, the Russian revolution was well under way and, by the middle of 1916, the final collapse of that government was almost certain.

The relatively low strength of the German forces on the western front led the Allies with much confidence to attempt a decision on this front; but the losses were very heavy and the effort signally failed. The failure caused a serious reaction especially on French morale, both in the army and throughout the country, and attempts to carry out extensive or combined operations were indefinitely suspended.

In the five months ending June 30, German submarines had accomplished the destruction of more than three and one-quarter million tons of Allied shipping, capturing three and one-quarter million tons of Allied offensives except Verdun crowned with success. Her battle lines were held on foreign soil and she had withstood every effort of the Allies to maintain the war, her general staff could now foresee the complete elimination of Russia, the possibility of defeating Italy before the end of the year and, finally, the destruction of the Triple Entente against the French and British on the western front which might lead to the conquest of Germany.

It can not be said that German hopes of final victory were extravagant, either as viewed at that time or as viewed in the light of history. Financial problems of the Allies were difficult, supplies were becoming exhausted and their armies had suffered tremendous losses. Discouragement existed not only among the civil population but throughout the armies as well. Such was the Allied morale that, although their superiority on the western front during the last half of 1916 and during 1917 amounted to 20 per cent, only local attacks could be undertaken and the program was insufficient against the German defense. Allied resources in man power, at home were low and there was little prospect of materially increasing their armed strength, even in the face of the probability of having practically the whole military strength of the Central Powers against them in the spring of 1918.

This was the state of affairs that existed when we entered the war and the initiative gave the Allies much encouragement yet this was temporary, and a review of conditions made it apparent that the Allies must make a supreme material effort as soon as possible. After duly considering the tonnage possibilities I cabled the following telegram to the Grand Fleet:

Plan should contemplate sending over at least 1,000,000 men by the end of the year. Organization Projects.—A general organization project, covering as far as possible the personnel of all combat, staff and administrative units on the Western Front, was initiated by the Department of State on Washington on July 11. This was prepared by the
Operations Section of my staff and adopted in joint conference with the War Department Committee then in France. The organization and effort required of America after a careful study of French and British experience. In forming the section, it is evident that a force of about 1,000,000 is the smallest unit which in modern war will be a complete, well-balanced, and independent fighting organization. However, it must be equally clear that the adoption of the principle on which the organization was designed would be the utmost use of those lines of the existing French railroad system that could bear an added load of 300,000 men per day, or 10,000,000 a month. The problem confronting the American Expeditionary Forces was then to superimpose the fixed forces on those of France where there would be the least possible disturbance to the arteries of supply of the two great Allied armies in France, which would enable them to support the utmost use of those lines of the existing French railroad system that could bear an added load of 300,000 men per day, or 10,000,000 a month. The problem confronting the American Expeditionary Forces was then to superimpose the fixed forces on those of France where there would be the least possible disturbance to the arteries of supply of the two great Allied armies in France, which would enable them to support the utmost use of those lines of the existing French railroad system that could bear an added load of 300,000 men per day, or 10,000,000 a month.

With a few minor changes, this project remained our guide until the end. While this general organization project provided certain Services of Supply troops, which were an integral part of the larger combat units, it did not include the great body of troops and services required to maintain an army overseas. To disembark 2,000,000 men, move them to their training areas, shelter them, feed them, clothe them, secure the supplies and equipment they required, called for an extraordinary and immediate effort in construction. To provide the organization, equipment, and services of the rear, including railways, was called to Wash-ington, where on November 18, 1917, was taken over by a complete service of the rear project, which listed item by item the troops considered necessary for the Services of Supply.

In order that the War Department might have a clear idea of the extent and material to insure the gradual building up of a force at all times balanced and symmetrical, a comprehensive service of the rear was established, in which the forces and services enumerated in these two projects should appear. This schedule of priority of services, forwarded to the War Department on October 7, divided the initial force called for by the two projects into six phases corresponding to combatant corps of divisions each. The importance of the three documents, the general organization project, the service of the rear project, and the schedule of priority of shipments, should be emphasized, because they formed the basis plan for providing an army in France together with its material for combat, construction, and supply.

For purposes of local administration our line of communications in France was subdivided into districts or sections. The territory corresponding to and immediately surrounding the principal ports were, respectively, called base sections, with an intermediate section embracing the region of the first section extending to the zone of operations, within which the billeting and training areas for our earlier divisions were located. In providing for the storage and distribution of reserve supplies an allowance of 45 days in the base sections was planned, with 30 days in the intermediate section and 15 days in the advance section. After the safety of our sea transport was assured, this was reduced to a total of 45 days, distributed proportionately. When the Armistice was signed all projects for construction had been completed and supplies were on hand to meet the needs of 2,000,000 men, while further plans for necessary construction and for the supply of an additional 2,000,000 were well under way.

General Staff.—The organization of the General Staff and supply services was one of the first matters to engage my attention. Our situation in this regard was wholly unlike that of our Allies. The British was at home and in close touch with its civil government and war department agencies. While the British were organized on an overseas basis, they were within easy reach of their base of supplies in England. Their problem of supply and replacement was very different from ours. Their training could be carried out at home with the experience of the front at hand, while our troops must be sent as ships were provided and their training resumed in France where discontinued in the States. Our available forces were not large enough to meet all the initial demands, so that priority of material for combat and construction, as well as for supplies that could not be purchased in the U.S., were set aside and were used to meet the needs of the Allies. This was done in consultation with the Allied governments.

The functions of the General Staff at my head-
quarters were finally allotted to the five sections, each under an Assistant Chief of Staff, as follows: To the First Section, responsibility for ocean tonnage, priorities for overseas shipments, replacement of men and animals, organization and types of equipment for troops, billeting, privvies, inspection, maps, censorship; to the Second, or Intelligence Section — information regarding the enemy, its strength and dispositions, staffs, operations, and employment of combat troops; to the Fourth Section — coordination of supply services, including Construction, Transportation, and Materiel Departments, control of regulating stations, and supply; to the Fifth, or Training Section — tactical training, schools, preparation of tactical manuals, and athletics. The same system was applied in the lower echelons of the command down to include divisions, except that in corps and divisions the Fourth Section was merged with the First and the Fifth Section with the Third.

The American Expeditionary Forces grew, it was considered advisable that, in matters of procurement, transportation, and supply, the chiefs of the several supply services, who had hitherto been under the General Staff at my headquarters, should be placed directly under the supervisory and controlling influence of the five and British Staff Sections, the Assistant Chief of Staff.

As the American headquarters therefore concerned itself with the broader phase of control. Under my general supervision and pursuant to clearly determined policy, the chiefs of Staff, coordinated by the Chief of Staff, issued instructions and gave general direction to the great combat units and to the Services of Supply, keeping always in close touch with the manner and promptness of their fulfillment. Thus a system of direct responsibility was put into operation which contemplated secrecy in preparation, prompt decision in emergency and co-ordinate action in execution.

With the growth of our forces the demand for staff officers rapidly increased. The available number of officers of this grade at our disposal was very limited. To meet this deficiency, a General Staff College was organized late in November, 1917, for the instruction of such officers as could be spared. An intensive course of study of three months was prescribed, embracing the details of our staff organization and administration, and our system of supply, and teaching the combined employment of all arms and services in combat. Officers were carefully chosen for their suitability and, considering the short time available, graduates from this school returned well equipped for staff duties and with a loyal spirit of common service much accentuated. The Staff College carried to completion four courses of three months each, graduate 137 staff officers.

Training. — Soon after our arrival in Europe careful study was made of the methods of training troops in combat. Both the French and British maintained continuously a great system of schools and training centers, which provided for both theoretical and practical instruction of inexperienced officers and noncommissioned officers. These centers were required not only for new arms, but to prepare officers and soldiers for advancement by giving them a short course in the duties of their new grade. These school systems made it possible to spread rapidly a knowledge of the latest methods developed by experience and at the same time counteract false notions.

A similar scheme was adopted in August, 1917, for our armies in which the importance of teaching throughout our forces a sound fighting doctrine of our own was emphasized. It provided for troop training in all units and included divisional instruction for noncommissioned officers and unit commanders of all arms. These centers also had special training for the instructors received at corps schools. Base training centers for replacement troops and special classes of craftsmen and mechanics were designated. The army and corps schools were retained under the direct supervision of the Training Section, General Headquarters, and graduated 21,530 noncommissioned officers and 13,916 officers.

Particular care was taken to search the ranks of the most promising soldiers, in order to develop leaders for the command of units and companies. These were graduated from these candidate schools in France 10,976 soldiers. It was planned to have 22,000 infantrymen in each of the states by January 1, 1919, graduating 5,000 to 6,000 each month. In addition, there were to be graduated monthly 600 artillerymen, 400 engineers, and 200 signalmen, making a total of about 7,000 soldiers each month. Prior to November 14, 1918, 12,732 soldiers were commissioned as officers.

It must be said most officers were ideal, but it represented a compromise between the demand for efficiency and the imperative and immediate necessity for training large forces. Every advantage was taken of the experience of our Allies in training officers. It was early recommended to the War Department that French and British officers be asked for to assist in the instruction of troops in the United States. When our own schools, a large number of our officers were sent to centers of instruction of the Allied armies. The training of our own officers was entirely dispensed with for training for open warfare. It was to avoid this result in our own service that the offensive spirit that the following was published in October 1917.

(i) The above methods to be employed must remain or become distinctly our own.

(ii) All instruction must contemplate the assumption of a vigorous spirit, both in every phase of training until it becomes a settled habit of thought.

(iii) The general principles governing combat remain unchangeable in their essence. This war has developed special features which involve special training, but the fundamental ideas enunciated in our Drill Regulatations, Small Arms Fire Manual, Field Service Regulations, and other service manuals remain essential for both officers and soldiers and constitute the standard by which their efficiency is to be measured, except as modified in detail by instructions from these headquarters.

(iv) The rifle and the bayonet are the principal weapons of the infantry soldier. He will be trained to a high degree as a sharpshooter, both on the target range and in field firing. An aggressive spirit must be developed until the soldi5er feels himself, as a bayonet fighting, invincible in battle.

(v) All officers and soldiers should realize that at no time in our history has discipline been so important; therefore, discipline must be en forced at all times. The standards for the American soldier must be maintained and high. An upright bearing, attention to detail, uncomplaining obedience to instructions required of the cadet will be required of every officer and of the army as a whole.

Recommendations were cabled to Washington emphasizing the importance of target practice in training, and recommending that instruction in open warfare be made the mission of troops in the United States, while the training in trench warfare so far as necessary be conducted in France. Succeeding divisions, whether serving temporarily with the British or French, were trained as thus indicated. The assistance of the French units was limited to demonstrations, and, in the beginning, French instructors taught the use of French arms and assisted in the preparation of elementary trench warfare exponents.

Assuming that divisions would arrive with their basic training completed in the United States, one month was allotted for the training of the instructors needed for the battalions down, a second month of experience in quiet sectors by battalions, and a third month for field practice in open warfare tactics by division, including artillery. Unfortunately many divisions did not receive the requisite amount of training before leaving the States and complete preparation of such units for battle was thus often seriously delayed.

The system of training profoundly influenced the combat efficiency of our troops by its determined insistence upon the instruction and practice in the technique of warfare of movement. Instruction which had hitherto been haphazard, varying with the ideas and conceptions of inexperienced officers, was brought under a system based on correct principles. Approved and systematic methods were maintained and enforced largely by the continual

presence of members of the Training Section with the troops both during the training period and in combat.

Intelligence.—Before our entry into the war, European experience had shown that military operations can be successfully conducted in an unceasingly changing environment only in the light of complete and reliable information of the enemy. Warfare with battle lines separated by great distances made possible the early accumulation of detailed information, such as that obtained through air reconnaissance, radio intercept stations, and the use of airplanes, sensitive instruments for detecting gun positions and raids to secure prisoners and documents. All such information was relied upon, and the intelligence agencies, including military, political, and economical, was collected, classified, and rapidly distributed where needed.

From careful studies of the systems and actual participation by our officers in methods in use at various Allied headquarters, an Intelligence Service was evolved in our forces which operated successfully from its first organization in August 1917.

A combination of the most modern methods, such as observation from the air and ground and the exploitation of prisoner and documents, has proved more effective than the less direct means. Every unit from the battalion up had an intelligence detachment, but only in divisions and theaters. The intelligence agencies embraced all available means and sources, including radio interception stations and sound and flash-ranging detachments.

The subjects studied by the Intelligence Section encompassed the entire area of the front line, his disposition, the history and fighting value of his divisions, his power, his combat activities, circulation of the army, his movement of his divisions, supply, construction and material, air service, radio service, strategy and tactics, and what he probably knew of our situation. The political and economic conditions within the enemy's countries were of extreme importance.

To disseminate conclusions, daily publications were necessary, such as a Secret Summary of Intelligence containing information of the broadest scope, which concentrated only on General Headquarters and a Summary of Information, distributed down to include the divisions, given in the daily print.
was determined that 85 per cent of these packages were received.

As soon as the Armistice was signed the Germans released large numbers of Allied prisoners, who immediately started toward the Allied lines. Four American regional replacement departments were established, to which all returning Americans were sent until proper records could be made. Those in good physical condition were evacuated through trains, including hospital cars, provided by the Swiss Government and paid for by the Government. These were met by American trains at the Swiss border. It was planned to withdraw all our prisoners by this route, but because of the rapid evacuation, the grip of war conditions, and the condition and improvement was inaugurated, utilizing German civil labor.

The Allied Commission obtained a statement of moneys paid Americans while in German prisons; investigated complaints concerning treatment of Americans; obtained a list of those who had died in captivity, or which had been left behind by the Germans; and also located the graves of the American dead.

On November 11, 1918, there were 248 American officers and 3,302 men in the German army, all of whom were evacuated by February 5, 1919. None of our prisoners were condemned to death, although 20 men died in captivity.

An Inter-Allied agreement of January 13, 1919, created a commission to control of Russian prisoners in Germany. The British and American representatives, aided by small armed detachments, were charged with the supervision of the Russian prison camps and succeeded in discharging their duties despite the civil disorders in Germany.

In January, 1919, the Red Cross outlined a plan to send a commission to Germany to assist in caring for and feeding Russian prisoners, and an American officer was later detailed to assist and accompany this commission. The Red Cross being financially unable to furnish the necessary food, arrangements were finally made with the French Government to furnish funds for its purchase from our Army stores, without any responsibility being assumed by the Army, as was desired by the Allied Food Commission. Such supplies as could be spared by the Army were also furnished to the French and American officers were detailed to assist in their distribution.

On April 10, 1919, the Supreme Allied War Council decided to give the German Government complete freedom in repatriating Russian prisoners of war, stipulating only that none should be repatriated by land or sea, and that all shall be given food and shelter sufficient for the journey.

Civil Administration of Occupied Territory. — To insure proper order, it was necessary that an American civil administration be created in the occupied territory. Directions were issued toward Luxembourg and occupied Germany, the former being a disarmed neutral and the latter occupied enemy territory. In both regions, proclamations defining our attitude toward the inhabitants.

In accordance with the precedent of our Government under similar circumstances, the local civil government remained in full possession of its former power, and retained jurisdiction over all civil matters. The organization of our civil administration in occupied territory provided for the control of civil affairs by the Officer-in-Charge of Civil Affairs in Occupied Territory, under whom Army, corps, and division commanders detailed suitable officers in local charge of civil matters.

In the case of the Luxembourg civil area, 700 officers were regulated by a corresponding representative with an office in the War Department.

The principle of requisitioning supplies was exercised extensively throughout the area, always under central control, and with the privilege of appeal. Under a board of appraisal payment was made for all property requisitioned, the money being obtained from the taxes levied under the terms of the Armistice. Food and forage were not requisitioned, and during most of the period of occupation no officers or men were allowed to purchase any German food and were forbidden to eat in the restaurants and cafés.

United States Liquidation Commission.—In February the United States Liquidation Commission, War Department, which had charge of the Liquidation of our Affairs in France, the sale of our property and Installations and the settlement of claims and accounts, was taken out of the hands of the contractors by the government. The work of disposing of large port and other Installations and immense quantities of transportation material, supplies and equipment. Much of this was of an immovable nature and the shipping situation forbade the transportation of other services later made possible by the movable effects. There was little or no demand for many of the articles to be disposed of, and the expense of maintaining a force of caretakers until the market improved would have been prohibitive. The accommodation committee was set up to liquidate the Liquidation of War affairs with France by the payment of a lump sum to the United States by the French Government.

Relations with the Allies.—Our troops arrived in Europe after France and Great Britain had been fighting desperately for nearly three years, and their reception was remarkable in its cordiality. The resources of our Allies in men and material had been taxed to the limit, but they always stood ready to furnish us with needed supplies, equipment and transportation when at all available. We were given valuable assistance and co-operation in our training program by both the French and British armies, and when the shortage of laborers and forage force arose the French Government rendered material assistance in the solution of this problem.

By the good fortune to have a year in France to organize and train our forces. When our troops entered the battle the veteran soldiers of France were entirely unaccustomed to our material and physical support. The artillery and supply organizations were supplied by the French Expeditionary Force, and co-operated with our Infantry; and their aviators fought in the air to assist the American soldier.

Throughout France our troops have been intimately associated with the French people, particularly the French peasant, and the relations growing out of these associations assure a permanent friendship between the two peoples. The small force of Americans serving in Italy was accorded a warm welcome and established with the Italian people the most friendly relations. The hospitable reception of those of our forces who passed through Southern Germany has left a close and lasting impression. The French, Belgians and English have been in close contact and blood have brought together the British and ourselves.

The good fortune of our soldiers with the French, British, Belgians and Italians was decisive in bringing success to the successful conclusion, and will have an echo of good will and enduring friendship; the belief of sympathy and good will among the peoples of these nations and ourselves.

WELFARE WORK.

Allied Food Commission.—At the request of the Allied Food Commission a selected party of officers and 404 men was placed at the disposal of the Commission. There was no other American personnel in France engaged on this work. Our officers were sent to various countries in charge of food distribution, and were everywhere received with the utmost friendliness. These officers and men, by their executive and administrative ability and their energetic resourcefulness, were in a large measure responsible for the manner in which these food supplies were delivered to the people in central Europe during a period of civil unrest or complete disorder. By their disinterested and selfless charitable work, they won for the American Army the admiration of the populations whom they served.

Soldiers' homes.—In the respective territories the Red Cross and Y. M. C. A. undertook the burden of supplying the needs of the entire American Expeditionary Forces. In their efforts they were handicapped to a large extent by a lack of tonnage. But shortage in tonnage, transportation, or personnel, did not prevent them from carrying out completely their appointed tasks; whereas with the smaller societies it meant inability to expand. In order to avoid duplication of effort, it was directed in August, 1917, that the Red Cross confine its activities to relief work, and that the Y. M. C. A. to amusement and recreation. The Knights of Columbus and the Salvation Army were later given official recognition. The Y. M. C. A., Jewish Welfare and the Library Association conducted their activities through one of the established societies.

The American Red Cross maintained within our zones a system of "Line of Communication Canteens," which furnished refreshments and relief to troops in transit and became a valuable part of the evacuation work. The statistical work of the searchers attached to the statistical sections and the transport of information for relatives. This society also aided in locating American prisoners to whom it sent food and clothes.

To avoid depleting our personnel, the Y. M. C. A. agreed to operate our canteens and was at first allotted 208 ship-tons per 25,000 men. In 1918 the allotment to the United States was but 1 ton to 100 tons. This materially reduced the valuable service the Y. M. C. A. might have rendered in this work. The termination of hostilities made it possible to relieve the society of this responsibility.

The need of great numbers of soldiers for welfare work after hostilities, such as athletics and education was at once recognized, and the co-operation of the welfare societies in all these activities was of great value. Immediately after the Armistice steps were taken to provide diversions and entertainment for our troops. Entertainers were assigned in all units, and the Y. M. C. A. Entertainment Department furnished professional entertainment and acted as a training and booking agency for soldier talent. Approximately 650 'soldier shows' were developed, which entertained hundreds of thousands of soldiers, who will remember this as one of the pleasant and unique enterprises of the American Expeditionary Forces.

The athletic program in the spring of 1919 culminated in the Inter-Allied games in June, held in the concrete stadium erected by our Engineers near Paris. The necessary funds being contributed by the Y. M. C. A. In number of participants and quality of entry, the games probably surpassed any of the past Olympic contests.

Leaves and Leave Areas.—A leave system was announced in general orders on March 2, 1918, and executed by seven days every four months, but it was necessary to suspend the privilege during active operations. In the leave areas free-board and lodging at first-class hotels were provided for soldiers, and the Y. M. C. A. furnished recreational and amusement facilities. A number of new areas were opened by the Services of Supply immediately after the Armistice, improved transport accommodations were eventually secured, and arrangements were made whereby men could visit England, Belgium and Italy.

It was my desire that every man in the American Expeditionary Forces should be given an opportunity to visit Paris before returning to the United States, but the crowded condition of the city during the Peace Conference, transportation difficulties, and other reasons, made it necessary to limit the number of men to 250,000.

Religious Work.—Religious work in our Army before the war was carried on by chaplains, one to each regiment. To meet the greatly increased needs of the regimental chaplaincy, legislation was recommended by me to provide not less than one chaplain for each 1,000 men. Although such act was passed in June, 1918, there was a continuous shortage of chaplains with the fighting units and in the hospital areas. This was largely met through the ready cooperation of the Welfare Societies who sent ministers, nurses, and priests where most needed. In addition to the Y. M. C. A. and Knights of Columbus and Red Cross, also aided in the work, the Red Cross sending chaplains to the States with units in many instances.
The religious work was directed and co-ordinated by a Board of Chaplains at general headquarters, of which Bishop Charles H. Brent was the head. With great devotion and duty this work was maintained despite the lack of transportation and other facilities. Chaplains, as well as clerical and spiritual leaders, were of their organizations, and established a high standard of active usefulness in religious work that made for patriotism and unselfish devotion to duty.

Educational Work—Prior to the Armistice, educational work was conducted through the organization of high schools under the cover of M. A. W., the pupils. The subjects studied being French language, French history, and, as causes of the Armistice, measures were taken for a systematic organization of non-military educational training.

The formal school work began January 2, with post schools. Then divisional educational centers gave the equivalent of high-school instruction and specialized on vocational training. The American Expeditionary Forces University at Beaune carried on undergraduate and grade work for the technical grades. Postgraduate work was provided by the entrance of our officers and soldiers into French and British universities. Special schools were organized to meet demands, such as the Practical Agricultural School at Allery and the Art Training Center at Paris, for painting, sculpture, architecture, and interior design. Advanced two-year courses were entered in the best ateliers of Paris. Active instruction was carried on in the base hospitals and convalescent camps.

An important branch of the educational work was the organization of a short course of instruction for extension lectures, organized to meet conditions due to the rapid repatriation of our soldiers and the constant movement of troops. At least half of our forces were reached by this means with brief intensive courses in business, training, their duties, agriculture, occupational guidance, and in citizenship.

On April 15 all educational work came under the control of the Training Section of the General Staff. The advantage of this change in management was at once apparent in the better coordination of the work with an excellent body of educators. The total attendance in the organized school system of the American Expeditionary Forces was 250,000, of which 181,475 attended post schools, 27,450 education centers, 8,538 the American Expeditionary Forces University at Beaune, 3,074 Art Training Centers, 4,144 Mechanical Trade Schools, 6,990 French universities, and 1,956 British universities. The attendance upon the short course centered on 900,000 and at the extension lectures 150,000, giving a total grand of attendance at all educational formations of 1,650,000.

The educational work in the American Expeditionary Forces was of undoubted value, not only in improving moral and mental culture in concrete benefits to the individual officer and soldier. It demonstrated satisfactorily that a combined military and educational program can be carried out by the Army with little damage to its essential training and with decided advantage to the individual officer and soldier.

Stars and Stripes—The Stars and Stripes was a weekly newspaper conceived with the idea of increasing the morale of American troops by providing a common medium of expression of the thoughts of the entire American Expeditionary Forces. Edited and managed by enlisted men who declined promotion preferring to remain in the ranks in order to interpret the spirit of the Army, it was a great unifying force and materially aided in the development of an esprit de corps. It lent loyal support to the Army, and was the expression of the educational program. In leading the men of our Army to laugh at their hardships, it was a distinct force for good and helped to create a healthy viewpoint. The campaign it conducted for the benefit of French orphans resulted in a fund of $500,000.

Appreciation—In this brief summary of the achievements of the American Expeditionary Forces it would be impossible to cite in detail the splendid ability, industry, and efficiency that characterized the service of both combatant and non-combatant individuals and organizations. The most striking quality of both officers and men was the unselfishness and energetic service employed, under all circumstances, in handling their problems.

The highest praise is due the commanders of armies, corps, and divisions, and their subordinate leaders, who labored toward the accomplishment of our task, suppressing personal opinions and ambitions in the pursuit of the common aim; and to their staffs, who, on the battle experience, into splendid teams without superiors in any army.

To my Chiefs of Staff, Major Gen. James G. Harbord, who was later placed in command of the Services of Supply, and Major Gen. James W. McAndrew, I am deeply indebted for highly efficient services in a post of great responsibility.

The important work of the staff at General Headquarters in organization and administration was characterized by a steady and unswerving devotion to duty. No chief ever had a more loyal and efficient body of assistants.

The function of the Services of Supply fully realized the importance of their duties, and the cooperation of that vast business system was conducted with the utmost precision. They deserve full share in the victory.

The Army and the Navy, both in official and private life, were decidedly patriotic and loyal, and invariably lent encouragement and helpfulness to the armies abroad.

The various societies, especially their women, including those of the theatrical profession, and our army nurses, played a most important part in brightening the lives of our troops and in giving aid and comfort to our sick and wounded.

The many in European waters, under command of Admiral Sims, at all times cordially aided the army. To our sister service we owe the safe arrival of our armies and their supplies. It is most gratifying to record that there has never been such perfect understanding between the two branches of the service.

Our armies were conscious of the support and cooperation of the American people, and of the steady and constant pressure upon the country's cause never equalled in our history.

Finally, the memory of the unflinching fortitude and heroic devotion of the men of the American Expeditionary Forces will live forever in the hearts of their grateful countryside.

In closing this report, Mr. Secretary, I desire to record my deep appreciation of the unqualified support accorded me throughout the war by the President and myself. Under it, I am sure, our confidence and wise counsel. I am, Mr. Secretary, very respectfully,

JOHN J. PERSHING,
General, Commander-in-Chief, American Expeditionary Forces.

17. THE PEACE CONFERENCE OF 1919. Co-operation and Organization.—That a conference of delegates of the nations at war with Germany and her allies should meet to formulate the terms of peace was a foregone conclusion; and no higher political body was needed to call it into existence. But the time and place of its formation and the form of its organization were matters of such vital importance that they were carefully discussed at length by the representatives of each nation to be represented before the conference met. The discussions were carried on at the request of the delegates of the Allied and associated States, acting through their diplomatic organs, and were conducted in a friendly and business-like manner.

Before the conference met much was said in the press about the admission of local representatives to the meetings. There seems to have existed an impression that the conference would debate matters in a general way, as in an ordinary parliament or congress, and that it would be well for the people of the countries to know what their representatives were saying and doing. The representatives of localities were never characterized by debate and they occurred so rarely and late in the conference that they may be described as the least important feature of the Peace Conference.
The first session was held on 18 Jan. 1919. At that time President Wilson had been in Europe more than a month. He had visited England, France, Belgium, Switzerland, Italy, and Germany, and had held conferences with the men who acted for those countries and for France. By the action of the foreign secretaries an understanding had been reached as to the procedure and the distribution of the Peace Conference. The result was seen in the easy way in which the conference divided itself into secret committees, each having charge of some vital phase of the proceedings, and the smooth way in which the decision was accepted by the delegates. Many bitter differences of will developed in the conference, but there was never a protest against the way its decisions were arrived at. It was not a parliamentary but a diplomatic body, and no one ever thought of disputing its procedure.

The following states were represented, arranged by the rules of the conference in the following categories: (1) Belligerent powers with general interests (the United States of America, the British Empire, France, Italy and Japan) and with particular interests (Belgium, Brazil, the British Dominions and India, China, Cuba, Greece, Guatemala, Haiti, Hedjaz, Honduras, Liberia, Nicaragua, Panama, Poland, Portugal, Rumania, Serbia, Siam and the Czechoslovak Republic); and (3) powers in a state of diplomatic rupture with the enemy powers (Bolivia, Ecuador, Peru and Uruguay). The attendance at the conference of neutral nations and nations in process of formation was recognized and in which their special interests were considered. The powers in class 1 were allowed five delegates each; Belgium, Brazil and Serbia were allowed three each; China, Greece, Hedjaz, Poland, Portugal, Rumania, Siam and the Czechoslovak Republic were allowed two each; and Cuba, Guatemala, Haiti, Honduras, Liberia, Nicaragua and Panama, as well as the powers of class 3 were allotted one each. The British Dominions were represented as follows: Australia, Canada, South Africa and India, two each, and from New Zealand one. Each delegation had the right to avail itself of the panel system. Each delegation was allowed to appear in person, with technical experts and stenographers, and the experts might speak to give information desired of them. The condition of representation of Russia was to be fixed by the conference when Russian matters came up. No general constitution of the Peace Conference has been announced, beyond such inevitable rules as referred to the numbers of delegates and the functions of the secretariat. By leaving the conference unrestricted its action could be most easily adjusted to the needs of the occasion. As it happened, however, the plenary sessions did little more than register the opinions of the committees.

The work of the conference was early divided into various parts with a commission to investigate. These were commissions on the formation of a League of Nations, on fixing responsibility for the war, on determining the reparations for damages, on international labor legislation, on international economic drafting, and on economic cooperation among the Allies. But a much more important body than any of these commissions was the central commission of the Peace Conference, which seems to have grown out of the sheer prominence of the five great powers. It was composed of President Wilson, Secretary of State Lansing, and of the prime ministers and foreign secretaries of the four other states of class 1. It was sometimes known as the Big Ten, and since each pair was dominated by one man, it eventually came to be the Big Four. Here was the centre of power of the Peace Conference. Account should be taken, also, of the Supreme War Council, which sat at Versailles during the second half of the war. Under the presidency of Marshal Foch it sat through the conference period with its eyes on the execution of the armistice and on similar affairs. But even this council did not resist the all-powerful Council of Ten, which superseded it at times or sat with and dominated it at others; but the Big Ten generally left the Supreme Allied Council to its own will in matters purely military.

Problems of the Peace Congress.—The first session was held in the Salons de Lux at the Ministry of Foreign Affairs, Quai d'Orsay, Paris, 18 Jan. 1919, at 3 P.M. Impressive ceremonies marked the opening of the session. Soldiers saluted the arriving delegates, trumpets sounded shrill notes of honor, dignitaries escorted the delegates to their places around a great green table, and the President of the French Republic made a speech of welcome. Then President Wilson rose and nominated M. Clemenceau, the French premier, for president of the conference, and Mr. Lloyd George seconded the nomination, which was carried unanimously. In a short speech Clemenceau pointed out the chief business before the delegates. At the head of the program he placed the proposition for a League of Nations, and after that reparation, responsibility for the war, and the international relations of labor. He invited each nation to submit proposals in regard to each subject.

As M. Clemenceau, however, did not allude to the crop of jealousies and local ambitions that were already springing up among the nations represented at the conference. An American editor who was in Paris thus put it: The vanities, cupidity and pugnacity that masquerade as 'national aspirations' are seething beneath the serenity of the Quai d'Orsay. ' He added that the opportunism of politicians, the materialism of business classes and the militarism of the professional soldiers operated to make a sinister peace in which should appear all the selfish motives that had characterized the congresses of Vienna and Berlin in whose deliberations were sown the seeds of the World's War. Over against these tendencies, said the same journalist, were three forces that worked for a treaty in which were the elements of permanent peace, and these were: The world's revolt against war, the disgust of liberal-minded people in all nations at the theory of the Balance of Power, and President Wilson's determination to place the project for a League of Nations at the head of any treaty that was made. The diagnosis was correct. In its large relations the conference was a battle royal between the forces of international brotherhood and those of selfish nationalism. President Wilson led the first and used freely in support of his cause the immense prestige which the
United States had at the time. The leaders of the other side were morally weak and did not dare fight openly for their views. They did not give them specifically and did not defend them as principles; and before President Wilson's attitude they were mute. But they did not consent to contend for the specific ends they had in mind, and in the conference they were sometimes strong enough to force Mr. Wilson to a compromise that gave the lie to the Fourteen Points, which they had accepted. It must not be thought that the situation here indicated was solely due to the leaders of the European states. It was as frequently due to the states of mind of the people. There was scarcely a statesman who stood out for a narrow national policy at Paris who did not know it would be politically foolish for him to do otherwise. The peoples of Europe had suffered a great deal and looked for some easing of their burdens at the expense of others. More, they had acquired definite convictions that their "national aspirations" were justified, and it would have been ill for a political leader or party that opposed them.

In this situation the United States and their President were to play a large part. The position of the United States at the conference of the other as a champion of international justice were chiefly responsible for this peculiar eminence. So deeply were the doubts and suspicions of European states rooted in past diplomatic history that no European nation at Paris trusted the other European nations to deal fairly. But they all trusted the United States, at first, because it had never become allied with the intrigues of Europe. When they learned the United States would not take up their quarrels, most of their confidence turned into scorn.

President Wilson went to the Peace Conference as no other man went there. Received in Europe as a herald of a new world, he had for moment the plaudits of a suffering continent, who looked to him for whatever they thought it needed in its sorrow. He had given the peoples of the belligerent countries a good deal to fight for when he announced that the war was war for democracy. The cry heartened the Allies and undermined the authority of the kaisers of Germany and Austria-Hungary. His suggestion of a League of Nations as a means of reducing future wars to restricted circles made a strong appeal to a world sick of battle horrors. He who had given peoples the hope that an ideal that men had dreamed of since the days of Henry of Navarre might now become a reality was certain to have a devoted following among men who wished well for the future. More than all else, he was in a particularly favorable position for taking a great part in the conference. He led the greatest, richest and least damaged nation by the war that was represented at the conference. Every other nation hoped to get aid from this nation in the era of reconstruction, and in the fawning spirit of the diplomacy of 1815 they dared not offend its President. Moreover, President Wilson had taken the earliest stages of the peace negotiations, and when he acted as intermediary to arrange the terms under which the Germans appealed for peace. His Fourteen Points had been accepted by both groups of Allies as the basis of peace. Although they were to be sadly distorted by his friends, the assumption when the conference met was that they would be the basis of all deliberations, and who could better guide such discussion and stimulate it than he who wrote them? Thus his personal influence in Europe and the weight he acquired from the position in which his country found itself, and his leadership in the ideas that seemed about to be made the foundation of the treaty all pointed to the high leadership of President Wilson at the Conference of Versailles in 1919.

Although the mass of business that seemed likely to come up had been parcelled out among the eight commissions named, it soon became evident that nothing important was to be done that did not go through the hands of the Council of Ten. Here was the chief power, and here was the chief action. The Big Ten, in fact, decided every important matter before it went to the conference. After a while the habit was established of dropping the foreign secretaries from the meetings, so that the council now became the Big Five. It is said that the reason the body was so reduced was that in its first form the secret business of the sessions seeped out to the French and British press to such an extent that they thought it best to debate the most important affairs in the smallest possible circle. From that time the meetings were generally in President Wilson's private rooms, and as the Japanese representative rarely attended the body became the Big Four.

The League of Nations.—The first business brought forward was the proposed League of Nations. It was, in fact, the most important thing suggested in the conference; for if such a league could be founded and made to work it would transform the political constitution of the world. If it could not be made to work it was a thing that should not be attempted. President Wilson went to Paris determined to carry it through the conference, if possible. In every European country were some persons of influence who believed it could be made to work, if adopted. But a larger portion of the men of political ideas looked on the suggestion with a certain good-humored tolerance with which Metternich received the tsar's suggested Holy Alliance. To overcome this lukewarmness was Mr. Wilson's task. Each statesman had some demand to make on the conference, and Wilson's demand was the admission of the League of Nations. In the final balancing of demands there was a disposition to make the President pay for his favorite idea by forcing him to give up something in favor of each of the other demands.

President Wilson was chairman of the commission to which was entrusted the task of preparing a covenant of the League of Nations and submitted a plan which had the approval of the American delegates. Another plan was submitted by General Smuts, of South Africa, and other suggestions were received. After much debate by the commission a tentative covenant was reported to the conference in plenary session on 14 Feb. 1919, and by it made Wilson's own, so that the hope that the criticism made would give its authors an opportunity to determine in what respects it would have to be amended before it was finally accepted. No strong demand for amendment was heard in any nation except the
WAR, EUROPEAN — THE PEACE CONFERENCE OF 1919 (17) 515

United States, where a group of Republican senators inserted a statement that the covenant would have to be amended before they would accept it. They did not specify the exact terms in which the document ought to be modified.

During the long period in which the idea of a league to promote peace had been discussed before 1919 in various societies in the world the suggestions fell in two groups. One series implied the creation of a common organization with no other power than public opinion to enforce its decisions. Such a league was analogous to the Hague Conferences—which did not succeed in arousing much respect before 1914. The other group favored the creation of a league with a central power strong enough to make and enforce international law. When President Wilson went to Paris many persons who desired a league in some form feared that the first type would be all that he could get adopted. Before the discussions at Paris ceased the opinion in the conference shifted in such a way that those who worked at an international league were favorable to a league strong enough to execute its laws and pledged to enforce them in some important respects. The covenant as finally announced leaned more to the second than to the first type of a league.

The main features of the covenant as finally incorporated in the treaty were as follows: A bicameral government was provided with a body of delegates composed of one member from each state, and a central executive council or cabinet. The executive council would have very little power; and an executive council of nine members, one from each of the five large states and four chosen, one each from the small states in rotation. This council was to have the right to recommend the quota of military and naval forces each state contributed in carrying out the purposes of the league, and it could fix the armaments and numbers of the troops of each state in the league. There was to be a court of arbitration, a permanent secretariat and a stated place of meeting, and the states pledged themselves not to go to war without first submitting their disputes to arbitration or to the judgment of the executive council. The United States was to permit an act of war against all the other states of the league and they could take economic or other steps to make the offending state obey the covenant. Each signatory state was to guarantee the territorial and political integrity of the other states against external aggression (Article X); a state could be admitted to the league with the approval of two-thirds of the states already in it; colonies taken from a mother state were to become mandatories of the league under the tutelage of states designated by the league; treaties to be valid must be registered with the league; and amendments to the covenant were to be effective when accepted by all the states represented in the executive council and by three-fourths of the powers represented in the body of delegates.

This remarkable document was received with equanimity by most of the states of Europe. By accepting it they pledged themselves to the maintenance of a certain number of powers in limitation of their freedom of action, and they entered into the arrangement without visible hesitation. The explanation seems to be that the war had brought them to such a state of prostration that they did not believe it possible to go on without some such a league to guarantee their safety while they were recovering from existing misfortunes. A league would enable them to reduce armaments, allay the fears of conquest by their ancient enemies, and give them the feeling that their possessions were secure. To the United States, however, the situation seemed otherwise. The country had suffered comparatively little through war, and its people were so confident of the future that they felt no need of the guarantee of other states to enable them to live in security. There was, also, some feeling that the other nations were asking too much of the United States, the one power that had great wealth and undiminished productive capacity. Over against this view was the opinion that the country might throw in its lot with the states of Europe for better or worse, partly because it was the generous thing to do and partly because by doing so it could use its influence in preventing wars which, if they started, would probably involve the United States themselves. The contention that now arose brought up clearly the question of joining or not joining the world movement in behalf of the control of war. The controversy that came up in the Senate of the United States over this question has little relation to this discussion. It was waged chiefly over Article X of the covenant, by which each state guaranteed the integrity of the other states against external aggression. Many Americans did not wish their government to assume such a burden. The compromises eventually made on this and other points took form in the reservations of certain rights and privileges to the United States, as the interpretation of the Monroe Doctrine, and the actual calling out of the army by Congress; but it does not yet appear what strength the reservations when adopted will have in actual use. At the present time the whole subject is unsettled.

The readiness with which the European states at the conference accepted the League of Nations was partly due to the fact that each of them had its own demands on the conference. Many of the European states put the league project with President Wilson. Great Britain, France, Japan and Italy, to say nothing of the smaller states, as Belgium, Poland, Yugoslavia and Czechoslovakia, all had their eyes on some advantage that the conference could give. This mass of questions made up the problem of European readjustment. At first it was thought that the European delegates would settle them among themselves, the delegates from the United States giving themselves to the league and such an academic question as the responsibility for the war. But President Wilson soon showed that he thought otherwise. The meeting was not a two-sided thing, in which the affairs of one continent had nothing to do with the affairs of the other. The Fourteen Points had definite relations with all the matters connected with readjustments, and President Wilson was their champion. Thus it came about that he took a leading part in negotiating with the European delegates. It was a new experience for the government of the United States to take such a strong hand in world affairs.

Disposition of the German Colonies.—The first matter of this kind to come up was the
disposition of the German colonies. Late in November it became known that informal plans had been made by which several of the British colonies would annex some of the German colonies, that Japan, France, Italy and possibly Belgium had hopes of taking certain others. Against these plans President Wilson protested vigorously. In a long discussion, the prime ministers of the principal British colonies stood together, with the support of the foreign minister of France, Mr. Hughes, of Australia, being especially vehement. At last Mr. Lloyd George called the colonial prime ministers into a consultation and persuaded them to be satisfied with the mandatory system, for which President Wilson contended. This system was to be administered under the supervision of the League of Nations, and it was in line with the fifth of the Fourteen Points, accepted in the preceding autumn by all of the states whose delegates now favored direct annexation of the colonies. The system was made to apply to dismembered portions of the Turkish Empire as well as to the colonies of Germany.

**Attempt to Side-track the League.**—President Wilson's insistence on the creation of the mandatory system was considered one of the cries of the conference. Another was the attempt of the leaders to side-track the League of Nations during his absence in the United States, between 15 February and 14 March 1919. They seem to have won the consent of Colonel House, who met the President at Potsdam with his return with a written statement of a plan to separate the league from the treaty, although on 25 January a specific vote of the conference had made it an integral part of that document in the making. The plan was embodied in a resolution, fathered by Mr. Balfour, providing for a general settlement of all points and saying nothing about the league. Newspapers and statesmen of the conservative school, who opposed the league, declared that it was a dead prospect for it was evident that the passions of the individual states had an opportunity to rise over the inevitable disappointments at the other features of the treaty. President Wilson felt that he was being deceived and could not make the French agency to announce that the vote of 25 January was of final force and that reports of contemplated changes were untrue. The news was greeted with derision in many quarters. The world wanted peace and it said that Wilson stood in the way. But the United States was necessary to the world at that time, and it was not to be denied that its demands were unselfish. When, therefore, the other statesmen realized that the President would oppose any aid to Europe if there was an attempt to go on under the old system of concert, they yielded and agreed to abide by the vote of 25 January. They were yet to wring important concessions from him in return for this agreement. This crisis past, the conference proceeded to consider other matters equally perilous.

**The Saar Valley and the Rhine Region.**—One of these matters was the settlement of the claims of the Allied states as to territory and reparation. By this time the Council of Ten had shrunk to the Big Four—Wilson, Lloyd George, Clemenceau and Orlando. Great Britain and France had suffered heavily at the hands of Germany and their people demanded heavy reparation. The prime minister of each nation was fortified to collect from Germany the uttermost. President Wilson stood by the spirit of the Fourteen Points that "there shall be no annexations, no contributions, no punitive damages." He demanded that the amount to be paid by Germany should be mentioned in the treaty. His associates objected, because they realized that any amount that Germany could pay or that Wilson would accept under the Fourteen Points would be so limited that public wrath in their respective countries would overwhelm them.

At the same time territorial claims were pressing for attention. France had definite claims to the Saar coal fields and her military men, headed by General Foch, wished to have a long period of military control of the entire west bank of the Rhine. By the short-lived treaty of 30 May 1914, the Saar Valley went to France, but it was awarded to Prussia on 20 November 1915. France now demanded its "restitution" by annexation. She has little coal but an abundance of iron and believed that she needed this rich fuel deposit to promote her industrial development. Her demands found some moral support in the heavy and wanton damage the Germans did to the Lens coal mines during the period of occupation. But the Saar Valley is German through and through by race and feeling, and President Wilson felt that to hand it over to France would violate that part of the Fourteen Points which stated that "peoples are not to be handed about from one sovereignty to another by an international conference," and he opposed the demand. He thus antagonized the French people in two respects and aroused their strong hostility. To his own friends it seemed that he but stood out for the principle of a just peace which would not plant the seed of future wars.

Other peoples had their claims to present, and they all took them straight to the President, who, it was said, occupied a central position in the negotiations. This was not so much because he had more power than Lloyd George and Clemenceau, but because those statesmen, representing the old diplomacy, were, in general, willing to use peace and make concessions for their own countries, as in the olden times. But they had to get the consent of the American President, and they found it hard to obtain. Not only was this true of Italy, who wished to get Plüme and cut off Juglavia from the Adriatic, but there were many small states, as Greece, Poland, Rumania and Czechoslovakia who asked his interest in their special claims. It was generally impossible to support them in their extremity, and by refusing the President added to the stream of criticism. There were, also, groups of peoples aspiring to nationality, as the Egyptians and the Irish, who laid their claims before him. If he had seriously taken up their causes he would have broken up the conference; but by refusing to play politics with them he aroused their deep resentment. It seemed that his opponents took some satisfaction in seeing this mass of criticism grow, expecting that this would lead to France's loss of influence in Paris that he would no longer be an obstacle to their wishes. Against this menace President Wilson played a vigorous stroke. On 7 April, when his opponents were momentarily expecting him to yield, came the announce.
ment that he had ordered the ship George Washington, then at Brooklyn, to be sent to Brest at once. It was tantamount to saying that he was prepared with fleet and fighter aircraft if the combinations against him continued to operate. But Clemenceau was too wise to allow such a thing to happen and next day the Paris Temps, by official inspiration, gave it as its opinion that France would join the Czecho-Slovak demand annexation of the Saar Valley. Other papers taking their cue modified their criticism of the President.

When the treaty was finally published it was seen that the Saar coal fields went to France in fee simple, as reparation for the damages at Lens; but it was provided that the political administration of the valley should be left to the League of Nations and that a plebiscite at the end of 15 years should settle its ultimate political control. As for the demand that France should have military control over the west bank of the Rhine, the treaty made the entire west bank and a strip 50 kilometers wide on the east bank a demilitarized area under German control. Forts and other military establishments had to exist on the Rhine side but not any other military steps taken. Thus were met France’s contention that her border was exposed; but it was a settlement for menace.

The Demand for Fiume.—The fourth crisis was the Italian dispute. Italy entered the war to obtain Italia Irredenta, unredemed Italy, that is, lands inhabited by Italians but held by Austria. When she threw in her sword in May 1915, she had taken the precaution to obtain the approval of her claims in the agreement known as the Pact of London. In this document she did not claim Fiume but agreed that it should go to Croatia, which in 1919 was a part of Jugoslavia. The city was the port of commerce for Jugoslavia and Hungary and had long been so considered; and that was the reason it was left to Croatia in 1915. Soon after the armistice was signed 11 Nov. 1918, a movement arose in Italy for a League State for Italy. Before the war according to statistics then accepted the Italian residents were a plurality but not a majority of its population. But agitators in Italy made it appear to the people that one of the jewels of the Italian crown was about to be handed over to foreigners, and the excitable people became aroused on the question. Probably Orlando, the prime minister, would have resisted the demand if he had felt able to defy popular opinion; but he had many enemies in politics and was in no position to act independently. He arrived in Paris pledged to demand Fiume and let it be known at once. Now neither Great Britain nor France looked favorably on Italy’s pretension to become a great colonial power. They were not willing to take the lead in opposing her, but they encouraged President Wilson to take such a position. The Italians were willing to do anything requested of them if they could have Fiume. Since they could get recognition that they were to get the city they sought to block progress, threatening to go home, ordering their trains, and forever repeating their arguments. At last President Wilson prepared a statement of the case against their claim, read it over to L. D. Photo and other members, held a conference, and finally gave it to the newspapers. So much had been said about the secrecy of the negotiation and the wholesome effects of publicity that President Wilson may have thought that a frank avowal of the matter would clear it up. His statement was generally approved outside of Italy. In that country passion rose to white heat. Orlando left Paris and was received with enthusiasm in Rome. The Italians seem to have thought that their departure would be followed by the Czecho-Slovak demand annexation of the Saar Valley. Other papers taking their cue modified their criticism of the President. When they saw that the treaty with Germany was about to be presented without them, they suddenly announced their return. When signs appeared that the Italian wave of passion was beginning to recede the poet, d’Annunzio with a band of followers appeared in Fiume, selected his grave, and announced that he would die in the city before it should pass into the hands of the Jugoslavs. President Wilson was supported by Great Britain and France. He let it be known that he would agree that Fiume might be left under international control, but Italy would have nothing but an Italian Fiume.

The Japanese Demands.—The fifth crisis occurred over the demands of the Japanese in Shantung. The position of Japan in Asia is different from Italy’s in Europe. Over against her lie the rich lands of Russia, China, with colonial possessions of Great Britain and France. Little was wasted by the war she was in a position to do great damage in Asia for the time being, if she feels that it is worth while to incur the hostility of her former friends. When, therefore, she asked Great Britain in February 1917, to agree that she should succeed to Germany’s rights at Kiaochow and in Shantung Peninsula she obtained a ready assent, and she was able to get France, Italy and Russia to make the same promise. In February 1917, Japan must have believed that the United States would enter the war. She doubtless believed, also, that they would take the side of China, who asked for the restoration of Shantung. By prudently getting the previous assent to her scheme of three great powers, she tied the hands of the United States and was in a position to make the demand. When it is asked why President Wilson did not treat Japan as he treated Italy it is sufficient to point out that he had Great Britain and France behind him on the Fiume incident, and that they, with Italy, were pledged against him on the Shantung incident. He got, however, a promise from Japan that she would eventually hand over Shantung to China in sovereignty, but she would not make the promise in writing, saying that her word was given and that to demand a written statement was to doubt her honor. It was not possible to assert that she was deceiving her associates; but it was unusual for a power that took written assurances from others as a basis of all treaties to refuse to give the same when she was binding herself.

The situation was serious for President Wilson. Without the support of the other powers, with the Italian delegates in Rome in threat of leaving, President Wilson seemed forced to make a compromise. Thus it was agreed in the treaty (sections 156, 157 and 158) that Japan should have all the rights that Germany had possessed at Kiaochow and in the Shantung province. Germany, it should be remembered, held Kiaochow under a 99 years lease, and Japan could not expect to hold it longer, nor more absolutely. At the same time
Japan made an oral supplementary agreement, on the surface voluntary, to hand back the Shantung Peninsula in full sovereignty to China, retaining only the economic privileges granted to Germany and the right to establish a settlement under the usual conditions at Tsingtao. China protested against this settlement and eventually refused to sign the treaty. To have done otherwise would have been to accept the signing away of rights she was compelled to defend as long as she could.

No other part of the peace treaty was so much criticized in the United States as the Shantung settlement. The opposition arose from a deep-seated suspicion of Japan's integrity in diplomacy; and it was freely predicted that if Japan did hand back Shantung to China she would find a way to retain vital control under the guise of economic privileges. But the economic privileges she has talked about whenever the subject has been discussed are such as other nations have obtained in China, and elsewhere, in establishing spheres of commercial influence. A feature of the problem now is really the boldness with which is the supineness of China. No nation of 400,000,000 persons has a right to be as weak as she and expect the rest of the world to defend her against the greed of a neighbor. It is hers to defend herself, and it may happen that the Shantung matter will serve to awaken the Chinese to the necessity of protecting their nation. If Japan's policy results in the rise of nationality in China, the situation will take care of itself. If Japan breaks her promise to China it will be for the other powers, or the League of Nations, to say that she shall not wage war to make good her broken faith.

In some circles it has been claimed that President Wilson had trouble at the Peace Conference because he tried to get the League of Nations adopted. That is an error. He had little trouble in getting it adopted. It was in trying to carry out the principles in his Fourteen Points, accepted formally by all the powers at war with Germany, that he incurred opposition. If he had been willing to ignore these principles, make a settlement on the basis of the division of the spoils, with the league established to see that the agreements was carried out, he would have had pleasant sailing at Paris. But such a peace would not have had the respect of posterity, nor would the defeated nations have accepted it in good faith. It would have sown seeds of future wars.

Boundaries of Small States.—The adjustments here described, the disposition of the German colonies, the arrangement with regard to reparations, the Saar Valley, and the demilitarized zone along the Rhine, and the recognition of Japan's claims to succeed Germany in China, along with the creation of the League of Nations are the achievements of the conference which aroused most feeling. But other adjustments were made, some of them both important and difficult. Of this class, one problem was the determining of the boundaries of the neutral small nations. In reconstituting the Polish state the question of a Polish port came up. Danzig is the natural outlet for Polish trade and it was once a Polish city. There was a demand for a port in Poland, but its cession to the new state. But it was situated in the strongly German province of East Prussia and it was not wise to assign it to Polish rule. It was finally decided that Danzig should be internationalized and that a "corridor" communicating with it from Poland should also be internationalized. The decision caused great disappointment to the Poles, but it satisfied most other people. The boundary was so drawn that the Polish kingdom as it existed before the partition of Poland should also be maintained territorially. Within its boundaries lies Upper Silesia rich in coal and iron, whose population is strongly German. To determine the fate of this province it was decided that a plebiscite must be taken in not less than 18 months after the ratification of the treaty to determine whether the province goes to Poland or Germany. East Prussia, lying east of the Vistula, for the most part was left to Germany, since its population is decidedly German. It was also provided that the province of Schleswig should be divided into two districts, each of which should by vote determine whether it should belong to Germany or to Denmark. Finally, the fortifications of Heligoland were ordered destroyed and by German labor under supervision of the superintendence.

Limitations on German Military Power.—The provisions by which Germany's power to wage war was to be reduced within the safety limits were devised with great care. After 31 March 1920, the army was not to contain more than seven divisions of infantry and three divisions of cavalry, a total of not more than 100,000 men, of whom not more than 4,000 should be officers, and the force was to confine itself strictly to non-presidential units. The number of guns that might be kept was specified, and the rest were to be handed over to the Allies. For each gun of 10.5 cm. or less calibre not more than 1,500 rounds of ammunition could be kept, and for larger guns not more than 500 rounds each. All surplus stocks of arms and ammunition were to be surrendered, all munitions factories to be closed and only enough maintained to supply the small army now allowed to exist. There was to be no more transportation nor existing or new installations of any kind. Universal military service was to be abolished by law, and the army in the future was to depend on voluntary enlistment. The period of enlistment was to be 12 years for officers and privates, and not more than 5 per cent of either class to be discharged in one year. Only one military school was to exist for each arm of the service; and the universities and other educational institutions "must not occupy themselves with any military matters." No measures of mobilization were to be taken.

The naval forces in commission were not to exceed 6 battleships of the Deutschland or Lützow type, 6 light cruisers, 12 destroyers, 12 torpedo boats, or any equal number constructed to replace them as provided elsewhere in the treaty. The personnel of the navy, including the reserve corps, coast defenses, signal stations, and other land forces of the navy, must not exceed 15,000 men, and there must not be more than 1,500 officers and warrant officers. All surface warships above the number specified were to be surrendered, or considered surrendered if they were already in Allied hands; and 28 auxiliary ships, of which 6 of them the Möe, were to be retained and converted into merchant vessels. All submarines.
with submarine docks and submarine salvage vessels, were to be surrendered or broken up under the supervision of the Allied powers, and the resultant material could only be used for industrial purposes. In the shipogs herein allowed to Germany armored ships were not to be larger than 10,000, light cruisers 6,000, destroyers 800, and torpedo boats 200 tons each; and no submarine was to be constructed or purchased in the future. Strict provisions were added to the number of officers and men, who were to be obtained by voluntary enlistment for long periods of service, as in the army. Germany was forbidden to maintain fortifications on her own coast between 54° and 55° 27' north latitude, and 9° and 16° longitude east of Greenwich. She was also forbidden to keep any military or naval air forces or aircrafts of any kind, and all such machines, except 100 seaplanes which were to be retained for location at the factories until 1 Oct. 1919, were to be surrendered.

To see that Germany did not find the means of evading these severe military and naval terms provision was made for an Inter-Allied Commission of Control of Germany, to be comprised of the principal Allied and Associated Powers which might take up its residence at Berlin, or elsewhere in Germany, if it saw fit, with full powers of inspection of documents, plants, and other things within its discretion, and the expenses of maintaining the Commission were to be borne by Germany. She was required, also, to give every facility for making such investigations as the League of Nations demanded.

The Punishment of Germans.—As the war drew near its close Allied opinion began to cry out for the punishment of the German kaiser and the officers who were responsible for the looting and other harsh measures committed by the Germans in violation of the accepted usages of war. It was not clear that these persons could be punished under any generally accepted rules; but once the feeling was abroad it was not wise to ignore it. The victims of the war were not likely to collect out of Germany half repayment for their property damages, to say nothing of the losses of life; and they were in a frame of mind to demand, as the least that could be done, the full punishment of those who precipitated their sorrows. It was in view of this feeling that the treaty-makers arranged for trials of persons they must have known they would have much difficulty in getting their hands on. "The Allied and Associated Powers," said article 227, "publicly arraign William II of Hohenzollern, formerly German Emperor, for a supreme offense against international morality and the sanctity of treaties and it provided for a special tribunal to try him and promised to ask Holland to surrender him that he might be given a fair trial. Germany was to hand over for trial by military courts persons accused of "having committed acts in violation of the laws and customs of war."

Reparations.—The reparations sections provided that Germany was to be held responsible for the damages suffered by the Allied governments and people on account of the war. It was admitted, however, that Germany's resources were not sufficient for full reparation. She pledged herself to compensate the civilian population for the losses she had inflicted upon them, and in addition to repay to Belgium the sums that government had been forced to borrow during the war. The amount of damages was to be determined by a Reparation Commission, which must examine damages to Germany by 1 May 1921 and draw up a schedule of payments by which the debt was to be discharged within 30 years from that time, unless the Commission agreed to extend the time for any deficit. Germany also agreed to hand over in gold by 1 May 1921 the sum of 20,000,000,000 marks or its equivalent out of which the expenses of maintaining the Allied army in Germany should first be met, the balance going to the reparations fund. This fund was to be divided among the Allied powers in the proportion already agreed upon among themselves. Germany also promised, in addition to the above reparations, to restore all cash and securities taken away and all animals driven off, when they could be identified. The German government undertook to furnish the Reparation Commission all possible facilities in arriving at just decisions and to pay its expenses. The constitution and powers of the Commission were carefully guarded by the Principal Allied and Associated Powers. It was to be the right of the Commission to see to the equal distribution of powers as between the states concerned. In anticipation of the reparation payments Germany was to issue: (1) bonds for 20,000,000,000 marks payable without interest on or before 1 May 1921, at a rate of 2½ per cent per annum; and (2) bonds for 50,000,000,000 marks at 2½ per cent per annum; and (3) bonds for an additional 20,000,000,000 marks if the Commission thought Germany could pay them. Thus money payments might be arranged to a total amount of 100,000,000,000 marks in gold.

The bill presented for submarine damages during the war was exceedingly steep. Recognizing that Germany could not replace all the sunken vessels, she was required to hand over all the merchant ships under her flag of 1,600 tons or more, half of those between 1,600 and 1,000 tons, and one-fourth of her trawlers and fishing boats. She was to build for the Allied powers, at a price per ton to be agreed upon by the Reparation Commission, ships to the total tonnage of not more than 200,000 tons a year for five years, these ships to be accounted for in the reparation payments. She was also to hand over any boats for inland navigation acquired by her or by her people during the war, and to surrender ships of her river fleet equal to the losses of river craft by the Allies, provided she did not give up more than 20 per cent of her river fleet as it existed 11 Nov. 1918.

Germany was to give up, the values to be credited on her reparation account, various kinds of property, as certain enumerated cables, specified quantities of coal for Italy and benzoil and other chemicals for France, and dyesuffs, if they were demanded. She was forced to accept a large number of restrictions on her financial and economic development and to the execution of the other obligations in the treaty. She also agreed to restore to the University of Louvain books and manuscripts equal in number and value to those destroyed by the Germans in the burning of Louvain; and various other works of artistic or historical interest
taken by Germany from Belgium or France in the past were to be restored; particularly the French flags taken in the Franco-Prussian war. The Kiel Canal was opened free to the vessels of commerce and war of all nations. The Elbe, Oder, Nieman, and the Danube from Ulm were declared international rivers, and arrangement was made for the creation of international commissions to supervise traffic upon them.

**International Labor.**—Finally, for the establishment of uniform conditions of labor, the treaty authorized the creation of a General Conference of Labor and an International Labor Office to gather and distribute information concerning labor. The Conference was to meet at least once a year. Each nation that belongs to the League of Nations was to send to the Conference two delegates appointed by the government besides one representing labor and one representing capital. The organization was given little power other than that which looked to the creation of public opinion, and its organization and annual meetings seem to make it something of what top-heavy; but it is admittedly a powerful step toward the internationalization of the conditions under which labor operates.

The Treaty Signed.—The treaty was delivered to the German delegates in Versailles 7 May 1919, the fourth anniversary of the sinking of the Lusitania. Its publication in Germany was a black event for her proud people, who had been bred to think themselves invincible. It took much careful work to keep down an explosion which would sweep the new republican government into ruins. After many protestations that they would never sign, the representatives at last submitted to dire necessity.

The new German Parliament approved the treaty, while declaring the country was not able to pay the sums exacted. and sent to Paris' delegates who were willing to sign it. The last ceremony was performed 28 June 1919, in the Hall of Mirrors of the palace at Versailles, the apartment in which the German Empire was proclaimed in 1871. On 10 Jan. 1920 treaty ratifications were exchanged by Great Britain, France and Italy, but in the United States Senate attempts were made to modify the league covenant with an eye to weakening the obligations the league would impose upon the United States.

The Treaties with Austria and Bulgaria.—The treaty accepted by Germany furnished the model for the treaties with Austria and Bulgaria. The former was submitted to the Austrian delegates on 2 June 1919 at the old royal castle of Saint Germain-en-Laye, in modern times a museum 13 miles from Paris. It was accepted and signed by the Austrian representative on 12 Sept. 1919. In the beginning Austria acknowledged responsibility for the war. Terms of reparation were accepted similar to those imposed upon Germany, to be executed under the supervision of the same Reparation Commission. Loot, especially artistic and historical objects, was to be surrendered. The separation of Austria from Hungary was recognized, as well as the creation of the states known as Czechoslovakia and Yugoslavia Austria thus gave up her claims to Bohemia, Hungary, and Austrian Poland. In the south she surrendered the Trentino the Tyrol, Istria, and a part of Dalmatia, which with most of the islands in the Adriatic went to Italy. She also gave up Carniola, Croatia, Bosnia, Herzegovina, and the other part of Dalmatia, which went to the new Yugoslav states. The disputed part of Fiume was in the region allotted to the Yugoslavs, but its disposition was not mentioned specifically. A further feature was to provide that Austria acquire equal rights to all her inhabitants without regard to race or religion, and she was forbidden to become a part of the German Empire. Her army was to be reduced to 30,000, and mobilization and compulsory military service were forbidden. The supplies of munitions were strictly limited and the manufacture of arms was limited to one factory controlled by the state. The navy was not to exceed three patrol boats on the Danube and no military or naval aircraft were to be maintained. Persons accused of violating the laws and usages of war were to be surrendered for trial.

Bulgaria was supposed to have obtained milder terms than her accomplices because she was the only one of the Central Powers to acquire equal rights to all her inhabitants without regard to race or religion, and she was forbidden to become a part of the German Empire. She agreed to pay 2,250,000,000 French francs within a period of 37 years, to reduce her army to 20,000 men and her gendarmerie to 10,000, to surrender her surplus war material, all her warships and all her military aircraft, to recognize the Yugoslav states, to compensate them for stolen coal by delivering 50,000 tons in five years, and to renounce the treaty of Brest-Litovsk. She was also to cede certain small strips of territory to Serbia, Greece, and Rumania, the most important being the triangle at Strumitsa. The most perplexing matter in connection with the treaty referred to the disposition of Western Thrace. After much debate it was finally decided that Bulgaria was to hand it over to the Allied powers to be disposed of later as they saw fit, but with the provision that Bulgaria's right of free access to the sea should not be denied. The treaty was handed to the Bulgarian delegates 19 Sept. 1919. It was not until 15 November that the Bulgarians notified the Conference that it was accepted. In making this treaty the delegates from the United States were asked to sit with the delegates from the Allied powers. The United States accepted the invitation, as looking to the future. They had not been at war with Bulgaria.

**Bibliography.**—The treaties of peace with Germany and Austria have been issued by the United States government in separate forms. The former was published in full in several newspapers in July 1919. Official summaries of each and of the Bulgarian treaty were also published in most of the large dailies. The treaty with Germany is published in a handy form by the American Association for International Conciliation, No. 142 (New York, September 1919). It is also issued as a supplement by The American Journal of International Law, XII, No. 3, July 1919 (New York, Oxford Press). There is a good analytical table of contents. In the same periodical for April 1919, Mr. George A. Finch presents an article *The Peace Conference at Paris,* a description of the transactions in the plenary sessions including the four large treaties. And Mr. Finch's paper is found in No. 139 of the publications of the American Association for International Conciliation (New York, June 1919). Much has appeared in the newspapers on the conflicts
that arose in the Conference, most of it colored, no doubt, by the personal views of the editor, reporter, or the person communicating the information. The only prominent actor in the affairs of the Conference who has appeared before the public is Mr. Ray Stannard Baker, whose small book, 'What Wilson did at Paris' (Garden City 1919) is a clear and well-intentioned description of the major controversies before the Conference. The author was in charge of the American Press Bureau at Paris, and saw President Wilson every day. His book is strongly for Wilson but it seems to be fair and its main points are not attacked by those who find fault with the temper of it. In Bassett, John S. 'Our War with Germany' (New York 1919) may be found a chapter on the Peace Conference, based by admission on the newspaper reports of the day.

18. THE PEACE TREATIES.

On 7 May 1919 the Treaty of Versailles was handed to Count von Brockdorff-Rantzau, the chief of the German plenipotentiaries. During the weeks of negotiation that followed many minor changes were made in the treaty terms and the French section was entirely rewritten. The complete and final text of the treaty as signed by the peace plenipotentiaries of Germany and of 26 Allied and Associated Powers on 28 June 1919 is given below. This text has been set from one of the printed copies issued by the Peace Conference. The copy which the plenipotentiaries signed was bound in morocco, sealed and deposited in the archives of the French Republic and of the League of Nations. All exceptions must be noted among the delegates seated in the preamble. China's delegates refused to sign because of the Shantung award by the Peace Conference to Japan, while the Orlando ministry was overthrown during the deliberations of the Conference and Italy's signatures were led by the Foreign Minister of the new cabinet, Tittoni. On the German side, the Brockdorff delegation withdrew and Dr. Hermann Muller and Dr. Johannes Bell signed for Germany.

The Versailles treaties could not become effective until at least three of the principal Allied and Associated Powers had ratified it in addition to Germany. Great Britain ratified the treaty 31 July 1919 and Belgium followed on 8 August. Belgium, however, was not one of the 'Principal Allied and Associated Powers.' France ratified the treaty 13 Oct. 1919 and the king of Italy signed a Decree of Ratification 7 Oct. 1919. The treaty went into immediate effect in France and was followed by the removal of all war reservations in that country and in Algeria. Canada ratified the treaty 14 September, and China, although unable to ratify because of her refusal to sign at Versailles, declared her adherence formally on 24 Sept. 1919, to all the treaty provisions except those concerning Shantung, and declared the state of war with Germany at an end. New Zealand ratified the treaty 2 Sept. 1919; the Union of South Africa 12 September and Australia on 2 Oct. 1919. By the treaty 30 Oct. 1919 and Czechoslovakia ratified both the German and Austrian treaties 7 Nov. 1919.

On 10 July 1919 President Wilson laid the Treaty of Versailles before the Senate of the United States. Four months of bitter debate ensued, during which the Republican majority, led by Senator Lodge of Massachusetts, strove to amend or modify the treaty and the Democratic minority tried to have it ratified intact. All amendments were defeated and a real battle developed over the adoption of 14 qualifying reservations reported by the Foreign Relations Committee on 7 Nov. 1919. The first test of strength came on the preamble, which required the written assent of three of the Allies to American reservations. This preamble was adopted by a vote of 48 to 40. On 10 Nov. 1919 began the debate on the principal reservations—that regarding Article X of the treaty. The ratifying resolution offered by Senator Lodge was as follows:

Resolved (two-thirds of the senators present concurring therein), That the Senate advise and consent to the ratification of the Peace Treaty of Versailles concluded at Versailles on the 28th day of June, 1919, subject to the following reservations and understandings, which are hereby made a part and condition of this resolution of ratification, which ratification is not to take effect or bind the United States unless and until the said reservations and understandings adopted by the Senate have been accepted by an exchange of notes as a part and condition of the resolution of ratification by at least three of the four principal allied and associated powers, to wit, Great Britain, France, Italy, and Japan:

1. The United States so understands and construes Article I that in case of non-payment of the annual contributions to the League of Nations, as provided in said article, the United States shall be the sole judge as to whether all its international obligations under the said covenant have been fulfilled, and notice of withdrawal by the United States may be given by a concurrent resolution of the Congress of the United States.

2. The United States assumes no obligation to preserve the territorial integrity or political independence of any other country or to interfere in controversies between nations—whether members of the League or not—under the provisions of Article X, or to employ the military or naval forces of the United States under any article of the treaty for any purpose, unless in any particular the Congress, which, under the Constitution, has the sole power to declare war or authorize the employment of the military or naval forces of the United States, shall by act or joint resolution so provide.

3. No mandate shall be accepted by the United States under Article XXII, Part I, or any other provision of the treaty of peace with Germany, except by action of the Congress of the United States.

4. The United States reserves to itself exclusively the right to decide what questions of domestic jurisdiction and declares that all domestic and political questions relating wholly or in part to its foreign affairs, including immigration, labor, trade, traffic, the tariff, commerce, the suppression of traffic in women and children, and in opium and other dangerous drugs, and all other domestic questions, are solely within the jurisdiction of the United States and are not under this treaty to be submitted in any way either to arbitration or to the consideration of the Council or of the Assembly of the League of Nations, or any agency thereof, or to the decision or recommendation of any other power.

5. The United States will not submit to arbitration or to inquiry by the Assembly or by the Council of the League of Nations, provided for in said treaty of peace, any questions which by the treaty between the United States depend upon or relate to its long-established policy, commonly known as the Monroe Doctrine: said doctrine is to be interpreted as being applicable to the United States alone and is hereby declared to be wholly outside the jurisdiction of said League to which it was entirely unaffected by any provision contained in the said treaty of peace with Germany.

6. The United States will not accept its assent to Articles CLVII, CLVIII, and CLVIII, and reserves full liberty of action with respect to any controversy which may arise under said articles between it and the Republic of China and the Empire of Japan.

7. The Congress of the United States will provide by law for the appointment of the representatives of the United States in the Assembly and the Council of
the League of Nations, and may in its discretion pro-
vide for the participation of the United States in any
commission, committee, tribunal, court, council, or cur-
rency union in the selection of any members thereof
and for the appointment of members of said comissions,
committees, tribunals, courts, councils, or currency
unions, or for the appointment of any other representatives under
the treaty of peace, or in carrying ou its provisions, unless
unanimously agreed to by the United States thereunder, and no citizen of
the United States shall be selected or appointed as a member
of said commissions, committees, tribunals, courts, councils, or conferences except with the approval of the
Senate of the United States.
8. The United States understands that the Repara-
tions Commission will regulate or interfere with ex-
ports from the United States to Germany, or from
Germany to the United States, only when the United
States by act or joint resolution of Congress approves
such regulation or interference.
9. The United States shall not be obligated to con-
tribute to any expense of the League of Nations,
or of any commission, or committee, or conference, or other agency, organized under the
League of Nations or under the treaty, for the pur-
pose of carrying out the treaty provisions, unless and until an appropriation of funds available for such pur-
poses shall have been made by the Congress of the United States.
10. If the United States shall at any time adopt any
plan for the limitation of armaments proposed by the
Council of the League of Nations under the provisions of
Article X, it reserves the right to increase such
armaments without the consent of the council when-
ever the United States is threatened with invasion or
encirclement in war.
11. The United States reserves the right to permit,
in its discretion, nationals of a covenant-breaking
State, as defined in Article XVI. of the covenant of
the League of Nations, residing within the United
States, to depart to countries other than that violating said
Article XVI., to continue their commercial, financial,
and personal relations with the nationals of the United
States.
12. Nothing in Articles CCXXVI., CCXXVII., or in
any of the annexures thereto or in any other article, sec-
tion, or annex of the treaty of peace with Germany
shall, as against citizens of the United States, be taken
to mean any heretofore, or in contravention of the
rights of citizens of the United States.
13. The United States withholds its assent to Part
XIII. (Articles CCCLXXVII. to CCCLXXVII., in-
clusive) unless Congress, by act or joint resolution shall
hereafter make provision for representation in the or-
ganization established by said Part XIII. and in such event the affixed States will be go-
vernment and conditioned by the provisions of such act
or joint resolution.
14. The United States assumes no obligation to be
bound by any election, decision, report, or finding of the
Council or Assembly, in which any member of the
League and its self-governing dominions, colonies, or
parts of empire, in the aggregate have cast more than
one vote, and assumes no obligation to be bound by
any decision, report, or finding of the Council or As-
sembly arising out of any dispute between the United
States and any member of the League if such member,
or any self-governing dominion, colony, empire, or
part of empire united with it politically has voted.

On 19 Nov. 1919 the treaty was rejected by the
Senate. It was reintroduced 10 Feb. 1920 at
the regular session. Substantially the same
reservations were adopted together with a new
concerning self-determination for Ireland.
Substitute reservations concerning Article X
were offered. The treaty with amended
reservations again failed of ratification when the
final vote was reached on 19 March 1920.
It was then withdrawn from the Senate and
returned to the President.

After the Senate adjourned on 19 Nov., 1919
without ratifying the Treaty of Versailles, the
representatives of England, France and Italy
at Paris proceeded to make arrangements for
the final ceremonies that would put the treaty
into operation.

The chief steps to be taken were the formal
exchange of ratifications and the deposit of the
instruments of ratification at the Foreign
Office, the drawing up of the proces-
verbal or formal record of the deposit of these
instruments, and the promulgation of the treaty.

On 10 Jan. 1920 ratifications were formally
exchanged at Paris between the signers of the
Treaty, and the Protocol was signed by
Baron Kurt von Lernser for Germany, Premier
Clemenceau for France, Premier Lloyd
George for England, Premier Nitti for Italy and Baron
Matsui for Japan. These were followed by the
delegates of the following nations: Belgium,
Bolivia, Brazil, Guatemala, Panama, Peru, Poland, Siam,
Czechoslovakia and Uruguay. The United
States, Greece, Roumania and China, not having
ratified the treaty, did not sign.

The treaty went into effect at 4:15 P.M.
Léon Bourgeois became first president of the
Council of the League of Nations and Sir Eric
Drummond was made secretary.

The Treaty of Peace with Austria, which
was handed to the Austrian delegates at Saint
Germain on 2 June 1919, is in many respects
identical with the peace treaty with Germany.
The Austrian treaty consists of a preamble and
14 parts. The Austrian National Assembly
ratified this treaty 17 Oct. 1919. The complete
text follows the text of the Treaty with
Germany.

The Bulgarian Treaty follows that of Aus-
tria. Two of the subsidiary treaties are in-
cluded, that with Poland and the Franco-
American Treaty. A summary of the short-
ived Brest-Litovsk Treaty, so often referred
to in the war articles, is also included.

I. Treaty with Germany.

The United States of America, the British
Empire, France, Italy, and Japan, these powers
being described in the present treaty as the prin-
cipal Allied and Associated Powers; Belgium,
Bolivia, Brazil, China, Cuba, Ecuador, Greece,
Guatemala, Haiti, the Hedjaz, Honduras, Liberia,
Nicaragua, Panama, Peru, Poland, Portugal,
Rumania, the Serb-Croat-Slovene State; Siam,
Czechoslovakia, and Uruguay, these powers con-
stituting with the principal powers mentioned
above the Allied and Associated Powers of the
one part; and Germany, of the other part:
Bearing in mind that on the request of the Im-
perial German Government an armistice was
granted on Nov. 11, 1918, to Germany by the
principal Allied and Associated Powers in
order that a treaty of peace might be concluded
with her, and the Allied and Associated Powers
being equally desirous that the war in which
they were so successively involved directly or in-
directly, and which originated in the declara-
tion of war by Austria-Hungary on 28 July 1914,
against Serbia; the declaration of war by Ger-
many against Russia on 1 Aug. 1914, and
against France on 3 Aug. 1914, and in the in-
vasion of Belgium, should be replaced by a
firm, just, and durable peace.

For this purpose the high contracting parties
represented as follows:

```
WAR, EUROPEAN — THE PEACE TREATIES (18)

THE PRESIDENT OF THE UNITED STATES OF AMERICA, by:
The Honorable Woodrow Wilson, President of the United States, acting in his own name and by his own proper authority;

GERMANY, by:
Count Brockdorff-Rantzau, Minister for Foreign Affairs of the Empire;
Dr. Landsberg, Minister of Justice of the Empire;
Mr. Giesberts, Minister of Posts of the Empire;
Oberbürgermeister Leinert, President of the Prussian National Assembly;
Dr. Schucking;
Dr. Karl Melchior;
Acting in the name of the German Empire and of each and every component State, WHO having communicated their full powers found in the instrument of ratification in due form HAVE AGREED AS FOLLOWS:
From the coming into force of the present treaty the state of war will terminate. From that moment and subject to the provisions of this treaty official relations with Germany and with any of the German States will be resumed by the Allied and Associated Powers.

PART I.—THE COVENANT OF THE LEAGUE OF NATIONS.

The high contracting parties, in order to promote international co-operation and to achieve international peace and security by the acceptance of obligations not to resort to war, by the prescription of open, just, and honorable relations between nations, by the firm establishment of the understandings of international law as the actual rule of conduct among Governments, and by the maintenance of justice and scrupulous respect for all treaty obligations in the dealings of organized peoples with one another, agree to this covenant of the League of Nations.

Article 1.—The original members of the League of Nations shall be those of the signatories which are named in the annex to this covenant and also such of those other States named in the annex as shall acceed to the covenant. Such accession shall be effected by a declaration deposited with the secretariat within two months of the coming into force of the covenant. Notice thereof shall be sent to all other members of the League.

Any fully self-governing State, of dominion, or colony not named in the annex may become a member of the League if its admission is agreed to by two-thirds of the members provided that it shall give effective guarantees of its sincere intention to observe its international obligations, and shall accept such regulations as may be prescribed by the League in regard to its military, naval and air forces and armaments.

Any member of the League may, after two years' notice of its intention so to do, withdraw from the League, provided that all its international obligations and all its obligations under this covenant shall have been fulfilled at the time of its withdrawal. Article 2.—The action of the League under this covenant shall be effected through the instrumentality of an assembly and of a council, with a permanent secretariat.

Article 3.—The assembly shall consist of representatives of the principal Allied and Associated Powers, together with the representatives of four other members of the League. These four members of the League shall be selected by the assembly from time to time in its discretion. Until the appointment of the representatives of the four members of the League first selected by the assembly, representatives of Belgium, Brazil, Spain, and Greece shall be members of the council.

With the approval of the majority of the council, the council may name additional members of the League whose representatives shall always be members of the council; the council with like approval shall determine the number of members of the League to be selected by the assembly for representation on the council. The council shall meet from time to time as occasion may require, and at least once a year, at the seat of the League, or at such other place as may be decided upon.

The council may deal at its meetings with any matter within the sphere of action of the League or affecting the peace of the world.

At meetings of the council each member of the League shall have one vote, and may have more than one vote, as follows, and may have not more than one representative.

The first Secretary General shall be the person named in the annex; thereafter the Secretary General shall be appointed by the council with the approval of a majority of the members of the League.

All matters of procedure at meetings of the assembly or of the council, including the appointment of committees to which the council may delegate powers and the regulation of the business of the council, shall be decided by a majority of the members of the League represented at the meeting.

The first meeting of the assembly and the first meeting of the council shall be summoned by the President of the United States of America.

Article 5.—The permanent secretariat shall be established at the seat of the League. The secretariat shall comprise a Secretary General and such secretaries and staff as may be required.

The first Secretary General shall be the person named in the annex; thereafter the Secretaries General shall be appointed by the council with the approval of a majority of the council.

The secretaries and staff of the secretariat shall be appointed by the Secretary General with the approval of the council.

The Secretary General shall act in that capacity at all meetings of the assembly and of the council.

The expenses of the secretariat shall be borne by the members of the League in accordance with the apportionment of the expenses of the International Bureau of the Universal Postal Union.

Article 7.—The seat of the League is established at Genoa.

The council may at any time decide that the seat of the League shall be established elsewhere.

All petitions under or in connection with the League, including the secretariat, shall be open equally to men and women.

Representatives of the members of the League and officials of the League who were engaged on the business of the League shall enjoy diplomatic privileges and immunities.

The buildings and other property occupied by the
League or its officials or by representatives attending its meetings shall be inviolable.

Article 8.—The members of the League recognize that the peace requires the reduction of national armaments to the lowest point consistent with national safety and the enforcement by common action of all international obligations.

The council, taking account of the geographical situation and circumstances referred to in Article 9, shall formulate plans for such reduction for the consideration and approval of the several Governments.

The council shall be subject to reconsideration and revision at least every ten years.

After these plans have been adopted by the several Governments, the limits of armaments therein fixed shall not be exceeded without the concurrence of the council.

The members of the League agree that the manufacture by private enterprise of munitions and implements of war is open to grave objections. The council shall advise how the evil effects attendant upon such manufacture can be prevented, due regard being had to the necessities of those members of the League which are not able to manufacture the munitions and implements of war necessary for their safety.

The League undertakes to interchange full and frank information as to the scale of their armaments, their military and naval establishments, the extent of such of their industries as are adaptable to warlike purposes.

Article 9.—A permanent commission shall be constituted to advise the council on the execution of the provisions of Articles 1 and 8 and on military and naval questions.

Article 10.—The members of the League undertake to respect and preserve as against external aggression the territorial integrity and existing political independence of all members of the League. In case of any such aggression or in case of any threat or danger of such aggression the council shall advise upon the means by which this obligation shall be fulfilled.

Article 11.—Any war or threat of war, whether immediately affecting the interests of the League or not, is hereby declared a matter of concern to the whole League, and the League shall take any action at such time as the council shall advise, for the defense of the peace of nations. In case any such emergency should arise, the council shall be convened without delay.

If any member of the League should, at any time, be declared to be the friendly right of each member of the League to bring to the attention of the assembly or of the council any circumstance whatever affecting international relations which threatens to disturb international peace or the good understanding between nations upon which peace depends.

The members of the League agree that in case there should arise between them any dispute likely to lead to a rupture they will submit the matter sooner to an inquiry by the council, and they agree in no case to resort to war until three months after the council has been convened by them.

In case any under this article the award of the arbitrators shall be made within a reasonable time, and the member concerned in the case within six months after the submission of the dispute.

Article 13.—The members of the League agree that if any member of the League shall be the subject of any award of the League, exclusive of the representatives of any of them, is found by the council to have failed to carry out the terms of settlement thereof as the council may deem appropriate.

If the council is not thus settled, the council shall declare itself unanimous or by a majority vote make and publish a report containing a statement of the facts of the dispute and the recommendations which are deemed just and proper.

Any member of the League represented on the council may make a public statement of his case in the dispute and of its conclusions regarding the same.

If a report by the council is unanimously agreed to by the members thereof other than the representatives of any of the parties to the dispute, the council may declare the League entitled to enforce such a report, and shall take such action as shall be necessary for the maintenance of the peace of nations.

If the dispute between the parties is agreed by them, and is found by the council to have arisen out of a question which by international law is subject to the domestic jurisdiction of that party, the council shall make no recommendation as to its settlement.

The council may in any case under this article refer the dispute to the assembly. The dispute shall be so referred at the request of either party to the dispute, provided that such request be made within fourteen days after the submission of the dispute to the council.

In any case referred to the assembly all the provisions of this article and of Article 14 shall apply. The action and powers of the council shall apply to the action and powers of the assembly; provided that a report made by the assembly shall be unanimous and that the representatives of those members of the League represented on the council and the representatives of the parties to the dispute shall have the same force as a report made by the council by a two-thirds vote of all the members thereof other than the representatives of one or more of the parties to the dispute.

The members of the League agree that whenever any dispute shall arise between them which they recognize to be suitable for submission to arbitration and which cannot be satisfactorily settled by diplomacy, they will submit the whole subject-matter to arbitration.

Disputes as to the interpretation of a treaty, as to any of the matters of international law, to the existence of any fact which if established would constitute a breach of any international obligation, or to the extent and nature of the preparation to be made for any such breach, are declared to be among those which are generally suitable for submission to arbitration.

For the consideration of any such dispute the Court of Arbitration to which the case is referred shall be the permanent peace and shall determine the effect there shall be no arbitration.

The council shall formulate and submit to the members of the League for adoption plans for the establishment of a Permanent Court of Interna-tional Justice. The court shall be competent to hear and determine any dispute of an international character in which the parties thereto submit the matter to the council and shall also give an advisory opinion upon any dispute or question referred to it by the council or by the assembly.

Article 15.—If there should be no members of the League any dispute likely to lead to a rupture, which is not submitted to arbitration in accordance with Articles 14, shall be decided by the council. In such case they will submit the matter to the council. Any party to the dispute may make a public statement of his case to the council. The council will advise of the existence of the dispute to the Secretary General, who will make all necessary arrangements for a full investigation and consideration of the case by the council.

For this purpose the parties to the dispute will communicate to the Secretary General, as promptly as possible, statements of their case in writing, and the council may forthwith direct the publication thereof.

The council shall endeavor to effect a settlement of the dispute, and if such efforts are successful a statement shall be made public giving such facts and conclusions as shall be deemed just and proper.

Any member of the League represented on the council may make a public statement of his case in the dispute and of its conclusions regarding the same.

If a report by the council is unanimously agreed to by the members thereof other than the representatives of any of the parties to the dispute, the members of the League agree that in case any such aggression or in case of any threat or danger of such aggression the council shall advise upon the means by which this obligation shall be fulfilled.

Article 11.—Any war or threat of war, whether immediately affecting the interests of the League or not, is hereby declared a matter of concern to the whole League, and the League shall take any action at such time as the council shall advise, for the defense of the peace of nations. In case any such emergency should arise, the council shall be convened without delay.
ARTICLES

Article 12.—In the event of a dispute between a member of the League and a State which is not a member of the League, or between States not members of the League, the States or States not members of the League shall be invited to accept the obligations of membership in the League for the purposes of such dispute, upon such conditions as the Council may deem just. If such invitation is accepted, the provisions of Articles 12 to 16 inclusive shall be applied with such modifications as may be deemed necessary by the Council.

Upon such invitation being given the Council shall immediately institute an inquiry into the circumstances of the dispute and the conditions of its settlement as may seem best and most expeditious in the circumstances.

If a State so invited shall refuse to accept the obligations of membership in the League for the purposes of such dispute, and shall resort to war against a member of the League, the provisions of Article 16 shall be applicable as against the State taking such action.

If both parties to the dispute so invited refuse to receive or to accept the obligations of membership in the League for the purposes of such dispute, the Council may take such measures and make such recommendations as will prevent the outbreak of hostilities and will result in the settlement of the dispute.

Article 18.—Every treaty or international engagement entered into hereafter by any member of the League shall be forthwith registered with the Secretariat and such registration may be made public as the Secretary-General may in his discretion see fit. No such treaty or international engagement shall be binding until so registered.

Article 19.—The assembly may from time to time advise the reconsideration by members of the League of treaties which have become inexpedient and the considerations of conditions whose continuance might endanger the peace of the world.

Article 20.—Members of the League generally agree that this covenant is accepted as abrogating all obligations or understandings inter se which are inconsistent with the terms thereof, and solemnly undertake that they will not hereafter enter into any engagements inconsistent with the terms thereof.

In the absence of a member of the League, any member of the League, having undertaken any obligations inconsistent with the terms of this covenant, it shall be the duty of such member to take immediate steps to procure its release from such obligations.

Article 21.—Nothing in this covenant shall be deemed to affect the validity of international engagements relating to arbitration or regional understandings like the Monroe Doctrine, for securing the maintenance of peace.

Article 22.—To those colonies and territories which as a consequence of the late war have ceased to be under the sovereignty of the States which formerly governed them and which are inhabited by peoples not yet able to stand by themselves under the strenuous conditions of the modern world, there should be applied the principle that the well-being and development of such peoples forms a sacred trust of civilization and that security for the performance of this trust should be embodied in this covenant.

The best method of giving practical effect to this principle is that the tutelage of such peoples should be intrusted to advanced nations who by reason of their resources, their experience, or their geographical position can best undertake this responsibility, and who are willing to accept it, and that this tutelage should be exercised by them as mandatories on behalf of the League.

The character of the mandate must differ according to the stage of the development of the people, the geographical situation of the territory, its economic conditions and other similar circumstances. Territories similarly belonging to the Turkish Empire have reached a stage of development where they can stand as independent nations can be provisionally recognized subject to the rendering of administrative advice and assistance by a mandatory until such time as they are able to stand alone. The wishes of these communities must be a principal consideration in the selection of the mandatory.

To those peoples to whom those of Central Africa, are at such a stage that the mandatory must be responsible for the administration of the territory under conditions which will guarantee freedom of conscience and religion, subject to the supervision of the mandates commission; respect for order and morals, the prohibition of abuses such as the slave trade and the liquor traffic, and the prevention of the establishment of fortifications or military and naval bases and of military training of the representatives of the mandatory, with the defense of territory, and will also secure equal opportunities for the trade and commerce of other members of the League.

There are territories, such as Southwest Africa and certain of the South Pacific islands, which, owing to the sparseness of population, the size, or their remoteness from the centres of civilization, or their geographical contiguity to the territory of the mandatory, and other circumstances, can be best administered under the laws of the mandatory as integral portions of its territory, subject to the safeguards above mentioned in the interests of the indigenous population.

In every case of mandate the mandatory shall render to the council an annual report in reference to the territory committed to its charge.

The degree of authority, control, or administration to be exercised by the mandatory shall, if not previously agreed upon, be explicitly defined in each case by the Council.

A permanent commission shall be constituted to receive and collate communications from the mandates and to advise the council on all matters relating to the observance of the mandate.

Article 23.—Subject to the observance of the provisions of international conventions existing or hereafter to be agreed upon, the members of the League:

(a) will endeavor to secure and maintain fair and humane conditions of labor for men, women, and children, both in their own countries and in all countries to which their commerce and industrial relations extend, and for that purpose will establish and maintain the necessary international organizations;

(b) undertake to secure just treatment of the inhabitants of territories under their control;

(c) will intrust the League with the general supervision over the execution of agreements with regard to the traffic in women and children and the traffic in opium and other dangerous drugs;

(d) will intrust the League with the general supervision of the trade in arms and ammunition with the countries in which the control of this traffic is necessary in the common interest;

(e) will make provision to secure and maintain freedom of communications and equitable treatment for the commerce of all members of the League. In this connection the special needs of states which have been devastated during the war of 1914-1918 shall be borne in mind;

(f) will endeavor to take steps in matters of international concern for the prevention and suppression of piracy.

Article 24.—There shall be placed under the direction of the League all international bureaux already established by general treaties if the parties to such treaties consent. All such international bureaux and all commissions for the regulation of matters of international interest hereafter constituted shall be placed under the direction of the League.

In all matters of international interest which are regulated by general conventions but which are not placed under the control of international bureaus or commissions, the secretariat of the League shall, subject to the consent of the countries interested, be the representative of the League, and, by the parties, collect and distribute all relevant information and shall render any other assistance which may be necessary or desirable to the maintenance of health, the prevention of disease, and the mitigation of suffering throughout the world.

The Council may include as part of the expenses of the secretariat the expenses of any bureau or commission which may be under the direction of the League.

Article 25.—The members of the League agree to encourage and promote the establishment and co-operation of duly authorized voluntary national Red Cross Organizations. It is the purpose of these organizations to improve the health, the prevention of disease, and the mitigation of suffering throughout the world.

At the time of the ratification of this covenant will take effect when ratified by the members of the League.
whose representatives compose the council and by a majority of the members of the League whose representa-
tive countries are not to be affected on the one hand or passing west of Geyersdorf, Brenno, Fehlen, Altikloster, Kiebel, and east of Ulbersdorf, Buchwald, Igenau, Wachtum, Lupitz, Schwenzen; thence in a northerly direction to the northernmost point of Lake Chlop: a line to be fixed on the ground following the outer land boundaries of the lakes; the town and the station of Bentzen, however, (including the junction of the lines Schwiebus-Bent-
zen and Zöllchen-Bentzen) remain to be a member of the League.

ANNEX.

I. Original members of the League of Nations signatories of the treaty of peace.

United States of America: Guatemala.
Belgium: Haiti.
Bolivia: Hedjaz.
Brazil: Honduras.
British Empire: Italy.
Canada: Japan.
Australia: Nicaragua.
South Africa: Panama.
New Zealand: Peru.
India: China.
Cuba: Colombia.
Czechoslovakia: Rumania.
Ecuador: Serb-Croat-Slovene State.
France: Sudan.
Greece: Syria.

States invited to accede to the covenant.

Argentina: Brazil.
Chile: Persia.
Colombia: Salvador.
Denmark: Spain.
Netherlands: Sweden.
Sweden: Switzerland.
Norway: Venezuela.
Paraguay: Uruguay.

II. First Secretary General of the League of Nations.

The Honorable Sir James Eric Drummond, K. C. M. G.

PART II.—BOUNDARIES OF GERMANY.

Article 27.—The boundaries of Germany will be determined as follows:

1. With Belgium: From the point common to the three frontiers of Belgium, Holland, and Germany, and in a southerly direction; the northeastern boundary of the Kreis of Katzenstein, the eastern boundary of the Kreis of Eupen, then the frontier between Belgium and the Kreis of Montjoie, then the northeastern and eastern boundary of the Kreis of Malmedy to its junction with the frontier of Luxem-
bourg.

2. With Luxembourg: The frontier of the 3d August, 1914, to its junction with the frontier of France of the 3d July, 1870.

3. With France: The frontier of the 18th July, 1870, from Luxembourg to Switzerland, with the reservations made in Article 48 of Section 4 (Sarre Basin) of Part III.

4. With Switzerland: The present frontier.

5. With Czecho-Slovakia: The frontier of the 3d August, 1914, from Switzerland to Czecho-Slovakia is hereinafter described.

6. With Austria: The southern boundary of Posnania crosses the river Bartsch a line to be fixed on the ground leaving the following places in Poland: Skorovych, Reichthal, Trebut-
schau, Kunzendorf, Schelze, Gross Kosel, Schreiber-
dorf, Klein Kuchen, Fürthlich-Niftern, Tschachens, Konradau, Johannisdorf, Modsenowe, Bogdaj, and in Germany: Losendorf, Kaulwitz, Glaucow, Dabbersdorf, Recewitz, Stradam, Gross Nartenberg Krusen, Neu Mittelwalde, Domalawitz, Wedelsdorf, Tschachenhammer; thence the boundary of Posnania northwest-
ward to the point where it cuts the Rattsch-Herrn-
stadt railway; thence to the point where the adminis-
trative boundary of Posnania crosses the Rhein-Techtum road: a line to be fixed on the ground passing west of Trebusch and Gabel and east of Saborowitz; thence the administrative boundary of Posnania to its junction with the eastern boundary of the Kreis of Fraustadt;

Thence in a northwesterly direction to a point to be chosen on the road between the villages of Un-
erstädt and Kopitsa; a line to be fixed on the ground passing west of Geyersdorf, Brenno, Fehlen, Altikloster, Kiebel, and east of Ulbersdorf, Buchwald, Igenau, Wachtum, Lupitz, Schwenzen; thence in an easterly direction to the northernmost point of Lake Chlop: a line to be fixed on the ground following the outer land boundaries of the lakes; the town and the station of Bentzen, however, (including the junction of the lines Schwiebus-Bent-
zen and Zöllchen-Bentzen) remain to be a member of the League.

Thence in a northerly direction to the point of junction of the boundaries of the Kreis of Schwerin, Birbaum, and Meßersitz: a line to be fixed on the ground passing east of Batsch; thence in a northerly direction the boundary separating the Kreis of Schwerin and Birbaum, then in an easterly direction the northern boundary of Posnania and to the point where it cuts the river Netze; thence upstream to its confluence with the Kudow; the course of the Netze; thence up-
stream to a point on the old boundary of the re-entrant of the northern boundary of Posnania about 5 kilometers west of Neidenburg; the line on the ground leaving the Schneidemühl-Konitz railway in this area entirely in German territory; thence the boundary of the Kreis of Neidenburg to the point where the salient it makes about 15 kilometers east of Flatoew; thence northeasterly to the point where the river Ramonikas meets the southern boundary of the Kreis of Konitz about 3 kilometers northeast of Grunau: a line to be fixed on the ground leaving the following places to Poland: Jadowowo, Gr. Lutau, Kl. Lutau and Wittkau, and to Germany: Gr. Butzig, Crzitowo, Battow, Böch, and Grundau;

Thence in a northerly direction the boundary between the Kreis of Konitz and Schlochau to the point where this boundary cuts the river Bracke; thence to a point on the boundary of Pommerania 15 kilometers east of Rummelsburg; a line to be fixed on the ground leaving the following localities in Poland: Konitz, Toporowo, Bluemad, Abt, Briesen, and in Germany: Sarnpohl, Neuguth, Bleinfort, and Gr. Peterkau; thence northwesterly in Pommerania in an easterly direction to its junction with the boundary between the Kowo, Battrow, Böch, and Grundau;

Thence northward the boundary between Pom-
merania and West Prussia to the point on the river Rheda about 3 kilometers northwest of Göhren where this river is joined by a tributary from the northwest; thence to a point to be selected in the bend of the Pinnitz River about 1 1/4 kilometers northwest of Warzschau: a line to be fixed on the ground; thence this river downstream, then the median line of Lake Trzebiez to the old boundary of West Prussia to the Baltic Sea.

8. With Denmark: The frontier as it will be fixed in accordance with Articles 27, 28, 29, 30, and 31 of Section XII (Schleswig).

Article 28.—The boundaries of East Prussia, with the reservations made in Section IX (East Prussia) of Part III will be determined as follows:

From a point on the coast of the Baltic Sea about 1 1/4 kilometers north of Priobernau Church in a direc-
tion of about 150 degrees east from true north: A line to be fixed on the ground for about 2 kilometers; thence in a straight line to the light at the bend of the Elbingener Channel in approximately latitude 54°19' north, longitude 19°26 east of Greenwich; 6 kilometers southeast of Schneidemühl; the course of the Kudow.

Thence to the easternmost mouth of the Notag River at a bearing of approximately 209 degrees east from true north:

Thence up the course of the Notag River to the point where the latter leaves the Neide.

Thence up the principal channel of navigation of the Vistula, then the southern boundary of the Kreis of Marienwerder, then that of the Kreis of Marienwerder, and then the boundary between the Kreise of Osterode and Neidenburg, then the course of the river Skotau down stream, then the course of the Neide up stream to a point situated about 5 kilometers west of Bialutten, being the northern point to the old frontier of Russia, thence in an easterly direction to point immediately south of the intersection of the road Neidenburg-Mila with the old frontier of Russia; A line to be fixed on the ground passing north of Bialutten;

Thence the old frontier of Russia to a point east of Schmelleningen, then the principal channel of navi-
528

WAR, EUROPEAN—THE PEACE TREATIES (18)

of the Niemen (Memel) down stream, then the Skierwieth arm of the delta to the Kurisches Haff: a distance of a straight line to the eastern shore of the Kurische Nehrung meets the administrative boundary about 4 kilometers southwest of Necpaltshausen.

Thence this administrative boundary to the western shore of the Kurische Nehrung.

Article 25.—The boundaries as described above are drawn in red on a one-in-a-million map which is annexed to the present treaty (Map No. 1).

In the case of any discrepancies between the text of the treaty and this map or any other map which may subsequently be fixed, the text shall hold.

Article 30.—In the case of boundaries which are defined by a waterway, the term "course" and "channel" used in the present treaty signify: in the case of non-navigable rivers, the median line of the water channel, and in the case of navigable rivers, the median line of the principal channel of navigation. It will rest with the boundary commission, incidentally fixed in each case whether the frontier line shall follow any changes of the course or channel which may take place during the time the present treaty remains in force.

PART III.—POLITICAL CLAUSES FOR EUROPE.

SECTION I.—BELGIUM

Article 31.—Germany, recognizing that the treaties of April 19, 1839, which established the status of Belgium before the war, no longer conform to the requirements of the situation, consents to the abrogation of the said treaties and undertakes immediately to recognize Belgium as an independent and sovereign state. After the convening conventions may be entered into by the principal allied and associated powers, or by any of them in concert with the Government of Belgium and of the Netherlands, to replace the said treaties of 1839. If her formal adhesion should be required to such conventions or to any of their stipulations, Germany shall give it.

Article 32.—Germany recognizes the full sovereignty of Belgium over the whole of the contested territory of Moersebet, (called Moersebet Neuret.)

Article 33.—Germany, in favor of Belgium all rights and title over the territory of Prussian Moersebet situated on the west of the road from Lige to Aix-la-Chapelle, that road will belong to Belgium where it bounds this territory.

Article 34.—Germany renounces in favor of Belgium all rights and title over the territory comprising the whole of the Kreis of Eupen and of Malmedy.

Article 35.—After the coming into force of this treaty, registries will be opened by the Belgian authorities at Eupen and Malmedy in which the inhabitants of both places will be entitled to record in writing a desire to see the whole or part of their territory remain under German sovereignty.

SECTION II.—LUXEMBOURG.

Article 40.—With regard to the Grand Duchy of Luxembourg, Germany renounces the benefit of all the provisions inserted in her favor in the treaties of Feb. 8, 1842; April 2, 1847; Oct. 20, 1851; Feb. 21 and May 11, 1867; May 10, 1871; June 11, 1872, and Nov. 11, 1892, and in all conventions consequent upon the Grand Duchy, as from Jan. 1, 1919; renounces all right to the exploitation of the railways, adheres to the termination of the regime of neutrality of the Grand Duchy, and accedes in advance all international arrangements which may be concluded by the Allied and Associated Powers relating to the Grand Duchy.

Article 41.—Germany undertakes to grant to the Grand Duchy of Luxembourg, in the form of an indemnity, such powers or their nationals in the present treaty, with regard to economic questions, to questions relative to transport and to aerial navigation.

SECTION III.—LEFT BANK OF THE RHINE.

Article 42.—Germany is forbidden to maintain or construct any fortifications either on the left bank of the Rhine or on the right bank to the west of a line drawn fifty kilometers west of the Rhine.

Article 43.—In the area defined above the maintenance and the assembly of armed forces either permanently or temporarily, or the actual movement of any kind, as well as the upkeep of all permanent works for mobilization, are in the same way forbidden.

Article 44.—In case Germany renounces of opinion will be communicated by the Belgian Government to the League of Nations, and Belgium undertakes to accept the decision of the League.

Article 45.—A commission of seven persons, five of whom will be appointed by the principal allied and associated powers, one by Germany and one by Belgium, will be set up fifteen days after the coming into force of the present treaty to settle on the spot the new frontier line between Belgium and Germany, taking into account the economic factors and the means of communication.

Decisions will be taken by a majority and will be binding on the parties without appeal.

Article 36.—When the transfer of the sovereignty over the territories referred to above has become definitive, the German nationals habitually resident in the territories will definitively acquire Belgian nationality ipso facto, and will lose their German nationality.

Article 37.—Within the two years following the definitive transfer of sovereignty over the territories assigned to Belgium under the present treaty, German nationals over 18 years of age habitually resident in those territories will be entitled to opt for German nationality.

Option by a husband will cover his wife, and option by a parent will cover their children under 18 years of age.

 Persons who have exercised the above right to opt must within the ensuing twelve months transfer their place of residence to Belgium.

They will be entitled to retain their immovable property in the territories acquired by Belgium. They may carry with them their movable property, in accordance with their description. No export or import duties may be imposed upon them in connection with the removal of such property.

Article 38.—The German Government will hand over without exchange all the archives, registra, plans, title deeds and documents of every kind concerning the civil, military, financial, religious or other character transferred by the territory transferred to Belgian sovereignty.

The German Government will likewise restore to the Belgian Government the archives and documents of every kind carried off during the war by the Belgian party and found in the territories in question in the archives, registra, plans, title deeds and documents of every kind concerning the civil, military, financial, religious or other character transferred to Belgian sovereignty.

The German Government will likewise restore to the Belgian Government the archives and documents of every kind carried off during the war by the Belgian party and found in the archives, registra, plans, title deeds and documents of every kind concerning the civil, military, financial, religious or other character transferred to Belgian sovereignty.

Article 39.—The proportion and nature of the financial liabilities of Germany and of Prussia which Belgium will have to bear on account of the territories ceded to her shall be fixed in conformity with Articles 254 and 256 of Part IX. (financial clauses) of the present treaty.

SECTION IV.—SARRE BASIN.

Article 45.—As compensation for the destruction of the coal mines in the North of France and as part payment toward the total reparation due from Germany for the damage resulting from the war, Germany cedes to France in full and absolute possession, with exclusive rights of exploitation, unincumbered and free from all debts and charges of any kind, the coal mines situated in the Sarre Basin as defined in Article 48.

Article 46.—In order to assure the rights and welfare of the population and to guarantee to France complete freedom in working the mines, Germany agrees to the provisions of Chapters I and 2 of the annex hereto.

Article 47.—In order to make in due time permanent provision for the government of the Sarre Basin, as dealt with in the present stipulations, will be fixed as follows:

On the south and southwest: By the frontier of France as fixed by the present treaty.

On the northwest and north: By a line following
the northern administrative boundary of the Kreis of Mersig from the point where it leaves the French frontier and where it meets the administrative boundary, separating the commune of Saarhölzbach from the commune of Britten; following this communal boundary southward and reaching the administrative boundary of the Canton of Mersig so as to include in the said Canton Mersig and the precincts of the canton of Mönchberg, with the exception of the commune of Britten; following successively the northern administrative limits of the Canton of Mersig and the precis of the canton of Mönchberg, then entering the administrative boundaries of the Kreise of Mersig, Treves, (Trier,) and the principality of Birkenfeld as far as a point situated about 500 meters north of the village of Furschweiler, (viz.: The highest point of the Metzberg.)

Article 40. Germany renounces in favor of the last point defined above to a point about 3/4 kilometers east-northeast of Saint Wendel:

At the end of fifteen years from the coming into force of the present treaty, the inhabitants of the said territory shall be called upon to indicate the sovereignty under which they may wish to be placed, having been laid down as follows:

Chapter I.—Cession and Exploitation of Mining Property.

1. From the date of the coming into force of the present treaty, all the deposits of coal within the Sarre Basin, as defined in Article 48 of the said treaty, become the complete and absolute property of the French State.

The French State will have the right of working or not working the said mines, or transferring to a third party the right of working them, without having to obtain any previous authorization or to fulfill any formalities.

The French State may always require that the German mining laws and regulations referred to below shall be applied in order to insure the determination of its rights.

2. The right of ownership of the French State will apply not only to the deposits which are free, and for which concessions have not yet been granted, but also to the deposits for which concessions have been granted, whoever may be the present proprietors, irrespective of whether they belong to the Prussian State, to the Bavarian State, to other States or bodies, to companies or to individuals, whether they have been worked or not, or whether a right of exploitation distinct from the right of ownership of the soil has or has not been recognized.

3. As far as concessions to mines which are being worked, the transfer of the ownership to the French State will apply to all the accessories and subsidiaries of the said mines, in particular of their plant and equipment both on and below the surface, to their extracting machinery, their plants for transforming coal into electric power, coke and by-products, their workshops, means of communication, electric lines, plant for catching and distributing water-haulage, such as offices, managers', employees', and workmen's dwellings, schools, hospitals, and dispensaries, their stocks and supplies of every description and plant and general equipment, and in general everthing which those who own or exploit the mines possess or enjoy for the purpose of exploiting the mines and their accessories and subsidiaries.

The transfer will also apply to the debts owing for products delivered before the entry into possession by the French State, and after the signature of the present treaty, and to deposits of money made by customers, whose rights will be guaranteed by the French State.

4. The French State will acquire the property free and clear of all debts and charges. Nevertheless the rights acquired, or in course of being acquired, by the exploitation of the mines and their accessories and subsidiaries at the date of the coming into force of the present treaty, in connection with pensions for old age or disability, will not be affected by this transfer; and the French State must pay over to the French State a sum representing the actual amounts to which the said employes are entitled.

5. The value of the property thus ceded to the French State will be determined by the Reparation Commission referred to in Article 38 of the present treaty.

This value shall be credited to Germany in part payment of the amount due for reparation.

It will be for Germany to indemnify the proprietors or parties concerned, whoever they may be.

6. No tariff shall be establishe on the German railways and canals which may directly or indirectly discriminate to the prejudice of the transport of the personnel or product of the mines and their accessories or subsidiaries, or of the materials necessary to their exploitation. Such transport shall enjoy all the rights and privileges which any international railway conventions may guarantee to similar products of French origin.

7. The equipment and personnel necessary to insure the dispatch and transport of the products of the mines and their accessories and subsidiaries, as well as the carriage of workmen and employees, will be provided by the local railway administration of the basin.

8. No obstacle shall be placed in the way of such improvements of railways or waterways as the French State may judge necessary to assure the dispatch and transport of the products of the mines and their accessories and subsidiaries, such as the enlargement of stations, and the construction of yards and appurtenances.

The distribution of expenses will, in the event of disagreement, be submitted to arbitration.
WAR, EUROPEAN — THE PEACE TREATIES (18)

The French State may also establish any new means of communication, such as roads, star telegraphs, and telephone lines, which it may consider necessary for the exploitation of the mines.

9. The French State shall always be entitled to demand the requisition of the German mining laws and regulations in force on the 11th November, 1918, excepting provisions adopted exclusively in view of the state of war, with a view to the acquisition of such land as it may judge necessary for the exploitation of the mines and their accessories and subsidiaries.

The payment for damage caused to immovable property by the working of the said mines and their accessories and subsidiaries shall be made in accordance with the German mining laws and regulations above referred to.

Every person whom the French State may substitute for itself as regards the whole or part of its rights in the exploitation of the mines and their accessories and subsidiaries shall enjoy the benefit of the privileges provided in this annex.

10. The mines and other immovable property which become the property of the French State may never be made the subject of measures of forfeiture, forced sale, expropriation or requisition, nor of any other measure affecting the right of property.

11. The works connected with the exploitation of these mines or their accessories and subsidiaries, as well as the product extracted from the mines manufactured in their accessories and subsidiaries, may not at any time be made the subject of any measures of requisition.

12. The exploitation of the mines and their accessories and subsidiaries, which become the property of the French State, will continue, subject to the provisions of Paragraph 23 below, to be subject to the régime established by the German laws and regulations in force on the 11th November, 1918, excepting provisions adopted exclusively in view of the state of war.

The rights of the workmen shall continue in accordance with the provisions of the said Paragraph 23, as established on the 11th November, 1918, by the German laws and regulations above referred to. No impairment shall be placed in the way of the introduction or employment in the mines and their accessories and subsidiaries of workmen from without the basin.

The employees and workmen of French nationality shall have the right to belong to French labor unions.

13. The amount contributed by the mines and their accessories and subsidiaries, either to the local budget of any territory of the Sarre Basin, or to the communal funds, shall be fixed with due regard to the ratio of the value of the mines to the total taxable wealth of the basin.

14. The French State shall always have the right of maintaining, on its territory, mining schools, either the mines, primary or technical schools for its employees and their children, and, if necessary, causing instruction therein to be given in the French language, in accordance with such curriculum and by such teachers as it may select.

15. The French State shall establish complete liberty with respect to the distribution, dispatch, and sale prices of the products of the mines and their accessories and subsidiaries.

Nevertheless, whatever may be the total product of the mines, the French Government undertakes that the requirements of local consumption for industrial and domestic purposes shall always be satisfied in the proportion existing in 1913 between the amount consumed locally and the total output of the Sarre Basin.

Chapter "II." — Government of the Territory of Sarre Basin.

16. The government of the territory of the Sarre Basin shall be intrusted to a commission representing the League of Nations; and this commission shall sit in the territory of the Sarre Basin.

17. The Governing Commission provided for by Paragraph 16 shall consist of five members chosen by the Council of the League of Nations, and will include one citizen of France, one native inhabitant of the State of Sarre, one citizen of France, and three members belonging to three countries other than France or Germany.

The members of the Governing Commission shall be appointed for one year from among the members of the commission by the Council of the League of Nations and may be reappointed. They can be removed by the Council of the League of Nations, which will provide for their replacement. The members of the Governing Commission will be entitled to a salary which will be fixed by the Council of the League of Nations, and charged on the local revenue of the State of Sarre, and are not entitled to receive any fees or allowance for their work.

18. The Governing Commission shall be appointed for one year from among the members of the commission by the Council of the League of Nations and may be reappointed. The Chairman will act as the executive of the commission.

19. Without prejudice to the powers of the Sarre Basin, the Governing Commission shall have all the powers of government hitherto belonging to the Prussian or Bavarian authorities, including the appointment and dismissal of officials, and the creation of such administrative and representative bodies as may be deemed necessary. It shall have full powers to administrate and operate the railways, canals, and the different public works.

Its decisions shall be taken by a majority.

20. Germany will place at the disposal of the Governing Commission all official documents and archives under the control of Germany, of any German State, or of any local authority, which may be in the possession of the Sarre Basin or to the rights of the inhabitants thereof.

21. It will be the duty of the Governing Commission to conserve, by such means and under such conditions as it may deem suitable, the protection abroad, of the interests of the inhabitants of the Sarre Basin.

22. The Governing Commission shall have the full right of user of all property, other than mines, belonging, both in public and in private domains, to the Imperial German Government, of any German State, or of any local authority, which may be in the possession of the Sarre Basin or to the rights of the inhabitants thereof.

23. Germany will not bring any claim against the Sarre Basin, except such as shall be determined by a mixed commission on which the government of the territory of the Sarre Basin and the German railways will be represented.

24. Persons, goods, vessels, carriages, wagons, and mails coming from or going to the German Empire shall enjoy all the rights and privileges relating to transit and transport which are specified in the provisions of Part XII (ports, waterways, railroads) of the peace treaty.

25. The laws and regulations in force on November 11, 1918, in the territory of the Sarre Basin, (except those enacted in consequence of the state of war,) shall continue to apply. If, for general reasons or to bring these laws and regulations into accord with the provisions of the present treaty, it is necessary to introduce modifications, these shall be decided on, and put into effect by the Governing Commission, after consultation with the elected representatives of the inhabitants in such a manner as the commission may determine. No modification may be made in the legal régime for the exploitation of the mines without the French State being previously consulted, unless such modification results from a general modification respecting labor adopted by the League of Nations.

In fixing the conditions and hours of labor for men, women, and children, the rights of the inhabitants of the Sarre Basin shall take into consideration the wishes expressed by the local labor organizations and societies as well as the principles adopted by the League of Nations.

26. The laws and regulations in force on November 11, 1918, in the territory of the Sarre Basin, (except those enacted in consequence of the state of war,) shall continue to apply. If, for general reasons or to bring these laws and regulations into accord with the provisions of the present treaty, it is necessary to introduce modifications, these shall be decided on, and put into effect by the Governing Commission, after consultation with the elected representatives of the inhabitants in such a manner as the commission may determine. No modification may be made in the legal régime for the exploitation of the mines without the French State being previously consulted, unless such modification results from a general modification respecting labor adopted by the League of Nations.

27. Germany and the Government of the territory of the Sarre Basin will preserve and continue all of the aforesaid rights.

28. The civil and criminal courts existing in the territory of the Sarre Basin shall continue.

29. A civil and criminal courts established by the Governing Commission to hear appeals from the decisions of the said courts, and to decide matters for which these courts are not competent. The Governing Commission will be responsible for settling the organization and jurisdiction of the said court.

Justice will be rendered in the name of the Governing Commission, and in the name of the German Empire.
These taxes and dues will be exclusively applied to the needs of the territory.

The conditions prevailing on November 11, 1918, will be maintained as far as possible, and no new tax can be levied on the territory.

The inhabitants of the territory will have full liberty to retain in their immovable property or sell it at their discretion and to remove their movable property free of any charges.

There will be no military service, whether compulsory or otherwise, in the territory, and the construction of fortifications therein is forbidden. Only a local gendarmerie of the minimum size shall be maintained.

The territory of the Sarre Basin shall be free of all customs duties. Products which originate in and pass from the basin into Germany shall be free of import duties for a period of five years from the date of the coming into force of the present treaty, and during the same period articles imported from Germany into the territory of the basin for local consumption shall likewise be free of import duties.

During these five years the French Government reserves to itself the right of limiting to the annual average of the quantities imported into Alsace-Lorraine and France in the years 1911 to 1913 the quantities which may be sent into France of all articles coming from the basin, which include raw materials and semi-manufactured goods imported duty free from Germany. Such quantities shall be determined by the French Government and the commission appointed to furnish all available official information and statistics.

No prohibition or restriction shall be imposed upon trade with the French or other foreign firms in the territory of the Sarre Basin. The French State shall have the right to establish, in connection with all purchases, payments, and contracts connected with the exploitation of the mines or their accessories and subsidiaries.

The French Government shall have power to decide all questions arising from the interpretation of the preceding provisions. France and Germany agree that any dispute involving a difference of opinion as to the interpretation of the said provisions shall in the same way be submitted to the Governing Commission.

The decision of a majority of the members of the commission shall be binding on both countries.

Chapter III.—Plebiscite.

At the termination of a period of fifteen years from the coming into force of the present treaty, the population of the territory of the Sarre Basin will be called upon to indicate their desires in the following manner:

A vote will take place, by communes or districts, on the three following alternatives: (a) Maintenance of the régime established by the present treaty and by the annex to the League of Nations, (b) union with France, (c) union with Germany.

Attention is directed to the provisions of the annex.

The vote will take place on the date of the signature of the present treaty, resident in the territory at the date of the signature of the present treaty, will have the right to vote.

The other conditions, methods, and the date of the voting shall be fixed by the Council of the League of Nations in such a way as to secure the liberality, secrecy, and trustworthiness of the voting.

The League of Nations shall decide on the sovereignty under which the territory is to be placed, taking into account the wishes of the inhabitants as expressed by the voting.

(b) If, for the whole or part of the territory, the League of Nations decides in favor of the maintenance of the régime established by the annex, Germany hereby agrees to make such renunciation of her sovereignty in favor of the League of Nations as the latter shall deem necessary. It will be the duty of the League of Nations to take appropriate steps to adapt the régime adopted for the permanent welfare of the territory and the general interests.

If, for the whole or part of the territory the League of Nations decides in favor of union with France, Germany hereby agrees to cede to France in accordance with the decision of the League of Nations all rights and title over the territory specified by the League.

If, for the whole or part of the territory the League of Nations decides in favor of union with Germany, it will be the duty of the League of Nations and the French Government to cause the German Government to be re-established in the government of the territory specified by the League.

If the League of Nations determines that the union of the whole or part of the territory of the Sarre Basin with Germany shall be beneficial to the interests of the whole of Europe, it shall be free to be purchased by Germany in its entirety at a price payable in gold. The price shall be fixed by three experts, one nominated by Germany, one by France, and one, who shall be neither a Frenchman nor a German, by the Council of the League of Nations. The decision of the experts will be given by a majority.

The obligation of Germany to make such payment shall be taken into account by the Reparation Commission, and for the purpose of its determination, Germany may create a prior charge upon her assets or revenues upon such detailed terms as shall be agreed to by the Reparation Commission.

If, nevertheless, Germany after a period of one year from the date on which the payment becomes due shall not have effected the said payment, the Reparation Commission shall do so in accordance with such instructions as may be given by the League of Nations, and, if necessary, by liquidating that part of the mines which is in question.

In consequence of the repurchase provided for in Paragraph 36, the ownership of the mines or any part of them is transferred to Germany, the French State and French nationals shall have the right to purchase such amount of coal of the Sarre Basin as their industrial and domestic needs may require. An equitable arrangement regarding amounts of coal, duration of contract, and prices will be fixed in due time by the League of Nations.

It is understood that France and Germany may, by special agreements concluded before the coming into force of the present treaty, fix the price for the repurchase of the mines, modify the provisions of Paragraphs 36 and 37.

The Council of the League of Nations shall make such provisions as may be necessary for the establishment of the régime which is to take effect after the decisions of the League of Nations mentioned in Paragraph 35 have become operative, including an equitable apportionment of any obligations of the Government of the territory of the Sarre Basin arising from loans raised by the commission or from other causes.

From the coming into force of the new régime, the powers of the Governing Commission will terminate, except in the case provided for in Paragraph 35. (a)

In all matters dealt with in the present annex, the decisions of the Council of the League of Nations will be taken by a majority.

SECTION V.—ALSACE-LOMBRAINE

The high contracting parties, recognizing the moral obligation to redress the wrong done by Germany in 1871, both to the rights of France and to the wishes of the population of Alsace and Lorraine, accept the annexation of their country in spite of solemn protests of their representatives at the Assembly of Bordeaux, agree upon the following articles:

Article 51.—The territories which were ceded to Germany in accordance with the preliminaries of peace
WAR, EUROPEAN — THE PEACE TREATIES (18)

signed at Versailles on the 26th February, 1871, and the treaty of Frankfort on the 10th May, 1871, are re-newed in full force and effect at the date of the armistice of the 11th November, 1918.

The provisions of the treaties establishing the delimitation of the frontiers before 1871 shall be restored.

Article 52.—The German Government shall hand over without delay to the French Government all archives, registers, plans, titles, and documents of every kind concerning the civil, military, financial, judicial, or other administrations of the territories restored to French sovereignty. If any of these documents, archives, registers, titles, or plans have been misplaced, they will be restored by the German Government on the demand of the French Government.

Delimitations shall be made between France and Germany dealing with the interests of the inhabitants of the territories referred to in Alsace-Lorraine, civil rights and their business and the exercise of their professions, being understood that Germany undertakes as from the present date to recognize and accept the regulations laid down in the annex hereto regarding the nationality of the inhabitants or natives of the said territories, not to claim at any time or in any place whatsoever as German nationals those who shall have been declaredFranzosen, to reside in Alsace-Lorraine, and to accord, in regards the property of German nationals in the territories indicated in Article 51, with the provisions of Article 70 of the annex to Section 4 of Part X (economic clauses) of the present treaty.

French nationals who without acquiring French nationality shall receive permission from the French Government to reside in the said territories shall not be subjected to the provisions of the said article.

Article 54.—Those persons who have regained French nationality in virtue of Paragraph 1 of the annex hereto, shall be held to be Alsace-Lorrainers for the purposes of the present section.

The persons referred to in Paragraph 2 of the said annex, as far as they have been made French nationals, shall be held to be Alsace-Lorrainers with retroactive effect as from the 11th November, 1918. From the 1st January, such application is rejected, the privilege will terminate at the date of the refusal.

Such juridical persons will also have the status of Alsace-Lorrainers as have been recognized as possessing this quality, whether by the French administrative authorities or by a judicial decision.

Article 55.—The territories referred to in Article 51 shall return to France, free and quit of all public debts under the conditions laid down in Article 255 of Part IX (financial clauses) of the present treaty.

Article 56.—In conformity with the provisions of Article 70 of the annex to Section 4 of Part X (economic clauses) of the present treaty, France shall enter into possession of all property and estate within the territories referred to in Article 51, belonging to the German Empire or German States, without any payment or credit on this account to any of the South German States. This provision applies to all movable or immovable property of public or private domain, together with all rights which formerly belonged to the German Empire or the German States or to their administrative areas.

Crown property and the property of the former Emperor or other German sovereigns shall be assimilated to property of the public domain.

Article 57.—Germany shall not take any action either by means of stamping or by any other legal or administrative measures not applying equally to the rest of her territory, which may be to the detriment of the fiscal value or realizable quality of German money, instruments or moneys at the date of the signature of the present treaty. France shall enter into possession of all property and estate within the territories referred to in Article 51, belonging to the German Empire or the German States, without any payment or credit on this account to any of the South German States. This provision applies to all movable or immovable property of public or private domain, together with all rights which formerly belonged to the German Empire or the German States or to their administrative areas.

Article 58.—A special convention will determine the conditions for repayment in marks of the exceptional war expenditure advanced during the course of the war, by public bodies in Alsace-Lorraine on account of the empire in accordance with German law, such as payment to the families of persons mobilized for the service, to the indemnity fund, or to persons who have been expelled. In fixing the amount of these sums Germany shall be credited with that portion which Alsace-Lorraine would have contributed to the empire to meet the expenses resulting from these payments, this credit being calculated according to the proportion of the imperial revenues derived from Alsace-Lorraine in 1913.

Article 59.—The French Government will collect for its own account the imperial taxes, duties, and dues of every kind leviable in the territories referred to in Article 51 and from that date at the time of the armistice of the 11th November, 1918.

Article 60.—The German Government shall without delay restore to Alsace-Lorraine all (individual, juridical persons, and public institutions,) all property, rights, and interests belonging to them on the 11th November, 1918, in which persons resident in Alsace-Lorraine would have been entitled if Alsace-Lorraine had remained under a German jurisdiction.

Article 61.—For the purpose of the obligation assumed by Germany in Part VIII (reparations) of the present treaty, every inhabitant of the former territories included in the zone of interchange referred to the civil populations of the Allied and Associated countries in the form of fines, the inhabitants of the territories referred to in Article 51 shall be assimilated to the above mentioned populations.

Article 62.—The regulations concerning the control of the Rhine and of the Moselle under Article XII (ports, waterways, and railways) of the present treaty.

Article 63.—Within a period of three weeks after the coming into force of the present treaty the Port of Strasbourg and the Port of Kehl shall be constituted, for a period of seven years, a single unit from the point of view of exploitation.

The administration of this single unit will be carried on by a manager named by the Central Rhine Commission, which shall also have power to remove him. He shall be of French nationality. The Port of Strasbourg and the Port of Kehl will be subject to the supervision of the Central Rhine Commission.

There will be established in the two free zones in conformity with Part XII (ports, waterways, and railways) of the present treaty.

A special convention between France and Germany, which shall be submitted to the approval of the Central Rhine Commission, will fix the details of this organization, particularly as regards finance.

It is understood that for the purpose of the present article the Port of Kehl including the whole of the area necessary for the movements of the port and the trains which serve it, including the harbor, quays and rail-roads, platforms, cranes, sheds, workshops, elevators and hydro-electric plants, which make up the equipment of the port.

The German Government undertakes to carry out all measures which shall be required of it in order to assure that all the making up and switching of trains arriving at or departing from the Port of Kehl from the right bank or the left bank of the Rhine, shall be carried on in the best conditions possible.

All property rights shall be safeguarded. In particular, the administration of the ports shall not prejudice any property rights of the French or Baden railroads.

Equality of treatment as respects traffic shall be assured in both ports to the nationals, vessels, and goods of every country.

In case at the end of the sixth year France shall consider that the progress made in the improvement of the Port of Strasbourg still requires a prolongation of this temporary regime, she may ask for such prolongation from the Central Rhine Commission, which may grant an extension for a period not exceeding three years.

Throughout the whole period of any such extension the free zones above provided for shall be maintained.

Pending the appointment of the first manager by the Central Rhine Commission, a provisional manager, who shall be of French nationality, may be appointed by the British and French (the two principal members of the Associated Powers, subject to the foregoing provisions.

For all purposes of the present article the Central Rhine Commission shall act by a majority of votes.

Article 66.—The railway and other bridges across the Rhine now existing within the limits of Alsace-Lorraine shall, as to all their parts and their whole
length, be the property of the French State, which shall insures their upkeep.

The French Government is substituted in all the rights of the German Empire, over all the railways which were administered by the Imperial Railways (of the present treaty clauses) of the present treaty working of which is under construction.

The same shall apply to the rights of the empire with regard to railway and tramway concessions within the territories referred to in Article 51. Only shall not entail any payment on part of the French State.

The frontier railway stations shall be established by a joint commission, and in advance it be established that on the Rhine frontier they shall be situated on the right banks.

Article 68. — In accordance with the provisions of Article 268 of Chapter I of Section I of Part X (economic clauses) and of Articles 300 and 301 of Section VI of Part X (economic clauses) of Article 51 on the coming into force of the present treaty, natural or manufactured products originating in and coming from the territories referred to in Article 51 shall, on importation into German customs territory, be exempt from all customs duties. The French Government shall fix each year, by decree communicated to the German Government, the nature and amount of the products which shall be exempt from duties.

The amount of each product which may be thus be sent annually into Germany shall not exceed the average of the years 1911-1913.

Further, during the period of five years above mentioned, the German Government shall allow the free export of all agricultural produce, excluding only tobacco, of Germany, exempt from all customs duties and other charges, arising from temporary storage, insurance, transit fees, and other like costs and expenses, without duties, and in any condition, sent from Germany into the territories referred to in Article 51, on the coming into force to any finishing process, such as bleaching, dying, printing, mercerization, gassing, twisting, dressing, etc.

Article 69. — During a period of ten years from the coming into force of the present treaty, all German electric-power and cotton textile supply works situated in German territory, and formerly furnishing electric power to the territories referred to in Article 51, or to any establishment the working of which passes permanently or temporarily from Germany to France, shall be required to continue such supply up to the amount of 70 per cent, consumption corresponding to the undertakings and contracts current on the 30th November, 1918.

Such supply shall be furnished according to the contracts in force and at a rate which shall not be higher than that paid to the said works by German nationals.

Article 70. — It is understood that the French Government preserves its right to prohibit in the future the trade in all these commodities, and to determine the conditions and prohibitions which shall govern their trade.

1. In the management or exploitation of the public distribution of public services, such as railways, navigable waterways, water works, gas works, electric power works, and telephones.

2. In the ownership of mines and quarries of every kind and in enterprises connected therewith.

Any establishment the working of which may not be connected with that of any mine.

Article 71. — As regards the territories referred to in Article 51, Germany renounces on behalf of herself and her nationals as from 1st November, 1918, all rights under the law of the 22nd May, 1910, regarding the trade in potash salts and generally under any stipulations for the intervention of German organizations in the working of the potash mines. Similarly she renounces on behalf of herself and her nationals all rights under any agreements, stipulations or laws, which may have been concluded in respect of the said territories.

Article 72. — The settlement of the questions relating to debts contracted before the 11th November, 1918, between the German Empire and the German States or their nationals residing in Germany on the one part, and Alsace-Lorrainers residing in Alsace-Lorraine on the other part, shall be effected in accordance with the provisions of Section V of Part X (economic clauses) of the present treaty, the expression "before the war" the meaning of all dates before the 30th November, 1918. The rate of exchange applicable in the case of such settlement shall be the average rate quoted in the "Kreditanstalt der Deutschen Länder" for the 30th November, 1918. There may be established in the territories referred to in Article 51, for the settlement of the conditions laid down in Section III of Part X (economic clauses) of the present treaty, a special clearing office, it being understood that this office shall be regarded as a central office under the provisions of Paragraph 1 of the annex to the said section.

Article 73. — The property rights and interests of Alsace-Lorrainers in Germany will be regulated by the stipulations of Section IV of Part X (economic clauses) of the present treaty.

Article 74. — The French Government reserves the right to retain and liquidate all the property, rights, interests and possessions which German nationals or societies possessed by Germany possessed in the territories referred to in Article 51 on the 11th November, 1918, subject to the conditions laid down in the last paragraph of Article 53 above.

Germany will directly compensate its nationals who may have been dispossessed by the aforesaid liquidations.

The product of these liquidations shall be applied in accordance with the stipulations of Sections III and IV of Part X (economic clauses) of the present treaty.

Article 75. — Notwithstanding the stipulations of Section V of Part X (economic clauses) of the present treaty, all contracts made before the date of the proclamation in Alsace-Lorraine of the French decree of 30th November, 1918, between Alsace-Lorrainers (whether individuals or juridical persons) or others resident in Alsace-Lorraine on the one part, and the German Empire or German States and their nationals on the other, of which has been suspended by the armistsce or by subsequent French legislation, shall be maintained.

Nevertheless, any contract which the French Government shall notify the cancellation to Germany in the general interest within a period of six months from the date of the coming into force of the present treaty shall be annulled except in respect of any debt or other pecuniary obligation arising from such contract, the money paid thereunder before the 11th November, 1918. If this dissolution would cause one of the parties substantial prejudice, equitable compensation shall be made by the party solely on the capital employed without taking account of loss of profits, shall be accorded to the prejudiced party.

With regard to prescriptions, limitations, and for whatever in Alsace-Lorraine. All provisions of Articles 300 and 301 of Section VI of Part X (economic clauses) shall be applied, with the substitution for the expression "outbreak of war" of the expression "11th November, 1918," and for the expression "duration of the war" of the expression "period from the 11th November, 1918, to date of the coming into force of the present treaty."

Article 76. — Questions concerning the right in industrial, literary, or artistic property of Alsatian-Lorrainers shall be regulated in accordance with the general stipulations of Section VII of Part X (economic clauses) of the present treaty, it being understood that Alsace-Lorrainers holding rights of this nature under German legislation will be entitled to the full and entire enjoyment of these rights in German territory.

The German Government undertakes to pay over to the French Government such proportion of all reserves accumulated by the empire or by public or private bodies dependent on the empire, as shall be destined for the benefit of the disabled and old age insurance, as would fail to the disability and old age insurance fund at Strasbourg.

The same shall apply in respect of the funds, and reserves accumulated in Germany falling legitimately to other insurance funds, to miners' superannuation funds, to the fund of the railways of Alsace-Lorraine, to other superannuation organizations established for the benefit of the personnel of public administrations and institutions operating in Alsace-Lorraine, and also in respect of the capital and reserves due by the insurance fund of private employees at Berlin by reason of engagements entered into for the benefit of insured persons of that category resident in Alsace-Lorraine.

A special convention shall determine the conditions and procedure of these transfers.

Article 77. — With regard to the execution of judgments, orders, and prosecutions, the following rules shall be applied:

1. All civil and commercial judgments which shall have been given since Aug. 3, 1914, by the courts of Alsace-Lorraine between Alsace-Lorrainers, or between Alsace-Lorrainers and nationals of the Allied States or subjects of the allies of Germany, shall only be capable of execution after the issue of an exequatur by the proper court corresponding to the new tribunal in the restored territory referred to in Article 51.

2. All judgments given by German courts since the 30 Aug., 1914, against Alsace-Lorrainers for political
crimes or misdemeanors shall be regarded as null and void.

All sentences passed since the 11th November, 1918, by the Imperial Court of Leipzig on Appeals against the decisions of the courts of Alsace-Lorraine shall be regarded as null and void and shall be so declared and pronounced. The papers in regard to the cases in which such sentences have been given shall be returned to the competent Authority concerning the case. All appeals to the Imperial Court against decisions of the courts of Alsace-Lorraine shall be suspended. In the cases referred to above, the papers shall be returned under the aforesaid conditions for transfer without delay to the French Cour de Cassation which shall be competent to decide them.

4. All prosecutions of Alsace-Lorraine for offenses committed during the period between the 11th November, 1918, and the coming into force of the present treaty shall be conducted under French law except in so far as this has been modified by decrees duly published on the spot by the French authorities.

All other questions as to competence, procedure or administration of justice, shall be determined by a special convention between France and Germany.

Article 79. The stipulations as to nationality contained in the annex hereto shall be considered as of equal force with the provisions of the present section.

All other questions concerning Alsace-Lorraine which are not regulated by the present section and the annex therefore reference the provisions of the present treaty, shall form the subject of further conventions between France and Germany.

ANNEX.

1. As from the 11th November, 1918, the following persons are ipso facto reinstated in French nationality:
   - Persons who lost French nationality by the application of the Franco-German treaty of the 10th May, 1871, and who have not since that date acquired any nationality other than German or Austrian.
   - Second. The legitimate or natural descendants of the person referred to in the said preceding paragraph, with the exception of those whose descendants in the paternal line include a German who migrated into Alsace-Lorraine after the 15th July, 1870;
   - Third. All persons born in Alsace-Lorraine of unknown parents or whose nationality is unknown.

2. All persons from the coming into force of the present treaty, persons included in any of the following categories may claim French nationality:
   - First. All persons not restored to French nationality under paragraph 1, above, whose ascendants include a Frenchman or French woman who lost French nationality under the conditions referred to in the said paragraph.
   - Second. All foreigners not nationals of a German State who acquired the status of a citizen of Alsace-Lorraine before the 3rd August, 1870;
   - Third. All Germans domiciled in Alsace-Lorraine.

3. All persons born in Alsace-Lorraine before 10th May, 1870, of foreign parents, and the descendants of such persons;

4. The husband or wife of any person whose French nationality may have been restored under Paragraph 1 or who may have claimed and obtained French nationality in accordance with the preceding provisions.

The legal representatives of a minor may exercise on behalf of the minor the right to claim French nationality; and if that right has not been exercised, the minor may claim French nationality within the year following his majority.

Except in cases provided in No. 6 of the present paragraph, the French authorities reserve to themselves the right in individual cases to reject the claim to French nationality.

3. Subject to the provisions of paragraph 2, Germans born or domiciled in Alsace-Lorraine shall not acquire French nationality by reason of the restoration of Alsace-Lorraine to France. Persons, however, who may have the status of citizens of Alsace-Lorraine.

They may acquire French nationality only by naturalization, on condition of having been domiciled in Alsace-Lorraine from a date previous to the 3rd August, 1919, and of submitting to the French authorities of the place in which they have resided within the restored territory for a period of three years from the 11th November, 1918.

France will be solely responsible for their diplomatic and consular protection from the date of their application for French naturalization.

4. The French Government shall determine the procedure by which reinstatement in French nationality as of right shall be effected, and the conditions under which the same shall be granted for French nationality and applications for naturalization, as provided by the present annex.

SECTION VI.—AUSTRIA.

Article 80. Germany acknowledges and will respect strictly the independence of Austria. Within the frontiers which shall be fixed by a treaty between Austria and the principal Allied and Associated Powers she agrees that the independence shall be inalienable, except with the consent of the Council of the League of Nations.

SECTION VII.—CZECHOSLOVAK STATE.

Article 81. Germany, in conformity with the action already taken by the Allied and Associated Powers, recognizes the complete independence of the Czechoslovak State, which will include the autonomous territory of the Ruthenians to the south of the Carpathians. Germany hereby recognizes the frontiers of this State as determined by the principal Allied and Associated Powers and the other interested States.

Article 82. The arbitration commission existed on Aug. 3, 1914, between Austria-Hungary and the German Empire will constitute the frontier between Germany and the Czechoslovak State.

Article 83. Germany renounces in favor of the Czechoslovak State all rights and titles over the portion of Silesian territory defined as follows:

- Starting from a point about 2 kilometers southeast of Katzenzollern, the line will follow the valley of the Kreis Loebschütz and Ratibo to the boundary between the two Kreise; then, the former boundary between Germany and Austria-Hungary up to a point on the Oder immediately to the south of the Ratibo-Oderberg railway; thence, toward the north-northwest and up to a point about 2 kilometers to the southeast of Katzenzollern, a line to be fixed on the spot passing to the west of Kranowitz.

A commission composed of seven members, five nominated by the Principal Allied and Associated Powers, one by Poland, and one by the Czechoslovak State, will be appointed fifteen days after the coming into force of the present treaty to trace on the spot the frontier line between Poland and the Czechoslovak State.

The decisions of this commission will be taken by a majority and shall be binding on the parties concerned.

Germany hereby agrees to renounce in favor of the Czechoslovak State all rights and titles over the territory of the Kreis Loebschütz comprised within the following boundaries in case after the determination of the frontier between the two countries by the commission that circle should become isolated from Germany: from the southeast up to the Austrian frontier at about 5 kilometers to the west of Loebschütz southward and up to a point of junction with the boundary between the Kreise Krensdorf and Ratibo; the former frontier between Germany and Austria-Hungary; then, northwest, the administrative boundary between the Kreise of Loebschütz and Ratibo to the southeast of Krensdorf; thence, northwestward and up to the starting point of this definition: a line to be fixed on the spot passing to the east of Krensdorf.

Article 84. Germans nationals habitually resident in any of the territories recognized as forming part of the Czechoslovak State will obtain Czechoslovak nationality ipso facto and lose their German nationality:

Article 85. Within a period of two years from the coming into force of the present treaty German nationals over 18 years of age habitually resident in any of the territories recognized as forming part of the Czechoslovak State will entitled to opt for German nationality. Czechoslovaks who are habitually resident in Germany will have a similar right to opt for Czechoslovak nationality.

Option by a husband will cover his wife, and option by parents will cover their children under 18 years of age. Persons who have exercised the above right to opt must within the succeeding twelve months transfer their place of residence into the territory to which they have opted. They will be entitled to retain their landed property in the territory of the other State where they had their place of residence before exercising the right to opt. They may carry with them their movable property of every description. No export or import duties may be imposed upon them in connection with the re-
WAR, EUROPEAN — THE PEACE TREATIES (18) 385

moval of such property. Within the same period Czechoslovakia who are German nationals and are in a foreign country, may be deprived of any possessions contrary to the foreign law, and if they have not acquired the foreign nationality, to obtain Czechoslovak nationality by complying with the requirements laid down by the Czechoslovak State.

Article 86.—The Czechoslovak State accepts and agrees to embody in a treaty with the principal Allied and Associated Powers, one by Germany, and one by Poland, shall be constituted fifteen days after the coming into force of the present treaty, up to a point situated between Upper and Middle Silesia, a boundary line between the eastern boundary of the Kreis of Falkenberg; the eastern boundary of the Kreis of Falkenberg to the point of the salient which is thirteen kilometers east of Puschenie; thence to the northern point of the salient of the old province of Austria separated from the rest of Austria by eighteen kilometers east of Neustadt: a line to be fixed on the ground, passing east of Zollin.

The regime under which the plebiscite will be taken and given effect to is laid down in the annex hereinafter referred to. The Polish and German Governments hereby respectively bind themselves to conduct no prosecutions on any part of their territory, and to take no exceptional proceedings for any political action performed in Upper Silesia during the period of the régime laid down in the annex hereinafter, and up to the settlement of the final status of the country Germany hereby renounces in favor of Poland all rights and title over the portion of Upper Silesia comprising the line fixed by the principal Allied and Associated Powers as this result of the plebiscite.

SECTION VIII.—POLAND.

Article 87.—Germany, in conformity with the action already taken by the Allied and Associated Powers, recognises the complete independence of Poland and renounces in her favor all rights and title over the territories which she possessed from the days of the partition of the German State as laid down in Article 27 of Part II (boundaries of Germany) of the present treaty, up to a point situated between Upper and Middle Silesia, at about two kilometers east of Kösseberg; then a line to the acute angle which the northern boundary of the Kreiss of the Oder and Rhein, and then a line thence northward of this point to the eastern boundary of the Kreiss of Falkenberg; thence to the eastern boundary of the Kreiss of Falkenberg to the point of the salient which is thirteen kilometers east of Puschenie; thence to the northern point of the salient of the old province of Austria separated from the rest of Austria by eighteen kilometers east of Neustadt: a line to be fixed on the ground, passing east of Zollin.

The plebiscite area shall be immediately disbanded. All members of such military organizations who are not domiciled in the said area shall be required to leave it.

2. The plebiscite area shall be immediately placed under the authority of an international commission of four members to be designated by the following powers: The United States of America, France, the British Empire, and Italy. It shall be occupied by troops belonging to the Allied and Associated Powers, and the German Government undertakes to give facilities for the transference of troops to Upper Silesia.

3. The commission shall adjust the powers exercised by the German or by the Allied and Associated Powers, except those of legislation or taxation. It shall also be substituted for the Government of the Province and the Regierungsbezirk.

It shall be within the competence of the commission to interpret the powers hereby conferred upon it, and to determine to what extent it shall exercise them, and to what extent they shall be left in the hands of the existing authorities.

Changes in the existing laws and the existing taxation shall only be brought into force with the consent of the commission.

The commission will maintain order with the help of the troops which will be at its disposal and to the extent which it may deem necessary by means of gendarmerie recruited among the inhabitants of the country. The commission will provide immediately for the replacement of the evacuated German officials, and, if occasion arises, shall itself order the evacuation of such authorities and proceed to the replacement of such local authorities as may be required. It shall take all steps which it thinks proper to insures the freedom, fairness, and secrecy of the vote. In particular, it shall have the right to order the expulsion of any person who may in any way have attempted to distort the result of the plebiscite by methods of corruption or intimidation.

The commission shall have full power to settle all questions arising from the execution of the present clauses. It shall be assisted by technical advisers, and by the bureau of the plebiscite commission. The decision of the commission shall be taken by a majority vote.

The vote shall take place at such date as may be determined by the principal Allied and Associated
Powers, but not sooner than six months or later than eighteen months after the establishment of the commission in the area.

The right to vote shall be given to all persons, without distinction, who have retained their immovable property in the area.

(a) Have completed their twentieth year on the 1st of January of the year in which the plebiscite takes place.

(b) Were born in the plebiscite area or have been domiciled there since a date to be determined by the commission, which shall not be subsequent to Jan. 1, 1919, or who have been expelled by the German authorities and have not retained their domicile there.

No vote or import duties or charges may be imposed upon them in connection with the removal of such property.

Within the same period Poles who are German nationals and are in a foreign country will be entitled, in the absence of any notification of any of the above offenses, to exercise their right of voting. Every person will vote in the commune where he has been domiciled, or in which he was born, if he has not retained his domicile in the area.

The result of the vote will be determined by the communes according to the majority of votes in each commune.

1. On the conclusion of the voting the number of votes cast in each commune will be communicated by the principal Allied and Associated Powers to the Polish Government.

In this recommendation regard will be paid to the wishes of the inhabitants, as shown by the vote, and to the economic and political conditions of the area.

The voting shall be held as soon as the frontier has been fixed by the principal Allied and Associated Powers the German authorities will be notified by the International Commission of the date of the vote and the day on which it is to be taken.

Within one month of the notification and in the manner prescribed by the commission, the Polish Government must proceed to take over the administration of the territory which it is recognized should be Polish.

When the administration of the territory has been provided for by the German and Polish authorities the commission will be dissolved.

The cost of the Army of Occupation and expenditure by the commission, whether in discharge of its own functions or in the administration of the territory, will be a charge on the area.

Article 89.—Poland undertakes to accord freedom of transit to persons, goods, vessels, carriages, wagons, and mails in transit between East Prussia and the rest of Germany over Polish territory including territorial waters, and to treat them at least as favorably as the persons, goods, vessels, carriages, wagons, and mails, respectively, of Poland or of any other in most-favored nationality, origin, importation starting point, or ownership, as regards facilities, restrictions, and all other matters.

Goods in transit shall be exempt from all customs or other similar duties.

Freedom of transit will extend to telegraphic and telephonic services under the conditions laid down by the commission referred to in Article 88.

Article 90.—Poland undertakes to permit, for a period of fifteen years, the exportation to Germany of the products of the mines in any part of Poland in accordance with the present treaty. Such export shall be subject to duties or other changes or restrictions on exportation.

Poland agrees to take such steps as may be necessary to secure that such products shall be available for sale to purchasers in Germany on terms as favorable as are applicable to like products sold under similar conditions to purchasers in Poland or in any other country.

Article 91.—German nationals habitually resident in territories recognized as forming part of Poland will acquire Polish nationality ipso facto and will lose their German nationality, German nationals, however, or their descendants who became resident in these territories after Jan. 1, 1908, will not acquire Polish nationality, without a previous declaration of the Polish State.

Within a period of two years after the coming into force of the present treaty, German nationals over 18 years of age, habitually resident in any of the territories referred to in the present treaty, will be entitled to opt for German nationality. Poles who are German nationals over 18 years of age, and habitually resident in Germany, will have a similar right to opt for Polish nationality. Option by a husband will cover his wife and option by parents will cover their children under 18 years of age. Persons who have exercised the above right to opt must within the succeeding twelve months transfer their place of residence to the State for which they have opted. They will be entitled to retain their immovable property in the other State, where they had their place of residence before exercising the right to opt. They may carry with them their immovable property subject to an ad valorem tax. No export or import duties or charges may be imposed upon them in connection with the removal of such property.

Within the same period Poles who are German nationals and are in a foreign country will be entitled, in the absence of any notification of any of the above offenses, to exercise their right of voting.

The voting shall be held as soon as the frontier has been fixed by the principal Allied and Associated Powers the German authorities will be notified by the International Commission of the date of the vote and the day on which it is to be taken.

Within one month of the notification and in the manner prescribed by the commission, the Polish Government must proceed to take over the administration of the territory which it is recognized should be Polish.

When the administration of the territory has been provided for by the German and Polish authorities the commission will be dissolved.

The cost of the Army of Occupation and expenditure by the commission, whether in discharge of its own functions or in the administration of the territory, will be a charge on the area.

The commission shall also determine the amount of such financial liabilities assumed by Poland that portion of the debt which, according to the finding of the Reparation Commission, is due to the Poles who have transferred to the German States which pass to Poland, with the territory transferred above, the Reparation Commission shall exclude from the valuation buildings, forests, and other State property which belonged to the former kingdom of East Prussia which shall not acquire these properties free of all costs and charges.

In all the German territory transferred in accordance with the present treaty and forming definitely a part of Poland, the property rights and interests of German nationals shall not be liquidated under Article 45. The whole of the territory shall be paid direct to the owners.

If, on his application, the mixed arbitral tribunal provided for by the Section 6 of Part X. (economic clauses) of the present treaty, or an arbitrator appointed by that tribunal, is satisfied that the conditions of the sale or measures taken by the Polish Government outside of its general legislation were unfairly prejudicial to the price obtained, they shall have discretion to order the Polish Government to compensate the owner for the loss of the sale or measures taken by the Polish Government.

Further agreements will regulate the disposition of the property of Poles who differ from the majority of the population in race, language or religion.

Poland further accepts and agrees to embody in a treaty with the principal Allied and Associated Powers such provisions as may be deemed necessary by the said powers to protect the interests of Polish who differ from the majority of the population in race, language or religion.

Article 93.—In the area between the southern frontier of East Prussia, as described in Article 16 of Part II (frontiers of Germany) of the present treaty, and the line described below, the inhabitants will be called upon to indicate by a vote the State to which they wish to belong.

The western national boundary of Regierungsbezirk Allenstein to its junction with the boundary between the Kreise of Oletako and Angerburg, thence, the northern Insterburg of the frontier of Germany, Oletako to its junction with the old frontier of East Prussia.

Article 94.—The German territories in this area will be withdrawn from the area defined above within a period not exceeding fifteen years after the coming into force of the present treaty, but in such event the inhabitants will not be entitled to opt for German nationality. Poles who are German nationals in this area will have a similar right to opt for Polish nationality. Option by a husband will cover his wife and option by parents will cover their children under 18 years of age.
WAR, EUROPEAN—THE PEACE TREATIES (18)

On the conclusion of the voting, the number of votes cast in each commune will be communicated by the commission to the principal Allied and Associated Powers, with a full report as to the taking of the vote and a recommendation as to the line which ought to be adopted as the boundary of East Prussia in this region. In this recommendation regard will be paid to the wishes of the inhabitants, to the geographical and economic conditions of the locality. The principal Allied and Associated Powers will then fix the frontier between East Prussia and Poland in this region, leaving in any case to Poland for the whole of the section both the free use of the sea and complete control of the river, including the east bank as far east of the river as may be necessary for its regulation and improvement. Germany agrees that in any portion of the said territory which remains German no fortifications shall at any time be erected.

The principal Allied and Associated Powers will at the same time draw up regulations for assuring to the population of East Prussia to the fullest extent and under equitable conditions, access to the Vistula, and the use of it for themselves, their commerce, and their boats.

The determination of the frontier and the foregoing regulations shall be binding upon all the parties concerned. When the administration has been taken over by the East Prussian and Polish authorities, respectively, the powers of the commission cease to exist.

Article 98.—Germany and Poland undertake, within five years of the conclusion of the present treaty, to enter into conventions of which the terms, in case of difference, shall be settled by the Council of the League of Nations, with respect to the following points: On the one hand to Germany full and adequate railroad, telegraphic, and telephonic facilities for communication between the river Oder and East Prussia over the intervening Polish territory, and on the other hand to Poland full and adequate railroad, telegraphic, and telephonic facilities for communication between Poland and the free city of Danzig over any German territory that may subsequently be ceded to it by the Vistula, intervene between Poland and the free city of Danzig.

SECTION X.—MEMEL.

Article 99.—The German troops in favor of the principal Allied and Associated Powers all rights and title over the territories included between the Baltic, the northeastern frontier of East Prussia as defined in Article 28 of Part II (frontiers of Germany) of the present treaty and the former frontier between Germany and Russia.

Germany undertakes to accept the settlement made by the principal Allied and Associated Powers in regard to these territories, particularly so far as concerns the nationality of the inhabitants.

SECTION XI.—FREE CITY OF DANZIG.

Article 100.—Germany renounces in favor of the principal Allied and Associated Powers all rights and title over the territory comprised within the following limits: From the Baltic Sea southward to the point where the principal channels of navigation of the Nogat and Vistula (Wichsel) meet; the boundary of East Prussia as described in Article 28 of Part II (boundaries of Germany) of the present treaty; and the former frontier between Germany and Russia.

The principal channel of navigation of the Vistula downstream to a point aabout 6½ kilometers north of the bridge of Dirschau; the northwest to point, 5, ½ kilometers southeast of the Church of Gilten; a line to be fixed on the ground passing between Mühlhans on the south and Rambertich on the north; the boundary of the Kreis of Berent, westward to the river Oder, thence to the southern point; thence to the southern end of the line of the Polskarei Sea; a line to be fixed on the ground; thence to a point on the median line of the Nogat; thence to a line to be fixed on the ground passing north of Neu Fietz and Schatarpi; thence to the northeastern point; thence to the southern end of the Polskarei Sea; a line to be fixed on the ground; thence to a point on the median line of the Polskarei Sea; thence to its northeastern point; thence in a northeasterly direction to a point about
WAR, EUROPEAN - THE PEACE TREATIES (18)

one kilometre south of Koliecken Church, where the Danzig-Neustadt Railway crosses a stream;

b. to be based on the ground passing southeast of Kamčenl, Krissau, Fidlin, Sulmin, (Richthof, Matzow, Marshau, Crispieken, Hoch and Klein Kelpin, Pulvermühle, Rennberg, and the towns of Oliva and Zoppot;

c. The Groatstream to the Baltic Sea may arise from the cession of the territory referred to in Article 100 shall be settled by further agreements.

**SECTION XII. - SCHLESWIG.**

**Article 109.** - The frontier between Germany and Denmark shall be fixed in conformity with the wishes of the population.

For this purpose the population inhabiting the territories of the former German Empire situated to the north of a line taking from sea to sea as far as possible the existing communal boundaries.

**Article 102.** - The principal Allied and Associated Powers undertake to establish the town of Danzig, togetherness with the rest of the territory described in Article 101, shall be placed under the protection of the League of Nations.

**Article 103.** - A constitution for the free city of Danzig shall be drawn up by the duly appointed representatives of the free city in agreement with a High Commissioner to be appointed by the League of Nations. Such constitution shall be placed under the protection of the League of Nations.

**Article 104.** - The principal Allied and Associated Powers undertake to negotiate a treaty between the Polish government and the free city of Danzig which shall come into force at the same time as the establishment of said free city, with the following objects:

1. To establish and provide for the adequate administration of the free city of Danzig within the Polish customs frontiers and to establish a free area in the port.

2. To ensure to Poland the control and administration of the Vistula and of the whole railway system within the free city; except such street and other railways as serve primarily the needs of the free city and of postal, telegraphic, and telephonic communication between Poland and the Port of Danzig.

3. To ensure to Poland the control and administration of the Vistula and other waters, docks, basins, wharves, and other works within the territory of the free city necessary for Polish imports and exports.

**Article 105.** - On the coming into force of the present treaty German nationals ordinarily resident in the territory described in Article 100 will have the right to opt for German nationality.

**Article 106.** - Within a period of two years from the coming into force of the present treaty German nationals over 18 years of age ordinarily resident in the territory described in Article 100 will have the right to opt for German nationality.

**Option.** - A husband will cover his wife and option by parents will cover their children less than 18 years of age.

**All persons who exercise the right of option referred to above must during the ensuing twelve months transfer to the fixed duty to Germany.**

These persons will be entitled to preserve the immovable property possessed by them in the territory of the free city of Danzig. They may carry with them their movable property of every description. No export of duties shall be imposed upon them in this connection.

**Article 107.** - All property situated within the territory of the free city of Danzig not belonging to the German Empire or any German State shall pass to the principal Allied and Associated Powers for transfer to the free city of Danzig or to the Polish State as they may consider equitable.

**Article 108.** - The proportion and nature of the financial liabilities of Germany and of Prussia to be borne by the Treaty Powers in accordance with Article 256 of Part IX (financial clauses) of the present treaty.

All other financial liabilities of Germany shall be settled by further agreements.

**Article 109.** - The frontier between Germany and Denmark shall be fixed in conformity with the wishes of the population.

For this purpose the population inhabiting the territories of the former German Empire situated to the north of a line taking from sea to sea as far as possible the existing communal boundaries.

**Article 102.** - The principal Allied and Associated Powers undertake to establish the town of Danzig, togetherness with the rest of the territory described in Article 101, shall be placed under the protection of the League of Nations.

**Article 103.** - A constitution for the free city of Danzig shall be drawn up by the duly appointed representatives of the free city in agreement with a High Commissioner to be appointed by the League of Nations. Such constitution shall be placed under the protection of the League of Nations.

The High Commissioner will also be entrusted with the duty of dealing in the first instance with all differences arising between Poland and the free city of Danzig which shall arise in the territory of the free city, or any arrangements or agreements made thereunder.

The High Commissioner shall reside at Danzig.

**Article 104.** - The principal Allied and Associated Powers undertake to negotiate a treaty between the Polish government and the free city of Danzig which shall come into force at the same time as the establishment of said free city, with the following objects:

1. To establish and provide for the adequate administration of the free city of Danzig within the Polish customs frontiers and to establish a free area in the port.

2. To ensure to Poland the control and administration of the Vistula and other waters, docks, basins, wharves, and other works within the territory of the free city necessary for Polish imports and exports.

3. To ensure to Poland the control and administration of the Vistula and of the whole railway system within the free city; except such street and other railways as serve primarily the needs of the free city and of postal, telegraphic, and telephonic communication between Poland and the Port of Danzig.

4. To ensure to Poland the right to develop and improve the waters, docks, basins, wharves, railways, and other works and means of communication mentioned in this article, as well as to lease or purchase their whole or part of the land possessing or under other property as may be necessary for the purposes of this article.

5. To prevent discrimination within the free city of Danzig to the detriment of citizens of Poland and other persons of Polish origin or speech.

The Polish Government shall undertake the conduct of the foreign relations of the free city of Danzig as well as the diplomatic protection of citizens of that city when abroad.

**Article 105.** - On the coming into force of the present treaty German nationals ordinarily resident in the territory described in Article 100 will have the right to opt for German nationality.

**Option.** - A husband will cover his wife and option by parents will cover their children less than 18 years of age.

**All persons who exercise the right of option referred to above must during the ensuing twelve months transfer to the fixed duty to Germany.**

These persons will be entitled to preserve the immovable property possessed by them in the territory of the free city of Danzig. They may carry with them their movable property of every description. No export of duties shall be imposed upon them in this connection.

**Article 107.** - All property situated within the territory of the free city of Danzig not belonging to the German Empire or any German State shall pass to the principal Allied and Associated Powers for transfer to the free city of Danzig or to the Polish State as they may consider equitable.
red line on Map No. 3, which is annexed to the present treaty).

Passing south of the Island of Alsen and following the median line of Flensburg Fjord;

Thence leaving the fjord about six kilometers north of Flensburg, following the course of the stream flowing past Kuiperhmühle upstream to a point north of Niebuus;

Resuming passing north of Pattburg and Ellund and south of Frösles to meet the eastern boundary of the Rendsburg Eider, then following the boundary between the old jurisdiction of Slogs and Kjaer, (Slogs Herred and Kjaer Herred);

Thence passing the latter boundary to where it meets the Scheldebek;

Thence the course of the Scheldebek, (Alte Au, Süderau, and Sperre) and wending a sinuous course to the point where the latter bends northward, about 1,500 meters west of Ruttebeul;

Thence a westerly northly direction to meet the North Sea north of Syltsted;

Thence passing north of the Island of Sylt.

The vote above provided for shall be taken within a period not exceeding three weeks after the evacuation of the country by the German troops and authorities.

The result will be determined by the majority of votes cast in the whole of this section. This result will be immediately communicated by the commission to the principal Allied and Associated Governments and proclaimed.

The resulting results in favor of the reincorporation of this territory in the Kingdom of Denmark, the Danish Government, in agreement with the commission, will be entitled to effect occupation with their military and administrative authorities immediately after the proclamation.

4. In the section of the evacuated zone situated to the north of the preceding section and to the north of the boundary established from the Baltic Sea thence towards the north of the islands of Oland and Langeness, the vote will be taken within a period not exceeding five weeks after the plebiscite shall have been held in the last section.

The result shall be determined by the commission (Geminden) in accordance with the majority of the votes cast in each commune. (Gemelden).

Failing a determination on the spot, a frontier line will be fixed by the principal Allied and Associated Powers, according to a line based on the result of the voting, and proposed by the International Commission, and taking into account the particular geographical and economic conditions of the localities in question.

From that time the Danish Government may effect the occupation of these territories which the Danish civil and military authorities may then re-establish in accordance with the provisions of Article 259 of Part IX (financial clauses) and Article 292 of Part X, (economic clauses), Germany accepts definitely the obligations of the Protocols of the present treaties, conventions, and agreements entered into by her with the Baltic States.

The Allied and Associated Powers now formally reserve the rights of Russia to obtain from Germany restitution and reparation based on the principles of the present treaty.

Article 117.—Germany undertakes to recognize the full force of all treaties or agreements which may be entered into by the Allied and Associated Powers with States or other States for the purpose of the former Russian Empire on August 1, 1914, in accordance with the provisions of Article 259 of Part IX (financial clauses) and Article 292 of Part X, (economic clauses), Germany accepts definitely the obligations of the Protocols of the present treaties, conventions, and agreements entered into by her with the Baltic States.

The Allied and Associated Powers now formally reserve the rights of Russia to obtain from Germany restitution and reparation based on the principles of the present treaty.

WAR, EUROPEAN—THE PEACE TREATIES (18)

SECTION I.—GERMAN COLONIES

Article 119.—Germany renounces in favor of the principal Allied and Associated Powers all her rights and titles over her overseas possessions.

Article 120.—All movable and immovable property in such territories as were acquired by the German Empire or by any German State shall pass to the Government exercising authority over such territories on the terms laid down in Articles 116 of Part IX (financial clauses) of the present treaty. The decision of the local courts in any dispute as to the nature of such property shall be final.

Article 121.—The provisions of Section I (concessions and privileges) of Section IV (property, rights, and interests) of Part X (economic clauses) of the present treaty shall apply in the case of these territories whatever of them may be granted.

Article 122.—The Government exercising authority over such territories may make such provisions as it thinks fit with reference to the protection of German nationals, and to the conditions upon which German subjects of European origin shall, or shall not, be allowed to reside, trade, or exercise a profession in them.

The provisions of Article 260 of Part IX (financial clauses) of the present treaty shall apply in the case of all agreements concluded with German nationals for the construction or exploitation of public works in the German overseas possessions, as well as to all sub-concessions or contracts resulting therefrom which may have been made or shall be made with such nationals or with such companies.

Article 123.—Germany hereby undertakes to pay into the Deutsche Bank at Peking on the 1st day of January, 1914, in gold, the sums of ten million marks, which shall be payable at the end of each year, or at any time after the end of the 3rd year, for a term of 15 years, as compensation for the expenses of the evacuation of the German entrenchments and fortifications at the conclusion of the present treaty.

Article 124.—Germany renounces all rights under the conventions and agreements with France of Nov. 4, 1902, and Sept. 25, 1912, relating to the concession at Tientsin. She undertakes to pay to the French Government, in accordance with the estimate to be presented by that Government and approved by the Reparation Commission, all the deposits, credits, advances, &c., effected by the French Government in favor of Germany.

Article 125.—Germany undertakes to accept and observe the agreements made or to be made by the Allied and Associated Powers or some of them with any other power with regard to the trade in arms and spirits, and to the matters dealt with in the general act of Berlin of Feb. 26, 1885, the general act of Brussels of July 2, 1890, and the conventions concluding or modifying the same.

Article 126.—The native inhabitants of the former German overseas possessions shall be entitled to the diplomatic protection of the Governments exercising authority over those territories.

SECTION II.—CHINA.

Article 128.—Germany renounces in favor of China all benefits and privileges resulting from the provisions of the final protocol signed at Peking on Sept. 5, 1901, and from all annexes, notes, and documents supplementary thereto. She likewise renounces in favor of China any claim to indemnities accruing thereunder subsequent to March 14, 1917.

Article 129.—From the coming into force of the present treaty the high contracting parties shall apply in so far as concerns them respectively:
1. The arrangement of Aug. 29, 1902, regarding the new Chinese customs tariff.
2. The arrangement of Sept. 27, 1905, regarding Whang-Poo, and the other arrangements of April 4, 1912. China, however, will no longer be bound to grant to Germany the advantages or privileges which she allowed Germany under these arrangements.

Article 130.—Subject to the provisions of Section VIII of this part, Germany cedes to China all the buildings, wharves and pontoons, barracks, forts, arsenals and munitions of war, vessels of all kinds, wireless telegraph installations and other public property belonging to the German Government, which are situated in the German concessions at Tientsin and Hankow or elsewhere in Chinese territory.

It is understood, however, that premises used as diplomatic or consular residences or offices are not included in the above cession, and, furthermore, that no steps shall be taken by the Chinese Government in respect of the German public and private property situated within the so-called legation quarter at Peking without the consent of the diplomatic representatives of the powers which, on the coming into force of the present treaty, remain parties to the final protocol of Sept. 19, 1901.

Article 131.—Germany undertakes to restore to China within twelve months from the coming into force of the present treaty all the astronomic instruments which her troops in 1900-1901 carried away from China, and to desist from的一切 measures interfering with the free execution of such restoration, including the expenses of dismantling, packing, transporting, insurance, and installation in Peking.

Article 132.—Germany agrees to the abrogation of the leases from the Chinese Government under which the German concessions at Hankow and Tientsin are now held.

China, restored to the full exercise of her sovereign rights in the above areas, declares her intention of opening them to international residence and trade. She further declares that the abrogation of the lease under which these concessions are now held shall not affect the property rights of nationals or Allied and Associated Powers who are holders of lots in these concessions.

Article 133.—Germany waives all claims against the Chinese Government or against any Allied or Associated Power arising out of the internment of German nationals in China before the date of the present treaty. She equally renounces all claims arising out of the capture and condemnation of German ships in China or the liquidation, whether before or after the date of the present treaty, of the property, rights, and interests in that country since Aug. 14, 1917. This provision, however, shall not affect the rights of the parties interested in any such liquidation, which shall be governed by the provisions of Part X (economic clauses) of the present treaty.

Article 134.—Germany renounces, in favor of the Government of the United States of America, the property or rights in the Mississippi River and the Tennessee River, and in the public lands of the Territory of Oregon, and in such other lands as may be determined by the General Treaty, and in the Tibetan State property in the British concessions at Shambu and at Canton. She renounces, in favor of the French and the Chinese Government, the property of the German school situated in the French concession at Shanghai.

SECTION III.—SIAM.

Article 135.—Germany recognizes that all treaties, conventions, and agreements between her and Siam, and all rights, titles, and privileges derived therefrom, including all rights of extraterritorial jurisdiction, terminated as from July 22, 1917.

Article 136.—All goods and property in Siam belonging to the German Empire or to any German State, with the exception of premises used as diplomatic or consular residences or offices, pass ipso facto and without compensation to the Siamese Government.

The goods, property, and private rights of German nationals in Siam shall be dealt with in accordance with the provisions of Part X (economic clauses) of the present treaty.

Article 137.—Germany waives all claims against the Siamese Government on behalf of herself or her nationals arising out of the internment of German ships, the liquidation of German property, or the internment of German nationals in Siam. This provision shall not affect the rights of the parties interested in the proceeds of any such liquidation, which shall be governed by the provisions of Part X (economic clauses) of the present treaty.

SECTION IV.—LIBERIA.

Article 138.—Germany renounces all rights and privileges arising from the arrangements of 1911 and 1912 regarding Liberia, and particularly the offer to nominate a German receiver of customs in Liberia. She further renounces all claims and measures whatsoever which may be adopted for the rehabilitation of Liberia.

Article 139.—Germany recognizes that all treaties and arrangements between her and Liberia terminated as from Aug. 4, 1912.

Article 140.—All property, property rights, and interests of Germans in Liberia shall be dealt with in accordance with Part X (economic clauses) of the present treaty.

SECTION V.—MOROCCO.

Article 141.—Germany renounces all rights, titles, and privileges conferred on her by the general act of Algiers of April 7, 1906, and by the Franco-German agreements of Feb. 10, 1900, and Nov. 4, 1911. All treaties, agreements, arrangements, and contracts co-
WAR, EUROPEAN—THE PEACE TREATIES (18) 541

cluded by her with the Sherifian Empire are regarded as abrogated as from Aug. 3, 1914.

Article 143. Germany takes advantage of these instruments, and she undertakes not to intervene in any way in negotiations relating to Morocco which may take place after the conclusion of the present treaty. For this purpose the German Empire and States shall be deemed to include all the property, rights, interests, claims, or the States, and the private property of the former German Emperor and other royal personages.

All movable and immovable property of Egypt belonging to German nationals shall be dealt with in accordance with Sections III and IV of Part X (economic clauses) of the present treaty.

Article 144. All property and possessions in the Sherifian Empire of the German Empire and the German States pass to the Maghzen without payment. For the purposes of this clause, the property and possessions of the German Empire and States shall be deemed to include all the property of the crown, the empire, or States, and the private property of the former German Emperor and other royal personages.

All movable and immovable property in the Sherifian Empire belonging to German nationals shall be dealt with in accordance with Sections III and IV of Part X (economic clauses) of the present treaty.

Article 145. The German Government shall be entitled to a transfer of a person nominated by the French Government of the shares representing Germany’s portion of the capital of the State Bank of Morocco. The value of the shares, as assessed by the Reparation Commission, shall be paid to the Reparation Commission for the credit of Germany on account of the sums due for reparations. The German Government shall be responsible for indemnifying its nationals so dispossessed. This transfer will take place without prejudice to the repayment of debts subject to the ordinary law.

Article 146. Morocco goods entering Germany shall enjoy the treatment accorded to French goods.

SECTION VI.—EGYPT.

Article 147. Germany declares that she recognizes the protectorate proclaimed over Egypt by Great Britain on Dec. 18, 1914, and that she renounces the régime of the Sherifian Empire. This renunciation shall take effect as from Aug. 4, 1914.

Article 148. All treaties, agreements, arrangements, and understandings, concluded by Germany with Egypt as regarded as abrogated as from Aug. 4, 1914.

In the case of Germany and Egypt, the German Government shall be responsible for indemnifying its nationals so dispossessed. This transfer will take place without prejudice to the repayment of debts subject to the ordinary law.

Article 149.- Until an Egyptian law of judicial organization establishing courts with universal jurisdiction comes into operation, a court of appeal shall be established, by means of decrees issued by his Highness the Sultan for the exercise of jurisdiction over German nationals and property by the British colonial tribunals.

Article 150.- The Egyptian Government shall have complete liberty of action in regulating the status of German nationals and the conditions under which they may establish themselves in Egypt.

Article 151.- Germany consents to the abrogation of the decrees issued by his Highness the Khedive on Nov. 26, 1904, relating to the commission of the Egyptian Government or of changes which the Egyptian Government may think it desirable to make therein.

Article 152.- Germany consents, in so far as she is concerned, to the transfer to his Britannic Majesty’s Government of all property and possessions of Imperial Majesty the Sultan, by the convention signed at Constantinople on Oct. 29, 1888, relating to the free navigation of the Suez Canal. She renounces all participation in the Sanitary, Maritime, and Quarantine Board of Egypt, and consents, in so far as she is concerned, to the transfer to the Egyptian authorities of the powers of that board.

Article 153.- All property and possessions in Egypt of the German Empire and the German States pass to the Egyptian Government without payment. For this purpose the German Empire and States shall be deemed to include all the property, rights, interests, claims, or the States, and the private property of the former German Emperor and other royal personages.

All movable and immovable property of Egypt belonging to German nationals shall be dealt with in accordance with Sections III and IV of Part X (economic clauses) of the present treaty.

Article 154.- Egyptian goods entering Germany shall enjoy the treatment accorded to British goods.

SECTION VII.—TURKEY AND BULGARIA.

Article 155.- Germany undertakes to recognize and accept all arrangements with Bulgaria. Allied and associated Powers may make with Turkey and Bulgaria, with reference to any rights, interests, and privileges whatever, to which might be claimed by Germany or her nationals in Turkey and Bulgaria and which are not dealt with in the provisions of the present treaty.

SECTION VIII.—SHANTUNG.

Article 156.- Germany renounces, in favor of Japan, all her rights, titles, and privileges—particularly those concerning the territory of Kiaochow, railways, mines, and submarine cables, which she acquired in virtue of the treaty concluded by her with China on 6th March, 1898, and of all other arrangements relative to the Province of Shantung.

All German rights in the Tsing-tao-Teinian-Fu railway, including its branch lines, together with its subsidiary property of all kinds, stations, shops, fixed and rolling stock, mines, plant, and material for the exploitation of the mines are and remain acquired by Japan, together with all rights and privileges attaching thereto.

The German State submarine cables from Tsing-tao to Shanghai and from Taipsing to Che Foo, with all the rights, privileges, and properties attaching thereto, are similarly acquired by Japan, free and clear of all charges and inincumbrances.

Article 157.- The movable and immovable property owned by the German State in the territory of Kiaochau, as well as all the rights which Germany might claim in consequence of the works or improvements made or of the expenses incurred by her, directly or indirectly, in connection with this territory, are and remain acquired by Japan, free and clear of all charges and inincumbrances.

Article 158.- Germany shall hand over to Japan within three months from the coming into force of the present treaty the archives, registers, plans, titles, and documents of every kind, wherever they may be, relating to the administrative, whether civil, military, financial, judicial or other, of Kiaochau.

Within the same period Germany shall give particulars to Japan of all treaties, arrangements or agreements relating to the rights, title or privileges referred to in the two preceding articles.

PART V.—MILITARY, NAVAL, AND AERIAL CLAUSES.

In order to render possible the initiation of a general limitation of the armaments of all nations, Germany undertakes strictly to observe the military, naval, and air clauses which follow:

SECTION I.—MILITARY CLAUSES.

Chapter I.— Effectiveness and Cadres of the German Army.

Article 159.- The German military forces shall be demobilized and reduced as prescribed hereinafter.

Article 160.- By April 30, 1920, the number of effectives in the army of the States contributing Germany must not exceed 100,000 men, including officers and establishments, and the army shall be devoted exclusively to the maintenance of order within the territory and to the control of the frontiers.

The total effective strength of officers, including the personnel of staffs, whatever their composition, must not exceed 4,000.
2. Divisions and army corps headquarters staffs shall be established in accordance with Table No. 1 annexed to this section.

The number and strength of the units of infantry and artillery, technical services, and troops laid down in the said table constitute maxima which must not be exceeded.

The following units may each have their own depot:

- An infantry regiment;
- A cavalry regiment;
- A field artillery regiment;
- A field artillery train regiment;
- A field artillery train division;
- A field hospital division;
- A field hospital regiment.

The divisions must not be grouped under more than two army corps headquarters staffs.

The number of batteries of guns differently grouped or of other organizations for the command of troops, or for preparation for war, is forbidden.

The Great German General Staff and all similar organizations shall be dissolved and may not be reconstituted in any form.

The officers, or persons in the position of officers, in the Ministries of War in the different States in Germany in the administrations attached to them, must not exceed three hundred in number and are included in the maximum strength of four thousand laid down in the third sub-paragraph of the first paragraph of this article.

Article 161.—Army administrative services consisting of clerical and technical personnel not included in the number of effective personnel prescribed by the present treaty, shall have a strength of the order of magnitude corresponding to the number of officials, and the number of personal services provided for shall not exceed one-twelfth of one per cent of the personnel of the said services.

The number of gendarmes, employees of the state, officials of the state, and gendarmeries, and of marshals of the court, may only be increased to the extent corresponding to the increase of population since 1913 in the districts or municipalities in which the gendarmeries are organized.

The employees of the courts shall be used for military training.

The reduction of the strength of the German military forces as provided for in Article 160 may be effected gradually in the following manner:

Within three months from the coming into force of the present treaty the number of effectives must be reduced to 1,900,000, and the number of units must not exceed twice the number of those laid down in Table No. 1.

At the expiration of this period, and at the end of each subsequent period of three months, a conference of military experts of the principal Allied and Associated Powers will fix the reductions to be made in the ensuing three months, so that by the 31st of March, 1920, at the latest, the total number of German effective personnel shall not exceed the maximum number of 100,000 men laid down in Article 160. In these successive reductions the same ratio between the number of officers and of men, and between the various kinds of units shall be maintained as is laid down in that article.

Chapter II.—Armament, Munitions, and Material.

Article 164.—Up till the time at which Germany is accepted as a member of the League of Nations the German Army must not possess an armament greater than the amounts fixed in Table No. 2, annexed to this section, with the exception of an optional increase not exceeding one-twenty-fifth part for small arms and one-fiftieth part for guns, which shall be exclusively used to provide for such eventual replacements as may be necessary.

Germany agrees that after she has become a member of the League of Nations the armaments fixed in the said table shall remain in force until the year 1920, when they shall be reduced to the strength permitted under Article 166. The maximum number of guns, machine guns, trench mortars, rifles, and the amount of ammunition and equipment for them, is allowed to be maintained during the period of the coming into force of the present treaty and the date of Article 160, shall be reduced to the amount proportionate to the amount authorized in Table No. 3 annexed to this section as the strength of the German Army is reduced from time to time in accordance with Article 160.

Article 165.—The maximum number of guns, machine guns, trench mortars, rifles, and the amount of ammunition and equipment for them, is allowed to be maintained during the period of the coming into force of the present treaty and the date of Article 160, shall be reduced to the amount proportionate to the amount authorized in Table No. 3 annexed to this section as the strength of the German Army is reduced from time to time in accordance with Article 160. The maximum number of guns, machine guns, trench mortars, rifles, and the amount of ammunition and equipment for them, is allowed to be maintained during the period of the coming into force of the present treaty and the date of Article 160, shall be reduced to the amount proportionate to the amount authorized in Table No. 3 annexed to this section as the strength of the German Army is reduced from time to time in accordance with Article 160.

Article 166.—At the date of March 31, 1920, the stock of munitions which the German Army may have at its disposal shall not exceed the amounts fixed in Table No. 4 annexed to this section.

Within the same period the German Government will store these stocks at points to be notified to the Governments of the principal Allied and Associated Powers. The German Government is forbidden to establish any other stocks, depots, or reserves of munitions.

Article 167.—The number and caliber of the guns constituting the maximum amount which may not be exceeded.

Within two months from the coming into force of the present treaty the maximum stock of ammunition for these guns shall be reduced to, and maintained at, the following uniform rates: Fifteen hundred rounds per piece for those the caliber of which is 10.5 cm. and under; 500 rounds per piece for others.

Article 168.—The manufacture of arms, munitions, or any war material shall only be carried out in factories or works the locations of which shall be communicated to and approved by the Governments of the principal Allied and Associated Powers, and the number of which shall be limited to the number necessary for the manufacture, preparation, storage, or design of arms, munitions, or any war material whatever shall be closed by the 31st of March, 1920.

The stock of munitions shall be reduced by 50 per cent for the manufacture of military material, except such as may be recognized as necessary for equipping the authorized strength of the German Army. The surrender in question will be effected at such points in German territory as may be selected by the said Governments.

Within the same period, arms, munitions, and war material, including anti-aircraft material, of origin other than German, in whatever state they may be, will be delivered to the said Governments, who will decide as to their disposal.

Arms and munitions which on account of the successively reductions in the strength of the German Army become in excess of the amounts authorized by Tables 2 and 3 of the annex shall be handed over to the said Governments, who will decide as to their disposal.

The same applies to materials specially intended for the manufacture, storage, and use of the said products or devices.

The manufacture and the importation into Germany of armored cars, tanks, and all similar constructions suitable for use in war are strictly prohibited.

Chapter III.—Recruiting and Military Training.

Article 172.—Within a period of three months from the coming into force of the present treaty the German Government will disclose to the Governments of the principal Allied and Associated Powers the nature and mode of manufacture of all explosives, toxic substances or other like chemical preparations used by them in the war or prepared by them for the purpose of being so used.
WAR, EUROPEAN — THE PEACE TREATIES (18) 543

Article 174.—The period of enlistment for non-commissioned officers and privates must be twelve consecutive years.

The number of men discharged for any reason before the expiration of their term of service must not exceed in any year 5 per cent. of the total effective force of the army as fixed by the second sub-paragraph of Paragraph 1 of Article 19 of the present treaty.

Article 175.—The officers who are retained in the army must undertake the obligation to serve in it up to the age of forty-five years, at least.

Officers newly appointed must undertake to serve on the active list for twenty-five consecutive years, at least.

Officers who have previously belonged to any formation whatever of the army and who are not retained in the units allowed to be maintained must not take part in any military exercise, whether theoretical or practical, and will not be under any military obligations whatever.

The number of officers discharged for any reason before the expiration of their term of service must not exceed in any year 5 per cent. of the total effective force of the corps retained for the third sub-paragraph of Paragraph 1 of Article 19 of the present treaty.

Article 176.—On the expiration of two months from the coming into force of the present treaty there must only exist in Germany the number of military schools which is absolutely indispensable for the recruitment of the officers of the units allowed. These schools will be exclusively intended for the recruitment of officers of the proportion of one school per arm.

The number of students admitted to attend the courses of the said schools will be strictly in proportion to the year’s strength to be filled in the cadres of officers. The students and the cadets will be reckoned in the effective fixed by the second and third sub-paragraphs of Paragraph 1 of Article 19 of the present treaty.

Consequently, and during the period fixed above, all military academies or similar institutions in Germany, as well as the different military schools for officers, student officers, (aspirants), cadets, non-commissioned officers, or student non-commissioned officers, (aspirants), other than the schools above provided for, will be abolished.

Article 177.—Educational establishments, the universities, schools of discharged soldiers, hunting or tourist clubs, and, generally speaking, associations of every description, whatever be the age of their members, must not occupy themselves with any military matters. In particular they will be forbidden to instruct or exercise their members, or to allow them to be instructed or exercised, in the practice or use of arms.

These societies and associations, educational establishments, universities, and schools must have no connection with the Ministries of War or any other military authority.

Article 178.—All measures of mobilization or appertaining to mobilization are forbidden.

In no case must formations, administrative services, or military staffs institute supplementary cadres.

Article 179.—Germany agrees, from the coming into force of the present treaty, not to accredit nor to send to any foreign government, any military mission, nor to allow any such missions to leave her territory, for the purpose of assisting in the military, naval, or air training thereof, or otherwise for the purpose of giving military, naval, or air instruction in any foreign country.

The Allied and Associated Powers agree, as far as they are concerned, from the coming into force of the present treaty, not to enroll in nor to attach to their armies or naval or air forces any German national for the purpose of assisting in the military training of such armies or naval or air forces, or otherwise to employ any such German national as military, naval, or aeronautic instructor.

The present provision, however, does not affect the right of France to recruit for the Foreign Legion in accordance with French military laws and regulations.

Chapter IV. — Fortifications.

Article 180.—All fortified works, fortresses, and field works situated in German territory to the west of a line drawn fifty kilometers to the east of the Rhine shall be disarmed and dismantled.

Within a period of two months from the coming into force of the present treaty such of the above fortified works, fortresses, and field works as are situated in territory not occupied by Allied and Associated troops shall be disarmed, and within a further period of four months they shall be dismantled. Those which are situated in territory occupied by Allied and Associated troops shall be disarmed and dismantled within such periods as may be fixed by the Allied High Command.

The construction of any new fortification, whatever its nature and importance, is forbidden in the zone referred to in the first paragraph above.

The system of fortified works on the southern and eastern frontiers of Germany shall be maintained in its existing state.

TABLE No. 1. State and Establishment of Army Corps Headquarters Staffs and of Infantry and Cavalry Divisions.

These tabular statements do not form a fixed establishment to be imposed on Germany, but the figures contained in them (number of units and strengths) represent maximum figures which should not in any case be exceeded.

SECTION II.—NAVAL CLAUSES.

Article 181.—After the expiration of a period of two months from the coming into force of the present treaty the German naval forces in commission must not exceed: Six battleships of the Deutschland or Lothringen type, six light cruisers, twelve destroyers, twelve torpedo boats, or an equal number of ships constructed to replace them as provided in Article 190.

No submarines are to be included. All other warships except where there is provision to the contrary in the present treaty, must be placed in reserve or devoted to commercial purposes.

Article 182.—Until the completion of the mine-sweeping prescribed by Article 183, the German navy will keep in commission such number of minesweeping vessels as may be fixed by the Governments of the principal Allied and Associated Powers.

Article 183.—After the expiration of a period of two months from the coming into force of the present treaty the total personnel of the German Navy, including the manning of the fleet, coast defenses, signal stations, administrative, and other land services, must not exceed 125,000, including officers and men of all grades and corps. The total strength of officers and warrant officers must not exceed 1,500. Within two months from the coming into force of the present treaty the personnel in excess of the above strength shall be demobilized. No naval or military corps or reserve force in connection with the navy may be organized in Germany without being included in the above strength.

Article 184.—From the date of the coming into force of the present treaty all the German surface warships which are not in German ports cease to belong to Germany, who renounces all rights over them. Vessels, which, in compliance with the armistice of Nov. 11, 1918, are now interned in the ports of the Allied and Associated Powers, are declared to be finally surrendered. Vessels which are now interned in neutral ports will be there surrendered to the Governments of the principal Allied and Associated Powers. The German Government's notification to effect the transfer of the German surface warships to the Governments of the principal Allied and Associated Powers in such allied ports as the said powers may direct. These warships will have been disarmed as provided in Article 23 of the armistice, dated Nov. 11, 1918. Nevertheless, they must have all their guns on board.

Battleships—Oldenburg, Thuringen, Ostfriesland, Helgoland, Posen, Westfalen, Rheninland, and Nassau.

Light Cruisers—Stettin, Danzig, Lübeck, Stralsund, Augsburg, Kolberg, and Stuttgart.

And in addition forty-two modern destroyers and fifty modern torpedo boats, as chosen by the Governments of the principal Allied and Associated Powers.

Article 186.—On the coming into force of the present treaty the German Government must undertake, under the supervision of the Governments of the principal Allied and Associated Powers, to break up or destroy all of the German surface warships now under construction.

Article 187.—The German auxiliary cruisers and fleet auxiliaries enumerated below will be disarmed and treated as merchant ships.

Ships interned in neutral countries: Berlin, Santa Fé, Seydlitz, Yorck.

Article 188.—On the expiration of one month from the coming into force of the present treaty the German submarines, salvage vessels, and docks for submarines, including the tubular dock, must have been handed over to the Governments of the principal Allied and Associated Powers. Such of these submarines, vessels, and docks as are considered to be fit to proceed under their own power to the ports of the powers shall be taken by the German Government into such allied ports as have been indicated and used for German war vessels, and also those in course of construction, shall be broken up entirely by the German Government under the supervision of the said Governments. The payment required must be completed within three months at the most after the coming into force of the present treaty.

Article 189.—Articles concerning the material arising from the breaking up of German warships of all kinds, whether surface vessels or submarines, may not be used except for purely industrial or commercial purposes. They may not be sold or disposed of to foreign countries.

Article 190.—Germany is forbidden to construct or acquire any warships other than those intended to replace the units in commission provided for in Article 181 of the present treaty. The warships intended for replacement purposes as above shall not exceed the following displacement: Armored ships, 10,000 tons; light cruisers, 6,000 tons; destroyers, 500 tons; torpedo boats, 200 tons. Except where a ship may be lost, units of the different classes shall only be replaced at the end of a period of twenty years in the case of battleships and cruisers, and fifteen years in the case of destroyers and torpedo boats, counting from the launching of the ship.

Article 191.—The construction or acquisition of any submarine, even for commercial purposes, shall be forbidden in Germany.

Article 192.—The warships in commission of the German fleet must only have on board or in reserve the allowances of arms, munitions, and war material of all kinds, including mines and torpedoes, now in the hands of the German Government and in excess of the said quantities, shall be surrendered to the Governments of the said powers at places to be indicated by them. Such arms, munitions and war material will be destroyed or rendered useless. All other stocks, depots or reserves of arms, munitions or naval war material of all kinds shall be forbidden. The German navy shall not receive any new arms, munitions, or war material articles in German territory for, and their export to foreign countries shall be forbidden.

Article 193.—On the coming into force of the present treaty Germany will forthwith sweep up the mines in the North Sea, that is to say, in the area to the eastward of longitude 4 degrees 00 minutes east of Greenwich: (1) Between parallels of latitude 53 degrees 00 minutes N. and 59 degrees 59 minutes N. (2) to the northward of latitude 60 degrees 30 minutes N. Germany must keep these areas free from mines. Germany must also sweep and keep free from mines such areas in the Baltic as may ultimately be notified by the Governments of the principal Allied and Associated Powers.

Article 194.—The personnel of the German Navy shall be recruited entirely by voluntary engagements entered into for a minimum period of twenty-five con
WAR. EUROPEAN — THE PEACE TREATIES (18) 845

secure years for officers and warrant officers, and
the number engaged to replace these charges for
any loss or destruction or expiration of their term of
service must not exceed 5 per cent. per annum of the
total strength of the present treatment. The charges
required under the third heading, which are not
belonging to the German Navy and not demobilized
must engage to serve till the age of 45 unless dis-
charged by the Governments of the principal Allied and
Associated Powers. Delivery must be at such
places as the said Governments may select, and must be
completed within three months. In particular, this ma-
terial will include all items under the following heads,
which are or have been in use or were designed for
warlike purposes:

Complete airplanes and seaplanes, as well as those
being manufactured, repaired, or assembled.

Plant for the manufacture of hydrogen.

Dirigible sheds and shelters of every kind for air-
craft.

Pending their delivery, dirigibles will, at the ex-
change of Germany, be supplied with hydrogen;
the plant for the manufacture of hydrogen, as well as the sheds for dirigibles, may, at the discretion
of Germany, be kept until the time when the dirigibles are handed over.

Engines for aircraft.

Nacelles and fuselages.

Armament, (guns, machine guns, light machine guns,
bomb-dropping apparatus, torpedo-dropping apparatus, and synchronization apparatus, etc.)

Munitions, (cartridges, shells, bombs, loaded or un-
loaded, stocks of explosives, or material for their manu-
facture).

Instruments for use on aircraft.

Wireless apparatus and photographic or cinematogra-
phic apparatus for use on aircraft.

Component parts of any of the items under the
mention heads.

The material referred to above shall not be removed
without special permission from the said Governments.

SECTION IV.—INTERALLED COMMISSIONS OF

CONTROL.

Article 203.—All the military, naval, and air
clauses contained in the present treaty, for the execu-
tion of which a time limit is prescribed, shall be exe-
cuted by Germany under the control of interalled
commissions specially appointed for this purpose by the
principal Allied and Associated Powers.

Article 204.—The Interalled Commissions of

Control will be specially charged with the duty of seeing
to the complete execution of the delivery, destruction,
demolition, and rendering things useless to be carried
out at the expense of the German Government in ac-
cordance with the present treaty. They will communi-
cate to the German authorities the decisions which the
principal Allied and Associated Powers have reserved
to the right to take, or which the authorities of the military,
naval, and air clauses may necessitate.

Article 205.—The Interalled Commissions of Con-

trol may establish their organization in the

Central German Government. They shall be enti-
eted as often as they think desirable to proceed to any
point whatever in German territory, or to send sub-
commissions, or to authorize one or more of their mem-
bers to go, to any such point.

Article 206.—The German Government must give all
necessary facilities for the accomplishment of their
missions to the Interalled Commissions of Control and
to their members. It shall attach a qualified repre-
sentative to each Interalled Commission of Control for
the purpose of receiving the communications which the
commission may have to address to the German Gov-
ernment, and of supplying it with procuring for the com-
mission all information or documents which may be re-
quired. The German Government must in all cases
furnish at its own cost all labor and material required
to effect the deliveries and the work of destruction,
dismantling, demolition, and of rendering things use-
less, provided for in the present treaty.

Article 207.—The upkeep and cost of the Commis-

sions of Control and the expenses involved by their
work shall be borne by Germany.

Article 208.—The Military Interalled Commission
of Control will represent the principal Allied and
Associated Powers in dealing with the

German Government in all matters concerning the ex-
cution of the military clauses. In particular it will be
its duty to receive from the German Government the
notifications relating to the location of the storage
depots of munitions, the armaments of the fortified
works, fortresses and forts which Germany is allowed
to retain, and the location of the works or factories
for the production of arms, munitions and war material and their operations. It will take delivery of the arms, munitions, and war material at the point where such delivery is to be effected, and will supervise the removal from and demolition of all rendering things useless which are to be carried out in accordance with the present treaty. The German Government must furnish to the Military Interallied Commission of Control all such information and documents as the latter may deem necessary to insure the complete execution of the naval clauses, and in particular, the true and complete account of all naval vessels, of which the German Government may have knowledge, including the breaking up of the ships which are under construction there, to take delivery of all surface ships or submarines, salvage ships, dockyard, naval dockyard, and to supervise the destruction and breaking up provided for in the naval clauses. The German Government shall also deliver to the Naval Interallied Commission of Control all such information and documents as the commission may deem necessary to insure the complete execution of the naval clauses, in particular the design of the warships, the composition of their armaments, the details and models of the guns, munitions, torpedoes, mines, explosives, wireless telegraphic apparatus and in general everything relating to naval war material, as well as all legislative or administrative measures or regulations.

Article 210.—The Aeronautical Interallied Commission of Control will represent the Governments of the principal Allied and Associated Powers in dealing with the German Government in all matters concerning the execution of the naval clauses. In particular it will be its duty to issue the complete execution of the naval clauses, in particular the design of the war ships, the composition of their armaments, the details and models of the guns, munitions, torpedoes, mines, explosives, wireless telegraphic apparatus and in general everything relating to naval war material, as well as all legislative or administrative measures or regulations.

Article 211.—After the expiration of a period of three months from the coming into force of the present treaty, the German Government shall be required to furnish the Aeronautical Interallied Commission of Control all such information and legislative or administrative measures or regulations as the commission may require to insure the complete execution of the aeronautical clauses, and, in particular, the design of the aircraft, the composition of their armaments, the details and models of the engines, propellers, arms, munitions, and explosives capable of being used by aircraft, to visit all aerodromes, sheds, landing grounds, parks, and depots, to authorize, where necessary, a removal of material, and to take delivery of such material as the commission may require. The German Government must furnish to the Aeronautical Interallied Commission of Control all such information and legislative or administrative measures or regulations as the commission may require to insure the complete execution of the aeronautical clauses, and, in particular, the list of the personnel belonging to all the German aviation forces, and of the existing material as well as of that in process of manufacture or on order, and a list of all establishments working for aviation of their positions, and of all sheds and landing grounds.

SECTION V.—GENERAL ARTICLES.

Article 212.—The following portions of the armistice of Nov. 11, 1918: Article VI, the first two and the sixth and seventh paragraphs of Article VII, Article IX, Clauses I, II, and V of Annex No. 2 and the protocol, dated April 4, 1919, supplementing the armistice of Nov. 11, 1918, remain in force so far as they are not inconsistent with the above stipulations to the present treaty shall be maintained in conformity with this part of the present treaty. Within the same period all the administrative or other measures relating to the execution of this part of the treaty must have been taken.

Article 213.—So long as the present treaty remains in force, Germany undertakes to give every facility for any investigation which the Council of the League of Nations, acting if need be by a majority vote, may consider necessary.

PART VI.—PRISONERS OF WAR AND GRAVES.

SECTION I.—PRISONERS OF WAR.

Article 214.—The repatriation of prisoners of war and interned civilians shall take place as soon as possible after the coming into force of the present treaty and shall be carried out with the greatest rapidity.

Article 215.—The repatriation of German prisoners of war and interned civilians shall, in accordance with Article 214, be carried out by a commission composed of representatives of the Allied and Associated Powers on the one part, and of the German Government on the other part.

Farewell to the Allied and Associated Powers a sub-
commission composed exclusively of representatives of

the interested powers and of delegates of the German Government shall regulate the details of carrying into effect the repatriation of prisoners of war and interned civilians.

Article 216.—From the time of their delivery into the hands of their respective possessions to the imprisonment of their homes by the said authorities. Those among them who are habitually resident in territory occupied by the troops of the Allied and Associated Powers are likewise to be sent to their homes, subject to the jurisdiction of the military authorities of the Allied and Associated Armies of Occupation.

Article 217.—The whole cost of repatriation from the moment of starting shall be borne by the German Government, who shall also provide the land and sea transport and staff considered necessary by the commission referred to in Article 215.

Article 218.—Prisoners of war and interned civilians awaiting disposal or undergoing sentences for offenses against discipline shall be repatriated irrespective of the completion of their sentence or of the proceedings pending against them.

This also shall be applicable to prisoners of war and interned civilians punished for offenses committed subsequent to May 1, 1919.

During the period of repatriating their repatriation all prisoners of war and interned civilians shall remain subject to the existing regulations, more especially as regards work and food, and in regard to prisoners of war and interned civilians who are awaiting disposal or undergoing sentence for offenses other than those against discipline mentioned.

Article 219.—The German Government undertakes to admit to its territory without distinction all persons liable to repatriation.

Prisoners of war and interned civilians of other nationalities who do not desire to be repatriated may be excluded from repatriation; but the Allied and Associated Governments reserve to themselves the right either to repatriate them or to take them to a neutral country or to allow them to reside in their own territory.

The German Government undertakes not to institute any exceptional proceedings against these persons or their families in the territories of the Allied and Associated Powers or to take any measures of any kind whatsoever against them on this account.

Article 220.—The Allied and Associated Governments reserve the right to make the repatriation of German prisoners of war or German nationals in their hands conditional upon the immediate notification and release by the German Government of any prisoners of war who are nationals of the Allied and Associated Powers and may still be in Germany.

Article 221.—Germany undertakes:

1. To give every facility to the commissions to inquire into the cases of those who cannot be traced; to furnish such commissions with all necessary means of transport; to allow them access to camps, prisons, hospitals, and all other places; and to place at their disposal all documents in their files, both public and private, which would facilitate their inquiries.

2. To impose penalties upon any German officials or private persons who shall obstruct or evade the provisions of the present treaty, or of the treaties with which the nationalities of any of the Allied and Associated Powers, or have neglected to reveal the presence of any such after it had come to their knowledge.

Article 222.—Germany undertakes to restore without delay from the date of the coming into force of the present treaty all articles, money, securities, and documents which have belonged to nationals of the Allied and Associated Powers and which have been retained by the German authorities.

Article 223.—The high contracting parties waive reciprocally all claims for sums due for the maintenance of prisoners of war in their respective territories.

SECTION II.—GRAVES.

Article 224.—The Allied and Associated Governments and the German Government will cause to be respected and maintained the graves of the soldiers and sailors buried in their respective territories.

They agree to recognize any commission appointed by an Allied or Associated Government for the purpose of identifying, registering, caring for, or erecting suitable memorials on the said graves and to facilitate the work of the commission.

Furthermore, they agree to afford, so far as the provisions of the present treaty shall allow, every facility for giving effect to requests that the bodies of their soldiers and sailors be transferred to their own countries.

Article 225.—The graves of prisoners of war and
WAR, EUROPEAN — THE PEACE TREATIES (18) 547

interred civilians who are nationals of the different belligerent States and have died in captivity shall be properly maintained in accordance with Article 235 of the present treaty.

The Allied and Associated Governments on the one hand and the Government of Germany on the other part, reciprocally undertake also to furnish to each other:
1. A complete list of those who have died, together with reliable and authentic data for its verification.
2. All information as to the number and position of the graves of all those who have been buried without identification.

PART VII.—PELIMONIES.

Article 217.—The Allied and Associated Powers publicly assign William II of Hohenzollern, formerly German Emperor, for a supreme offense against international morality and the sanctity of treaties, to the mercy of the Allies.

A special tribunal will be constituted to try the accused, thereby assuring him the guarantees essential to the right of defense. It will be composed of five judges, one appointed by each of the following powers: The United States of America, Great Britain, France, Italy, and Japan.

In its decision, the tribunal will be guided by the highest motives of international policy with a view to vindicating the solemn obligations of international undertakings and the validity of international morality. It will then fix the punishment which it considers should be imposed.

The Allied and Associated Powers will address a request to the Government of the Netherlands for the surrender to them of the ex-Emperor in order that he may be put on trial.

Article 218.—The German Government recognizes the right of the Allied and Associated Powers to bring before military tribunals persons accused of having committed acts in violation of the laws and customs of war. Such persons shall, if found guilty, be sentenced to punishments laid down by law. This provision will apply, notwithstanding any proceedings or prosecution before a tribunal in Germany or in the territory of her allies.

The German Government shall hand over to the Allied and Associated Powers or to such one of them as shall so request, all persons accused of having committed acts in violation of the law and customs of war who are specified either by name or by the rank, office, or employment which they held under the German authorities.

Article 219.—Persons guilty of criminal acts against the nationals of one of the Allied and Associated Powers will be brought before military tribunals composed of members of the military tribunals of the powers concerned.

In every case the accused will be entitled to name his counsel and witnesses.

Article 220.—The German Government undertakes to furnish all documents and information of every kind, the production of which may be considered necessary to insure the full knowledge of the incriminating acts, the identity of offenders, and the just appreciation of responsibility.

PART VIII.—REPARATION.

SECTION I.—GENERAL PROVISIONS.

Article 231.—The Allied and Associated Governments affirm, and Germany accepts, the responsibility of Germany and her allies for causing all the loss and damage to which the Allied and Associated Governments and their nationals have been subjected as a consequence of the war imposed upon them by the aggression of Germany and her allies.

Article 232.—The Allied and Associated Governments recognize that the resources of Germany are not adequate to the discharge of the reparation, including the payment of the indemnities of such resources which will result from other provisions of the present treaty, to make complete reparation for all such loss and damage.

The Allied and Associated Governments, however, require and German Government undertakes that she will make reparation for all damage to the civilian population of the Allied and Associated Powers and to their property caused by the aggression of Germany and her allies on land, sea, and in the air, and in violation of the rules of international law.

In accordance with Germany's pledges, already given as to complete restoration for Belgium, Germany undertakes, in addition to the compensation for damage elsewhere in this chapter provided for, as a consequence of the violation of the treaty of 1839, to reimburse all sums which Belgium has borrowed in gold in order to meet the reparations from Nov. 11, 1918, together with interest at the rate of 5 per cent. per annum on such sums. This amount shall be determined by the Reparation Commission and the German Government undertakes thereupon forthwith to make a special issue of bearer bonds to an equivalent amount payable in gold marks, on May 26, 1926, or, at the option of the German Government, on the 1st of May in any year up to and including 1925. Subject to the foregoing, the form of such bonds shall be determined by the Reparation Commission. Such bonds shall be handed over to the German Government, which has authority to take and acknowledge receipt thereof on behalf of Belgium.

Article 233.—The amount of the above damage for which compensation is to be made by Germany shall be determined by an independent Commission, which has authority to take and acknowledge receipt thereof on behalf of Belgium.

The findings of the commission as to the amount of damage defined as above shall be concluded and subjected to the German Government on or before the 1st of May, 1921, representing the extent of that Government's obligations.

The commission shall concurrently draw up a schedule of payments prescribing the time and manner of the discharge of their obligations. The period of thirty years from the 1st of May, 1919. If, however, within the period mentioned, Germany fails to discharge her obligations, or to effectual restitutions unpaid may, within the discretion of the commission, be postponed for settlement in subsequent years, may be handled otherwise in such manner as the Allied and Associated Governments, acting in accordance with the procedure laid down in this part of the present treaty, shall determine.

Article 234.—The Reparation Commission shall after the 1st of May, 1921, from time to time consider the resources and capacity of Germany and, after giving her representatives a just opportunity to be heard, shall have discretion to extend the date and to modify the form of payments, such as are to be provided for in accordance with Article 233 but not to cancel any part, except with the specific authority of the several Governments represented upon the commission.

Article 235.—In order to enable the Allied and Associated Powers to proceed at once to the restoration of their industrial and national life, pending the full determination of their claims, Germany shall pay such installments and in such manner (whether in gold, commodities, ships, securities, or otherwise) as the Reparation Commission may fix, during 1919, 1920, and the first four months of 1921, the equivalent of 20,000,000,000 gold marks.

Out of this sum the expenses of the armies of occupation subsequent to the armistice, including those of November, 1918, shall first be met, and such supplies of food and raw materials as may be judged by the Governments of the principal Allied and Associated Powers to be essential to enable Germany to meet her obligations for reparation may also, with the approval of the said Governments, be paid for out of the above sum. The balance shall be reckoned toward liquidation of the amounts due for reparation.

Germany shall further deposit bonds as prescribed in Paragraph 12 (c) of Annex II hereto.

Article 236.—Germany further agrees to the direct application of her economic resources to reparation as specified in Annexes III, IV, V, and VI, relating respectively to merchant shipping, coal and other minerals, raw materials, and to coal and derivatives of coal, and to dyestuffs and other chemical products, provided always that the value of the property transferred and any services rendered by her under these annexes, assessed in the manner therein prescribed, be credited to her toward liquidation of her obligations under the above articles.

Article 237.—The successive installments, including the above sum, paid over by Germany in satisfaction of her reparation claims, will be divided by the Allied and Associated Governments in proportion to the damages determined upon by them in advance on a basis of general equity and of the right of each.

For the purposes of this division the value of
WAR, EUROPEAN— THE PEACE TREATIES (18)

property transferred and services rendered under Article 243 and under Annexes III, IV, V, VI, and VII to the same manner as cash payments effected in that year.

Article 238.—In addition to the payments mentioned above, Germany shall in accordance with the procedure laid down by the Reparation Commission, make restitution of cash, of other assets for direct or indirect losses, as well as for the restitutions of all other such objects of every nature, and securities taken away, sei'ded, or otherwise removed from their possession, which it proves possible to identify them in territory belonging to Germany or her allies.

The said procedure is laid down in accordance with the provisions of the armistice of 11th of November, 1918, and its renewals and the protocols thereto.

Article 239.—Germany undertakes to make forthwith the restitution contemplated by Article 238 and to make the payments and deliveries contemplated by Articles 233, 234, 235, and 236.

The Government recognizes the commission for the purpose of Article 233 as the same may be constituted by the Allied and Associated Governments in accordance with Annex II and agrees irrevocably to the possession and exercise by such commission of the powers and authority thereto given by Articles 235, 236 and 238, and that said commission shall in all the particulars mentioned in Annex II, and according to the provisions of Article 235, act on behalf of Germany and her nationals, whether they are persons of the United States or their nationals, with the exception of naval and military works of war materials, which have been destroyed, damaged, or otherwise removed or disposed of, by order of the Government of Germany or her allies, or from the air, or from the land, by enemy agents, or otherwise.

The Government will accord to the members of the commission and its authorized agents the same rights and immunities as are enjoyed by Germany by duly accredited diplomatic agents of friendly powers.

The Government further agrees to provide for the salaries and expenses of the commission, and of such staff as it may employ.

Article 241.—Germany undertakes to pass, issue, and maintain in force any legislation, orders, and decrees that may be necessary to give complete effect to these clauses.

Article 242.—The provisions of this part of the present treaty do not apply to the property, rights, and interests referred to in Sections III and IV of Part X (economic clauses) of the present treaty, nor to the production of their liquidation, except so far as concerns any final balance in favor of Germany under Article 241 (a).

Article 243.—The following shall be reckoned as credits to Germany in respect of her reparation obligations:

(a) Any final balance in favor of Germany under Sections III and IV of Part X (economic clauses) and Section V (Alsace-Lorraine) of Part III, (political clauses for Europe).

(b) Amounts due to Germany in respect of transfers under PartIX, (financial clauses), Part XII, (political clauses for Europe), and Section XXVIII (Sarre Basin) of Part III, (political clauses for Europe).

(c) Amounts which in the judgment of the Reparation Commission should be credited to Germany on account of any other transfers under the present treaty of property, rights, concessions, or other interests.

In no case, however, shall credit be given for property restored in accordance with Article 218.

Article 244.—The transfer of the German submarine cables which do not form the subject of particular provisions of the present treaty is regulated by Annex VII hereto.

ANNEX I

Compensation may be claimed from Germany under Article 212 above in respect of the total damage under the following categories:

1. Casualties to injured persons and to surviving dependents by personal injury to or death of civilians caused by acts of war, including bombardments or other attack, and to persons and property, including the direct consequences thereof, and of all operations of war by the two groups of belligerents wherever arising, including damage or death of civilians caused by acts of violence, or maltreatment, (including injuries to life or health, as a consequence of imprisonment, deportation, internment, or evacuation, of exposure at sea, or of being forced to labor by Germany or her allies, wherever arising, and to the surviving dependents of such victims.

2. Damage caused by Germany or her allies in their own territory or in occupied or invaded territory to civilians victims of all acts of violence, or maltreatment, whether committed by the parties in conflict, whether mutilated, wounded, sick, or invalided, and to the dependents of such victims, the amount due to the Allied and Associated Governments being calculated for each of them as being the capitalized cost of such damages and compensations at the date of the coming into force of the present treaty, on the basis of the scales in force in France at such date

3. The cost of assistance by the Governments of the Allied and Associated Powers to prisoners of war and to their families and dependents.

4. Allowances to the Governments of the Allied and Associated Powers to the families and dependents of mobilized persons or persons serving with the forces, the amounts to be determined by the Allied and Associated Governments in accordance with the principles laid down in Annex II and the provisions of the present treaty, on the basis of the scales in force in France at such date

5. Damage caused to civilians by Germany or her allies in their own territory or in occupied or invaded territory to civilians victims of all acts of violence, or maltreatment, whether committed by the parties in conflict, whether mutilated, wounded, sick, or invalided, and to the dependents of such victims, the amount due to the Allied and Associated Governments being calculated for each of them as being the capitalized cost of such damages and compensations at the date of the coming into force of the present treaty, on the basis of the scales in force in France at such date

6. The cost of assistance by the Governments of the Allied and Associated Powers to prisoners of war and to their families and dependents.

7. Allowances to the Governments of the Allied and Associated Powers to the families and dependents of mobilized persons or persons serving with the forces, the amounts to be determined by the Allied and Associated Governments in accordance with the principles laid down in Annex II and the provisions of the present treaty, on the basis of the scales in force in France at such date

8. Damage caused to civilians by Germany or her allies in their own territory or in occupied or invaded territory to civilians victims of all acts of violence, or maltreatment, whether committed by the parties in conflict, whether mutilated, wounded, sick, or invalided, and to the dependents of such victims, the amount due to the Allied and Associated Governments being calculated for each of them as being the capitalized cost of such damages and compensations at the date of the coming into force of the present treaty, on the basis of the scales in force in France at such date

9. Damage in the form of levies, fines and other similar exactions imposed by Germany or her allies upon the civilian population.

ANNEX II

1. The commission referred to in Article 233 shall be called "The Reparation Commission," and is hereinafter referred to as "the commission." The commission shall be constituted by the United States of America, Great Britain, France, Italy, Japan, Belgium, and the Serb-Croat-Slovene State. Each of these powers shall appoint one delegate and one assistant delegate, who shall vote in case of absence, and in other cases shall vote as a quorum. On occasion the delegation of five of the above powers shall have the right to take part in the proceedings of the commission only as observers. The delegates of the United States, Great Britain, France, and Italy shall have this right on all occasions. The delegate of Belgium shall have this right on all occasions other than those referred to below. The delegate of Japan shall have this right on occasions when questions relating to the rights of the Allied and Associated Powers are raised under Article 260 of Part IX (financial clauses), in which Japanese interests are concerned. The delegate of the Serb-Croat-Slovene State shall have this right when questions relating to Austria, Hungary, or Bulgaria are under consideration.

Each Government represented on the commission shall have the right to withdraw therefrom upon twelve months notice, filed with the commission and confirmed in the course of the sixth month after the date of the original notice.

3. Such of the other Allied and Associated Powers as may be interested shall have the right to appoint a delegate to be present and act as assessor only while their respective claims and interests are under examination or discharge, but without the right to vote.

4. In case of the death, resignation or recall of any delegate, assistant delegate, or successor to him shall be nominated as soon as possible.

5. The commission shall have its principal permanent bureaus in Paris, and shall hold its meetings in Paris as soon as practicable after the coming into force of the present treaty, and thereafter will meet in such place, on such days, and for such periods as it may deem convenient and as may be necessary for the most expeditious transaction of business.

6. At its first meeting the commission shall elect from among the delegates referred to above a Chairman and a Vice-Chairman, who shall hold office for one year and shall be eligible for re-election.
marks gold bearer bonds, bearing interest at 3¼ per cent. per annum between 1921 and 1926, and thereafter at 5 per cent. per annum, with an additional 1 per cent. for amortization beginning in 1926 on the whole amount of the issue.

Third. To be delivered forthwith a covering under-taking in writing, to issue when, but not until, the commission is satisfied that Germany has met such interest and sinking fund obligations, a further in-stallment of 40,000,000,000 marks gold 5 per cent. bearer bonds, the time and manner of payment, the amount of principal and interest to be determined by the commission.

The dates for payment of interest, the manner of applying the amortization fund, and all other questions relating to the issue, management, and regulation of the bond issue shall be determined by the commission from time to time.

Further issues by way of acknowledgment and security may be required as the commission subsequently determines from time to time.

(d) In the event of bonds, obligations, or other evidence of indebtedness issued by Germany by way of security for or acknowledgment of her reparation debt being disposed of outright, not by way of pledge, to persons other than the several Governments in whose favor Germany's original reparation indebtedness was created, an amount equal to such reparation indebtedness shall be deemed to be extinguished corre-sponding to the nominal value of the bonds, etc., so disposed of outright, and obligation of Germany in respect of such bonds shall be confined to her liabili-ties to the holders of the bonds, as expressed upon their face.

(e) The damage for repairing, reconstructing, and rebuilding property in the invaded dis-tricts, including reinstallation of furniture, machinery and other equipment, will be calculated according to the cost at the dates when the work is done.

(f) Decisions of the commission relating to the total or partial cancellation of the capital interest of any verified debt of Germany must be accompanied by a statement of its reasons.

13. As to voting, the commission will observe the following rules:

When a decision of the commission is taken, the votes of all the delegates entitled to vote, in the absence of any of them, of their assistant delegates, shall be recorded. Abstention from voting is to be treated as a vote against the proposal under discussion. Assemblers have no vote.

On the following questions unanimity is necessary: (a) Questions involving the sovereignty of any of the Allied and Associated Powers, or the cancellation of the whole or any part of the debt or obligations of Germany.

(b) Questions of determining the amount and conditions of bonds or other obligations to be issued by the German Government and of fixing the time and manner for selling, negotiating, and disposing of said bonds.

(c) Any postponement, total or partial, beyond the end of 1929, of the payment of installments falling due between the 1st May, 1921, and the end of 1926 inclusive.

(d) Any postponement, total or partial, of any installment falling due after 1926 for a period exceeding three years.

(e) Questions of applying in any particular case a method of measuring damages different from that which has been previously applied in a similar case.

(f) Questions of the interpretation of the provisions of this part of the present treaty.

All other questions shall be decided by the vote of a majority.

In case of any difference of opinion among the delegates, which cannot be solved by reference to their Governments, upon the question whether a given case is one which requires a unanimous vote for its deci-sion or not, such difference shall be referred to the immediate arbitration of some international tribunal to be agreed upon by the Governments, whose award the Allied and Associated Governments agree to accept.

14. Decisions of the commission with the powers conferred upon it, shall forthwith become binding and may be put into immediate execution without further proceedings.

15. The commission will issue to each of the interested powers, in such form as the commission shall fix:

First: A certificate stating that it holds for the account of each of the said powers, a copy of the certificate, on the demand of the power concerned, being divisible in a number of parts not exceeding five:

Second. From time to time certificates stating the
goods delivered by Germany on account of her reparation debt which it holds for the account of the said powers.

The said certificates shall be registered, and, upon notice to the commission, may be transferred by indorsement.

When bonds are issued for sale or negotiation, and when securities are delivered by the commission, certificates to an equivalent value must be withdrawn.

16. Interest shall be debited to Germany as from 1st May, 1921, in respect of her debt as determined by the commission, after allowing for sums already covered by cash payments or their equivalent, or by bonds issued in consideration of the commission's surrender of vessels No. 243. The rate of interest shall be 5 per cent., unless the commission shall determine at some future time that circumstances justify a variation of this rate.

The commission, in fixing on 1st May, 1921, the total amount of the debt of Germany, may take account of interest due on sums arising out of the reparation of material damage as from 11th November, 1918, up to 1st May, 1921.

17. In case of default by Germany in the performance of any obligation under this part of the present treaty, the commission will forthwith give notice of such default to each of the interested powers and may make such recommendations as seem to it necessary in consequence of such default as it may think necessary.

18. The measures which the Allied and Associated Powers shall have the right to take, in case of voluntary default by Germany which the Allied and Associated Governments do not regard as acts of war, may include economic and financial prohibitions and reprisals and in general such measures as may be considered necessary by the Allied and Associated Governments.

19. Payments required to be made in gold or its equivalent on account of the principal claims of the Allied and Associated Powers may at any time be accepted by the commission in the form of credits or cheques, properties, commodities, businesses, rights, concessions, within or without German territories, ships, bonds, shares or other securities of any kind, or in any other currency or currencies of Germany and the other States, the value of such substitutes for gold being fixed at a fair and just amount by the commission itself.

20. The commission, in fixing or accepting payment in specified properties or rights, shall have due regard for any legal or equitable interests of the Allied and Associated Powers or of neutral powers or of their nationals therein.

21. No member of the commission shall be responsible, except to the Government appointing him, for any action or omission as such member. No one of the Allied or Associated Governments assumes any responsibility in respect of any other Government.

22. Subject to the provisions of the present treaty this annex may be amended by the unanimous decision of the Governments representing the powers upon which it is based.

23. All amounts due from Germany and her allies under the present treaty or the decisions of the commission have been discharged and all sums received by the other sides have been distributed to the powers interested, the commission shall be dissolved.

ANNEX III

1. Germany recognizes the right of the Allied and Associated Powers to the replacement, ton for ton (gross tonnage) and class for class, of all merchant ships and fishing boats lost or damaged owing to the war.

Nevertheless, and in spite of the fact that the tonnage of German shipping at present in existence is much less than that lost by the Allied and Associated Powers in consequence of the German aggression, the right thus recognized will be enforced on German ships and boats under the following conditions:

The German Government on behalf of itself and so as to bind all other persons interested, cede to the Allied and Associated Governments the property in all the German merchant ships which are of 1,600 tons gross and upward; in one-half, reckoned in tonnage, of the ships which are under 1,600 tons gross; in one-quarter, reckoned in tonnage, of the ships which are of 1,600 tons gross and upward; in one-quarter, reckoned in tonnage, of the other fishing boats.

2. The German Government will, within two months of the coming into force of the present treaty, declare to the Reparation Commission all the ships and boats mentioned in Paragraph 1.

3. Germany agrees to cause merchant ships to be built in German yards for the purpose of the Allied and Associated Governments as follows:

(a) Within three months of the coming into force of the present treaty, the commission will notify to the Government the amount of tonnage to be laid down in German shipyards in each of the two years next succeeding the coming into force of the present treaty.

(b) Within twenty-four months of the coming into force of the present treaty, the commission will notify to the German Government the amount of tonnage to be laid down in each of the three years following the two years mentioned above.

(c) The amount of tonnage to be laid down in each year shall be divided equally between the two, two-thirds of the tonnage to be laid down in the third year.

(d) The specifications of the ships to be built, the conditions under which they are to be built and delivered, the price per ton at which they are to be accounted for by the Reparation Commission, and all other questions affecting the design, building, and delivery of the ships, shall be determined by the commission.

6. Germany undertakes to restore in kind and in normal condition of upkeep to the Allied and Associated Powers, within two months of the coming into force of the present treaty, in accordance with procedure to be laid down by the Reparation Commission, any boats and other movable appliances belonging to inland navigation which since the 1st August, 1914, have been of whatever character, come into her possession or into the possession of her nationals, and which can be identified.

With a view to make good the loss in inland navigation tonnage, from whatever cause arising, which has been incurred during the war by the Allied and Associated Powers, and which cannot be made good by means of the restitution prescribed above, Germany agrees to cede to the Reparation Commission a portion of the German river fleet up to the amount of loss mentioned above, provided that such cession shall not exceed the aggregate value of the river fleet as it existed on the 15th November, 1918.

The condition of this section shall be settled by the arbitrators referred to in Article X (ports, waterways and railways) of the present treaty, who are charged with the settlement of all difficulties relating to the apportionment of river tonnage resulting from the new international régime applicable to certain river systems or from the territorial changes affecting those systems.

7. Germany agrees to take any measures that may be indicated to her by the Reparation Commission for obtaining the full title to the property in all ships which have been during the war transferred to Governments in process of transfer, to neutral flags, without the consent of the Allied and Associated Governments.

8. Germany waives all claims of any description against the Allied and Associated Governments and their nationals in respect of the detention, employment, loss or damage of the ships or cargoes mentioned above, with the exception of losses being made of payments due in respect of the employment of ships in conformity with the armistice agreement of the 11th January, 1919, and subsequent agreements.

The handing over of the ships of the German mercantile marine must be continued without interruption in accordance with the said agreement.

9. Germany agrees to cause vessels or cargoes sunk by or in consequence of naval action and subsequently salvaged, in which any of the Allied or associated Governments or their nationals have any interest, either as owners, charterers, insurers or other-
ANNEX IV.

1. The Allied and Associated Powers require, and Germany undertakes to deliver in equal monthly installments in the three months following the coming into force of the present treaty the following quantities of live stock:

First. To the French Government, 500 stallions, (3 to 7 years), 30,000 fillies and mares, (18 months to 7 years), type: Ardenais, Boulognais, or Belgian; 2,000 bulls, (18 months to 3 years), type: large Belgian; (2 to 6 years), 1,000 rams, 100,000 sheep, 10,000 goats.

Second. To the Belgian Government, 200 stallions, (3 to 7 years), large Belgian type, 5,000 mares, (3 to 7 years), large Belgian type, 5,000 fillies, (18 months to 3 years), large Belgian type, 2,000 cows, (18 months to 3 years), 50,000 milk cows, (2 to 6 years), 40,000 heifers, 200 rams, 20,000 sheep, 15,000 goats.

The animals delivered shall be of average health and condition. To the extent that animals so delivered cannot be identified as animals taken away or seized, the value of such animals shall be credited against the value of the live stock delivered in accordance with Paragraph 5 of this annex.

Without waiting for the decisions of the commission, referred to in Paragraph 5 above, a decision to be taken, Germany must continue the delivery to France of the agricultural material referred to in Article 3 of the renunciation of the armistice of 16th January, 1919.

ANNEX V.

1. Germany accords the following options for the delivery of coal and derivatives to the undermentioned signatories of the present treaty.

2. Germany undertakes to deliver to France 7,000,000 tons of coal per year for ten years. In addition, Germany undertakes to deliver to France annually for a period not exceeding ten years an amount of coal equal to the difference between the annual production before the war of the coal mines of the Nord and Pas de Calais, destroyed as a result of the war, and the production of the mines of the same area during the years in question; such delivery not to exceed 10,000,000 tons in any one year of the ten years, 8,000,000 tons in any one year of the succeeding five years.

It is understood due diligence will be exercised in the restoration of the destroyed mines in the Nord and Pas de Calais.

3. Germany undertakes to deliver to Belgium 8,000,000 tons of coal annually for ten years.

4. Germany undertakes to deliver to Italy, up to the following quantities of coal:

   | July, 1919, to June, 1920 | 4,500,000 tons |
   | July, 1920, to June, 1921 | 2,500,000 tons |
   | July, 1921, to June, 1922 | 7,500,000 tons |
   | July, 1922, to June, 1923 | 2,500,000 tons |
   | July, 1923, to June, 1924 | 4,500,000 tons |

   and each of the following five years, 8,500,000 tons.

At least two-thirds of the actual deliveries to be land borne.

5. Germany further undertakes to deliver annually to Luxembourg, if directed by the commission, a quantity of coal equal to the pre-war annual consumption of German coal in Luxembourg.

6. The prices to be paid for coal delivered under these options shall be as follows:

   (a) For overland delivery, including delivery by barge, the German pithead price to German nationals, plus the freight to French, Belgian, Italian, or Luxemburg frontier, provided the "pithead" price does not exceed the pithead price of British coal for export. In case of Belgian bunker coal, the price shall not exceed the Dutch bunker price for this coal, if the price shall not be higher than the lowest similar rates paid in Germany.

   (b) For sea delivery, the German export price f. o. b. the German ports, or the British export price f. o. b. British ports, whichever is lower.

   (c) The Allied and Associated Governments interested may demand the delivery in place of coal of metallurgical coke in the proportion of three tons of coke to four tons of coal.

8. Germany undertakes to deliver to France and to transport to the French frontier by rail or by water the following products during each of the three years following the coming into force of this treaty:

   Renso — 35,000 tons.
   Coal tar — 50,000 tons.
   Subrate of ammonia — 100,000 tons.
   Sulphate of ammonia — 10,000 tons.

All or part of the coal tar may, at the option of
WAR, EUROPEAN — THE PEACE TREATIES (18)

the French Government, be replaced by corresponding quantities of products of distillation, such as light oils, hydrocarbons, anphrasy, naphthaline, or pitch.

9. The price paid for coke and for the articles referred to in the preceding paragraphs shall be the same as for German nationals under the same conditions of shipment to the French frontier or to the German ports, and shall be subjected to any advantages which may be accorded similar products furnished to German nationals.

10. The foregoing options shall be exercised through the intervention of the Reparation Commission, which, subject to the specific provisions hereof, shall have power by an express order to prescribe all questions relative to prices and the quantities and qualities of products, the quantity of coke which may be substituted for coal, and the times and modes of delivery and payment. In giving notice to the German Government of the foregoing options the commission shall give at least 120 days' notice of deliveries to be made after the 1st January, 1920, and at least thirty days' notice of deliveries to be made between the coming into force of this treaty and the 1st January, 1920. Until Germany has received the demands referred to in this paragraph the provisions of the protocol of the 25th December, 1918, (execution of Article 6 of the armistice of the 11th November, 1918,) remain in force.

The notice to be given to the German Government of the exercise of the right of substitution accorded by Article 245 shall be such as the Reparation Commission may consider sufficient.

11. It shall determine that the full exercise of the foregoing options would interfere unduly with the industrial requirements of Germany, the contracts authorized to postpone or to cancel deliveries, and in so doing to settle all questions of priority, but the coal to replace coal from destroyed mines shall receive priority over other deliveries.

ANNEX VI.

I. Germany accords to the Reparation Commission an option to require as part of reparation the delivery by Germany of such quantities and kinds of dyestuffs and chemical drugs as the commission may designate, not exceeding 50 per cent. of the normal stock of each and every kind of dyestuff and chemical drug in Germany or under German control at the date of the coming into force of the present treaty.

This option shall be exercised within sixty days of the receipt by the commission of such particulars as to stocks as may be considered necessary by the commission.

Germany further accords to the Reparation Commission an option to require delivery during the period from the date of the coming into force of the present treaty until Jan. 1, 1920, and during each period of six months thereafter until Jan. 1, 1925, of any defined kind of dyestuff and chemical drug, to an amount not exceeding 25 per cent. of the German production of such dyestuffs and chemical drugs during the previous six months, subject to the condition that the production during such previous six months was, in the opinion of the commission, less than normal, the amount required may be 25 per cent. of the normal production.

12. This option shall be exercised within four weeks after the receipt of such particulars as to production and in such form as may be considered necessary by the commission; these particulars shall be furnished by the German Government immediately after the expiration of each six months' period.

3. For dyestuffs and chemical drugs delivered under Paragraph 1 the price shall be fixed by the commission, having regard to pre-war net export prices and to subsequent increases of cost.

For dyestuffs and chemical drugs delivered under Paragraph 2 the price shall be fixed by the commission, having regard to pre-war net export prices and subsequent increases of cost; or, in the case of certain dyestuffs and chemical drugs to any other purchasers, to any other prices, details, including mode and times of exercising the options and making delivery, and all other questions arising under this arrangement shall be determined by the Reparation Commission; the German Government will furnish to the commission all necessary information and other assistance which it may require.

The above expression "dyestuffs and chemical drugs" includes all synthetic dyes and drugs and intermediate or other products used in connection with dyeing, so far as they are manufactured for sale. The present arrangement shall also apply to cinnabar and salts of quinine.

ANNEX VII.

Germany renounces on her own behalf and on behalf of her nationals in favor of the principal Allied and Associated Powers all rights, titles, and interest whatsoever in the submarine cables set out below, or in any portions thereof

Emden-Vigo: from the Straits of Dover to off Vigo;

Emden-Brest: from off Cherbourg to Brest;

Emden-Tenerife: from off Dunkirk to off Tenerife;

Emden-Azores (1): from the Straits of Dover to Fayal;

Emden-Azores (2): from the Straits of Dover to Fayal;

Azores-New York (1): from Fayal to New York;

Azores-New York (2): from Fayal to the longitude of Halifax;

Tenerife-Monrovia: from off Tenerife to off Monrovia;

Monrovia-Lome: from about latitude 2 degrees 30 minutes north, and longitude 7 degrees 40 minutes west of Greenwich, to about latitude 4 degrees 30 minutes north, and longitude 5 degrees 30 minutes west of Greenwich, and from about latitude 3 degrees 45 minutes north, and longitude 6 degrees 45 minutes to Lome;

Lome-Duala: from Lome to Dala;

Monrovia-Pernambuco: from off Monrovia to off Pernambuco;

Constantinople-Constanza: from Constantinople to Constanza;

Yap-Shanghai; Yap-Guam, and Yap-Menado (Celebes); from Yap Island to Shanghai, from Yap Island to Guam Island, and from Yap Island to Manado.

The value of the above-mentioned cables or portions thereof in so far as they are privately owned, calculated on the basis of the original outlay and with suitable allowance for depreciation, shall be credited to Germany in the reparations account.

SECTION II. — SPECIAL PROVISIONS.

Article 245.—Within six months after coming into force of the present treaty the German Government must restore to the French Government the trophies, archives, historical souvenirs, or works of art carried away from France by the German authorities in the course of the war of 1870-1871 and during this last war, in accordance with a list which will be communicated to it by the French Government; particularly the French flags taken in the course of the war of 1870-1871, and all the political papers taken by the German authorities on Oct. 10, 1870, at the Château of Cercy, near Brusnoy (Seine-et-Oise,) belonging at the time to M. Rouher, formerly Minister of State.

Article 246.—Within six months of the coming into force of the present treaty Germany will restore to his Majesty the King of the Héjaz the original Koran of the Caliph Othman, which was removed from Medina by the Turks in 1916 and is believed to have been presented to the ex-Emperor William II.

Within two years Germany will hand over to his Britannic Majesty's Government the skull of the Sultan Mkwawa, which was removed from the province of German East Africa by German authorities.

The delivery of the articles above referred to will be effected in such place and in such conditions as may be laid down by the Governments to which they are to be restored.

Article 247.—Germany undertakes to furnish to the University of Louvain, within three months after a request made by it and transmitted through the intervention of the Reparation Commission, manuscripts, incunabula, printed books, maps, and objects of collection corresponding in number and value to those destroyed in the burning by Germany of the library of Louvain. All details regarding such replacement will be determined by the Reparation Commission.

Germany undertakes to deliver to Belgium, through the Reparation Commission, within six months of the coming into force of the present treaty, in order to enable Belgium to reconstitute her two great artistic works:

(a) The leaves of the triptych of the Mystic Lamb painted by the Van Eyck brothers in the Church of St. Bavon at Ghent, now in the Berlin Museum.

(b) The leaves of the triptych of the Last Supper, painted by Dieric Bouts, formerly in the Church of St. Peter at Louvain, two of which now in the Berlin Museum and two in the old Franckothek at Munich.
PART IX.—FINANCIAL CLAUSES.

Article 248.—Subject to such exceptions as the Reparation Commission may approve, a first charge upon all the assets and revenues of the German Empire or its constituent States, the cost of reparation and all other costs arising under the present treaty, shall be borne by Germany, and the cost of reparations furnished to Germany or any German nationals on assets in their ownership at that date.

Article 249.—The powers to which German territory is ceded shall, subject to the conditions laid down in Article 255, undertake to pay:

1. A portion of the debt of the German Empire as it stood on the 1st August, 1914, calculated on the basis of the ratio between the average for the three financial years 1911, 1912, 1913, of the ceded territory and the average for the same years of such revenues of the whole German Empire as in the judgment of the Reparation Commission are to be calculated to represent the relative ability of the respective territories to make payments.

2. A portion of the debt as it stood on the 1st August, 1914, of the German State to which the ceded territory belonged, to be determined in accordance with the principle stated above.

Such portions shall be determined by the Reparation Commission.

The method of discharging the obligation both in respect of capital and of interest, so assumed, shall be fixed by the Reparation Commission. Such method may take the form, inter alia, of the assumption by the power to which the territory is ceded of all the liability for the German debt held by her nationals. But in the event of the method adopted involving any payments to the German Government, such training of troops and for keeping their numbers up to strength and for the maintenance of the forces, shall be paid in gold marks.

Article 250.—Germany confirms the surrender of all material handed over to the Allied and Associated Powers in accordance with the armistice of the 11th November, 1918, and recognizes the title of the Allied and Associated Powers to such materials.

There shall be credited to the German Government against the sums due from it to the Allied and Associated Powers for reparation, the value, as assessed by the Reparation Commission referred to in Article 233 of Part VIII (reparation) of the present treaty, of the material handed over in accordance with Article 7 of the armistice agreement of the 11th November, 1918, Article 3 of the armistice agreement of the 1st December, 1918, and of subsequent armistice agreements, for which, as having non-military value, credit should, in the judgment of the Reparation Commission, be allowed to the German Government.

Property belonging to the Allied and Associated Governments or surrendered under the armistice agreements in specie shall not be credited to the German Government.

There shall be a review of the charges established by Article 248 shall, subject to the qualifications made below, be as follows:

(a) The cost of all arms of occupation as defined under Article 249 during the armistice and its extensions:

(b) The cost of any arms of occupation as defined under Article 249 after the coming into force of this treaty:

(c) The cost of reparation arising out of the present treaty or any treaties or conventions supplementary thereto.

(d) The cost of all other obligations incumbent on Germany arising out of this treaty or any treaties or conventions supplementary thereto.

The payment for such supplies of food and raw material for Germany and such other payments as may be made to the Allied and Associated Powers is essential to enable Germany to meet her obligations in respect of reparation. It will have priority in respect of all other payments which may be determined by the Governments of the said powers.

Article 252.—The right of each of the Allied and Associated Powers to make payment, whether within its jurisdiction at the date of the coming into force of this treaty or at any time hereafter, is not affected by the foregoing provisions.

Article 253.—Nothing in the foregoing provisions shall prevent Germany from mortgaging lawfully effected in favor of the Allied and Associated Powers or their nationals respectively, before the date at which a state of war existed between Germany and the Allied and Associated Powers concerned, by the German Empire or its constituent States, or any German nationals on assets in their ownership at that date.

Article 254.—The powers to which German territory is ceded shall, subject to the conditions laid down in Article 255, undertake to pay:

1. A portion of the debt of the German Empire as it stood on the 1st August, 1914, calculated on the basis of the ratio between the average for the three financial years 1911, 1912, 1913, of the ceded territory and the average for the same years of such revenues of the whole German Empire as in the judgment of the Reparation Commission are to be calculated to represent the relative ability of the respective territories to make payments.

2. A portion of the debt as it stood on the 1st August, 1914, of the German State to which the ceded territory belonged, to be determined in accordance with the principle stated above.

Such portions shall be determined by the Reparation Commission.

The method of discharging the obligation both in respect of capital and of interest, so assumed, shall be fixed by the Reparation Commission. Such method may take the form, inter alia, of the assumption by the power to which the territory is ceded of all the liability for the German debt held by her nationals. But in the event of the method adopted involving any payments to the German Government, such training of troops and for keeping their numbers up to strength and for the maintenance of the forces, shall be paid in gold marks.

Article 255.—(1) As an exception to the above provision and inasmuch as referred to in the above paragraph, the Allied and Associated Powers, or the German State, shall have the right to undertake any portion of the burden of the French debt, France shall be, in respect of Alsace-Lorraine, exempt from any payment under Article 254.

2. In the case of Poland that portion of the debt which, in the opinion of the Reparation Commission is attributable to the measures taken by the German and Prussian Governments for the German colonization of Poland shall be excluded from any payment under Article 254.

3. In the case of all ceded territories other than Alsace-Lorraine that portion of the debt of the German Empire or German States which in the opinion of the Reparation Commission represents expenditure by the Governments of the German Empire or States upon the government properties referred to in Article 256 shall be excluded from the apportionment to be made under Article 254.

Article 256.—Powers to which German territory is ceded shall acquire all property and possessions situated therein belonging to the German Empire or to the German States, and the value of such acquisitions shall be fixed by the Reparation Commission, and paid by the State acquiring the territory to the Reparation Commission for the credit of the German Government on account of the sums due for reparation.

For the purposes of this article, all property and possessions of the German Empire and States shall be deemed to include all the property of the Crown, the Empire or the States, and the private property of the former German Emperor and other royal personages.

In view of the terms on which Alsace-Lorraine was ceded to Germany in 1871, France shall be exempt in respect thereof from making any payment or credit under this article for any property or possessions of the German Empire or States situated therein. Belgium also shall be exempt from making any payment or any credit under this article for any property or possessions of the German Empire or States situated in German territory ceded to Belgium under the present treaty.

Article 257.—In the case of the former German territories, including colonies and dependencies, administered by a mandatory under Article 22 of Part I (League of Nations) of the present treaty, neither the territory nor the mandatory power shall be charged with any portion of the debt of the German Empire or States.

All property and possessions belonging to the German Empire or to the German States situated in such territory shall be transferred to the Mandatory Power in its capacity as such, and no payment shall be made nor any credit given to those Governments in consideration of the transfer.

For the purpose of this article the property and possessions of the German Empire and the German States shall be deemed to include all the property of the crown, the empire or the States and the private property of the former German Emperor and other royal personages.

Article 258.—Germany renounces all rights ac-
WAR, EUROPEAN — THE PEACE TREATIES (18)

recorded to her or her nationals by treaties, conventions or agreements, of whatsoever kind, to representation upon or participation in the control or administration of any bank agencies or other financial or economic organizations of an international character, or to participate in the control or administration, in any way, of any bank, or in any bank operating in any of the Allied or Associated States, or in Austria, Hungary, Bulgaria or Turkey, or in the dominions of any of these States, or in the former Russian Empire.

Article 259. Germany agrees to deliver within one month from the coming into force of the present treaty, to such authority as the principal Allied and Associated Powers may designate, the sum of one hundred million gold notes. The German States may designate, the sum of five million gold notes. The German States may designate, the sum of five million gold notes in which the Reichsbank in the name of the Council of the Administration of the Ottoman Public Debt as security for the first issue of Turkish Government currency notes.

Germany recognizes her obligation to make annually the periodic payment of the sum of gold for which provision is made in the German Treasury bonds deposited by her from time to time in the name of the Council of the Administration of the Ottoman Public Debt as security for the second and subsequent issue of Turkish Government currency notes.

Germany undertakes to deliver, within one month from the coming into force of the present treaty, to the principal Allied and Associated Powers, any gold notes in excess of fifteen million. The German States may, at their own discretion, deliver, at the rate of exchange of gold agreed to on the 5th of May, 1915, the Council of the Administration of the Ottoman Public Debt to the Imperial Ottoman Government.

Germany agrees to transfer to the principal Allied and Associated Powers any title that she may have to the sum in gold and silver transmitted by her to the Turkish Ministry of Finance in November, 1918, in anticipation of the payment to be made in May, 1919, for the service of the Turkish internal loan.

Germany undertakes to transfer to the principal Allied and Associated Powers, a sum of gold in excess of twenty-five million. The German States may be made willing, to the extent of the sum, in gold. Germany undertakes to deliver, within one month from the coming into force of the present treaty, any sums in gold transferred as pledge or collateral security for the German Government or its nationals in connection with loans made by them to the Austrian-Hungarian Government.

Without prejudice to Article 252 of Part X (economic clauses) of the present treaty, Germany confirms the renunciation provided for in Article XV of the Peace Treaty of the 11th November, 1918, of any benefit disclosed by the treaties of Burebist and of Brest-Litovsk, and by the treaties supplementary thereto.

Germany undertakes to transfer, either to the principal Allied and Associated Powers, as the case may be, all monetary instruments, specie, securities and negotiable instruments or goods which shall have been the subject of the aforementioned treaties.

The sums of money and all securities, instruments and goods of whatever nature, to be delivered, paid and transferred under the provisions of this article, shall be disposed of by the principal Allied and Associated Powers in a manner hereafter to be determined by these powers.

Article 260. Without prejudice to the renunciation of rights by Germany on behalf of herself or of her nationals in the other provisions of the present treaty, the Reparation Commission may, within one year from the coming into force of the present treaty, demand that the German Government become possessed of any rights and interests of the German nationals in any public utility undertaking or in any concession operating in Russia, China, Turkey, Austria, Hungary and Bulgaria, or in the possessions or dependencies of any of these States or in any territory formerly belonging to Germany or her allies, to be ceded by Germany or her allies to any power, or to have been admitted by a treaty under the present treaty, and may require that the German Government be ceded or possessed by the Reparation Commission, within six months of the date of demand, all such rights and interests and any similar rights and interests the German Government may, itself possess, to the Reparation Commission.

Germany shall be responsible for indemnifying her nationals, who have been dispossessed and the Reparation Commission shall credit Germany in account of sums due in reparation with such sums in respect of the value of the rights and interests as may be assessed by the Reparation Commission, and the German Government shall, within six months from the coming into force of the present treaty, communicate to the Reparation Commission all such rights and interests, whether already possessed or not yet exercised, on the part of Germany, and shall renounce on behalf of itself and its nationals in favor of the Allied and Associated Powers all such rights and interests which have not been so communicated.

Article 261. Germany undertakes to transfer to the Allied and Associated States, any sums due in reparation, with any interest not yet assessed, and any other sums which may arise, now or hereafter, from the fulfillment of undertakings made by Germany during the war to those of the former Russian Empire.

Article 262. Any monetary obligation due by Germany arising out of the present treaty and expressed in terms of gold or other currency shall be payable in the currency of the creditor, or in pounds sterling payable in London, or in gold dollars payable in New York; or gold francs payable in Paris, or gold lire payable in Rome.

For the purpose of this article, gold coins mentioned above shall be defined as being of the weight and fineness of gold as enacted by law on the 1st January, 1907.

Article 263. Germany gives a guarantee to the Brazilian Government that all sums representing the sale of coffee belonging to the State of Sao Paulo in the Ports of Hamburg, Bremen, Antwerp, and Trieste, which were placed on deposit in a bank of Reichdrachers at Berlin, shall be reimbursed, together with interest at the rate or rates agreed upon.

Germany, having prevented the transfer of the sums in question to the State of Sao Paulo at the proper time, guarantees the State of Sao Paulo that such transfers shall be effected at the rate of exchange of the day of the deposit.

PART X. — ECONOMIC CLAUSES.

SECTION I. — COMMERCIAL RELATIONS.

Chapter I. — Customs Regulations, Duties, and Restrictions.

Article 264. Germany undertakes that goods, the produce or manufacture of any one of the Allied or Associated States imported into German territory, from whatsoever place arriving, shall not be subjected to other or higher duties or charges (including internal charges) than those to which the like goods, the produce or manufacture of any other such State or of any other foreign country are subject.

Germany will not maintain or impose any prohibition or restriction on the importation into German territory of any goods the produce or manufacture of any one of the Allied or Associated States, from whatever place arriving, which shall not equally extend to the importation of the like goods the produce or manufacture of any other such State or of any other foreign country.

Article 265. Germany further undertakes that, in the matter of the régime applicable on importation, no discrimination against the commerce of any of the Allied and Associated States, or of any other State or of any other foreign country shall be made, even by indirect means, such as customs regulations or procedure, methods of verification or analysis, conditions of payment of duties, tariff classification or interpretation, or the operation of monopolies.

Article 266. In all that concerns exportation Germany undertakes that goods, natural products or manufactured articles, exported from German territory to the territories of any one of the Allied or Associated States shall not be subjected to other or higher duties or charges (including internal charges) than those paid on the like goods the produce or manufacture of any other such State or to any other foreign country.

Germany will not maintain or impose any prohibition or restriction on the exportation of any goods sent from her territory to any one of the Allied or Associated States which shall not equally extend to the exportation of the like goods, the produce or manufacture of any other such State or to any other foreign country whatever shall be made subject to other or higher duties or charges (including internal charges) than those paid on the like goods the produce or manufacture of any other such State or to any other foreign country.

Article 267. Every favor, immunity, or privilege in regard to the importation, exportation, or transit of goods, the grant of which has been refused to the goods, the produce or manufacture of any other such State or to any other foreign country whatever shall be equally extended to the goods, the produce or manufacture of any other such State or to any other foreign country.

The provisions of Articles 264 to 267 inclusive of this chapter and of Article 323 of Part XII (ports, waterways, and railways) of the present treaty are obligatory on the following:

(a) For a period of five years from the coming into force of the present treaty, or not yet exercised, and shall renounce on behalf of itself and its nationals in favor of the Allied and Associated Powers all such
shall, on importation into German customs territory, be exempt from all customs duty.

The French Government shall fix each year, by decree, the quantity of German products which shall enjoy this exemption.

The amount of each product which may be thus sent annually into Germany shall not exceed the average of the amounts sent annually in the years 1912-1913.

Further, during the period above mentioned, the German Government shall allow the free export from Germany, and the free reimportation into Germany, of wool, cotton, raw silk, and other materials (excluding internal charges), of yarns, tissues, and other textile materials or textile products of any kind and in any condition, sent from Germany into the territories of Alsace or Lorraine, to be subjected there to any finishing process, such as bleaching, dyeing, printing, mercerising, or other processes.

(b) During a period of three years from the coming into force of the present treaty, natural or manufactured products which both originate in and come from Polish territories which before the war were part of Germany shall, on importation into German customs territory, be exempt from all customs duty.

The Polish Government shall fix each year, by decree communicated to the German Government, the nature and amount of the products which shall enjoy this exemption.

The amount of each product which may be thus sent annually into Germany shall not exceed the average of the amounts sent annually in the years 1912-1913.

The Allied and Associated Powers reserve the right to require Germany to accord freedom from customs duty, on importation into German customs territory, to natural products and manufactured articles which both originate in and come from the Grand Duchy of Luxemburg, for a period of five years from the coming into force of the present treaty.

The nature and amount of the products which shall enjoy the benefits of this regime shall be communicated each year to the German Government.

The amount of each product which may be thus sent annually into Germany shall not exceed the average of the amounts sent annually in the years 1912-1913.

**Chapter III.—Unfair Competition.**

**Article 274.**—Germany undertakes to adopt all the necessary legislative and administrative measures to prevent goods the production, sale, or manufacture of which are in accordance with the flag flown by the vessels of an Allied or Associated Power having no seaworthy which are registered at some one specified place situated in its territorial waters, from entering into the trade of Germany, or being kept in warehouse at any point of the coast or not, provided that such certificates and documents shall be issued in conformity with the general practice observed in the principal maritime States.

In the case of the flag flown by the vessels of an Allied or Associated Power having no seaworthy which are registered at some one specified place situated in its territorial waters, such place shall serve as the port of registry of such vessels.

**Chapter IV.—Treatment of Nationals of Allied and Associated Powers.**

**Article 276.**—Germany undertakes:

(a) not to subject the nationals of the Allied and Associated Powers to any prohibition in regard to the exercise of occupations, professions, trade, and industry, which shall not be equally applicable to all aliens without exception;

(b) not to subject the nationals of the Allied and Associated Powers in regard to the rights referred to in Paragraph (a) to any regulation or restriction which might contravene directly or indirectly the stipulations of the said paragraph, or which shall be other or more disadvantageous than those which are applicable to nationals of the most-favored nation;

(c) to subject the nationals of the Allied and Associated Powers, their wives and minor children, and other persons having the same interests, including companies and associations in which they are interested, to any charge, tax, or impost, direct or indirect, other or higher than those which may be imposed on her own nationals or their property, rights, or interests;

(d) not to subject any one of the Allied and Associated Powers to any restriction which was not applicable on July 1, 1914, to the territory occupied by Germany without such restriction is likewise imposed on her own nationals.

**Article 277.**—The nationals of the Allied and Associated Powers shall enjoy in German territory a constant protection for their persons and for their property, rights, and interests, and shall have free access to the courts of law.

**Article 278.**—Germany undertakes to recognize any new nationality which has been or may be acquired by her nationals under the laws of the Allied and Associated Powers, and in accordance with the regulations of the competent authorities of these powers pursuant to naturalization laws or under treaty stipulations, and to regard such persons as having in consequence the acquisition of such new nationality, in all respects severed their allegiance to the German Empire, and to admit them to the exercise of their functions in conformity with the usual rules and customs.

**Chapter V.—General Articles.**

**Article 280.**—The obligations imposed on Germany by Chapter I and by Articles 271 and 272 of Chapter
II above shall cease to have effect five years from the date of the coming into force of the present treaty, unless otherwise provided for in the text, or unless the Council of the League of Nations shall, at least twelve months before the expiration of that period, decide that these provisions shall be maintained for a further period with or without amendment.

Article 276 of Chapter IV shall remain in operation with or without amendment, after the period of five years for such further period, if any, not exceeding ten years, as may be determined by a majority of the Council of the League of Nations.

Article 278.—If the German Government engages in international trade, it shall not have or be deemed to have any rights, privileges, or immunities of sovereignty.

SECTION II.—TREATIES.

Article 279.—From the coming into force of the present treaty and subject to the provisions thereof the multilateral treaties, conventions, and agreements of an economic or technical character enumerated below and in the subsequent articles shall alone be applied as between Germany and those of the Allied and Associated Powers party thereto:

1. Conventions of March 4, 1884; Dec. 1, 1886, and March 23, 1887, and final protocol of July 7, 1897, regarding the protection of submarine cables.
2. Convention of Oct. 11, 1900, regulating the international circulation of motor cars.
3. Agreement of May 13, 1886, regarding the sealing of packages subject to customs inspection, and protocol of May 18, 1907.
5. Convention of July 5, 1890, regarding the publication of customs tariffs and the organization of an international union for the publication of customs tariffs.
7. Convention of April 24, 1897, regarding the raising of the Turkish customs tariff.
8. Convention of March 14, 1837, for the redemption of toll dues on the sound and belt.
10. Convention of July 16, 1863, for the redemption of toll dues on the Scheldt.
11. Convention of Oct. 29, 1888, regarding the establishment of a definite arrangement guaranteeing the free use of the Suez Canal.
12. Convention of Sept. 23, 1910, respecting the unification of certain regulations regarding collisions and salvage at sea.
13. Convention of Dec. 21, 1904, regarding the exemption of hospital ships from dues and charges in ports.
14. Convention of Feb. 4, 1898, regarding the tonnage measurement of vessels for inland navigation.
17. Conventions of May 18, 1904, and May 4, 1910, regarding the suppression of the white slave traffic.
18. Convention of May 4, 1910, regarding the suppression of obscene publications.
19. Sanitary conventions of January, 1894; April 15, 1893; April 3, 1894; April 19, 1897, and Dec. 3, 1902.
20. Convention of May 20, 1875, regarding the unification and improvement of the metric system.
22. Convention of Nov. 16 and 19, 1895, regarding the establishment of a concert pitch.
23. Convention of June 7, 1905, regarding the creation of an International Agricultural Institute at Rome.
24. Conventions of Nov. 3, 1881, and April 15, 1889, regarding precautionary measures against phyloxera.
25. Convention of March 19, 1902, regarding the protection of birds useful to agriculture.
26. Convention of June 12, 1902, as to the protection of miners.

Article 283.—From the coming into force of the present treaty the high contracting parties shall apply the conventions and agreements hereinafter mentioned, in so far as concerns them, on condition that the special stipulations contained in this article are fulfilled by Germany.

Postal Conventions.

Conventions and agreements of the Universal Postal Union concluded at Vienna, July 4, 1861.

Conventions and agreements of the Universal Postal Union signed at Washington, June 15, 1877.

Conventions and amendments of the Postal Union signed at Rome, May 26, 1906.

Telegraphic Conventions.

International Telegraphic Conventions signed at St. Petersburg July 10, (22), 1875.

Regulations and tariffs drawn up by the International Telegraphic Conference, London, 1876.

Germany undertakes in a not to refuse her assent to the conclusion by the new States of the special arrangements referred to in the conventions and agreements relating to the Universal Postal Union and to the International Telegraphic Union, to which the said new States have adhered or may adhere.

Article 284.—From the coming into force of the present treaty a new convention regulating international telegraphic communications should have been concluded to take the place of the convention of July 5, 1912, this new convention shall bind Germany even if Germany should refuse assent in drawing up the convention or to subscribe thereto.

This new convention will likewise replace the provisional regulations in force.

Article 285.—From the coming into force of the present treaty the high contracting parties shall agree in so far as concerns them, under the conditions stipulated in Article 272 the conventions hereinafter mentioned:

1. The conventions of May 6, 1882, and Feb. 1, 1889, regulating the fisheries in the North Sea outside territorial waters.
2. The conventions and protocols of Nov. 16, 1887, Feb. 14, 1893, and April 11, 1894, regarding the North Sea liquor traffic.
3. Article 286.—The International Convention of Paris of March 20, 1883, for the protection of industrial property, revised at Washington on June 2, 1911; the International Convention of Berne of Sept. 9, 1886, for the protection of literary and artistic works, revised at Berlin on Nov. 13, 1908, and completed by the additional protocol signed at Berne on March 30, 1914, will again come into effect as from the coming into force of the present treaty, in so far as they are not affected or modified by the exceptions and restrictions resulting therefrom.

4. Article 287.—From the coming into force of the present treaty the high contracting parties shall apply, in so far as concerns them, the Convention of the Hague of July 17, 1905, relating to women's work. This renewal, however, will not apply to France, Portugal, and Rumania.

5. Article 288.—The special rights and privileges granted to Germany by Article 3 of the convention of Dec. 2, 1890, relating to Samoa shall be considered to have terminated on Aug. 4, 1914.

6. Article 289.—Each of the Allied or Associated Powers, being guided by the general principles or special provisions of the present treaty, shall notify to Germany the bilateral treaties or conventions which such Allied or Associated Power wishes to revive with Germany.

The notification referred to in the present article shall be made either directly or through the intermediary of another power. Receipt thereof shall be acknowledged in writing by Germany. The date of the revival shall be that of the notification.

The Allied and Associated Powers undertake among themselves not to revive with Germany any conventions or treaties which are not in accordance with the terms of the present treaty.

The notification shall mention any provisions of the said conventions and treaties which, not being in accordance with the terms of the present treaty, shall not be considered as revived.

Only those bilateral treaties and conventions which
WAR, EUROPEAN — THE PEACE TREATIES (18) 557

have been the subject of such a notification shall be recognized by the Allied and Associated Powers and Germany; all the others are and shall remain abrogated.

The above regulations apply to all bilateral treaties or conventions of any kind between the Allied and Associated Powers, signatories to the present treaty and Germany, even if the said Allied and Associated Powers had entered into a state of belligerency with Germany before Aug. 1, 1914, until the coming into force of the present treaty and are and shall remain abrogated by the present treaty.

Article 291.—Germany undertakes to secure to the Allied and Associated Powers, and to the officials and nationals of the said powers, the enjoyment of all the rights and advantages of any kind which they may have granted to Roumania, Hungary, Bulgaria, or Turkey, or to the officials and nationals of these States by treaties, conventions, or arrangements, in force on Aug. 1, 1914, so long as those treaties, conventions, or arrangements remain in force.

The settlers of the Allied and Associated Powers reserve the right to accept or not the enjoyment of these rights and advantages.

Article 292.—Germany recognizes that all treaties, conventions, or arrangements which she concluded with Russia or with any State or Government of which the territory formerly constituted a part of Russia have been forced since Aug. 1, 1914, by reason of military occupation or any other manner or for any other cause, to grant or to allow to be granted by the act of, or at the instance of the Russian Government, and in favor of any kind to Germany or to a German national, such concessions, privileges, and favors are ipso facto and in all cases null and void.

No claims or indemnities which may result from this annulment shall be charged against the Allied or Associated Powers and their nationals, they being ipso facto the rights and advantages of any kind which she has granted by treaties, conventions, or arrangements with States or their nationals since Aug. 1, 1914, until the coming into force of the present treaty so long as those treaties, conventions, or arrangements remain in force.

Article 293.—Those of the high contracting parties who have signed or ratified, or have not yet ratified, the Opium Convention signed at The Hague on Jan. 23, 1912, agree to bring the said convention into force, to enact the necessary legislation without delay and in any case within a period of twelve months from the coming into force of the present treaty.

Furthermore, they agree that ratification of the present treaty should in the case of powers which have not yet ratified the Opium Convention be deemed in all respects equivalent to the ratification of that convention and to the signature of the special protocol which was opened at The Hague in accordance with the resolutions adopted by the Third Opium Conference in 1912 for bringing the said convention into force.

For this purpose the Government of the French Republic will communicate to the Government of the Netherlands the certified copy of the protocol of the deposit of ratifications of the present treaty, and will invite the Government of the Netherlands to accept and deposit the said certificate of the deposit of ratifications of the Opium Convention and a signature of the additional protocol of 1914.

SECTION III.—DEBTS.

Article 296.—There shall be settled through the intervention of clearing offices to be established by each of the high contracting parties within three months of the notification referred to in paragraph (e) hereinafter to be paid by the debtors, as the case may be, by the debtors.

1. Debts payable before the war and due by a national of one of the contracting powers, residing within its territory, to a national of an opposing power, residing within its territory.

2. Debts which became payable during the war to nationals of one contracting power residing within its territory and arose out of transactions or contracts with the nationals of an opposing power residing within its territory, of which the total or partial execution was suspended on account of the war.

3. Interest which has accrued due before and during the war to a national of one of the contracting powers in respect of securities issued by Germany or its powers, provided that the payment of such securities to the nationals of that power or to neutrals has not been suspended during the war.

4. Capital sums which have become payable before and during the war to nationals of one of the contracting powers in respect of securities issued by one of the opposite powers, provided that the payment of such capital sums to the nationals of that power or to neutrals has not been suspended during the war.

The proceeds of liquidation of enemy property, rights, and interests mentioned in Section IV and in the annex thereto will be accounted for through the clearing offices, in the paid or credited rate of exchange hereinafter provided in Paragraph (d) and disposed of by them under the conditions provided by the said section and annex.
ANNEX.
1. Each of the high contracting parties will, within three months from the ratification provided for in Article 260, Paragraph (e), establish a clearing office for the collection and payment of enemy debts.

2. In this annex the pecuniary obligations referred to in the first paragraph of Article 260 are described as "enemy debts," the persons from whom the same are due as "enemy debtors," the persons to whom they are due as "themselves and others," the clearing office of the country of the creditor is called the "Creditor Clearing Office," and the clearing office in the country of the debtor is called the "Debtor Clearing Office."

3. The high contracting parties will subject contraventions of Paragraph (a) of Article 260 to the same penalties as are at present provided by their legislation for trading with the enemy. They will similarly prohibit within their territory all legal process relating to the payment of enemy debts, except in accordance with the provisions of this annex.

4. Within six months of its establishment, each clearing office shall furnish the Clearing Office with any documents and information required of them.

5. The high contracting parties will take all suitable measures to trace and punish collusion between enemy creditors and debtors. The clearing offices will compare as between one another any evidence and information which might help the discovery and punishment of such collusion.

6. Every clearing office will facilitate as much as possible postal and telegraphic communication at the expense of the parties concerned and through the intervention of the clearing offices between debtors and creditors desiring of coming to an agreement as to the settlement of their debt.

7. The Creditor Clearing Office will notify the Debtor Clearing Office when funds have been declared to it. The Debtor Clearing Office will, in due course, inform the Creditor Clearing Office which debts are admitted and which debts are not admitted. In the latter case the Debtor Clearing Office will give the grounds for the non-admission of debt.

8. If a debt has been admitted, in whole or in part, the Debtor Clearing Office will at once credit the Creditor Clearing Office with the amount admitted, and at the same time notify it of such credit.

9. The debt shall be deemed to be admitted in full and shall be credited forthwith to the Creditor Clearing Office unless within three months from the receipt of the notification or such longer time as may be agreed to by the Creditor Clearing Office notice has been given by the Creditor Clearing Office that it is not admitted.

10. When the whole or part of a debt is not admitted the clearing office of the creditor should require an agreement between the parties, if possible, and will endeavor to bring the parties to an agreement.

11. The Creditor Clearing Office will pay to the individual creditor the sums credited to it out of the fund created at its disposal by the Government of the country and in accordance with the conditions fixed by the said Government, retaining any sums considered necessary to cover risks, expenses, or commissions.

12. Any person having claimed payment of an enemy debt and in whole or in part shall pay to the clearing office by way of fine interest at 5 per cent. on the part not admitted. Any person having unduly refused to admit the whole or part of a debt claimed from him shall pay by way of fine interest at 5 per cent. on the amount of the claim at his refusal shall be disallowed.

13. Such interest shall run from the date of expiration of the period provided for in Paragraph 7 until the date on which the claim shall have been disallowed or the debt paid in cash by the debtor. Debtors within a week.

14. Nevertheless, any credit balances which may be due by one or more of the Allied and Associated Powers shall be retained until complete payment shall have been effected of the sums due to the Allied or Associated Powers or their agents, or account of the war.

15. To facilitate discussion between the clearing offices each of them shall have a representative at the place where the other is established.

16. For special reasons all discussions in regard to claims will, so far as possible, take place at the Debtor Clearing Office.

17. In conformity with Article 260, Paragraph (b), the high contracting parties are responsible for the payment of the enemy debts owing by their nationals. The Debtor Clearing Office of each high contracting party shall credit the Creditor Clearing Office with all debts admitted, even in case of inability to collect them from the individual debtor. The Governments, however, will, nevertheless, invest their respective clearing offices with necessary powers for the recovery of debts which have been admitted.

18. As an exception the admitted debts owing by persons having suffered injury from acts of war shall only be credited to the Creditor Clearing Office when the compensation due to the person concerned in respect of such injury shall have been paid.

19. Each Government will defray the expenses of the clearing offices out of its territory, including the salaries of the staff.

20. Where the two clearing offices are unable to agree whether a debt claimed is due, or in case of a difference between an enemy creditor and an enemy debtor or between the clearing offices, the dispute shall either be referred to arbitration if the parties so agree under conditions fixed by agreement between them, or referred to the mixed arbitral tribunal provided for in Section VI hereafter.

21. At the request of the Creditor Clearing Office the tribunal may, however, be submitted to the jurisdiction of the courts of the place of domicile of the debtor.

22. Recovery of sums found by the mixed arbitral tribunal, the court, or the arbitration tribunal to be due shall be credited to the clearing offices, if these sums were debts admitted by the Debtor Clearing Office.

23. Each of the Governments concerned shall appoint an agent who will be responsible for the presentation to the mixed arbitral tribunal of the cases conducted on behalf of its clearing office and who will have a general control over the representatives or counsel employed by the Government.

24. Decisions will be arrived at on documentary evidence, but it will be open to the tribunal to hear the parties in person, or, according to their preference, by their representatives approved by the two Governments, or by the agent referred to above, who shall be competent to intervene along with the party or to reopen and maintain a claim abandoned by the same.

25. The clearing offices concerned will lay before the mixed arbitral tribunal all the information and documents in their possession, so as to enable the tribunal to decide rapidly on the cases which are brought before it.

26. Where one of the parties concerned appeals against the judgment of the tribunal, the other party shall make a deposit against the cost, which deposits shall only be refunded when the first judgment is modified in favor of the appellant and in proportion to the success he may attain, his opponent in case of such a verdict, paying an equivalent proportion of the cost and expenses. Security accepted by the tribunal may be substituted for a deposit.

27. A fee of 1 per cent. on the amount of the dispute shall be charged in respect of all cases brought before the tribunal. This fee shall be paid in cash in whole or in part. Otherwise, it shall be borne by the unsuccessful party. Such fee shall be added to the deposit referred to in Section VI.
The tribunal may award to one of the parties a sum in respect of the proceedings.

Any sum payable under this paragraph shall be credited to the clearing office of the successful party as a separate item.

21. With a view to the rapid settlement of claims, due in respect of claims in the amount of the claims held by persons connected with the clearing offices, or with the Mixed Arbitral Tribunal to their knowledge of the laws with respect to the rights and interests of the clearing offices will be at liberty to correspond with the other, and to forward documents in its own language.

22. Subject to any special agreement to the contrary, the claims held by persons in addition to the clearing offices shall be credited to them in accordance with the provisions of the following terms:

(a) Interest shall not be payable on sums of money due by way of dividend, interest, or other periodic payments which themselves represent interest on capital.

(b) The rate of interest shall be 5 per cent. per annum, except in cases where, by contract, law, or custom, the person is entitled to payment of interest at a different rate. In such cases the rate to which he is entitled shall prevail.

(c) Interest shall run from the date of commence of hoistilities (or, if the sum of money to be recovered fell due after the hoistilities, from the date at which it fell due) until the sum is credited to the clearing office of the creditor.

(d) Sums due by way of interest shall be treated as debts admitted by the clearing offices and shall be credited to the Creditor Clearing Office in the same way as debts due to other creditors.

(e) Where by decision of the clearing offices or the Mixed Arbitral Tribunal a claim is held not to fall within Article 296, the creditor shall be at liberty to prosecute the claim before the courts or, where such other proceeding may be open to him. The presentation of a claim to the clearing office suspends the operation of any period of prescription.

23. In any case where the Creditor Clearing Office denies to notify a claim to the Debtor Clearing Office, or to take any step provided for in this annex, intended to make effective in whole or in part a request of which it has received due notice, the enemy creditor shall be entitled to receive from the clearing office a certificate certifying the amount in question, and shall then be entitled to prosecute the claim before the courts or to take such other proceedings as may be open to him.

SECTION IV.—PROPERTY, RIGHTS, AND INTERESTS.

Article 297. The questions of private property, rights, and interests are the subject of the annex hereto:

(a) The exceptional war measures and measures of transfer (defined in paragraph 3 of the annex hereto) taken in respect of property, rights, and interests of nationals of Allied or Associated Powers, including companies and associations in which they are interested, when liquidation has not been completed, shall be immediately discontinued or stayed and the property, rights, and interests concerned restored to their owners, who shall enjoy full rights therein in accordance with the provisions of Article 296.

(b) Subject to any contrary stipulations which may be provided for in the present treaty, the Allied and Associated Powers reserve the right to retain and liquidate all property, rights, and interests belonging at the date of the coming into force of the present treaty to German nationals, or to companies controlled by them, within their territories, colonies, possessions, and protectorates including territories ceded to them by the present treaty.

The liquidation shall be carried out in accordance with the laws of the Allied or Associated State concerned, and the use of such property, rights, or interests in the purpose of such property, rights, or interests nor to subject them to any charge without the consent of that State.

German nationals who acquire ipso facto the nationality of any Allied or Associated State in accordance with the provisions of the present treaty shall be considered as German nationals within the meaning of this annex.

(c) The price or the amount of compensation in respect of the exercise of the right referred to in the preceding paragraph (b) will be fixed in accordance with the methods of sale or valuation adopted by the laws of the country in which the property has been retained or liquidated.

(d) As between the Allied and Associated Powers or their nationals on the one hand and Germany or her nationals on the other hand, all the exceptional war measures, or measures of transfer, or acts done or to be done in execution of such measures in Paragraphs 1 and 3 of the annex hereto shall be considered as null and binding upon all persons except as regards the reservations laid down in the present treaty.

(e) The nationals of Allied and Associated Powers shall be entitled to compensation in respect of damage or injury inflicted upon their property rights, or interests, including any company or association in which they are interested, in Germany as on Aug. 1, 1914, by the application either of the exceptional war measures or measures of transfer mentioned in Paragraphs 1 and 3 of the annex hereto. The claims made in this respect by such nationals shall be investigated, and the total of the compensation shall be determined by the Mixed Arbitral Tribunal, or by any other tribunal, or by any arbitral tribunal appointed by the tribunal. This compensation shall be born by Germany, and may be charged upon the property of German nationals, within the territory or under the control of the claimant's State, constituted as a pledge for enemy liabilities under the conditions fixed by Paragraph 4 of the annex hereto. The payment of this compensation shall not prejudice the Allied or Associated State, and the amount will be debited to Germany.

(f) Whenever a national of an Allied or Associated Power is entitled to property which has been subjected to a measure of transfer in Germany and expresses a desire for its restitution, his claim for compensation in accordance with Paragraph (e) shall be satisfied by the restitution of the said property if it still exists in specie.

In such case Germany shall take all necessary steps to restore the evicted owner to full possession of his property, free from all incumbrances or burdens with which it may have been charged after the liquidation, and to indemnify all third parties injured by the restitution.

If the restitution provided for in this paragraph cannot be effected, private agreements arranged by the intermediary of the powers concerned or the clearing offices provided for in Article 296 may be made, in order to secure that the national of the Allied or Associated Power may secure compensation for the injury referred to in Paragraph (f) for the grant of advantages or equivalents which he agrees to accept in place of the property, rights or interests of which he was deprived.

Through the restitution in accordance with this article, the price or the amount of compensation fixed by the application of Paragraph (e) will be reduced by the actual value of the property restored, account being taken of compensation in the event of use, consumption, or deterioration.

(g) The rights conferred by Paragraph (f) are reserved to owners who are nationals of Allied or Associated Powers within whose territory legislative measures prescribing the general liquidation of enemy property, rights, or interests were not applied before the signature of the armistice.

(h) Except in cases where, by application of Paragraph (f), restitution is possible, for the purpose of war legislation, or by application of this article, and in general all cash assets of enemies, shall be dealt with as follows:

(1) As regards powers adopting Section III and the annex thereto, the said proceeds and cash assets shall be credited to the power of which the owner is a national, through the clearing office established thereunder, any credit balance in favor of Germany arising therefrom shall be dealt with as provided in Article 248.

(2) As regards powers not adopting Section III and the annex thereto, the proceeds of the property, rights, and interests, and the cash assets, of the nationals of Allied or Associated Powers held by Germany shall be paid immediately to the person entitled thereto or to his Government; this also concerns rights, interests, and the cash assets, of German nationals received by an Allied or Associated Power shall be subject to disposal by such power in accordance with its laws and regulations and may be applied in payment of the claims, as specified in this annex or Paragraph 4 of the annex hereto. Any property, rights, and interests or proceeds thereof or cash assets not used as above provided may be retained by the said Allied or Associated Power and if retained
WAR, EUROPEAN THE PEACE TREATIES (18)

the cash value thereof shall be dealt with as provided in that State.

In the case of liquidations effected in new States, which are signatories of the present treaty as Allied and Associated Powers and whose by their way of life are not entitled to share in the reparation payments to be made by Germany, the proceeds of liquidations effected by such States shall, subject to the rights of the Reparations Commission under the present treaty, particularly under Article 260, be paid to the owner thereof on the application of that owner, the Mixed Arbitral Tribunal, provided for by Section VI of this Part or any other tribunal appointed by it, is satisfied that the conditions of the sale or measures taken by the Government of the State in question outside its general legislation were unfair prejudicial to the price obtained, they shall have discretion to award to the owner equitable compensation to be paid by that State.

(1) Germany undertakes to compensate its nationals in respect of the sale or retention of their property, rights or interests in Allied or Associated States.

The amount of all taxes and imposts upon capital levied to be levied by Germany on the property, rights, or interests of its nationals in Allied or Associated Powers from the 11th of November, 1918, until three months from the coming into force of the present treaty, or, in the case of property, rights or interests which have been subjected to exceptional measures, to the Allied Powers and Associated Powers in accordance with the provisions of Article 297, Paragraph (a) or (f):

(a)  to restore and maintain, except as expressly provided in the present treaty, the property, rights, and interests of the nationals of the Allied or Associated Powers in respect of their legal rights or interests in respect of the property, rights, and interests of German nationals under the laws in force before the war,

(b) not to subject the property, rights, or interests of the nationals of the Allied or Associated Powers to any measures of derogation of property rights and interests not applied equally to the property, rights, and interests in German national property, and to pay the due debts out of compensation in the event of the application of these measures.

ANNEX.

1. In accordance with the provisions of Article 297, Paragraph (d), the validity of vesting orders and of orders for the winding up of businesses or companies, and of any directions, decisions, or instructions of any court or any department of the Government of any of the high contracting parties made or purporting to be made or given, in pursuance of war legislation with regard to enemy property is confirmed. The interests of all persons shall be regarded as having been effectively dealt with by any order, direction, decision, or instruction, or in any manner of property in which they may be interested, whether or not such interests are specifically mentioned in the order, direction, decision, or instruction. The question shall be considered to be completed by a transfer of any property, rights, or interests dealt with in pursuance of orders, directions, decisions, or instructions of any court or of any department of the Government of any of the high contracting parties made or of an order, direction, or instruction, or in any manner of property in which they may be interested, whether or not such interests are specifically mentioned in the order, direction, decision, or instruction. Every action taken with regard to any property, business, or company, whether as regards its investigation, sequestration, compulsory administration, requisition, supervision, or winding up, the sale or management of property, rights, or interests, the discharge of debts, the payment of costs, charges or expenses, or any other matter whatsoever, in pursuance of orders, directions, decisions, or instructions of any court or of any department of the Government of any of the high contracting parties, made or of an order, direction, or instruction, or in any manner of property in which they may be interested, whether or not such interests are specifically mentioned in the order, direction, decision, or instruction, shall be considered to be completed by transfer of any property, rights, or interests dealt with in pursuance of war legislation with regard to enemy property, rights, or interests, is confirmed. Provided that the provisions of this paragraph shall not be held to prejudice the titles to property heretofore acquired in good faith and for value and in accordance with the laws of the country in which the property is situated by nationals of the Allied and Associated Powers.

2. Any claim or action shall be made or brought against any Allied or Associated Power against any person acting on behalf of or under the direction of any legal authority or department of the Government of such a power by Germany or by its nationals wherever resident in respect of any act or omission with regard to his property, rights, or interests during the war which has not been or shall not be dealt with under the present treaty, or for the conservation of property, rights, and interests of the nationals of the Allied or Associated Powers, including companies and associations in which they are interested, that have been or shall be made or given in pursuance of war legislation with regard to enemy property, and which have had or will have the effect of removing from the proprietors the power of disposition over their property, though without affecting the ownership, such as measures of supervision, of compulsory administration, and of sequestration; or measures which have had or will have as an object the seizure of the use of, or the interference with, enemy assets, for whatsoever purpose, under what-soever form or in whatsoever place. Acts in the execution of these measures include all detentions, instructions, orders, or other measures of the Allied or Associated Governments.

4. All property, rights, and interests of German nationals within the territory of or in Allied or Associated Powers and the proceeds of liquidations or other dealings therewith may be charged by the Allied or Associated Powers in the first place with payment of amounts due in respect of claims by the nationals of that Allied or Associated Power with regard to their property, rights, or interests held in the territory of other enemy powers, or debts owing to them by nationals of such powers, and the proceeds of liquidations or other dealings therewith may be charged by the Allied or Associated Governments or held by them for the benefit of persons holding claims or debts against Germany.

5. Notwithstanding the provisions of Article 297, where immediately before the outbreak of war a company incorporated in an Allied or Associated State had rights in companies, including companies incorporated in Germany, they shall not be handed over to the former company, notwithstanding any action taken under German war legislation with regard to the latter company or its business, industrial property or shares. Nevertheless, the former company, if requested, shall deliver to the latter company derivative copies or the continuance of reproduction of articles for use within German territory.

6. Up to the time when restitution is carried out in accordance with the provisions of this Part of this treaty for the conservation of property, rights, and interests of the nationals of the Allied or Associated Powers, including companies and associations in which they are interested, that have been subjected by her to exceptional war measures.

7. Within one year from the coming into force of the present treaty the Allied or Associated Powers will specify the details of the abovementioned measures to which they intend to exercise the right provided in Article 297, Paragraph (f).

8. The restitution provided in Article 297 will be carried out by order of the German Government or of the authorized Power who against any person acting on behalf of or under the direction of any
WAR, EUROPEAN — THE PEACE TREATIES (18) 561

furnished to the interested persons by the German authorities upon request, which may be made at any time after the coming into force of the present treaty.

9. The expression "cash assets" includes all deposits or funds established before or after the declaration of war, as well as all assets coming from deposits, revenues, or profits collected by administrative officers, or others from funds placed on deposit or otherwise, but does not include sums belonging to the Allied or Associated Powers, or to their representatives or of any kind, as a result of transactions concerning such property, rights or interest.

10. All investigations wherever effected with the cash assets of nationals of the high contracting parties, including companies and associations in which such nationals are interested, be they controlled for the administration of enemy properties or having control over such administration, or by order of such persons or of any authority whatsoever shall be annulled. These cash assets shall be accounted for irrespective of any seizure in kind.

11. Within one month from the coming into force of the present treaty, or on demand at any time, Germany shall be informed of all accounts, vouchers, records, documents, and information of any kind which may be within German territory concerning the property, rights and interests of the nationals of those powers, including companies and associations in which they are interested, that have been subjected to an exceptional war measure, or to a measure of transfer either in German territory or in territory occupied by Germany or her allies.

12. The controllers, supervisors, managers, administrators, sequestrators, liquidators, and receivers shall be personally responsible for the accurate record of all matters provided for in Article 297 between Germany and the Allied or Associated States, and in Section III regulating the method of payment. The provisions of this section shall be applied unless the Government of the Allied or Associated Power concerned shall within six months of the coming into force of the present treaty notify Germany that the said provisions are not to be applied.

13. The provisions of Article 297 and this annex relating to property, rights and interests in an enemy country include those parts of the Annex which apply to debts, credits and accounts, Section III regulating only the method of payment.

14. The provisions of Article 297 and this annex apply to industrial, literary, and artistic property which has been or will be dealt with in the liquidation of property, rights, interests, or business under war legislation by the Allied or Associated Power, in accordance with the stipulations of Article 297, Paragraph (b).

SECTION V — CONTRACTS, PRESCRIPTIONS, JUDGMENTS.

Article 299. — (a) All contracts concluded between entities shall be regarded as having been dissolved as from the time when any two of the parties become extinct or when their war obligation arising out of an act done or money paid within the required time to present the subject to special rules with regard to particular contracts or classes of contracts contained herein or in the annex.

(b) Any contract of which the execution shall be required in the general interest, within six months from the date of the coming into force of the present treaty, by the Allied or Associated Governments of which one of the parties is a national, shall be excepted from dissolution under this article.

When the execution of the contract thus kept alive would, owing to the alteration of conditions, have been an unfair measure to one of the parties substantial prejudice the mixed arbitral tribunal provided for in Article 303 shall be empowered to grant to the prejudiced party equitable compensation.

(c) Having regard to the provisions of the Constitution and law of the United States of America, of Brazil, and of Japan, neither the present Article, nor Article 300, nor the Annexes to the present Treaty shall apply to contracts made between nationals of these States and German nationals; nor shall Article 303 apply to the United States of America or its nationals.

(d) The present Article and the Annex hereto shall not apply to contracts between parties to which became by reason of one of them being an inhabitant of territory of which the sovereignty has been transferred, if such party shall acquire under the present Treaty the nationality of an allied or associated power, nor shall they apply to contracts between nationals of the Allied and Associated Powers between whom trading has been prohibited by reason of one of the parties being in allied or associated territory in the occupation of the enemy.

(e) Nothing in the present Article or the Annex hereto shall be deemed to authorize a transaction or fully carried out in accordance with a contract between enemies if it has been carried out with the authority of one of the belligerent Powers.

Article 300. — (a) All periods of prescription, or limitation of right of action, which are to run before or after the outbreak of war, shall be treated in the territory of the High Contracting Parties, so far as regards relations between enemies, as having been suspended for the duration of the war. They shall begin to run again at a reasonable time after the coming into force of the present Treaty. This provision shall apply to the period prescribed for the presentation of interest or other documents for the representation for repayment of securities drawn for repayment or pay or repayable on any other ground.

(b) Where, on account of failure to perform any act or comply with any formality during the war, measures of execution have been taken in German territory to the prejudice of a national of an Allied or Associated Power, the claim of such national shall, if the matter does not fall within the competence of the courts of an Allied or Associated Power, be heard by the mixed arbitral tribunal provided for by Section VI.

(c) Upon the application of any interested person who is a national of an Allied or Associated Power, the mixed arbitral tribunal shall order the restoration of the rights which have been prejudiced by the measures of execution referred to in paragraph (b), whenever, having regard to the particular circumstances of the case, such restoration is equitable and possible.

If such restoration is impossible the mixed arbitral tribunal may grant the prejudiced party to be paid by the German Government.

(d) Where a contract between enemies has been dissolved by reason either of failure on the part of either party to carry out its provisions, or by the right stipulated in the contract itself the party prejudiced may apply to the Mixed Arbitral Tribunal for relief. The tribunal will have the powers provided for in paragraph (c).

(e) The provisions of the preceding paragraphs of this article shall apply to nationals of Allied and Associated Powers who have been prejudiced by reason of measures referred to above taken by Germany in invaded or occupied territory, if they have not been otherwise compensated.

(f) Germany shall compensate any third party who may be prejudiced by any restitution or restoration ordered by the Mixed Arbitral Tribunal in accordance with the provisions of the preceding paragraphs of this Article.

(g) As regards negotiable instruments, the period of three months provided under paragraph (d) shall commence as from the date on which any exceptional regulations applied in the territories of the interested power with regard to negotiable instruments shall have definitely ceased to have force.

Article 301. — As between enemies no negotiable instrument made before the outbreak of the war in either party's territory shall become invalid by reason only of failure within the required time to present the instrument for acceptance, or to give notice of non-acceptance or non-payment to drawers or indorsers, or to protest the instrument, nor by reason of failure to complete any formality during the war.
WAR, EUROPEAN — THE PEACE TREATIES (18)

Where the period within which a negotiable instrument should have been presented for acceptance or for payment, or within which notice of non-acceptance or non-payment should have been given to the drawer, indorser, or within which the instrument should have been demanded, has elapsed during the war, a period of not less than three months from the coming into force of the present treaty shall be allowed within which presentation, notice of non-acceptance or non-payment or protest may be made.

Article 303. — Where a note or bill is payable to the order of an Allied or Associated Power in all cases which, under the present treaty, they are competent to decide, shall be recognized in Germany as due, and shall be enforced without it being necessary to have them declared executory.

If a judgment in respect of any dispute which may have arisen has been given during the war by a German court against a national of an Allied or Associated State in a case in which he was not able to make defense, the allied and associated national who has suffered prejudice thereby shall be entitled to recover compensation, to be fixed by the Mixed Arbitral Tribunal provided for in Section VI.

At the instance of the national of the Allied or Associated Power the compensation above mentioned may, upon order to that effect of the Mixed Arbitral Tribunal, be effected where replacing the parties in the situation which they occupied before the coming into force of the treaty by the German court.

The above compensation may likewise be obtained before the Mixed Arbitral Tribunal by the nationals of Allied and Associated States who have suffered prejudice by judicial measures taken in invaded or occupied territories, if they have not been otherwise compensated.

Article 303. — For the purpose of Sections III, IV, V, and VI, the expression "during the war" means for each Allied or Associated Power the period between the commencement of the state of war between that power and Germany and the coming into force of the present treaty.

ANNEX.

I. General Provisions.

1. Within the meaning of Articles 299, 300 and 301, the parties to a contract shall be regarded as enemies when trading between them shall have been prohibited by or otherwise became unlawful under laws, orders or regulations duly given by one of those parties subject. They shall be deemed to have become enemies from the date when such trading was prohibited or otherwise became unlawful.

2. The following classes of contracts are excepted from the restrictions of Article 299 and, without prejudice to the rights contained in Article 297 (b) of Section IV, remain in force subject to the agreement of domiciles thereof, the parties being nationals of the said Annex by the instrumentality of the Clearing Offices, which shall assume the rights of the holder as regards the various remedies open to him.

7. If a person has either before or during the war become liable upon a negotiable instrument in accordance with an undertaking given to him by a person who has subsequently become an enemy, the latter shall remain liable to indemnify the former in respect of his liability, notwithstanding the outbreak of war.

III. Contracts of Insurance.

8. Contracts of insurance entered into by any person with another person who subsequently became an enemy will be dealt with in accordance with the following paragraphs.

Fire Insurance.

9. Contracts of the insurance of property against fire entered into by a person interested in such property with another person who subsequently became an enemy shall not be deemed to have been dissolved by the outbreak of war, or by the fact of the coming of an enemy, or on account of the failure during the war and for a period of three months thereafter to perform his obligations under the contract, but they shall be dissolved at the date when the annual premium becomes payable for the first time after the expiration of a period of three months after the coming into force of the present treaty.

A settlement shall be effected of unpaid premiums which became due during the war, or of claims for losses which occurred during the war.

10. Where by administrative or legislative action an insurance against fire effected before the war has been transferred during the war from the original to another insurer, the transfer will be recognized and the liability of the original insurer will be deemed to have ceased as from the date of the transfer. The original insurer will, however, be entitled to receive on demand full information as to the terms of the transfer, and if it should appear that these terms were not equitable they shall be amended so far as may be necessary to render them equitable.

Furthermore, the insured shall, subject to the concurrence of the original insurer, be entitled to retransfer the contract to the original insurer as from the date of the demand.

Life Insurance.

11. Contracts of life insurance entered into between an insurer and a person who subsequently became an enemy shall not be deemed to have been dissolved by the outbreak of war, or by the fact of the person becoming an enemy. Any sum which during the war became due upon contract deemed not to have been paid, under the preceding provision shall be recoverable after the war with the addition of interest at five per cent. per annum from the date of its becoming due up to the day of payment.
WAR, EUROPEAN — THE PEACE TREATIES (18) 583

Other Insurance.
19. Contracts of insurance entered into before the war between an insurer and a person who subsequently became an enemy shall be treated in all respects on the same footing as contracts of insurance entered into, and the same persons would be dealt with under the said paragraphs.

Re-insurance.
20. All treaties of re-insurance with a person who became an enemy shall be regarded as having been abrogated by the person being treated as one day, but without prejudice in the case of life or marine risks which had attached before the war to the right to recover payment after the war for sums due in respect of such risks.

Nevertheless, if, owing to invasion, it has been impossible for the reinsurer to find another reinsurer, the treaty shall remain in force until three months after the coming into force of the present treaty.

Where a re-insurance treaty becomes void under this paragraph, there shall be an adjustment of accounts between the parties in respect both of premiums paid and payable and of liabilities for losses in respect of life or marine risk which had attached before the war. In the case of risks other than those mentioned in Paragraphs 11 to 18 the adjustment of accounts shall be made as at the date of the becoming of the enemy without regard to claims for losses which may have occurred since that date.

The provisions of the preceding paragraph will extend equally to re-insurances existing at the date of the parties becoming enemies of particular risks undertaken by the insurer in a contract of insurance against any risks other than life or marine risks.

21. Re-insurance of life and marine risks by particular contracts and not under any general treaty remain in force.

The provisions of Paragraphs 12 to 18 and the last part of Paragraph 16 shall apply to contracts for the re-insurance of marine risks.

SECTION VI.—MIXED ARBITRAL TRIBUNAL.

Article 304.—(a) Within three months from the date of the coming into force of the present treaty, a Mixed Arbitral Tribunal shall be established between each of the Allied and Associated Powers on the one hand and Germany on the other. Each such tribunal shall consist of three members. Each of the Governments concerned shall appoint one member. The President shall be chosen by agreement between the two Governments concerned.

(b) The Mixed Arbitral Tribunals established pursuant to paragraph (a) shall decide all questions within their competence under Sections III, IV, V, and VII.

In addition, all questions, whatsoever their nature, relating to contracts concluded before the coming into force of the present treaty between nationals of the Allied and Associated Powers and German nationals shall be decided by the Mixed Arbitral Tribunal, always excepting questions which, under the laws of the Allied, Associated or neutral powers, are within the jurisdiction of the national courts of the one or the other party. Such questions shall be decided by the national courts in question, to the exclusion of the Mixed Arbitral Tribunal. In each case of the party who is a national of an Allied or Associated Power may nevertheless bring the case before the Mixed Arbitral Tribunal if this is not prohibited by the laws of his country.

Marine Insurance.
16. Contracts of marine insurance including time policies and voyage policies entered into between an insurer and a person who subsequently became an enemy, shall be deemed to have been dissolved on his becoming an enemy, and the premiums paid for the period undertaken in the contract had attached before he became an enemy.

Where the risk had not attached, money paid by way of premium or otherwise shall be recoverable from the insurer. Where the risk had attached effect shall be given to the contract notwithstanding the party becoming an enemy, and sums due under the contract either by way of premiums or in respect of losses shall be recoverable after the coming into force of the present treaty.

In the event of any agreement being come to for the payment of interest on sums due before the war to or by the nationals of States which have been at war and recovered after the war, such interest shall in the case of losses recoverable under contracts of marine insurance be paid in the period of one year from the date of the loss.

No contract of marine insurance with an insurer who subsequently became an enemy entered after the outbreak of war into a new contract entered into with an insurer who was not an enemy, the new contract shall be deemed to be substituted for the original contract entered into at the date when it was entered into, and the premiums payable shall be adjusted on the basis of the original insurer having received the premiums in the contracts entered into up to the time when the new contract was entered into.
WAR, EUROPEAN — THE PEACE TREATIES (18)

(c) If the number of cases justifies it, additional members shall be appointed and each Mixed Arbitral Tribunal shall sit in divisions. Each of these divisions will be constituted as above.

Each Mixed Arbitral Tribunal will settle its own procedure except in so far as it is provided in the following Annex, and is empowered to award the sums to be paid by the loser in respect of the costs and expenses of the proceedings.

The agent and counsel of the parties to the case before the Tribunal shall pay the remuneration of the member of the Mixed Arbitral Tribunal appointed by it and of any agent whom it may appoint to represent it before the Tribunal. The remuneration of the President will be determined by special agreement between the Governments concerned, and this remuneration and the joint expenses shall be paid by the two Governments in equal moieties.

The tribunal, in transmitting notices and collecting evidence, shall be managed as if each contracting party agreed that their courts and authorities shall render to the Mixed Arbitral Tribunal direct all the assistance in their power, partial or total.

(4) The high contracting parties agree to regard the decisions of the Mixed Arbitral Tribunal as final and conclusive, and to render them binding upon their nationals.

ANNEX

1. Should one of the members of the Tribunal either die, retire, or be unable for any reason whatever to discharge his function, the same procedure will be followed for filling the vacancy as was followed for appointing him.

2. Each tribunal may adopt such rules of procedure as shall be in accordance with justice and equity and deal fairly with the cause at which each party may conclude its arguments, and may arrange all formalities required for dealing with the evidence.

3. The members of the tribunal on each side are authorized to present orally and in writing to the tribunal arguments in support or in defense of each case.

4. The tribunal shall keep record of the questions and facts submitted and the proceedings thereon, with the dates of such proceedings.

5. Each of the Powers concerned may appoint a secretary, who shall act in the same manner as the secretaries of the tribunal and shall be subject to its direction. The tribunal may appoint and employ any other necessary officer or officers to assist in the performance of its duties.

6. The tribunal shall decide all questions and matters submitted upon such evidence and information as may be furnished by the parties concerned.

7. Germany agrees to give the tribunal all facilities and information required by it for carrying out its investigations.

8. The language in which the proceedings shall be conducted shall, unless otherwise agreed, be English, French, Italian, or Japanese, as may be determined by the Allied or Associated Power concerned.

9. The place and time for the meetings of each tribunal shall be determined by the President of the tribunal.

Article 305.—Whenever a competent court has given a decision in a case covered by Sections III, IV, V or VII, and such decision is inconsistent with the provisions of such sections, the party who has not prejudiced by the decision shall be entitled to obtain redress which shall be fixed by the Mixed Arbitral Tribunal. At the request of the national of an Allied or Associated Power, the redress may, whenever possible, be effected by the Mixed Arbitral Tribunal directing the replacement of the parties in the position occupied by them before the judgment was given by the German Court.

SECTION VII.—INDUSTRIAL PROPERTY.

Article 306.—Subject to the stipulations of the present treaty, rights of industrial, literary, and artistic property, as such property is defined by the International Conventions of Paris and of Berne, mentioned in Article 266, shall be re-established or restored, as from the coming into force of the present treaty in the territories of the high contracting parties, in favor of the persons entitled to the benefit of them at the moment when the state of war commenced, or their legal representatives. Equally rights which, except for the war, would have been acquired during the war in consequence of an application made for the protection of such rights or the publication of a literary or artistic work, shall be recognized and established in favor of those persons who would have been entitled thereto from the coming into force of the present treaty.

Nevertheless, all acts done by virtue of the special measures to prevent or redress any violations or administrative or authoritative action of any Allied or Associated Power in regard to the rights of German nationals in industrial, literary, or artistic property, or by any persons acting on behalf of or with the consent of such Government of any rights in industrial, literary or artistic property, shall remain in force and shall continue to maintain their full effect.

No claim shall be made or action brought by Germany or German nationals in respect of the use during the war by the Government of Allied or Associated Power, or by any persons acting on behalf of or with the consent of such Government of any rights in industrial, literary or artistic property, for the manufacture, offering for sale, or use of any products, articles, or apparatus whatsoever to which such rights applied.

Unless the legislation of any one of the Allied or Associated Powers in force at the moment of the signature of the present treaty otherwise directs, sums due or paid in virtue of any act or operation resulting from the execution of the special measures mentioned in Paragraph 1 of this article shall be dealt with in the same way as other sums due to German nationals are directed to be dealt with by the present treaty; and sums produced by any special measure adopted by the German Government in respect of rights in industrial, literary or artistic property belonging to the nationals of the Allied or Associated Powers shall be considered and treated in the same way as other debts due from German nationals.

Each of the Allied and Associated Powers reserves to itself the right to impose such limitations, conditions or restrictions on rights of industrial, literary, or artistic property (with the exception of trademarks) acquired before or during the war, or subsequently acquired in accordance with its legislation, by German nationals, whether by granting licenses, or by the working, or by preserving or exploiting, or in any other way as may be considered necessary for national defense or for assuring the fair treatment by Germany of the rights of industrial, literary, and artistic property held in German territory by its nationals or securing the due fulfillment of all the obligations undertaken by Germany in the present treaty.

As regards rights of industrial, literary and artistic property acquired after the coming into force of the present treaty, the Allied and Associated Powers shall only be exercised in cases where these limitations, conditions or restrictions may be considered necessary for national defense or in the public interest.

In the event of the application of the provisions of the preceding paragraph by any of the Allied or Associated Powers, there shall be paid reasonable indemnities or royalties which shall be dealt with in the same way as other sums due to German nationals are directed to be dealt with by the present treaty.

Each of the Allied or Associated Powers reserves the right to treat as void and of no effect any transfer in whole or in part of or other dealing with rights of or in respect of industrial, literary, and artistic property effected after Aug. 1, 1914, or in the future, which would have the result of defeating the objects of the provisions of this article.

The provisions of this article shall not apply to rights in industrial, literary or artistic property which have been dealt with in the liquidation of businesses or companies under war legislation by the Allied or Associated Powers, or which may be so dealt with in virtue of Article 297, paragraph (b).

Article 307.—A minimum of one year after the coming into force of the present treaty shall be accorded to the nationals of the high contracting parties, without extension fees or other formalities to enable persons to accomplish any act, fulfill any formality, pay any fees, and generally satisfy any obligation prescribed by the laws or regulations of the respective States relating to the obtaining, preserving, or opposing rights to, or in respect of, industrial property either acquired before the 1st of August, 1914, or which, except for the war, might have been acquired since that date as a result of any application made before the war or during its continuance, but nothing in this article shall give any right to reopen interference proceedings in cases where the final hearing has taken place.

All rights in, or in respect of, such property which may have been prejudiced by any failure to accomplish any act, fulfill any formality, or make any payment, shall revive, as far as may be, by reason of the provisions of this article, without prejudice to the modification or suppression or new design or the imposition of such conditions as each Allied or Associated Power may deem reasonably necessary for this purpose, or to procure the elimination or abrogation of a registration or the termination or suspension or modification of the registration of such property while the rights had lapsed. Further, where rights
WAR, EUROPEAN — THE PEACE TREATIES (18) 565

to patents or designs belonging to German nationals are restricted under the secret subject in respect of the grant of licenses to the same provisions as would have been applicable to them during the war, as well as to all the rights of the present treaty.

The period from the 1st August, 1914, until the conclusion of the present treaty shall be included in the time within which a patent should be worked or a trademark or design used, and it shall be presumed that both marks or design in force on the 1st of August, 1914, shall have been used during the war, and not only of the failure to work such patent or use such trademark or design for two years after the coming into force of the present treaty.

Article 308. — The rights of priority, provided by Article IV of the International Convention for the Protection of Industrial Property of Paris, of the 20th March, 1883, revised at Washington in 1911, or by any other convention or statute, for the filing or registration of applications for patents or models of utility, and for the registration of trademarks, designs, and models, shall be extended until the 1st August, 1914, and those which have arisen during the war, or would have arisen but for the war, shall be extended by each of the contracting parties for all nationals of the other high contracting parties for a period of six months after the coming into force of the present treaty.

Nevertheless, such extension shall in no way affect the right of the person whose application for registration, or registration, or registration of design, or model, or trademark, or use of trademark, or use of design, was already in respect of any person who before the coming into force of the present treaty was bona fide in possession of any rights of ownership, or of the rights of ownership, or of the rights of registration, or of the rights of possession, or of the rights of use, or of the rights of use, or of the rights of possession, or of the rights of use, of such designs, or trademark, or use of trademark, or use of design, as derived from their right from it or him before the coming into force of the present treaty, and such persons shall not be amenable to any action or other process of law in respect of infringement.

No action shall be brought and no claim made by persons residing or carrying on business within the territories of Germany on the one part and of the Allied and Associated Powers on the other, or persons who are nationals of such powers, respectively, or by any one deriving title from the war from such persons, by reason of any action which has taken place within the territory of the other party between the date of the declaration of war and that of the coming into force of the present treaty, which might constitute an infringement of the rights of industrial property or rights of literary and artistic property, existing at any time during the war or revived under the provisions of Articles 307 and 308.

Equally, no action for infringement of industrial, literary or artistic property rights by such persons shall at any time be brought by persons residing or carrying on business in Germany, offering for sale a period of one year after the signature of the present treaty in the territories of the Allied and Associated Powers on the other, or products or articles manufactured, or parts of products or articles manufactured, during the period between the declaration of war and the signature of the present treaty, or against those who have acquired title to such products or articles from those persons, in Germany, or elsewhere; nevertheless, that provision shall not apply when the possessor of the rights was domiciled or had an industrial or commercial establishment in the districts occupied by Germany during the war.

This article shall not apply as between the United States of America on the one hand and Germany on the other.

Article 310. — Licenses in respect of industrial, literary, or artistic property concluded before the war between nationals of the Allied or Associated Powers or persons residing in the territories of which were in being at any time, on both sides, shall be considered as canceled, as from the date of the declaration of war between Germany and the Allied or Associated Powers. But, in any case of consent between the parties, the agreements of this kind shall have the right, within a period of six months after the coming into force of the present treaty, to determine secondarily the terms on which the rights which the grant of a new license, the conditions of which, in default of agreement between the parties, shall be fixed by the duty of the tribunal in the country under whose legislation the rights had been acquired, except in the case of works protected by patents, and of the rights the grant of which under German law. In such cases the conditions shall be fixed by the Mixed Arbitral Tribunal referred to in Section V of Article 217. The term of any such license, or of any such aerodrome such aircraft shall be treated on a footing of equality with German aircraft as regards charges of every description, including charges for landing and accommodation.

Article 314. — The aircraft of the Allied and Associated Powers shall have full liberty of passage and landing, over, and in the territory and territorial waters of Germany, and shall enjoy the same privileges as the German aircraft, particularly in case of distress by land or sea.

Article 315. — The aircraft of the Allied and Associated Powers shall, while in transit to any foreign country whatever, enjoy the same rights in the territory and territorial waters of Germany without landing subject always to any regulations which may be made by Germany, and which shall be applicable equally to the aircraft of Germany and those of the Allied and Associated Powers.

Article 316. — All aerodromes in Germany open to national public traffic shall be open for the aircraft of the Allied and Associated Powers, and any such aerodrome such aircraft shall be treated on a footing of equality with German aircraft as regards charges of every description, including charges for landing and accommodation.

Article 318. — Subject to the present provisions, the
rights of passage, transit and landing, provided for in Articles 313, 314 and 315, are subject to the observance of the following provisions:

Article 317.—Certificates of nationality, airworthiness, and registration, of passengers and mail, and vessels, issued or recognized as valid by any of the Allied or Associated Powers, shall be recognized in Germany as valid and as equivalent to the certificates and licenses issued by Germany.

Article 318.—As regards internal commercial air traffic, the certificate of nationality and associated Power shall enjoy in Germany most favored nation treatment.

Article 319.—Germany undertakes to enforce the regulations for the protection of air traffic on the territory of Germany, and in the neighborhood of aerodromes, which have been laid down in the convention relative to aerial navigation concluded between the Allied and Associated Powers.

Article 320.—The obligations imposed by the preceding provisions shall remain in force until 1 January, 1923, unless before that date Germany shall have been admitted into the League of Nations or shall have been authorized by the League of Nations, by treaty, to join the Allied and Associated Powers, to adhere to the convention relative to aerial navigation concluded between those powers.

PART XII.—PORTS, WATERWAYS AND RAILWAYS.

SECTION I.—GENERAL PROVISIONS.

Article 321.—Germany undertakes to grant freedom of transit through her territories on the routes most convenient for international transit, either by rail, navigable waterway, or canal, to persons, goods, vessels, cars, mail, and mail vessels coming from or going to the territories of any of the Allied and Associated Powers, (whether contiguous or not) for this purpose the crossing of territorial waters shall be allowed. Such persons, goods, vessels, cars, mail vessels, and mail shall not be subjected to any transit duty or to any other duties or charges, and shall be entitled in Germany to national treatment as regards charges, facilities, and all other matters.

Goods in transit shall be exempt from all customs or other similar duties.

The charges imposed on transit in transit shall be reasonable, having regard to the conditions of the traffic. No charge, facility, or restriction shall depend directly or indirectly on the ownership or on the nationality of the ship or other means of transport on which any part of the through journey has been, or is to be, accomplished.

Article 322.—Germany undertakes neither to impose control over transshipment traffic through her territories beyond measures necessary to insure that passengers are bona fide in transit; nor to allow any shipper, company or any other private body, corporation or person interested in the traffic to take any part whatever in, or to exercise any direct or indirect influence over, any administrative service that may be necessary for this purpose.

Article 323.—Germany undertakes to make no discrimination or preference, direct or indirect, in the duties, charges, and prohibitions relating to importations into or exports from her territories, or, subject to the special engagements contained in the present treaty, in the charges and conditions of transport of goods or persons entering or leaving her territories, based on the frontier crossed; or on the kind, ownership, or flag of the means of transport (including aircraft) employed; or on the original or immediate place of departure of the vessel, wagon, or aircraft, or other means of transport employed, or its ultimate or intermediate destination; or on the route of or places of transshipment, as the case may be, or on whether any part of the journey, or on whether any part of the goods through which the goods are imported or exported is a German port or a port belonging to any foreign country or on whether the goods are imported or exported by sea, by land, or by air.

Germany particularly undertakes not to establish a toll on goods or vessels of any of the Allied and Associated Powers any surtax or any direct or indirect bounty for the transport of goods or vessels by German ports of vessels, by those of another power, for example by means of combined tariffs. She further undertakes that passengers or goods passing through a port or using a vessel of any of the Allied and Associated Powers shall not be subjected to any formality or delay whatever, that in any cases this would not be subjected if they passed through a German port or a port of any other power, or used a German vessel or a vessel of any other power.

Article 324.—The above-mentioned administrative and technical measures shall be taken to shorten, as much as possible, the transmission of goods across the German frontiers and to insure the best transport from such frontiers, irrespective of whether such goods are crossing the territorial waters of the Allied and Associated Powers or are in transit from or to those territories, under the same material conditions in all respects as those enjoyed by similar goods and care en route as are enjoyed by other goods of the same kind that travel within the territory of the German territory under similar conditions of transport.

In particular, the transport of perishable goods shall be promptly and with the utmost care insured, and all regular arrangements for the carriage and treatment of goods shall be effected in such a way as to allow the goods to be carried straight through by trains which make connection.

Article 325.—The seaports of the Allied and Associated Powers are entitled to all favors and to all reduced tariffs granted on German railways or navigable waterways for the benefit of German ports or of any port of another power.

Article 326.—Germany may not refuse to participate in the tariffs or combinations of tariffs intended to secure for ports of the Allied or Associated Powers advantages similar to those granted by Germany to her own ports or the ports of any other power.

SECTION II.—NAVIGATION.

Chapter I.—Freedom of Navigation.

Article 327.—The nationals of any of the Allied and Associated Powers as well as their vessels and property shall enjoy in all German ports and in the inland navigation routes of Germany, the same treatment in all respects as German nationals, vessels and property.

In particular the vessels of any one of the Allied or Associated Powers shall be entitled to transport goods of any description, and pass through any ports or places in German territory to which German vessels may have access, under conditions which shall not be more onerous than those applied in the case of national vessels; they shall be treated on a footing and with respect to national vessels, as regards ports and harbor facilities and charges of every description, including facilities for stationing, loading and unloading, and duties and charges of tonnage, harbor, pilotage, lighthouse, quarantine, and all analogous duties and charges of whatsoever nature, levied in the name of or for the profit of the Government, public functionaries, private individuals, corporations or establishments of any kind.

In the event of Germany granting a preferential regime to any of the Allied or Associated Powers or to any other foreign power, this shall be extended immediately and unconditionally to all the Allied and Associated Powers.

There shall be no impediment to the movement of persons or vessels other than those arising from prescriptions concerning customs, health, immigration and emigration and immigration and those relating to the import and export of prohibited goods. Such regulations must be reasonable and uniform and must not impede traffic unnecessarily.

Chapter II.—Free Zones in Ports.

Article 328.—The free zones existing in German ports on the 1st August, 1914, shall be maintained. These free zones and any other free zones which may be established in German territory by the present treaty, shall be subject to the regime provided for in the following articles.

Goods entering or leaving a free zone shall not be subject to any import or export duty, other than those provided for in Article 339.

Vessels and goods entering a free zone may be subjected to inspection, and charges payable for inspection, for the purpose of ascertaining that the goods have not been smuggled, on the condition, however, of having regard to the expenditure incurred, and shall be levied in the conditions of equality provided for in Article 327.

Goods shall not be subjected to any other charge except a stated duty which places a tax on the goods as a result of their sale or use, and which shall be devoted exclusively to defraying the expenses of compiling statements of the traffic and its results.

Article 329.—The facilities granted for the erection of warehouses, for packing and unpacking goods, shall be in accordance with trade requirements for the time being. All goods allowed to be consumed in
WAR, EUROPEAN — THE PEACE TREATIES (18) 507

the free zone shall be exempt from duty, whether of excise or of any other description, apart from the state tax levied for in Article 330 above.

There shall be no discrimination in regard to any of the provisions of the present article between persons belonging to different nationalities or between goods of different origin or destination.

Article 330.—Import duties may be levied on goods landed in the free zone for consumption in the country on the territory of which the port is situated. Conversely, exported goods shall be capable of being reimported from such country and brought into the free zone. These import and export duties shall be levied on the same basis as the corresponding duties levied by the other customs frontiers of the country concerned.

On the other hand, Germany shall not levy, under any denomination, any import, export, or transit duty on goods carried by land or water across her territory to or from the free zone from or to any other State. Germany shall draw up the necessary regulations to secure and guarantee such freedom of transit over such waterways and across the free territory as normally give access to the free zone.

Chapter III.—Clauses Relating to the Elbe, the Oder, the Niemen (Russtrom-Memel-Niemen), and the Danube.

(1) General Clauses.

Article 331.—The following rivers are declared international:
The Elbe (Labe) from its confluence with the Vienna (Moldau) and the Vitava (Moldau) from Prague;
the Oder (Odra) from its confluence with the Oppa; the Niemen (Memel-Niemen) from Grodno;
and the Danube from Ulm;
and all navigable parts of these river systems which naturally provide more than one State with access to the sea, with or without transshipment from one vessel to another, together with lateral canals and channels constructed either to duplicate or to improve naturally navigable parts of the main system, or to connect two naturally navigable sections of the same river.

The same shall apply to the Rhine-Danube navigable waterway, should such a waterway be constructed under the conditions laid down in Article 335.

On the waterways declared to be international in the preceding article, the nationalities, property and flags of all powers shall be treated on a footing of perfect equality, no distinction being made to the detriment of the nationalities, property or flag of any power by reason of the nationality, property or flag of the riparian State itself or of the most favored nation.

Nevertheless, German vessels shall not be entitled to carry passengers or goods by regular services between any ports of any Allied or Associated Power, without special authority from such power.

Article 333.—Where such charges are not precluded by existing conventions, charges varying on different sections of a river may be levied on vessels using the navigable channels or their approaches, provided that they are intended solely to cover equitably the cost of maintaining in a navigable condition, or of improving, the river and its approaches, or to meet expenditure incurred in the interests of navigation. The schedule of such charges shall be calculated on the basis of such expenditure and shall be posted up in the ports. These charges shall be levied in such a manner as to render any detailed examination of cargoes unnecessary, except in cases of suspected fraud or contravention.

Article 334.—The transit of vessels, passengers, and goods on these waterways shall be effected in accordance with the general conditions prescribed for transit in Section 3 above.

When the two banks of an international river are within the same State goods in transit may be placed under the custody of the customs officers of the port on the banks of the river, where the river forms a frontier goods and passengers in transit shall be exempt from all customs formalities; the authorities of the bordering countries are responsible for the embarkation and disembarkation of passengers, shall only take place at the ports first named by the riparian State.

Article 335.—No dues of any kind other than those provided for in the present part shall be levied along the course of these rivers.

This provision shall not prevent the fixing by the riparian States of customs, local octroy, or consumption duties, levied on goods in transit, and unloading duties, levied in the ports, in accordance with public tariffs, for the use of cranes, elevators, quays, ware-

houses, etc.

Article 336.—In default of any special organization for carrying out the works connected with the upkeep and improvement of the international portion of navigable waterways, each riparian State shall be bound to take suitable measures to remove any obstacle or danger to navigation and to insure the maintenance of good conditions of navigation.

If a State neglects to comply with this obligation any riparian State, or any two or more riparian States, may convene an International Commission, if there is one, may appeal to the tribunal instituted for this purpose by the League of Nations.

Article 337.—The same procedure shall be followed in the case of a riparian State undertaking any works of a nature to impede navigation in the international section. The tribunal mentioned in the preceding article shall be entitled to enforce the suspension or suppression of such works, making due allowance in its decisions for all rights in connection with irrigation, water power, fisheries, and other national interests, which with the consent of all the riparian States or of all the States represented on the International Commission, if there be one, shall be given priority over the requirements of navigation.

Appeal to the tribunal of the League of Nations does not require the suspension of the works.

Article 338.—The regime set out in Articles 332 to 337 above shall be superseded by one laid down in a General Convention drawn up by the Allied and Associated Powers, and approved by the League of Nations, relating to the waterways recognized in such Convention as having an international character. This Convention shall apply in particular to the navigable part of the above-mentioned river systems of the Elbe, (Labe), the Oder, (Odra), the Niemen, (Russtrom-Memel-Niemen), and the Danube, and such other parts of these river systems as may be covered by a general definition.

Germany undertakes in accordance with the provisions of Article 379, to adhere to the said General Convention as well as to all other regulations in accordance with Article 343 below for the revision of existing international agreements and regulations.

Article 339.—Germany and the Allied and Associated Powers concerned, within a maximum period of three months from the date on which notification shall be given her, a proportion of the tugs and vessels remaining registered in the ports of the river systems referred to in Article 331 after the deduction of those surrendered by way of restitution or reparation. Germany shall in the same way cede material of all kinds necessary to the Allied and Associated Powers concerned for the utilization of those river systems.

The number of the tug and vessel amount of the material so ceded, and their distribution, shall be determined by an arbitrator or arbitrators nominated by the United States of America, in regard being had to the legitimate needs of the parties concerned, and particularly to the shipping traffic during the five years preceding the war.

All craft so ceded shall be provided with their fittings and gear, shall be in a good condition to carry goods, and shall be selected from among those most recently built.

The cessions provided for in the present article shall entail a credit of which the total amount, settled in a lump sum by the arbitrator or arbitrators, shall not in any case exceed the value of the capital expended in the initial establishment of the material ceded, and shall be set off against the total sums due from Germany; in consequence, the indemnification of the proprietors shall be a matter for Germany to deal with.

(2) Special Clauses Relating to the Elbe, the Oder, and the Niemen (Russtrom-Memel-Niemen).

Article 340.—The Elbe (Labe) shall be placed under the administration of an International Commission which shall comprise:

4 representatives of the German States bordering on the river;
2 representatives of the Czechoslovak State;
1 representative of Great Britain;
1 representative of France;
1 representative of Italy;
1 representative of Belgium.

Whatever be the number of members present, each delegation shall have the right of casting votes equal to the number of representatives allotted to it.

If certain of these representatives cannot be appointed at the time of the coming into force of the present treaty, the final decisions of the commission shall nevertheless be valid.
WAR, EUROPEAN — THE PEACE TREATIES (18)

Article 341.—The Oder (Odra) shall be placed under the administration of an International Commission, consisting of:
1 representative of Poland;
3 representatives of Prussia;
1 representative of the Czechoslovak State;
1 representative of Great Britain;
1 representative of France;
1 representative of Denmark;
1 representative of Sweden.

If certain of these representatives cannot be appointed at the time of the coming into force of the present treaty, the decisions of the commission shall nevertheless be valid.

Article 342.—On a request being made to the League of Nations by any riparian State, the Niemen (Rusström-Memel-Niemen) shall be placed under the administration of an International Commission, which shall comprise one representative of each riparian State, and three representatives of other States specified by the League of Nations.

Article 343.—The International Commissions referred to in Article 342 shall meet within three months from the date of the request made by a riparian State. Each of these commissions shall proceed immediately to prepare a project for the revision of the existing international agreements and regulations, drawn up in connection with the Niemen Convention referred to in Article 338, should such convention have been already concluded. In the absence of such convention, the powers of revision shall be in conformity with the principles of Articles 332 to 337, above.

Article 344.—The projects referred to in the preceding article shall enter into force:
(a) Designate the headquarters of the International Commissions and prescribe the manner in which its President is to be nominated;
(b) Specify the extent of the commission's powers, particularly in regard to the revision of existing agreements and regulations, and the execution of works for the maintenance, control, and improvement on the river system, the financial régime, the fixing and collection of charges, and regulations for navigation;
(c) Define the sections of the river and its tributaries to which the international régime shall be applied.

Article 345.—The international agreements and regulations at present governing the navigation of the Elbe, (Labe) the Oder, (Odra,) and the Niemen (Rusström-Memel-Niemen) shall be provisionally maintained in force until the ratification of the above-mentioned projects. Nevertheless, in all cases where such agreements and regulations in force are in conflict with the provisions of Articles 332 to 337 above, or of the General Convention to be concluded, the latter provisions shall prevail.

(3) Special Clauses Relating to the Danube.

Article 346.—The European Commission of the Danube shall assume the powers it possessed before the war. Nevertheless, as a provisory measure, only representatives of Great Britain, France, President Italy, and Rumania shall constitute this commission.

Article 347.—From the point where the competence of the European Commission ceases, the Danube system referred to in Article 331 shall be placed under the administration of an international commission composed as follows:
2 representatives of German riparian States;
1 representative of each other riparian State;
1 representative of each non-riparian State represented in the future on the European Commission of the Danube.

If certain of these representatives cannot be appointed at the time of the coming into force of the present treaty, the decisions of the commission shall nevertheless be valid.

Article 348.—The International Commission provided for in the preceding article shall meet as soon as possible after the coming into force of the present treaty, and shall undertake provisionally the administration of the river in conformity with the provisions of Article 334. The pow(power) in such times of all definite statute regarding the Danube is concluded by the powers of the Allied and Associated Powers, which shall meet within one year after the coming into force of the present treaty, and shall appoint one of their representatives.

Article 349.—Germany agrees to accept the régime which shall be laid down for the Danube by a convention of the powers nominated by the Allied and Associated Powers, which shall meet within one year after the coming into force of the present treaty, and shall appoint one of their representatives.

Article 350.—The mandate given by Article 37 of the Treaty of Berlin of the 13th July, 1878, to Austria-Hungary, and transferred by her to Hungary, to carry out works at the Iron Gate, is from the International Commission intrusted with the administration of this part of the river shall lay down provision for the settlement of accounts subject to the financial provisions of the present treaty, charges which may be necessary shall in no case be levied by Hungary.

Article 351.—Should the Czechoslovak State, the Serb-Croat-Slovene State, or Rumania, with the authorisation of or under mandate from the International Commission, undertake maintenance, improvement, weir, or other works on a part of the river which forms a frontier, these States shall enjoy on the opposite bank, and also on the part of the bed which is outside their territory, all necessary facilities for the survey, execution, and maintenance of such works.

Article 352.—Germany shall be obliged to make to the European Commission of the Danube all restitutions, reparations, and indemnities for damages inflicted on the commission during the war.

Article 353.—Should a deep-draught Rhine-Danube navigable waterway be constructed, Germany undertakes to apply thereto the regime prescribed in Articles 332 to 338.

Chapter IV.—Clauses Relating to the Rhine and the Moselle.

Article 354.—As from the coming into force of the present treaty, the Convention of Mannheim of 17th October, 1867, and the Convention of 18th November, 1875, shall continue to govern navigation on the Rhine, subject to the conditions hereinafter laid down.

Should the existence of any part of the said Convention be in conflict with those laid down by the General Convention referred to in Article 315, (which shall apply to the Rhine,) the provisions of the General Convention shall prevail.

Within a maximum period of six months from the coming into force of the present treaty, the Central Convention referred to in Article 335 shall meet to decide whether and in what degree of accuracy in Mannheim. This project shall be drawn up in harmony with the provisions of the General Convention referred to in Article 334, shall have been concluded by that time, and shall be submitted to the powers represented on the Central Commission. Germany hereby agrees to adhere to the project so drawn up.

Further, the modifications set out in the following articles shall immediately be made in the Convention of Mannheim.

The Allied and Associated Powers reserve to themselves the right to arrive at an understanding with this connection with Holland, and Germany hereby agrees to accept if required by the understanding.

Article 355.—The Central Commission provided for in the Convention of Mannheim shall consist of nineteen members, viz.:
Two representatives of the Netherlands;
Two representatives of Switzerland;
Four representatives of German riparian States;
Four representatives of France, which in addition shall appoint one of their representatives.
Two representatives of Great Britain;
Two representatives of Italy;
Two representatives of Belgium.

The headquarters of the Central Commission shall be at Strasbourg.

Whatever be the number of members present, each delegation shall have the right to record a number of votes equal to the number of representatives allotted to it.

If certain of these representatives cannot be appointed at the time of the coming into force of the present treaty, the decisions of the Commission shall nevertheless be valid.

Article 356.—Vessels of all nations, and their cargoes shall have the same rights and privileges as those which are granted to vessels belonging to the Rhine navigation, and to their cargoes.

None of the provisions contained in Articles 15 to 20 and 26 of the above-mentioned Convention of Mannheim, in Article 4 of the Final Protocol thereof, or in later Conventions, shall impede the free navigation of vessels and on waterways to which such Conventions apply, subject to compliance with the regulations of the Rhine and other police measures drawn up by the Central Commission.

The provisions of Article 22 of the Convention of Mannheim and of Article 5 of the Final Protocol thereof shall be applied only to vessels registered on the Rhine. The Central Commission may make steps to be taken to ensure that other vessels satisfy the con-
WAR, EUROPEAN — THE PEACE TREATIES (18) 569

ditions of the general regulations applying to naviga-

tion on the Rhine and the Moselle.

**Article 357.** — Within a maximum period of three

months from the date on which notification shall be
given to France in accordance with Article 356, any

from among those remaining registered in German

Rhine ports after the conclusion of the present

surrenders by way of restitution or repair, or shares in

German Rhine navigation companies.

When such shares are ceded, such vessels and tugs,
together with their fittings and gear, shall be in

good state of repair, shall be in condition to carry on

commerce on the Rhine where it formed the boundary

of France and Germany without the previous approval

of the Central Commission or of its agents.

**Article 359.** — Subject to the preceding provisions, no

works shall be carried out in the bed or on either

bank of the Rhine where it formed the boundary

between France and Germany without the previous

approval of the Central Commission or of its agents.

**Article 360.** — France reserves the option of sub-

resulting from agreements arrived at between the

sitting herself as regards the rights and obligations

of the French Lorraine and the Grand Duchy of

Baden concerning the works to be carried out on the

Rhine; she may also determine such agreements within

term of five years dating from the coming into force

of the present treaty.

France shall also have the option of causing works to be

carried out which may be recognized as necessary by

the Central Commission for the upkeep or improve-

ment of the navigability of the Rhine above Mann-

heim.

**Article 361.** — Should Belgium, within a period of

25 years from the coming into force of the present

treaty decide to create a deep-draught Rhine-Mouse

navigable waterway, in the region of Ruhrort, Germany

shall be bound to construct, in accordance with plans
to be communicated to her by the Belgian Govern-

ment, after agreement with the Central Commission, the

portion of this navigable waterway situated within her

territory shall be a matter for Germany to deal with.

**Article 368.** — Subject to the obligation to comply

with the provisions of the Convention of Mannheim or

of the convention which may be substituted therefor,

and with the stipulations of the present treaty, France

shall have on the whole course of the Rhine included

between the two extreme points of the French frontiers —

(a) the exclusive right to the river Rhine for

navigation and irrigation canals (constructed or to

be constructed) or for any other purpose, and to

erect on the German bank all works necessary

for the exercise of this right;

(b) the exclusive right to the power derived from

works of regulation on the river, subject to the

payment to Germany of the value of half the

power actually produced, this payment, which will
take into account the cost of the works necessary

for producing the power, being made either in

money shall be paid to Germany in default of agreement

being determined by arbitration. For this pur-

pose France shall have the right to cut out in the

river the various works of regulation (weirs or other

works) which she may consider necessary for the

production of power. Similarly, the right of taking water from

the Rhine is accorded to Belgium to feed the Rhine-

navigable waterway provided for below.

The exercise of the rights mentioned under (a) and

(b) of the present article shall not interfere with navi-

gability nor reduce the facilities for navigation, either

in the bed of the Rhine or in the derivations which may

be substituted therefor, nor shall it involve any increase

in the width or depth of the bed under the convention in

force. All proposed schemes shall be laid before the

Central Commission in order that commission may

assure itself that these conditions are complied with.

To insure the proper and faithful execution of the

provisions contained in (a) and (b) above, Germany

(i) binds herself not to undertake or to allow the

construction of any lateral canal or any derivation on

the right bank of the river opposite the French

frontiers;

(ii) recognizes the possession by France of the

right to the river and all lands situated on the right

bank which may be required in order to carry on,

and to operate, weirs while France, with the consent of the

Central Commission, may subsequently decide to establish. In accordance with the provisions of paragraph (ii) shall be decided

upon and the limits of the necessary sites, and she

shall be permitted to occupy such lands after a period

of two months after simple notification, subject to the

payment by her to Germany of indemnities of which the
total amount fixed by the Central Commission.

Germany shall make it her business to indemnify the

proprietors whose property will be burdened with such

services, works or permanent occupations.

Should Switzerland so demand, and if the Central

Commission approves, the same rights shall be accorded

to Switzerland for the part of the river forming her

frontier with other riparian States;

(iii) shall hand over to the French Government,
during the month following the coming into force of

the present treaty, all projects, designs, drafts of con-

cessions and of specifications concerning the regula-

tion of the Rhine for any purpose whatever which have

been drawn up or received by the Governments of

Alsatia-Lorraine or of the Grand Duchy of

Baden.

**Article 359.** — Subject to the preceding provisions, no

works shall be carried out in the bed or on either

bank of the Rhine where it formed the boundary

between France and Germany without the previous approval of

the Central Commission or of its agents.

**Article 360.** — France reserves the option of sub-

resulting from agreements arrived at between the

sitting herself as regards the rights and obligations

of the French Lorraine and the Grand Duchy of

Baden concerning the works to be carried out on the

Rhine; she may also determine such agreements within

term of five years dating from the coming into force

of the present treaty.

France shall also have the option of causing works to be

carried out which may be recognized as necessary by

the Central Commission for the upkeep or improve-

ment of the navigability of the Rhine above Mann-

heim.

**Article 361.** — Should Belgium, within a period of

25 years from the coming into force of the present

treaty decide to create a deep-draught Rhine-Mouse

navigable waterway, in the region of Ruhrort, Germany

shall be bound to construct, in accordance with plans
to be communicated to her by the Belgian Govern-

ment, after agreement with the Central Commission, the

portion of this navigable waterway situated within her

territory shall be a matter for Germany to deal with.

The Belgian Government shall, for this purpose, have

the right to carry out on the ground all necessary

surveys.

Should Germany fail to carry out all or part of these

works, the Central Commission shall be entitled to

take the right to carry them out instead; and, for this

purpose, the commission may decide upon and fix the limits of

the necessary sites and occupy them and after a period of

two months after simple notification, subject to the

payment of indemnities to be fixed by it and paid by

Germany.

This navigable waterway shall be placed under

the same administrative regime as the Rhine itself, and

the division of the cost of initial construction, including

the above indemnities, among the States crossed thereto-

by shall be made by the Central Commission.

**Article 362.** — Germany hereby agrees to offer no

objection to any proposals of the Central Rhine

Commission extending its jurisdiction:

(1) to the Moselle below the Franco-Luxembourg

divide to right Rhine, subject to the consent of

Luxembourg;

(2) to the Rhine above Bâle up to the Lake of

Constance, subject to the consent of Switzerland;

(3) to the lateral canals and channels which may be

established either to duplicate or complete

naturally navigable sections of the Rhine or the Moselle, or to

connect two naturally navigable sections of these rivers,

and also any other parts of the Rhine-Rhône system which may be covered by the General Convention pro-

vided for in Article 338 above.

Chapter V. — Clauses giving to the Czechoslovak State the Use of Northern Ports.

**Article 354.** — In the ports of Hamburg and Stettin,

Germany shall lease to the Czechoslovak State, for a

period of ninety-nine years, areas which shall be placed

under the general regime of free zones and shall be

used for the direct transit of goods coming from or going to that State.

**Article 355.** — The delimitation of these areas, and

their equipment, their exploitation, and in general all

conditions for their utilization, shall be determined by

a delegation of one delegate of Germany, one delegate of

the Czechoslovak State and one delegate of Great

Britain. These conditions shall be submitted to review every ten years in the same manner.

Germany declares in advance that she will adhere to

the decisions so taken.

SECTION III. — RAILWAYS.

Chapter I. — Clauses Relating to International Transport.

**Article 365.** — Goods coming from the territories of

the Allied and Associated Powers, and going to
WAR, EUROPEAN — THE PEACE TREATIES (18)

Germany, or in transit through Germany from or to the territories of the Allied and Associated Powers, shall enjoy on the German railways as regards charges to be collected (rebates and drawbacks being taken into account) on all other matters, the same favorable treatment applied to goods of the same kind carried on or off such railways either in internal traffic or for export, import or in transit, under similar conditions of transport, for example as regards length of route, and the same rates shall be applied, on the request of one or more of the Allied and Associated Powers, to goods specially designated by such power or powers consigned to, or passing through, Germany and going to their territories.

International tariffs established in accordance with the rates referred to in the preceding paragraph and involving through waybills shall be established when one of the Allied and Associated Powers shall require it for:

Article 356.—From the coming into force of the present treaty a new convention for the transportation of passengers, luggage and goods by rail shall have been concluded to replace the Berne convention concluded in October, 1890, and the subsequent additions referred to above, this new convention and its appendices for international railway transport by rail which may be based on it shall bind Germany even if she shall have refused to take part in the conclusion of the convention or to subscribe to it.

Until a new convention shall have been concluded, Germany shall conform to the provisions of the Berne Convention and the subsequent additions referred to above, and to the current supplementary provisions.

Article 357.—Germany shall be bound to cooperate in the establishment of through ticket services (for passengers and their luggage) which shall be rendered without charge by any of the Allied and Associated Powers to insure their communication by rail with each other and with all other countries by transit across the territories of Germany; in particular Germany shall, for this purpose, accept trains and carriages coming from the territories of the Allied and Associated Powers and shall forward them with a speed at least equal to that of her best long-distance trains on the same lines.

The rates applicable to such through services shall not in any case be higher than the rates collected on German internal services for the same distance, under the same conditions of speed and comfort.

The tariffs applicable under the same conditions of speed and comfort to the transportation of emigrants going to or coming from ports of the Allied and Associated Powers and using the German railways, shall not be at a higher kilometric rate than the most favorable rates of railroads and roads being taken into account and enjoyed on the said railways by emigrants going to or coming from any other ports.

Article 358.—Germany shall not apply specially to such through services or to the transportation of emigrants going to or coming from ports of the Allied and Associated Powers, any technical, fiscal or administrative measures such as measures of customs examination, general police, sanitary police, and control, the result of which would be to impede or delay such services.

Article 359.—In case of transport partly by rail and partly by internal navigation, with or without through-way-bill, the preceding Articles shall apply to the part of the journey performed by rail.

Chapter II.—Rolling Stock.

Article 370.—Germany undertakes that German wagons shall be fitted with apparatus allowing:
(1) of their inclusion in good trains on the lines such of the Allied and Associated Powers as are parties to the Berne Convention on May 15, 1866, as modified on May 18, 1907, without hampering the action of the continuous brake which may be adopted in such countries within ten years of the coming into force of the present treaty, and
(2) of the acceptance of wagons of such countries in internal traffic on the German lines.

The rolling stock of the Allied and Associated Powers shall fit the German lines the same treatment as German rolling stock as regards movement, upkeep and repairs.

Chapter III.—Cessions of Railway Lines.

Article 371.—Subject to any special provisions concerning the cession of ports, Germany is to cede to the Allied and Associated Powers, in the territories over which Germany abandons her sovereignty, and to the financial conditions, relating to the members of the personnel, the cession of railways will take place under the following conditions:

1. The works in the completion of all the railroads shall be handed over complete and in good condition.

2. When a railway system is handed over in its entirety by Germany to one of the Allied and Associated Powers, such stock shall be handed over complete, in accordance with the last inventory before November 11th, 1918, in a normal state of upkeep.

3. As regards lines without any special rolling-stock, commissions of experts designated by the Allied and Associated Powers, on which Germany shall be represented, shall fix the proportion of the stock existing on the system to which those lines belong to be handed over. The commissions shall have regard to the amount of material registered on these lines in the last inventory before November 11th, 1918, the length of track (sidings included), and the nature and amount of traffic. These commissions shall also specify the locomotives, coaches, and wagons to be handed over in each case; they shall decide upon the conditions of their acceptance, and shall make the provisional arrangements necessary to insure their repair in German workshops.

4. Stocks of stores, fittings and plant shall be handed over under the same conditions as the rolling-stock.

The provisions of paragraphs 3 and 4 above shall be applied to the German railways not ceded to the Allied and Associated Powers by Germany to the German gauge, such lines being regarded as detached from the Prussian State System.

Article 372.—Within a result of the fixing of new frontiers a railway connection between two parts of the same country crosses another country, or a branch line of one country has its terminus in another, the conditions of working, if not specifically provided for in the present treaty, shall be laid down in a convention between the railway administrations concerned. If the administration cannot come to an agreement as to the terms of such convention, the points of difference shall be decided by commissions of experts composed as provided in the preceding Article.

Article 373.—Within three years from the coming into force of the present treaty the Czechoslovak State may require the construction of a railway line in German territory between the stations of Schlaueney and Nachod. The cost of construction shall be borne by the Czechoslovak State.

Article 374.—Germany undertakes to accept, within ten years of the coming into force of the present treaty, on request being made by the Czechoslovak Government after agreement with the Italian Government, the denunciation of the International Convention of the 13th October, 1909, relative to the St. Gothard railway. In the absence of agreement as to the conditions of such denunciation, Germany hereby agrees to accept the decision of an arbitrator designated by the United States of America.

Chapter V.—Transitory Provisions.

Article 375.—Germany shall carry out the instructions given her, in regard to transport, by an authorized body acting on behalf of the Allied and Associated Powers:

1. For the carriage of troops under the provisions of the present treaty, and of material, ammunition and supplies required for their use.

2. As a temporary measure, for the transportation of supplies for certain regions requiring, restoration, as rapidly as possible, of the normal conditions of transport, and for the organization of postal and telegraphic services.

SECTION IV.—DISPUTES AND REVISION OF PERMANENT CLAUSES.

Article 376.—Disputes which may arise between interested powers with respect to the application of the preceding articles shall be settled as provided by the League of Nations.
Article 377.—At any time the League of Nations may recommend the revision of such of these Articles as relate to a permanent administrative régime.

The special stipulations of Articles 321 to 330, 332, 365, and 367 to 369 shall be subject to revision by the Council of the League of Nations at any time when all the parties to the Articles or any majority of them may so request, on the initiative of one of the permanent members of the League of Nations or of a combination of them in case the League comprises more than one permanent member.

Article 378.—Without prejudice to the special obligations imposed on her by the present treaty for the benefit of the Allied and Associated Powers, Germany undertakes to adhere to any general conventions regarding the international régime of transit, waterways, ports or railways which may be concluded by the Allied and Associated Powers and the League, or, in the case of war, within five years of the coming into force of the present treaty.

SECTION VI.—CLAUSES RELATING TO THE KIEL CANAL.

Article 380.—The Kiel Canal and its approaches shall be maintained free and open to the vessels of commerce and of war of all nations at peace with Germany, without any restriction on the basis of nationality.

Article 381.—The nationals, property, and vessels of all powers shall, in respect to charges, facilities, and the like, be treated on a footing of strict equality in the use of the canal, no distinction being made between the different nationalities, the property, and vessels of any power between them and the nationals, property, and vessels of Germany or of the most favored nations.

No impediment shall be placed on the movement of persons or vessels other than those arising out of police, customs, sanitary, emigration, or immigration regulations, and those relating to the import or export of prohibited goods. Such regulations must be reasonable and uniform and must not unnecessarily impede traffic.

Article 382.—Only such charges may be levied on vessels using the canal or its approaches as are intended to cover, in an equitable manner, the cost of maintaining in a navigable condition, or if improving, the canal or its approaches, or to meet expenses incurred in the defense or protection of the canal and its approaches, or the expenses of landing and unloading of goods, and the embarkation and disembarkation of passengers, shall only take place in the ports specified by Germany.

Article 383.—No charge of any kind other than those provided for in the present treaty shall be levied along the course or at the approaches of the Kiel Canal.

Article 384.—Germany shall be bound to take suitable measures to remove any obstacle or danger to navigation, and to insure the maintenance of good condition of navigation. She shall not undertake any works of a nature to impede navigation on the canal or its approaches.

Article 385.—In the event of violation of any of the conditions of Articles 380 to 384, or of disputes as to the interpretation of these Articles, any interested power can appeal to the jurisdiction instituted for the purpose by the League of Nations.

PART XIII.—LABOR.

SECTION I.—ORGANIZATION OF LABOR.

Whereas the League of Nations has for its object the establishment of universal peace and such a peace can be established only if it is based upon social justice;

And whereas conditions of labor exist involving such injustice, hardship, and injury to laborers and workers that their numbers of people as to produce unrest so great that the peace and harmony of the world are imperiled; and an improvement of those conditions is urgently required: as, for example, by the regulations of the hours of work, including the establishment of a maximum working day and week, the regulation of the labor supply, the prevention of unemployment, the provision of an adequate living for workers, the protection of the worker against sickness, disease, and injury arising out of his employment, the protection of the children, young persons, and women from undue pressure and injury, and protection of the interests of workers when employed in countries other than their own, recognition of the principle of freedom of association, the organization of vocational and technical education, and other measures;

Whereas also the failure of any nation to adopt humane conditions of labor is an obstacle in the way of other nations which in the conditions in their own countries;

The high contracting parties, moved by sentiments of justice and humanity as well as by the desire to secure the permanent peace of the world, agree to the following:

Chapter I.—Organization.

Article 387.—A permanent organization is hereby established for the purpose of forming a basis of labor conditions set forth in the preamble.

The original members of the League of Nations shall be the original members of this organization, and hereafter the membership of the League of Nations shall carry with it membership of the said organization.

The permanent organization shall consist of:

(i) A General Conference of Representatives of the Members, and,

(ii) An International Labor Office controlled by the governing body described in Article 393.

Article 388.—The meetings of the General Conference of Representatives of the Members shall be held from time to time as occasion may require, and at least once in every year. It shall be composed of four representatives of each of the members, of whom two shall be Government delegates and the two others shall be delegates representing respectively the employers and the workpeople of each of the members.

Each delegate may be accompanied by advisers, who shall not exceed two in number for each item on the agenda of the meeting. When questions specially affecting women are to be considered by the conference, one of the representatives of each of the members in question shall be a woman.

The members undertake to nominate non-Government delegates and advisers in agreement with the industrial organizations, if such organizations exist, which are most representative of employers or workpeople, as the case may be, in their respective countries.

Advisers shall not speak except on a request made by the delegate whom the organization in question has authorized the President of the conference, and may not vote.

A delegate may be notified in writing addressed to the President appoint one of his advisers to act as his deputy, and the adviser, while so acting, shall be allowed to speak and vote.

The names of the delegates and their advisers will be communicated to the International Labor Office by the Government of each of the members.

The credentials of delegates and their advisers shall be subject to scrutiny by the conference, which may, by two-thirds of the votes cast by the delegates present, refuse to admit any delegate or adviser whom it deems not to have been nominated in accordance with this article.

Article 389.—Every delegate shall be entitled to vote individually on all matters which are taken into consideration by the conference.

If one of the members fails to nominate one of the non-Government delegates whom it is entitled to nominate, the other non-Government delegates shall be allowed to sit and speak at the conference, but not to vote.

If, in accordance with Article 389, the conference refuses admission to a delegate of one of the members, the provisions of the present article shall apply as if that delegate had not been nominated.

Article 390.—The meetings of the conference shall be held at the seat of the League of Nations, or at such other place as may be decided by the conference at
The Director shall be responsible to the Secretary-General of the League for the proper expenditure of all moneys paid to him in pursuance of this Article.

Chapter II.—Procedure

Article 400.—The agenda of all meetings of the conference will be settled by the governing body, who shall consider any suggestion as to the agenda that may be made by the Governor-General, the industrial members or by any representative organization recognized for the purpose of Article 389.

Article 401.—The Director shall act as the Secretary of the Conference, and shall transmit the agenda so as to reach the members four months before the meeting of the conference, and, through them, the non-Government delegates when appointed.

Article 402.—Any one of the members of the conference may formally object to the inclusion of any item or items in the agenda. The grounds for such objection shall be set forth in a reasoned statement addressed to the Director, who shall circulate it to all the members of the permanent organization.

Items to which such objection has been made shall not, however, be excluded from the agenda if at the conference a majority of two-thirds of the votes cast by delegates present is in favor of considering them.

The period of office of the members of the governing body will be three years. The method of filling vacancies and other similar questions may be determined by the governing body subject to the approval of the conference.

The governing body shall, from time to time, elect one of their number to be Chairman, who shall regulate its own procedure, and shall fix its own times of meeting. A special meeting shall be held if a question affecting the essential interests of the conference is made by at least ten members of the governing body.

Article 404.—There shall be a Director of the International Labor Office, who shall be appointed by the governing body and, subject to the instructions of the governing body, shall be responsible for the efficient conduct of the International Labor Office and for such other duties as may be assigned to him. He or his deputy shall attend all meetings of the governing body.

Article 405.—The staff of the International Labor Office shall be appointed by the Director, who shall, as far as is possible with due regard to the efficiency of the work of the Office, select persons of different nationalities. A certain number of these persons shall be women.

The functions of the International Labor Office shall include the collection and distribution of information on all subjects relating to the international adjustment of conditions of industrial life and labor, and particularly the examination of subjects and the preparation of a report before the conference. It shall also have, with a view to the conclusion of international conventions, and the conduct of such special investigations as may be ordered by the conference, the power to address conferences.

It will prepare the agenda for the meetings of the conference.

It will carry out the duties required of it by the provisions of this part of the present treaty in connection with the International Labor Organization.

It will edit and publish in French and English, and in such other languages as the governing body may think desirable, a periodical paper dealing with problems of industry and employment, and international interest.

Generally, in addition to the functions set out in this Article, it shall have such other powers and duties as may be assigned to it by the conference.

Article 407.—The Government departments of any of the members which deal with questions of industry and employment may invite from the Secretary-General of the League through the representative of their Government on the governing body of the International Labor Office, an expert such representative, through such other qualified official as the Government may nominate for the purpose.

Article 408.—The International Labor Office shall be entitled to the assistance of the Secretary-General of the League of Nations in any matter in which it can be given.

Article 409.—Each of the members will pay the traveling and subsistence expenses of its delegates and their advisers and of its representatives attending the meeting of the conference or governing body, as the case may be.

All the other expenses of the International Labor Office and of the members of the conference or governing body shall be paid to the Director by the Secretary-General of the League of Nations out of the general funds of the League.
WAR, EUROPEAN — THE PEACE TREATIES (18)

if the draft convention fails to obtain the consent of the countries whose authority competes with the matter lies, no further obligation shall rest upon the member.

With the exercise of a federal state, the power of which to enter into conventions on labor matters is subject to the consent of the person whose qualifications are that of that state, the Government of that state, or the national interest shall be drawn from the members of the Commission of Inquiry.

The qualifications of the persons so nominated shall be subject to scrutiny by the Governing Body, which may by two-thirds of the votes of the members present refuse to accept the nomination of any person whose qualifications in the opinion of the body so constituted do not conform with the requirements of the present article.

Upon the application of the Governing Body, the Secretary-General shall institute a commission of inquiry, which shall consist of three persons, one from each section of the group of countries concerned, and shall designate one of them as President of the commission. None of these three persons shall be a person nominated to the panel by any member directly concerned in the complaint.

The members agree that, in the event of the refusal of a complaint to a commission of inquiry under Article 411, they will each, whether directly concerned in the complaint or not, place the facts of the dispute in the possession which bears upon the subject-matter of the complaint.

When the Commission of Inquiry has fully considered the complaint, it shall prepare a report embodying its findings and recommendations, and shall cause it to be published.

Each of these Governments shall within one month inform the Secretary-General of the League of Nations whether or not it accepts the recommendations contained in the report, and shall state whether or not it proposes to refer the complaint to the Permanent Court of International Justice of the League of Nations.

In the event of any member failing to take the action required by Article 409, with regard to a recommendation or draft convention in which any other member shall be entitled to refer the matter to the Permanent Court of International Justice.

The decision of the Permanent Court of International Justice in regard to a complaint or recommendation which has been referred to it in pursuance of Article 411 shall be final.

The Permanent Court of International Justice may, in the event of any member failing to carry out within the time limited any recommendation or decision, or in the decision of the Permanent Court of International Justice, as the case may be, any other member may take against that member the measures of an economic character indicated in the report of the Commission or of the decision of the Court as appropriate to the case.

The defaulter Government may, at any time inform the Governing Body that it has taken the steps necessary to comply with the recommendations of the Commission of Inquiry, in which case the decision of the Permanent Court of International Justice is in favor of the defaulter, the permanent Court of International Justice shall forthwith discontinue the measures of an economic character that they have taken against the defaulter Government.

Chapter III.—General.

The members engage to apply conventions which they have ratified in accordance with
the provisions of this part of the present treaty to their colonies, protectorates, and possessions which are not fully self-governing.

In no case where owing to the local conditions the convention is inapplicable, or
2. Subject to such modifications as may be neces-
sary to adapt the conventional system to local conditions.

And each of the members shall notify to the Inter-
national Labor Office the action taken in respect of each of its colonies, protectorates, and possessions which are not fully self-governing.

Article 422.— Any question or dispute relating to the
implementation of this part of the present treaty or
of any subsequent convention concluded by the
members in pursuance of the provisions of this part of the
present treaty shall be referred for decision to the
Permanent Court of International Justice.

Chapter IV.—Transitory Provisions.

Article 424.— The first meeting of the Conference
shall take place in October, 1919. The place and
agenda for the before-specified session in the
Annex hereto.

Arrangements for the convening and the organiza-
tion of the first meeting of the Conference will be
made by the Government designated for the purpose
in Article 25, the Conference shall be assisted in the
preparation of the documents for submission to the
Conference by an International Committee con-
stituted as provided in the said Annex.

The expenses of the first meeting and of all subse-
quent meetings held before the League of Nations has
been able to establish a general fund, other than the
expenses of delegates and their advisers, will be borne
by the said fund. According with the Spirit of the
expenses of the International Bureau of the
Universal Postal Union.

Article 424.— Until the League of Nations has been
constituted all communications which under the pro-
visions of the foregoing articles should be addressed
to the Secretary-General of the League will be pre-
served by the Director of the International Labor
Office, who will transmit them to the Secretary-General of
the League.

Article 426.— Pending the creation of a Permanent
Court of International Justice, disputes which in ac-
cordance with this part of the present treaty would be
submitted to it for decision will be referred to a tri-
bunal of three persons appointed by the Council of the
League of Nations.

ANNEX.

First Meeting of Annual Labor Conference,
1919.

The place of meeting will be Washington.

The International Organizing Committee will con-
stitute seven members, appointed by the United States
of America, Great Britain, France, Italy, Japan, Bel-
ggium, and Switzerland. The committee may, if it thinks
necessary, invite other members to appoint represen-
tatives.

Agenda:

1. Application of principle of the 8-hours day or
   of the 48-hours week.
2. Question of preventing or providing against un-
   employment.
3. Women's employment:
   (a) Before and after childbirth, including the
     question of maternity benefit.
   (b) During the night.
   (c) In unhealthy processes.
4. Employment of children:
   (a) Minimum age of employment.
   (b) During the night.
   (c) In unhealthy processes.
5. Extension and application of the International Conventions adopted at Berne in 1906 on the pro-
   hibition of night work for women employed in industry and
   the prohibition of the use of white phosphorus in the
   manufacture of matches.

SECTION II.—GENERAL PRINCIPLES.

Article 427.— The High Contracting Parties, recog-

nizing that the well-being, physical, moral, and intel-

lectual, of industrial wage earners is of supreme inter-
national importance, have framed and adopted this
great end, the permanent machinery provided for
in Section I and associated with that of the League of
Nations.

They recognize that differences of climate, habits,
and customs in the different countries and in the
industrial tradition, make strict uniformity in the conditions of
labor difficult of immediate attainment. But, holding as they do, that
such uniformity should be pursued as an article of commerce, they think that there are
methods and principles for securing fair conditions which all industrial communities should endeavor to
apply, so far as their special circumstances will permit.

Among such principles and methods, the following seem to the High Contracting Parties to be of special
and urgent importance:

First.— The guiding principle above enunciated that
labor should not be regarded merely as a commodity
or article of commerce.

Second.— The right of association for all lawful
purposes by the employed as well as by the employers.

Third.— The payment to the employed of a wage
adequate to maintain a reasonable standard of life as
this is understood in their time and country.

Fourth.— The adoption of an eight hours day or a
forty-eight hours week as the standard to be aimed at
where it has not already been attained.

Fifth.— The adoption of the weekly rest of at least
twenty-four hours, which should include Sunday where-
ever practicable.

Sixth.— The abolition of child labor and the im-
position of such limitations on the labor of young
persons as are found necessary. Those who should
be employed, training, and assure their proper physical development.

Seventh.— The principle that men and women should
receive an equal remuneration for work of equal value.

Eighth.— The standard set by law in each country
with respect to the conditions of labor should have due
regard to the equitable economic treatment of all
workers lawfully resident therein.

Ninth.— The State should make provision for a
system of inspection in which women should take part
in order to insure the enforcement of the laws and
regulations for the protection of the employed.

Without claiming that these methods and principles are
either complete or final, the High Contracting Par-
ties are of opinion that they are well fitted to guide
the policy of the League of Nations; and that, if
adopted by the industrial communities who are mem-
bers of the League, and safeguarded in practice by an
adequate system of such inspection, they will confer
lasting benefits upon the wage earners of the world.

PART XIV.—GUARANTEES.

SECTION I.—WESTERN EUROPE.

Article 428.— As a guarantee for the execution of
the present treaty by Germany, the German territory
situated to the west of the Rhine together with the
bridgeheads, will be occupied by Allied and Associated
forces for a period of fifteen years from the coming
into force of the present treaty.

Article 429.— If the conditions of the present treaty
are faithfully carried out by Germany, the term of
referred to in Article 428 will be successively restricted as
follows:

(i) At the expiration of five years there will be
   evacuated—the bridgehead of Cologne and the terri-
   tories north of the line running along the Ruhr, then
   along the railway line between Jülich, Duren, Euskirchen, Rhen-
   bach, thence along the road Rheinbach to Simmern, and
   reaching the Rhine at the confluence with the Ahr; the
   roads, railways and places mentioned above being ex-
   cluded from the area evacuated.

(ii) At the expiration of ten years, there will be
   evacuated—the bridgehead of Coblenz and the terri-
   tories north of a line to be drawn from the intersection
   between the frontiers of Belgium, Germany and Hol-
   land, running about 4 kilometers south of Aix-la-
   Chapelle, then to and following the crest of Fort
   Gemund, then east of the railway of the Urft Valley
   then along Blankenheim, Veldorf, Dreis, Ulmen to
   and following the Moselle from Bremm to Nehren,
   then passing by Kappel and Simmern, then following
   the line of the heights between Simmern and the
   Rhine and reaching this river at Bacharach; all the places,
   valleys, roads and railways mentioned above being ex-
   cluded from the area evacuated.

(iii) At the expiration of fifteen years there will be
   evacuated—the bridgehead of Maine, the bridge-
   head of Heil and the remainder of the territory under occupation.

If at that date the guarantees against unproven
aggradation by Germany are not considered sufficient by the Allied and Associated Powers in the evacuation of the occupying troops may be delayed to the extent regarded as necessary for the purpose of obtaining the required guarantees.

Article 430.—In case either during the occupation or immediately after the evacuation, referred to above, the Reparation Commission finds that Germany refuses to observe the whole or part of her obligations undertaken by her with the United States, the Powers, and the League of Nations, the whole or part of the areas specified in Article 429 will be occupied immediately by the Allied and Associated forces.

Article 431.—If before the expiration of the period of occupation fixed in Article 429, no compliance with all the undertakings resulting from the present treaty, the occupying forces will be withdrawn immediately.

Article 432.—All matters relating to the occupation and not provided for by the present treaty shall be regulated by the treaties of peace and the conventions, which Germany hereby undertakes to observe.

SECTION II.—EASTERN EUROPE.

Article 433.—As a guarantee for the execution of the provisions of the present treaty, by which Germany accepts definitely the abrogation of the Brest-Litovsk Treaty, and of its treaties and agreements entered into by her with the Maximalist Government in Russia, and in order to secure the restoration of peace conditions, and that it is for France and Lithuania, all German troops at present in the said territories, as well as those on the frontiers of Germany as soon as the Governments of the principal Allied and Associated Powers shall think the moment suitable, regard the internal situation of these territories. These troops shall abstain from all requisitions and seizures and from any other coercive measures for obtaining supplies intended for Germany, and shall in no way interfere with such measures for national defense as may be adopted by the provisional Governments of Esthonia, Letvia, and Lithuania.

No other German troops shall proceed to evacuate or after the evacuation is complete, be admitted to the said territories.

PART XV.—MISCELLANEOUS PROVISIONS.

Article 434.—Germany undertakes to recognize the full force of the treaties of peace and additional conventions, which may be concluded by the Allied and Associated Powers with the powers who fought on the side of Germany, and to recognize whatever disposition may be made concerning the territories of the former Austro-Hungarian Monarchy, of the Kingdom of Bulgaria, and of the Ottoman Empire, and to recognize the new States within their frontiers as they are laid down.

Article 435.—The high contracting parties, while they recognize the guarantees stipulated by the treaties of peace and of the treaties of November 20, 1815, in favor of Switzerland, said guarantees constituting international obligations for the maintenance of Switzerland, shall recognize that the provisions of these treaties, conventions, declarations and other supplementary acts concerning the neutralized zone of Savoy, as laid down in paragraph 1 of Article 93 of the Final Act of the Congress of Vienna, and in paragraph 2 of Article 3 of the Treaty of Paris of 20th November, 1815, are no longer consistent with present conditions. For this reason the high contracting parties take note of the agreement reached between the French Government and the Swiss Government for the abrogation of the stipulations relating to this zone which are and remain abrogated.

The high contracting parties also agree that the stipulations of 1815 and of the other supplementary acts concerning the free zones of Upper Savoy and the Gex district are no longer consistent with present conditions, and that it is for France and Switzerland to come to an agreement together with a view to settling between themselves the status of these territories under such conditions as shall be considered suitable by both countries.

ANNEX.

1. The Swiss Federal Council has informed the French Government on the 5th May, 1919, that after extensive discussion with a view to the conclusion of a treaty of friendship and of a close relationship of sincere friendship it has happily reached the conclusion that it was possible to acquiesce in it under the following reservations and reservations and reservations.

First.—The neutralized zone of Haute-Savoie: (a) It will be understood that as long as the Federal Chambers have not ratified the agreement come to between the two Governments for the evacuation of the occupying troops may be delayed to the extent regarded as necessary for the purpose of obtaining the required guarantees.

(b) The assent given by the Swiss Government to the abrogation of the above-mentioned stipulations shall not be considered as valid if the treaty of peace concluded by the United States and the Swiss, by the declaration of 20th November, 1815.

(c) The agreement between the Governments of France and Switzerland for the abrogation of the above-mentioned stipulations shall only be considered as valid if the present agreement, and of the declaration of 20th November, 1815, which are not signatories of the present treaty.

Second.—Free zone of Haute-Savoie and the district of Gex.

(a) The Federal Council makes the most express reservations to the interpretation to be given to the statement mentioned in the last paragraph of the above article for insertion in the treaty of peace, which provides that "the stipulations of the treaties of 1815 and other supplementary acts concerning the free zone of Haute-Savoie and the Gex district are no longer consistent with the present conditions." The Federal Council would not wish that the wording which is appropriate to the geographical and economical situation and which has been maintained in the present treaty.

In the opinion of the Federal Council the question is not the modification of the customs system of the free zones as set up by the treaties mentioned above, but only the regulation in a manner more appropriate to the economic conditions of the two countries, with regard to the terms of the exchange of goods between the regions in question. The Federal Council has been led to make the preceding reservations by the perusal of the draft convention concerning the future constitution of the zones, which was annexed to the note of April 20 from the French Government. While making the above reservations the Federal Council declares its readiness to examine in the most friendly spirit any proposals which the French Government may deem it convenient to make on the subject.

(b) It is conceded that the stipulations of the treaties of 1815 and other supplementary acts relative to the free zones will remain in force until a new arrangement is come to between France and Switzerland to regulate matters in this territory.

2. The French Government, in their note of May 5, on this subject, have expressed various views and reservations.

Concerning the observations relative to the free zones of Haute-Savoie and the Gex district, the French Government have the honor to observe that the provisions of the last paragraph of Article 435 are so clear that their purport cannot be misunderstood, especially where it implies that no other power but France and Switzerland will in future be interested in that question.

The French Government, on their part, are anxious to protect the interests of the French territories concerned, and, with that object, having their special situation in view, they bear in mind the desirability of assuring them a suitable customs regime and determining, in a manner better suited to present conditions, the methods of exchanges between these territories and the adjacent Swiss territories, while taking into account the reciprocal interests here involved.

It is understood that this must in no way prejudice the right of France to adjust her customs line in this region in conformity with her political frontier, as is
done on the other portions of her territorial boundaries, and as was done by Switzerland long ago on her own boundaries in this region.

French Government are pleased to note on this subject in what a friendly disposition the Swiss Government take this opportunity of declaring their willingness to consider any French proposal dealing with the system to be substituted for the present régime of the free zones, which the French Government intend to formulate in the same friendly spirit.

Moreover, the French Government have no doubt that the provisional maintenance of the régime of 1815 and the free zones referred to in the above-mentioned paragraph of the note from the Swiss Legation of May 5, whose object is to provide for the passage from the present régime to the conventional régime, will cause no delay whatsoever in the establishment of the new situation which has been found necessary by the two Governments. This remark applies also to the ratification by the Federal Chambers, dealt with in Paragraph 1 of the Swiss note of May 5, under the heading "Neutralized Zone of Haute-Savoie."

Article 436.—The high contracting parties declare and place on record that they have taken note of the treaty signed by the Government of the French Republic on July 17th, 1918, with His Serene Highness the Duke of Modena defining the relations between France and the Principality.

Article 437.—The high contracting parties agree that, in the absence of a subsequent agreement to the contrary, the Chairman of any commission established by this treaty shall, in the event of an equal number of votes, be entitled to a second vote.

Article 438.—The Allied and Associated Powers agree that where Christian religious missions were being maintained by German societies or persons in territories ceded to them, or of which the government is intrusted to them in accordance with the present treaty, the property which these missions or missionary societies possess including that of trading societies whose profits were devoted to the support of missions, shall continue to be devoted to missionary purposes. In order to insure the due execution of this undertaking, the Allied and Associated Governments will hand over the property adjutant or approved by the Governments and composed of persons holding the faith of the mission whose property is involved.

The Allied and Associated Governments, while continuing to maintain full control as to the individuals by whom the missions are conducted, will safeguard the interests of such missions.

Germany, taking note of the above undertaking, agrees to accept all arrangements made or to be made by the Allied or Associated Government concerned for carrying out the work of the said missions or trading societies and waives all claims on their behalf.

Article 439.—Without prejudice to the provisions of the note from the Swiss Legation of May 5, Germany undertakes not to put forward directly or indirectly against any Allied or Associated Powers, or against the object of the present treaty, any claim, including those which without having declared war, have broken off diplomatic relations with the German Empire, and which occurred on events which occurred at any time before the coming into force of the present treaty.

The present stipulation will bar completely and finally all claims of this nature, which will be thenceforward extinguished, whoever may be the parties in interest.

Article 440.—Germany accepts and recognizes as valid and binding all decrees and orders concerning German ships and goods and all orders relating to the payment of costs made by any prize court of any of the Allied or Associated Powers, and undertakes not to put forward any claim arising out of such decrees or orders relating to any German national.

The Allied and Associated Powers reserve the right to examine in such manner as they may determine all decrees and orders of German Prize Courts, the origin of which is affecting the property rights of nationals of those powers or of neutral powers. Germany agrees to furnish copies of all the documents constituting the record of the cases, including the decisions and orders made, and to accept and give effect to the recommendations made after such examination of the cases.

The present treaty, of which the French and English versions are authentic, shall be ratified.

The deposit of ratifications shall be made at Paris as soon as possible.

Articles of which the seat of the Government is outside Europe will be entitled merely to inform the Government of the French Republic through their diplomatic representative at Paris that their ratification has been given; in that case they must transmit the instrument of ratification as soon as possible.

A first procès-verbal of the deposit of ratifications will be drawn up as soon as the treaty has been signed by Germany on the one hand, and by three of the principal Allied and Associated Powers on the other hand.

From the date of the first procès-verbal the treaty will come into operation between the three Governments who have ratified it. For the determination of all periods of time provided for in the present treaty this date will be the date of the coming into operation of the treaty.

In all other respects the treaty will enter into force for each power at the date of the deposit of its ratification.

The French Government will transmit to all the signatory powers a certified copy of the procès-verbals of the deposit of ratifications.

DRAFTED AT VERSAILLES, in a single copy which will remain deposited in the archives of the French Republic, and of which authenticated copies will be transmitted to each of the signatory powers.

(2) Treaty of Peace Between the Principal Allied and Associated Powers and Austria.

N. B.—There are many references to the German Treaty in the Austrian Treaty as printed below. It is, of course, to be borne in mind in such clauses that an identical word, "Austria", "Austro-Hungary", "Austrian", etc., are substituted for the words "Germany", "German", etc. Where the dates of Germany's entering on a state of war and ceasing to be a belligerent are inserted as affecting the coming into operation of or marking a commencement of a clause, these dates in the Austrian treaty are as of 28 July 1914 and 3 Nov. 1918 respectively.

THE UNITED STATES OF AMERICA, THE BRITISH EMPIRE, FRANCE, ITALY AND JAPAN,
These Powers being described in the present Treaty as the Principal Allied and Associated Powers;
BELGIUM, BOLIVIA, BRAZIL, CHINA, CUBA, ECUADOR, GREECE, GUATEMALA, HAITI, THE HEDJAZ, HONDURAS, LIBERIA, NICARAGUA, PANAMA, PERU, POLAND, PORTUGAL, ROUMANIA, THE SERB-CROAT-SLOVENE STATE, SIAM, CZECHOSLOVAKIA and URUGUAY;
These Powers constituting, with the Principal Powers mentioned above, the Allied and Associated Powers, of one part;
And AUSTRIA, of the other part;
Whereas on the request of the former Imperial and Royal Austro-Hungarian Government, the United States of America, on November 3, 1918, by the Principal Allied and Associated Powers in order that a Treaty of Peace might be signed, granted to Austria-Hungary, on July 28, 1914, by the former Imperial and Royal Austro-Hungarian Government, and in the hostilities conducted by Germany in alliance with Austria-Hungary, should be replaced by a firm, just and durable Peace, and
Whereas the former Austro-Hungarian Monarchy has now ceased to exist, and has been replaced in Austria by a republican government, and
Whereas the Principal Allied and Associated Powers have already concluded separate treaties with the Czecho-Slovak State, in which are incorporated certain portions of the said Monarchy, in a free, independent and Allied State, and
Whereas the said Powers have also recognized the union of certain portions of the said Monarchy with the territory of the Kingdom of Serbia as a free, independent and Allied State, under the name of the Serb-Croat-Slovene State, and
Whereas it is desirable, while restoring peace, to regulate the situation which has arisen from the dissolution of the said Monarchy and the formation of the said States, and to establish the said countries on a firm foundation of justice and equity,
For this purpose the HIGH CONTRACTING PARTIES represented as follows:
WAR, EUROPEAN — THE PEACE TREATIES (18)

THE PRESIDENT OF THE UNITED STATES OF AMERICA, by:

Mr. Milenko Vranitch, Envoy Extraordinary and Minister Plenipotentiary of H. M. the King of the Serbs, the Croats and the Slovenes at Paris;

Vol. 28 — 37
WAR, EUROPEAN—the Peace Treaties (18)

HIS MAJESTY THE KING OF SIAM, by:
Prince Chao Don, Envoy Extraordinary and Minister Plenipotentiary to the King of Siam at Paris;
Prince Traidos Phra Phadon, Under Secretary of State for Foreign Affairs;

THE PRESIDENT OF THE CZECH-SLOVAK REPUBLIC, by:
Mr. Karel Kamar, President of the Council of Ministers;
Mr. Eduard Bank, Minister for Foreign Affairs;

THE PRESIDENT OF THE REPUBLIC OF URUGUAY, by:
Mr. Juan Antonio Bucio, Minister for Foreign Affairs, formerly Minister of Industry;

AUSTRIAN, by:
Mr. Charles Renner, Chancellor of the Austrian Republic.

WHO, having communicated their full powers, found in good and due form, have AGREED AS FOLLOWS:

From the coming into force of the present Treaty the state of war will terminate.

Austria is recognized under the name of the "Republic of Austria.

From that moment, and subject to the provisions of this Treaty, official relations will exist between the Allied and Associated Powers and the Republic of Austria.

PART I—THE COVENANT OF THE LEAGUE OF NATIONS.

(When 1-26 with Annex)

PART II—FRONTIERS OF AUSTRIA.

Article 27.—The frontiers of Austria shall be fixed as follows (see Map):
1. With Switzerland and Liechtenstein:
   the present frontier.
2. With Italy:
   From the point 915 (Gruben J.) eastwards to point 3915 (Klopfers Spitz),
   a line to be fixed on the ground passing through point 1483 on the Reichen-Nauders road;
   thence eastwards to the summit of Dibžern Spits (point 3505).
   the watershed between the basins of the Inn to the north and the Adige to the south;
   thence south-eastwards to point 2045 (March-Kinken) on the watershed between the basins of the Drave to the east and the Adige to the west;
   the south-eastwards to point 2483 (Helm' Spitz) a line to be fixed on the ground crossing the Drave between Winibach and Arnbach;
   thence westwards to point 9050 (Ostering) about 9 kilometres north-east of Tarvis;
   the watershed between the basins of the Drave on the north and successively the basins of the Senzenbach, the Plave and the Tagliamento on the south;
   thence south-eastwards to point 1492 (about 2 kilometres west of Thörl),
   the watershed between the Gall and the Gallits;
   thence eastwards to point 1509 (Fec),
   a line to be fixed on the ground cutting the Gallitz south of the town and station of Thörl and passing by point 1370 (Cabin Berg).
3. On the South, and then with the Klagenfurt area:
   subject to the provisions of Section II of Part III (Political Clauses for Europe):
   a line to be fixed on the point 1509 (Fec) eastwards to point 1857 (Maleschter),
   the crest of the Karavenken;
   from point 1817 (Maleschter) and in a north-easterly direction as far as the Drave at a point situated about 1 kilometre southeast of the railway bridge on the eastern branch of the bend made by that river about 6 kilometres east of Villach;
   a line to be fixed on the ground cutting the railway between Maleschter and Faak and passing through point 565 (Poliana),
   thence in a south-easterly direction to a point about 2 kilometres above St. Martin;
   thence northwards, leaving the Drave, running approximately from south to north to be fixed on the ground:
   thence north-eastwards to a point to be chosen near point 725 about 10 kilometres north-west of Klagenfurt on the administrative boundary between the districts of St. Veit and Klagenfurt,
   a line to be fixed on the ground passing through points 1019 (Taubenbühel), 1045 (Gallenberg) and 815 (Freudenberg),
   thence north-eastwards to a point to be chosen on the ground west of point 1075 (Steinbruch Kogel),
   the administrative boundary between the districts of St. Veit and Klagenfurt,
   thence north-eastwards to the point on the Gurk where the administrative boundary of the district of Völkermarkt leaves this river,
   a line to be fixed on the ground passing through point 1076:
   thence north-eastwards to point 1890 (Speikkogel),
   the administrative boundary between the districts of St. Veit and Völkermarkt,
   thence south-eastwards to point 842 (1 kilometre west of Kasparstein),
   the north-eastern boundary of the district of Völkermarkt;
   thence north-eastwards to point 1522 (Hühen Kogel),
   a line to be fixed on the ground passing north of Lavamünd.
4. With the Serb-Croat-Slovene State, subject to the provisions of Section II of Part IV (Political Clauses for Europe):
   From point 1522 (Hühen Kogel) eastwards to point 917 (St. Lorenzen),
   a line to be fixed on the ground passing through point 1330:
   thence eastwards to the point where it meets the administrative boundary between the districts of Marburg and Leibnitz,
   the watershed between the basins of the Drave to the south and the Saagau to the north;
   thence north-eastwards to the point where this administrative boundary meets the Mur, the above-referenced administrative boundary,
   thence to the point where it meets the old frontiers of 1867 between Austria and Hungary 5 kilometres south-east of Radkersburg,
   the principal course of the Mur downstream;
   thence northwards to a point to be fixed east of point 400 about 16 kilometres north of Radkersburg,
   the old frontier of 1867 between Austria and Hungary;
   thence north-eastwards to a point to be fixed on the watershed between the basins of the Raab and the Mur about 2 kilometres east of Toka,
   a line to be fixed on the ground, passing between the villages of Bonisalva and Gedovdour.

This point is the common point to the three frontiers of Austria, Hungary and the Serb-Croat-Slovene State.
5. With Hungary:
   From the point above defined north-eastwards to point 353 about 6 kilometres north-east of Szentgotthard:
   a line to be fixed on the ground passing through point 353 (Janke B.),
   then west of the Radkersburg-Szentgotthard road and east of the villages of Nagylavva, Nemzetik and Kákeresztró,
   thence in a general north-easterly direction to point 27 about 7 kilometres north-north-east of Pinka-Mindesztan,
   a line to be fixed on the ground passing through point 323 (Hochkogel),
   then south of the villages of Zsamand, Kemethickös and Karacsa, and between Nagyarsolak and Pinka-Mindesztan;
   thence northwards to point 883 (Tröt Kő) about 9 kilometres south-west of Közeg,
   a line to be fixed on the ground passing through points 241, 265 and 273, then east of Nagymáros and Rohonc and west of Dozat and Batsching;
   thence north-eastwards to point 252 (Kamenje) about 2 kilometres south-east of Nikitsch,
   a line to be fixed on the ground, passing south-east of Liebing, Olmod and Locszmad, and north-west of Közeg and the road from Közeg to Salamonfa;
   thence northwards to a point to be selected on the southern shore of Neusiedler See between Hölbling and Hidseg;
   a line to be fixed on the ground, passing east of Nikitsch and Zinkendorf and west of Kövesd and Nemzet-Pesterbirta;
   thence eastwards to point 135 situated about 8 kilometres south-east of St. Johann,
   a line to be fixed on the ground, crossing the Neusiedler See, passing south of the island containing point 135, leaving in Hungarian territory running north-westwards from the station of Mexiko as well as the entire Eimer canal, and passing south of Pambagn:
   thence northwards to a point to be selected about 1 kilometre west of Antonienhof (east of Kitsee), this
WAR, EUROPEAN — THE PEACE TREATIES (18) 579

point being the point common to the three frontiers of Austria-Hungary, the Czechoslovakia, and the Soviet State; the line to be fixed on the ground, leaving entirely in Hungary the railway line for the South-Western railway line of the severance of the Hungarian railway line to the river Tisza, west of the Tisza and to the east of the Austrian and Hungarian border.

6. With the Czechoslovak State:

From the point above defined north-westwards to the point of the border of the Czechoslovak State and Hungary about 2½ kilometres north-east of Berg, along the direction of the railway line of the Austrian State to the Hungarian State, to the point of the Kiskazán-Pressburg road about 2 kilometres north of Kiskazán; thence northwards to a point to be selected on the principal canal and navigations of the Danube about 4½ kilometres upstream from the Pressburg bridge; thence to be fixed on the ground following as much as possible the old frontier of 807 between Austria and Hungary; thence westwards to the confluence of the Moravia (March) with the Danube, the principal channel of navigation of the Danube; thence westwards, along the course of the Thaya upstream to a point to be selected about 2 kilometres east of the site of the Austrian-Ruden bridge over the Ruden, and following the principal channel of navigation of the Danube about 4½ kilometres upstream from the Pressburg bridge, thence on the Danube to the junction of the Atter and the Danube, thence thence westwards the above-mentioned administrative boundary between Lower Austria and Moravia situated about 400 metres south of the point where the principal channel of navigation of the Danube is about 3 kilometres east of the village of Franzensthal, thence westwards to the above-mentioned administrative boundary; thence southwards to a point to be selected about 3 kilometres east of the village of Franzensthal, thence westwards to the above-mentioned administrative boundary between Lower Austria and Bohemia; thence southwards to point 408 (Gelsenberg) about 5½ kilometres west of the northern terminus of the line which will deliver authentic copies to the Powers who sign the present Treaty.

PART III.—POLITICAL CLAUSES FOR EUROPE

SECTION 1. ITALY.

Article 36. — Austria renounces, so far as she is concerned, in favour of Italy all rights and title over the territory of the former Austro-Hungarian Monarchy situated beyond the frontier laid down in Article 27 (2) and lying between that frontier and the Hungarian frontier, the Adriatic Sea, and the eastern frontier of Italy as subsequently determined.

Austria similarly renounces so far as she is concerned in favour of Italy all rights and title over other territory of the former Austro-Hungarian Monarchy which may be recognized as forming part of Italy by any treaties which may be concluded for the purpose of completing the present settlement.

A Commission composed of five members, one nominated by Italy, three by the Principal Allied and Associated Powers, and one by Austria, shall be constituted within fifteen days from the coming into force of the present Treaty to trace all the spot the frontier line between Italy and Austria. The decisions of the Commission will be taken by a majority and shall be binding on the parties concerned.

Article 37. — Notwithstanding the provisions of Article 269 of Part X (Economic Clauses), persons having their usual residence in the territory of the former Austro-Hungarian Monarchy transferred to Italy who, during the war, have been outside the territories of the former Austro-Hungarian Monarchy or have been imprisoned, interned or evacuated, shall enjoy the full benefit of the provisions of Articles 252 and 253 of Part X (Economic Clauses).

Article 38. — A special Convention will determine the terms of repayment in Austrian currency of the special war expenditure advanced during the war by territory of the former Austro-Hungarian Monarchy to Italy or by public associations in that territory on account of the Austro-Hungarian Monarchy under its legislation, such as allowances to persons mobilized, requisitions, billeting of troops, and relief to persons who have been evacuated.

In fixing the amount of these sums Austria shall be credited with the amount which the territory would have contributed to Austria-Hungary had the expenses resulting from these payments, this contribution being calculated according to the proportion of the resources of the former Austro-Hungarian Monarchy from the territory in 1913.

Article 39. — The Italian Government will collect
Article 48.—A Commission consisting of seven members, five nominated by the Principal Allied and Associated Powers, one by the Serb-Croat-Slovene State, and one by Austria, shall be established by the said State and which are actually working or under construction.

The same shall apply to the rights of the former Austrian-Hungarian Monarchy with regard to railway and tramway concessions within the above-mentioned territories.

Article 49.—The frontier railway stations shall be determined by a subsequent agreement.

Article 50.—Austria shall restore to Italy within a period of three months all the wagons belonging to the Italian railways which before the outbreak of war had passed to Austria.

Article 51.—Austria renounces as from November 3, 1918, on behalf of herself and her nationals in regard to territories transferred to Italy all rights to which she may be entitled with regard to the products of the above-mentioned territories, under any agreements, stipulations or laws establishing trusts, cartels or other similar organisations.

Article 52.—For a period of ten years from the coming into force of the present Treaty central electric power stations situated in Austrian territory and formerly used by the territories transferred to Italy or to any other establishment the exploitation of which passes to Italy shall be required to continue furnishing this supply up to an amount corresponding to the undertakings and contracts in force on November 3, 1918.

Austria further admits the right of Italy to the free use of the waters of Lake Raibl and its derivative water-course and to divert the said waters to the basin of the Koriniza.

Article 53.—Judgments rendered since August 4, 1914, by the courts in the territory transferred to Italy in civil and commercial cases between the inhabitants of such territory and other nationals of the former Austrian Empire, or between such inhabitants and the subjects of the allies of the Austrian-Hungarian Monarchy, shall not be carried into effect until after endorsement by the corresponding new court in such territory.

All decisions rendered for political crimes or offences since August 4, 1914, by the judicial authorities of the former Austro-Hungarian Monarchy against Italian nationals, including persons who obtain Italian nationality under the present Treaty, shall be annulled.

In all matters relating to proceedings initiated before the coming into force of the present Treaty before the competent authorities of the territory transferred to Italy, the Italian and Austrian judicial authorities shall unite until the coming into force of a special convention on this subject be authorized to correspond with each other. Requests thus presented shall be given effect to as far as the laws of a public character allow in the country to the authorities of which the request is addressed.

Appeals to the higher Austrian judicial and administrative authorities beyond the limits of the territory transferred to Italy against decisions of the administrative or judicial authorities of this territory shall be suspended. The records shall be submitted to the competent authorities, whose decision the appeal entered. They must be transmitted to the competent Austrian authorities without delay.

As to jurisdiction, procedure or the administration of justice will be determined by a special convention between Italy and Austria.

SECTION II. SERB-CROAT-SLOVENE STATE.

Article 46.—Austria, in conformity with the action already taken by the Allied and Associated Powers recognizes the independence of the Serb-Croat-Slovene State.

Article 47.—Austria renounces so far as she is concerned in favour of the Serb-Croat-Slovene State all rights and title over the territories of the former Austrian Monarchy situated outside the frontiers of Austria as laid down in Article 37 of Part II (Frontiers of Austria) and recognized by the present Treaty as the boundaries of the territories so transferred to the new state shall be determined by a special convention between Austria and the Serb-Croat-Slovene State.

Article 48.—A Commission consisting of seven members, five nominated by the Principal Allied and Associated Powers, one by the Serb-Croat-Slovene State, and one by Austria, shall be established by the said State and which are actually working or under construction.

The same shall apply to the rights of the former Austrian-Hungarian Monarchy with regard to railway and tramway concessions within the above-mentioned territories.

Article 49.—The frontier railway stations shall be determined by a subsequent agreement.

Article 50.—Austria shall restore to Italy within a period of three months all the wagons belonging to the Italian railways which before the outbreak of war had passed to Austria.

Article 51.—Austria renounces as from November 3, 1918, on behalf of herself and her nationals in regard to territories transferred to Italy all rights to which she may be entitled with regard to the products of the above-mentioned territories, under any agreements, stipulations or laws establishing trusts, cartels or other similar organisations.

Article 52.—For a period of ten years from the coming into force of the present Treaty central electric power stations situated in Austrian territory and formerly used by the territories transferred to Italy or to any other establishment the exploitation of which passes to Italy shall be required to continue furnishing this supply up to an amount corresponding to the undertakings and contracts in force on November 3, 1918.

Austria further admits the right of Italy to the free use of the waters of Lake Raibl and its derivative water-course and to divert the said waters to the basin of the Koriniza.

Article 53.—Judgments rendered since August 4, 1914, by the courts in the territory transferred to Italy in civil and commercial cases between the inhabitants of such territory and other nationals of the former Austrian Empire, or between such inhabitants and the subjects of the allies of the Austrian-Hungarian Monarchy, shall not be carried into effect until after endorsement by the corresponding new court in such territory.

All decisions rendered for political crimes or offences since August 4, 1914, by the judicial authorities of the former Austro-Hungarian Monarchy against Italian nationals, including persons who obtain Italian nationality under the present Treaty, shall be annulled.

In all matters relating to proceedings initiated before the coming into force of the present Treaty before the competent authorities of the territory transferred to Italy, the Italian and Austrian judicial authorities shall unite until the coming into force of a special convention on this subject be authorized to correspond with each other. Requests thus presented shall be given effect to as far as the laws of a public character allow in the country to the authorities of which the request is addressed.

Appeals to the higher Austrian judicial and administrative authorities beyond the limits of the territory transferred to Italy against decisions of the administrative or judicial authorities of this territory shall be suspended. The records shall be submitted to the authorities, whose decision the appeal entered. They must be transmitted to the competent Austrian authorities without delay.

As to jurisdiction, procedure or the administration of justice will be determined by a special convention between Italy and Austria.

Article 48.—A Commission consisting of seven members, five nominated by the Principal Allied and Associated Powers, one by the Serb-Croat-Slovene State, and one by Austria, shall be established by the said State and which are actually working or under construction.

The same shall apply to the rights of the former Austrian-Hungarian Monarchy with regard to railway and tramway concessions within the above-mentioned territories.

Article 49.—The frontier railway stations shall be determined by a subsequent agreement.

Article 50.—Austria shall restore to Italy within a period of three months all the wagons belonging to the Italian railways which before the outbreak of war had passed to Austria.

Article 51.—Austria renounces as from November 3, 1918, on behalf of herself and her nationals in regard to territories transferred to Italy all rights to which she may be entitled with regard to the products of the above-mentioned territories, under any agreements, stipulations or laws establishing trusts, cartels or other similar organisations.

Article 52.—For a period of ten years from the coming into force of the present Treaty central electric power stations situated in Austrian territory and formerly used by the territories transferred to Italy or to any other establishment the exploitation of which passes to Italy shall be required to continue furnishing this supply up to an amount corresponding to the undertakings and contracts in force on November 3, 1918.

Austria further admits the right of Italy to the free use of the waters of Lake Raibl and its derivative water-course and to divert the said waters to the basin of the Koriniza.

Article 53.—Judgments rendered since August 4, 1914, by the courts in the territory transferred to Italy in civil and commercial cases between the inhabitants of such territory and other nationals of the former Austrian Empire, or between such inhabitants and the subjects of the allies of the Austrian-Hungarian Monarchy, shall not be carried into effect until after endorsement by the corresponding new court in such territory.

All decisions rendered for political crimes or offences since August 4, 1914, by the judicial authorities of the former Austro-Hungarian Monarchy against Italian nationals, including persons who obtain Italian nationality under the present Treaty, shall be annulled.

In all matters relating to proceedings initiated before the coming into force of the present Treaty before the competent authorities of the territory transferred to Italy, the Italian and Austrian judicial authorities shall unite until the coming into force of a special convention on this subject be authorized to correspond with each other. Requests thus presented shall be given effect to as far as the laws of a public character allow in the country to the authorities of which the request is addressed.

Appeals to the higher Austrian judicial and administrative authorities beyond the limits of the territory transferred to Italy against decisions of the administrative or judicial authorities of this territory shall be suspended. The records shall be submitted to the authorities, whose decision the appeal entered. They must be transmitted to the competent Austrian authorities without delay.

As to jurisdiction, procedure or the administration of justice will be determined by a special convention between Italy and Austria.
WAR, EUROPEAN — THE PEACE TREATIES (18) 581

administration thereof. This Commission will be com-
posed as follows: four members nominated respectively
by the United States, Great Britain, France and Italy,
one by Austria, one by the Serb-Croat-Slovene State,
the Austrian member only taking part in the deliber-
ations of the Commission in regard to the second zone,
and the Serb-Croat-Slovene member only taking part
therein with regard to the first zone. The decisions of
the Commission will be taken by a majority.

The second zone will be occupied by the Austrian
troops and administered in accordance with the general
regulations made by the Commission.

The first zone will be occupied by the troops of
the Serb-Croat-Slovene State and administered in
accordance with the general regulations of the legislation of
that State.

In both zones the troops, whether Austrian or Serb-
Croat-Slovene, shall be reduced to the numbers which
the Commission may consider necessary for the preserva-
tion of order, and shall carry out their mission under
the control of the Commission. These troops shall be
replaced as speedily as possible by a police force re-
trained on the spot.

The Commission will be charged with the duty of
arranging for the vote and of taking such measures
as it may deem necessary to ensure its freedom, fair-
ness and secrecy.

In the first zone the plebiscite will be held within
three months from the coming into force of the present
Treaty, at a date fixed by the Commission in favour of the
Serb-Croat-Slovene State, a plebiscite will be held in the second zone
within six months from the coming into force of the present
Treaty, at a date fixed by the Commission in favour of the
Austrians.

The right of voting will be granted to every person
who, January 1, 1919,
(a) Has attained the age of 20 years on or before
January 1, 1919;
(b) Has on or before January 1, 1919, lived in the zone
subject to the plebiscite; and
(c) Was born within the said zone, or has had his
or her habitual residence or rights of citizenship
(Austrians) from a date previous to January 1,
1912.

The result of the vote will be determined by the
majority of votes in the whole of each zone.

On the conclusion of each vote the result will be
communicated by the Commission to the Principal
Allied and Associated Powers; with a full report as to the
taking of the vote, and will be proclaimed.

In the second zone the plebiscite will be held within
a month of the coming into force of the present
Treaty, in favour of the incorporation either of
the first zone, or of both zones in the Serb-Croat-
Slovene State, Austria hereby renounces, so far as
she is concerned, and to the extent corresponding
to the result of the vote, in favour of the Serb-Croat-
Slovene State all rights over said territories.

After agreement with the Commission the Serb-
Croat-Slovene Government may definitely establish its authority
over the said territories.

The voting in the first or second zone is in favour of
Austria, the Austrian Government, after agreement
with the Commission, will be entitled definitely to re-
establish its authority over the whole of the Klingenfurst
area, or in the second zone, as the case may be.

When the administration of the country, either
by the Serb-Croat-Slovene State, or by Austria, as
the case may be, has been thus assured, the powers of the
Commission will terminate.

Expenditure by the Commission will be borne by
Austria and the Serb-Croat-Slovene State, in equal
mollies.

Article 51 — The Serb-Croat-Slovene State accepts
and agrees to embody in a Treaty with the Principal
Allied and Associated Powers such provisions as these Powers
can agree to, the interests of inhabitants of that State who differ from
the majority of the population in race, language, or
religion.

The Serb-Croat-Slovene State further accepts and
agrees to embody in a Treaty with the Principal
Allied and Associated Powers such provisions as these Powers
can agree to, the interests of inhabitants of that State who differ from
the majority of the population in race, language, or
religion.

Subsequent agreements will decide all questions
which are not decided by the present Treaty and which may
arise in consequence of the cession of the said
territory.

SECTION III.—CZECHOSLOVAK STATE.

Article 53.—Czechoslovakia, in conformity with the action
already taken by the Allied and Associated Powers,
recognizes the complete independence of the Czecho-
Slovak State, which will include the autonomous terri-
torial of the Ruthenians to the south of the Carpathians.

Article 54.—Czechoslovakia recognizes that there is
in favour of the Czecho-Slovak State all rights and title
over the territories of the former Austro-
Hungarian Monarchy situated outside the frontiers of
Austria as laid down in Article 37 of Part II (Frontiers of
Austria) and recognized in accordance with the
present Treaty as forming part of the Czecho-Slovak
State.

Article 55.—A Commission composed of seven
members, five nominated by the Principal Allied and Asso-
ciated Powers, one by the Czecho-Slovak State, and
one by Austria, will be appointed fifteen days after
the coming into force of the present Treaty to trace
the spot the frontier line laid down in Article 37 (6) of
Part II (Frontiers of Austria) of the present Treaty.

The decisions of this Commission will be taken by a
majority and shall be binding on the parties con-
cerned.

Article 56.—The Czecho-Slovak State undertakes not
to erect any military works in that portion of its
territory which lies on the right bank of the Danube
and the south of Gorj (Plec) and shall, on the request of the
serb-Croat-Slovene State, at a date fixed by
the Commission.

In the first zone the plebiscite will be held within
three months from the coming into force of the present
Treaty, at a date fixed by the Commission in favour of the
Serb-Croat-Slovene State, a plebiscite will be held in the second
zone within six months from the coming into force of the present
Treaty, at a date fixed by the Commission in favour of the
Austrians.

The right of voting will be granted to every person
who, January 1, 1919,
(a) Has attained the age of 20 years on or before
January 1, 1919;
(b) Has on or before January 1, 1919, lived in the zone
subject to the plebiscite; and
(c) Was born within the said zone, or has had his
or her habitual residence or rights of citizenship
(Austrians) from a date previous to January 1,
1912.

The result of the vote will be determined by the
majority of votes in the whole of each zone.

On the conclusion of each vote the result will be
communicated by the Commission to the Principal
Allied and Associated Powers; with a full report as to the
taking of the vote, and will be proclaimed.

In the second zone the plebiscite will be held within
a month of the coming into force of the present
Treaty, in favour of the incorporation either of
the first zone, or of both zones in the Serb-Croat-
Slovene State, Austria hereby renounces, so far as
she is concerned, and to the extent corresponding
to the result of the vote, in favour of the Serb-Croat-
Slovene State all rights over said territories.

After agreement with the Commission the Serb-
Croat-Slovene Government may definitely establish its authority
over the said territories.

If the vote in the first or second zone is in favour
of Austria, the Austrian Government, after agreement
with the Commission, will be entitled definitely to re-
establish its authority over the whole of the Klingenfurst
area, or in the second zone, as the case may be.

When the administration of the country, either
by the Serb-Croat-Slovene State, or by Austria, as
the case may be, has been thus assured, the powers of the
Commission will terminate.

Expenditure by the Commission will be borne by
Austria and the Serb-Croat-Slovene State, in equal
mollies.

Article 51 — The Serb-Croat-Slovene State accepts
and agrees to embody in a Treaty with the Principal
Allied and Associated Powers such provisions as these Powers
can agree to, the interests of inhabitants of that State who differ from
the majority of the population in race, language, or
religion.

The Serb-Croat-Slovene State further accepts and
agrees to embody in a Treaty with the Principal
Allied and Associated Powers such provisions as these Powers
can agree to, the interests of inhabitants of that State who differ from
the majority of the population in race, language, or
religion.

Subsequent agreements will decide all questions
which are not decided by the present Treaty and which may
arise in consequence of the cession of the said
territory.

SECTION IV.—ROUMANIA.

Article 59.—Austria renounces, so far as she is
concerned, in favour of Roumania, all right and title
over such portion of the former Duchy of Bukovina
as lies within the frontiers of Roumania which may
ultimately be fixed by the Principal Allied and Asso-
ciated Powers.

Article 60.—Roumania accepts and agrees to
embody in a Treaty with the Principal Allied and Asso-
ciated Powers such provisions as these Powers may
decree necessary to protect freedom of transit and
equitable treatment for the commerce of other nations.

Article 61.—The proportion and nature of the
financial obligations of the former Austrian Empire
which the Czecho-Slovak State will have to assume
on account of the territory placed under its sovereignty
will be determined in accordance with Article 203 of Part IX (Financial
Clauses) of the present Treaty.

Subsequent agreements will decide all questions
which are not decided by the present Treaty and which may
arise in consequence of the cession of the said
territory.

SECTION V.—PROTECTION OF MINORITIES.

Article 62.—Austria undertakes that the stipulations
contained in this Section shall be recognised as funda-
mental laws, and that no law or action shall conflict or interfere with these
stipulations, nor shall any law, regulation or official action prevail
over them.

Article 63.—Austria undertakes to assure full and
complete protection of life and liberty to all inhabitants
of Austria without distinction of nationality, language, race or
religion.
All inhabitants of Austria shall be entitled to the free exercise, whether public or private, of any creed, religion or belief, whose practices are not inconsistent with public morals.

Article 64.—Austria admits and declares to be Austrian nationals ipso facto and without the right of appeal, persons possessing citizenship in such territory transferred to Italy, be acquired ipso facto;

(a) by persons who acquired their rights of citizenship in such territory who were not persons possessing citizenship in such territory transferred to Italy, be acquired ipso facto;

(b) by persons who acquired their rights of citizenship in such territory transferred to Italy, or

(c) by persons whose father, mother or spouse was an Austrian national, and

(d) by persons who have served in the Italian Army during the present war, and their descendants, may claim Austrian nationality subject to the conditions prescribed in Article 78 for the right of option.

Article 73.—The claim to Austrian nationality by the persons referred to in Article 72 may in individual cases be refused by the competent Austrian authority.

Article 74.—Where the claim to Austrian nationality under Article 72 is not made, or is refused, the persons concerned will obtain ipso facto the nationality of the State exercising sovereignty over the area in which they possessed rights of citizenship before acquiring such rights of citizenship transferred to Italy.

Article 75.—Juridical persons established in the territory transferred to Italy shall be considered Austrian if they are recognized as such by the Italian administrative authorities or by an Italian judicial decision.

Article 76.—Notwithstanding the provisions of Article 70, persons who acquired rights of citizenship after the 1st January, 1914, in a territory which became part of the present Treaty to the Serb-Croat-Slovene State, or to the Czechoslovak State, will not acquire Serb-Croat-Slovene or Czechoslovak nationality without a permit from the Serb-Croat-Slovene State or the Czechoslovak State respectively.

Article 77.—If the permit referred to in Article 76 is not applied for, or is refused, the persons concerned will obtain ipso facto Austrian nationality, exercising sovereignty over the territory in which they previously possessed rights of citizenship.

Article 78.—Persons over 18 years of age losing their Austrian nationality and obtaining ipso facto a new nationality under Article 70 shall be entitled within a period of one year from the coming into force of the present Treaty to opt for the nationality of the State in which they possessed rights of citizenship before acquiring such rights of citizenship transferred to Italy.

Persons who have exercised the above right to opt must within the succeeding twelve months transfer their place of residence to the State for which they have opted.

They will be entitled to retain their immovable property in the other State, and to dispose of their place of residence before exercising their right to opt.

They may carry with them their movable property of every description. No export or import duties may be imposed upon them in connection with the removal of such property.

Article 79.—Persons entitled to vote in plebiscites provided for in the present Treaty shall within a period of six months after the definitive attribution of the area in which the plebiscite has taken place be entitled to opt for the nationality of the State in which they have a right to vote.

The provisions of Article 78 relating to the right of option shall apply equally to the exercise of the right under this Article.

Article 80.—Persons possessing rights of citizenship in territory forming part of the former Austro-Hungarian Monarchy, who acquired Austrian nationality ipso facto by virtue of Article 13 of the Covenant, shall have the right to possess rights of citizenship in such territory transferred to Italy, or to the Austrian nationality by virtue of Article 13 of the Covenant.

 SECTION VI.—CLAUSES RELATING TO NATIONALITY.

Article 70.—Every person possessing rights of citizenship in territory which formed part of the territories of the former Austro-Hungarian Monarchy shall obtain ipso facto the exclusion of Austrian nationality the nationality of the State exercising sovereignty over such territory.

Article 71.—Notwithstanding the provisions of Article 70, persons possessing citizenship in such territory who were not persons possessing citizenship in such territory transferred to Italy, be acquired ipso facto;

(a) by persons who acquired their rights of citizenship in such territory transferred to Italy, or

(b) have served in the Italian Army during the present war, and their descendants, may claim Italian nationality subject to the conditions prescribed in Article 78 for the right of option.
Powers themselves, to choose any other nationality which may be open to them.

Article 89. — For the purposes of the provisions of this Treaty, the children of a woman who is governed by that of her husband, and the status of children under 18 years of age by that of their parents.

SECTION VII. — POLITICAL CLAUSES RELATING TO CERTAIN EUROPEAN STATES.

1. Belgium.

Article 83. — Austria, recognizing that the Treaties of April 19, 1819, which established the status of Belgium as a free state, no longer conform to the requirements of the situation, consents so far as she is concerned to the total cession of the Belgian provinces which may be concluded by the Allied and Associated Powers relating to the Grand Duchy.

2. Luxemburg.

Article 84. — Austria agrees, so far as she is concerned, to the total cession of the Grand Duchy of Luxemburg, and accepts in addition all arrangements regarding the cession which may be concluded by the Allied and Associated Powers relating to the Grand Duchy.

Article 85. — Austria hereby accepts so far as she is concerned all arrangements made by the Allied and Associated Powers relating to the territories whose abandonment was imposed upon Denmark by the Treaty of October 30, 1864.

4. Turkey and Bulgaria.

Article 86. — Austria undertakes to recognize and accept as binding all arrangements which the Allied and Associated Powers may make with Turkey and Bulgaria, with reference to the rights and privileges which might be claimed by Austria or her nationals in Turkey or Bulgaria and which, at all events, dealt with in the provisions of the present Treaty.

5. Russia and Russian States.

Article 87. — 1. Austria acknowledges and agrees to respect as permanent and inalienable the independence of all the territories which were part of the former Russian Empire on August 1, 1914.

In accordance with the provisions of Article 210 of Part III of the Treaty (Concessions) and Article 244 of Part X (Economic Clauses) of the present Treaty, Austria accepts definitely so-called economic or subsidies, and shall not be allowed to demand the restoration of the Brest-Litovsk Treaty. And, of all treaties, conventions and agreements entered into by the former Austro-Hungarian Government with the Maximalist Government in Russia.

The Allied and Associated Powers formally reserve the rights of Russia to obtain from Austria restitution and reparations based on the principles of the present Treaty.

2. Austria undertakes to recognize the full force of all treaties or agreements which may be entered into by the Allied and Associated Powers with States now existing or coming into existence in future in the whole or part of the former Empire of Russia as it existed on August 1, 1914, and to recognize the frontiers of any such States as determined therein.

SECTION VIII. — GENERAL PROVISIONS.

Article 88. — The independence of Austria is inalienable otherwise than with the consent of the Council of the League of Nations. Consequently, Austria undertakes in the absence of the consent of the said Council to abstain from any act which might directly or indirectly, or by any means whatsoever compromise her independence, particularly, and until her admission to membership of the League of Nations, by participation in the affairs of another Power.

Article 89. — Austria hereby recognizes and accepts the frontiers of Bulgaria, Greece, Hungary, Poland, Roumania, the Serb-Croat-Slovene State and the Czecho-Slovak State. And, any frontiers may be determined by the Principal Allied and Associated Powers.

Article 90. — Austria undertakes to recognize the full force of the Treaties of Peace and Additional Conventions which have been or may be concluded by the Allied and Associated Powers with the Powers who fought on the side of the former Austro-Hungarian Monarchy, and to recognize such conventions which have been or may be made concerning the territories of the former German Empire, of Hungary, of the Kingdom of Bulgaria and of the Ottoman Empire, and to recognize the new States within their frontiers as there laid down.

Article 91. — Austria renounces so far as she is concerned in favour of the Principal Allied and Associated Powers all rights and title over the territories which, previously belonged to the former Austro-Hungarian Monarchy and which, being situated in the frontiers of Austria as described in Article 27 of Part II (Frontiers of Austria), have not at present been assigned to any State.

Austria undertakes to accept the settlement made by the Principal Allied and Associated Powers in regard to those territories, particularly in so far as concerns the nationality of the inhabitants.

Article 92. — No inhabitant of the territories of the former Austro-Hungarian Monarchy shall be disturbed or molested on account either of his political attitude between July 28, 1914, and the definitive settlement of the sovereignty over these territories, or of the determination of his nationality effected by the present Treaty.

Article 93. — Austria will hand without delay to the Allied and Associated Governments concerned the archives, registers, plans, title-deeds and documents of every kind belonging to the civil, military, financial, judicial or other forms of administration in the ceded territories. If any one of these documents, archives, registers, title-deeds or plans is missing, it shall be immediately restored upon the demand of the Allied or Associated Government concerned.

In case the archives, registers, plans, title-deeds or documents referred to in the preceding paragraphs, exclusive of those of a military character, are not restored to the administrations in Austria, and cannot therefore be handed over without inconvenience to such administrations, Austria undertakes, subject to reciprocity, to give access thereto to the Allied and Associated Governments concerned.

Article 94. — Separate conventions between Austria and each of the States to which territory of the former Austrian Empire is transferred, and each of the States arising from the dismemberment of the former Austro-Hungarian Monarchy, will provide for the interests of the inhabitants, especially in connection with the civil rights, their commerce and the exercise of their professions.

PART IV. — AUSTRIAN INTERESTS OUTSIDE EUROPE.

Article 95. — In territory outside her frontiers as fixed by the present Treaty, Austria renounces so far as she is concerned all rights, titles and privileges whatever in or over territory outside Europe which belonged to the former Austro-Hungarian Monarchy and its allies, and all rights, titles and privileges whatever their origin which it held as against the Allied and Associated Powers.

Austria undertakes immediately to recognize and to conform to the measures which have been taken or in the future by the Principal Allied and Associated Powers, in agreement where necessary with third Powers, in order to carry the above stipulation into effect.

SECTION I. — MOROCCO.

Articles 96 to 101 identical with Articles 147 to 146 inclusive of German Treaty, with the exception of the substitution of the words Austria, Austrian, etc., for Germany, German, etc.

SECTION II. — EGYPT.

Articles 102 to 109 identical with Articles 147 to 154 of German Treaty with the exception of the substitution of the words Austria, Austrian, etc., for Germany, German, etc.

SECTION III. — SIAM.

Articles 110, 111, 112 identical with Articles 133, 136 and 137 of the German Treaty with the exception of the substitution of the words Austria, Austrian, etc., for Germany, German, etc.

SECTION IV. — CHINA.

Article 113. — Austria renounces, so far as she is concerned, in favour of China all benefits and privileges resulting from the provisions of the final Protocol signed at Peking on September 7, 1907, and from all annexes.
WAR, EUROPEAN—THE PEACE TREATIES (18)

notes and documents supplementary thereto. She likewise renounced in favour of China any claim to indemnities accruing thereunder subsequent to August 14, 1917.

Article 114.—From the coming into force of the present Treaty the High Contracting Parties shall apply, in so far as concerns them respectively:
(1) The Arrangement of August 29, 1903, regarding the new Chinese customs tariff.
(2) The Arrangement of September 27, 1905, regarding the rights and advantages or privileges which she allowed to the former Austro-Hungarian Monarchy under these Arrangements.

Article 115.—Austria, so far as she is concerned, cedes to China all her rights over the buildings, wharves and pontoons, barracks, forts, arms and munitions of war, vessels of all kinds, wireless telegraphy installations and other public property which belonged to the former Austro-Hungarian Monarchy, and which are situated or may be in the Austro-Hungarian Concession at Tientsin or elsewhere in Chinese territory.

It is understood, however, that premises used as diplomatic or consular residences or offices, as well as the effects and furniture and apparatus therein are not included in the above cession, and, furthermore, that no such cession shall be taken by the Chinese Government to dispose of the public and private property belonging to the former Austro-Hungarian Monarchy situated within the so-called Legation Quarter at Peking without the consent of the Diplomatic Representatives of the Powers which, on the coming into force of the present Treaty, retain or acquire rights or interests in the Legation Quarter, as provided by the Protocol of September 27, 1905.

Article 116.—Austria agrees so far as she is concerned to the abrogation of the leases from the Chinese Government under which the Austro-Hungarian Concession at Tientsin is now held.

China, restored to the full exercise of her sovereign rights to this territory, declares her intention of opening it to international residence and trade. She further declares that the abrogation of the leases under which the concession is now held shall not affect the property rights of nationals of Allied and Associated Powers who are holders of lots in this concession.

Article 117.—Austria waives all claims against the Chinese Government or against any Allied or Associated Government arising out of the internment of Austrian nationals in China and their repatriation. She equally renounces, so far as she is concerned, all claims arising out of the capture and condemnation of Austro-Hungarian ships in China, or the liquidation, sequestration or control of Austrian properties, rights and interests in that country since August 14, 1917. This provision, however, shall not affect the rights of the powers of the procedures of any such liquidation, which shall be governed by the provisions of Part X (Economic Clauses) of the present Treaty.

PART V.—MILITARY, NAVAL AND AIR CLAUSES.

In order to render possible the initiation of a general limitation of the armaments of all nations, Austria undertakes strictly to observe the military, naval and air clauses which follow.

SECTION I.—MILITARY CLAUSES.

Chapter I.—General.

Article 118.—Within three months of the coming into force of the present Treaty, the military forces of Austria shall be demobilised to the extent prescribed hereinafter.

Article 119.—Universal compulsory military service shall be abolished in Austria. The Austrian Army shall be reduced to a constant and recruited by means of voluntary enlistment.

Chapter II.—Effectiveness and Coders of the Austrian Army.

Article 120.—The total number of military forces in the Austrian Army shall not exceed 30,000 men, including officers and non-commissioned officers. Subject to the following limitations, the formations composing the Austrian Army shall be fixed in accordance with the wishes of Austria:
(1) The effectiveness of units must be fixed between the maximum and minimum figures shown in Table I annexed to this Section.
(2) The proportion of officers, including the personnel of staffs and special services, shall not exceed the twentieth of the total effective with the colours, and that of non-commissioned officers shall not exceed one fiftieth of the total effective with the colours.
(3) The number of machine guns, guns and howitzers shall not exceed per thousand men of the total effective with the colours those fixed in Table V annexed to this Section.

The Austrian Army shall be devoted exclusively to the maintenance of order within the territory of Austria, and to the control of her frontiers.

Article 121.—The maximum strength of the Staffs and of all formations which Austrian army permitted to raise are given in the Tables annexed to this Section; these figures need not be exactly followed, but must not be exceeded.

All other organisations for the command of troops or for preparation for war are forbidden.

Article 122.—All measures of mobilisation, or appertaining to mobilisation, are forbidden.

In no case must formations, administrative services or staffs include supplementary cadres.

The carrying out of any preparatory measures with a view to requisitioning animals or other means of military transport is forbidden.

Article 123.—The number of gendarmes, customs officers, forest inspectors, members of the local or municipal police or other like officials may not exceed the number of men employed in 1913 within the boundaries of Austria as fixed by the present Treaty.

The number of police which shall not be increased in the future except as may be necessary to maintain the same proportion between the number of officials and the total population of the localities or municipalities which employ them.

These officials, as well as officials employed in the railway service, shall be associated in the event of taking part in any military exercises.

Article 124.—Every formation of police not included in the Tables annexed to this Section is forbidden. Such other formations as may exist in excess of the 30,000 effective authorised shall be suppressed within the period laid down by Article 118.

Chapter III.—Recruiting and Military Training.

Article 125.—All officers must be regular (officiers de carrière). Officers now serving who do not join the new army will be released from all military obligations; they must not participate in any military exercises, whether theoretical or practical.

Officers newly appointed must undertake to serve on the active list for 20 consecutive years at least.

The number of officers discharged for any reason before the expiration of their term of service must not exceed in any year one twentieth of the total of officers provided for in Article 120. If this proportion is unavoidably exceeded the resulting shortage must not be made good by fresh appointments.

Article 126.—The period of enlistment for non-commissioned officers and privates must be for a total period of not less than 12 consecutive years, including at least 6 years with the colours.

The proportion of men discharged before the expiration of the period of their enlistment for reasons of health or as a result of disciplinary measures or any other reasons must not in any year exceed one twentieth of the total strength fixed by Article 120. If this proportion is unavoidably exceeded, the resulting shortage must not be made good by fresh enlistments.

Chapter IV.—Schools, Educational Establishments, Military Clubs and Societies.

Article 127.—The number of students admitted to attend the courses in military schools shall be strictly proportionate to the number of vacancies which must not be filled by officers. The students and the cadets shall be included in the effective fixed by Article 120 of the present Section.

Consequently all military schools not required for this purpose shall be abolished.

Article 128.—Educational establishments, other than those referred to in Article 127, as well as all sporting and other clubs, must not occupy themselves with any military matters.

Chapter V.—Armament, Munitions and Material Fortifications.

Article 129.—On the expiration of three months from the coming into force of the present Treaty, the armament of Austria shall be fixed to the figures fixed per thousand men in Table V annexed to
WAR, EUROPEAN—THE PEACE TREATIES (18)

this Section. Any excess in relation to effectives shall only be used for such replacements as may eventually be necessary.

Article 130.—The stock of munitions at the disposal of the Austrian Army shall not exceed the amounts fixed in Table V annexed to this Section. Within three months from the coming into force of the present Treaty the Austrian Government shall deposit any existing surplus of armament and munitions in such places as shall be notified to it by the Principal Allied and Associated Powers.

No other stock, depot or reserve of munitions shall be formed.

Article 131.—The number and calibre of guns constituting the fixed normal armament of fortified places existing at the present moment in Austria shall be immediately notified to the Principal Allied and Associated Powers, and will constitute maximum amounts which must not be exceeded.

Within three months from the coming into force of the present Treaty the maximum stock of ammunition for these guns shall be reduced to and maintained at the following uniform rates:

1,500 rounds per gun for those the calibre of which is .55 mm. and under;
500 rounds per gun for those of higher calibre.

Article 132.—The manufacture of arms, munitions and war materials shall only be carried on in one single factory, which shall be controlled by and belong to the State, and shall be strictly limited to the manufacture of such arms, munitions and war material as is necessary for the military forces and armaments referred to in Articles 120, 123, 129, 130 and 131.

The manufacture of sporting weapons is not forbidden, provided that sporting weapons manufactured in Austria taking ball cartridges are not of the same calibre as that of military weapons used in any European army.

With the same length of time, all arsenals shall also be closed down, except those to be used as depots for the authorised stocks of munitions, and their staffs discharged.

The plant of any establishments or arsenals in excess of the amount required for the manufacture authorized shall be rendered useless or converted to purely commercial uses.

The manufacture of all such arms, munitions and war materials as is necessary for the military forces and armaments referred to in Articles 120, 123, 129, 130 and 131 is strictly forbidden.

Article 133.—Within three months from the coming into force of the present Treaty all armaments and war material, including any kind of anti-aircraft material, of whatever origin, existing in Austria in excess of the quantity authorized shall be handed over to the Principal Allied and Associated Powers.

Delivery shall take place at such points in Austrian territory as may be appointed by the said Powers, who shall also decide on the disposal of such material.

Article 134.—The importation into Austria of arms, munitions and war material of all kinds is strictly forbidden.

The manufacture for foreign countries and the exportation of arms, munitions and war material shall also be forbidden.

Article 135.—The use of flame throwers, asphyxiating, poisonous or other gases, and all similar liquids, materials or devices being prohibited, their manufacture and importation are strictly forbidden in Austria.

Material specially intended for the manufacture, storage or use of the said products or devices is equally forbidden.

The manufacture and importation into Austria of armoured cars, tanks or any similar machines suitable for use in war are equally forbidden.

(1) Automatic rifles or carbines are counted as light machine-guns.

NOTE.—No heavy gun, i.e. of a calibre greater than 105 mm. is authorised, with the exception of the normal armament of fortified places.

SECTION II.—NAVAL CLAUSES.

Article 136.—From the date of the coming into force of the present Treaty, all Austro-Hungarian warships, submarines included, are declared to be finally surrendered to the Principal Allied and Associated Powers.

All the monitors, torpedo boats, and armed vessels of the Danube Flotilla will be surrendered to the Principal Allied and Associated Powers.

In particular, this material will include all items under the following heads which are or have been designed for warlike purposes.

Complete aeroplanes and seaplanes, as well as those being manufactured, repaired or assembled. Dwellings able to take the material will include all items under the following heads which are or have been designed for warlike purposes.

Plant for the manufacture of hydrogen.

Sections for manufacture of hydrogen. Sections for the manufacture of hydrogen, as well as the sheds for dirigibles, may, at the discretion of the said Powers, be left to Austria until the time when the dirigibles are handed over.

Engines for aircraft.

Nacelles and fuselages.

Artillery (guns, machine guns, light machine guns, bomb-dropping apparatus, torpedo apparatus, synchronisation apparatus, aiming apparatus).

Munitions (cartridges: shells, bombs loaded or unloaded, stocks of explosives or material for their manufacture).

Instruments for use on aircraft.
Wireless apparatus and photographic or cinematographic apparatus for use on aircraft.

Component parts of any of the items under the previous head shall also be removed without special permission from the said Governments.

SECTION IV.—INTER-ALLIED COMMISSIONS OF CONTROL.

Article 149.—All the Military, Naval and Air Authorities contained in the present Treaty for the execution of any command shall be executed by Austria under the control of Inter-Allied Commissions appointed for that purpose by the Principal Allied and Associated Powers.

The above-mentioned Commissions will represent the Governments of the Principal Allied and Associated Powers in dealing with the Austrian Government in all matters concerning the execution of the Military, Naval and Air Clauses. They will communicate to the Austrian authorities the decisions which the Principal Allied and Associated Powers have reserved the right to take or which the execution of the said Clauses may necessitate.

Article 150.—The Inter-Allied Commissions of Control may establish their organisations at Vienna and shall be entitled, as often as they think desirable, to proceed to any foreign country and to Austria, to inspect the forces and technical establishments, or to give such advice or direction as they may deem necessary to ensure the execution of their mission, and all measures in that respect shall be taken both by the Austrian Government and by the Principal Allied and Associated Powers; and all the above-mentioned Commissions may need to ensure the complete execution of the Military, Naval and Air Clauses.

The Austrian Government must furnish to the Inter-Allied Commissions of Control all special documents and all information or data which it may have to address the Austrian Government, and furnishing it with, or procuring, all information or documents demanded.

Article 152.—The upkeep and cost of the Commissions, including the expense involved by their work shall be borne by Austria.

Article 153.—It will be the special duty of the Military Inter-Allied Commission of Control to receive from the Austrian Government the communications relating to the location of the stocks and deports of munitions, the armament of the fortified works, fortresses and forts, and the location of the works or factories for the production of arms, munitions, and war material and their operations.

It will take delivery of the arms, munitions, war material and plant intended for war construction, will select the points where such delivery is to be effected, and will supervise the works of destruction, and remove things useless, or of transformation of material which are to be carried out in accordance with the present Treaty.

Article 154.—It will be the special duty of the Naval Inter-Allied Commission of Control to proceed to the building yards and to supervise the breaking-up of the ships which are under construction there, to take delivery of arms, munitions and naval war material, and to supervise the destruction and breaking-up provided for in the treaty.

The Austrian Government must furnish to the Naval Inter-Allied Commission of Control all such information and documents as the Commissions may deem necessary to ensure the complete execution of the Naval Clauses. In particular the designs of the warships, the composition of their armament, the details of the guns, munitions, torpedoes, mines, explosives, wireless telegraphic apparatus, and in general everything relating to the material, naval and military or administrative documents or regulations.

Article 155.—It will be the special duty of the Aeronautical Inter-Allied Commission of Control to make an inventory of the aeronautical material which is actually in the possession of the Austrian Government, to inspect aeroplanes, balloon and motor manufactories, and factories producing arms, munitions and explosives capable of being used by aerial, sea, land, or land forces, sheds, landing grounds, parks and depots which are now in Austrian territory, and to authorise where necessary a removal of material and to take delivery of such material.

The Austrian Government must furnish to the Aeronautical Inter-Allied Commission of Control all such information, administrative or other documents which the Commissions may consider necessary to ensure the complete execution of the Air Clauses, and, in particular, a list of the personnel belonging to all the air services of Austria and of the existing material, as well as of that in process of manufacture or on order, and a list of all establishments working for aviation, of their positions, and of all sheds and landing grounds.

SECTION V.—GENERAL ARTICLES.

Article 156.—After the expiration of a period of three months from the coming into force of the present Treaty, the Austrian laws must have been modified and shall be maintained by the Austrian Government in conformity with this Part of the present Treaty.

Within the same period all the administrative or other measures relating to the execution of this Part must have been taken by the Austrian Government.

Article 157.—The following portions of the Armistice of November 3, 1918; paragraphs 2 and 3 of Chapter I (Military Clauses), paragraphs 2, 3, 6 of Chapter I of the annexed Protocol (Military Clauses), remain in force so far as they are not inconsistent with the above stipulations.

Article 158.—Austria undertakes, from the coming into force of the present Treaty, not to accredit nor to send to any foreign country a Military, naval or air mission, nor to allow any such mission to leave her territory; Austria further agrees to take the necessary measures to prevent Austria from leaving her territory to enlist in the Army, Navy or Air service of any foreign Power, or to send an Austrian soldier to the Army, Navy or Air service for the purpose of assisting in the military, naval or air training thereof, or generally for the purpose of giving military, naval, or aeronautic instruction in any foreign country.

The Allied and Associated Powers undertake, so far as they are concerned, that from the coming into force of the present Treaty they will not enrol in nor attach to their armies or naval or air forces any Austrian national for the purpose of assisting in the military training of such armies or naval or air forces, or otherwise employ any such Austrian national as military, naval or aeronautic instructor.

The present provision does not, however, affect the right of France to recruit for Foreign Legion in accordance with French military laws and regulations.

Article 159.—So long as the present Treaty remains in force, Austria undertakes to submit to any investigation which the Council of the League of Nations, acting if need be by a majority vote, may consider necessary.

PART VI.—PRISONERS OF WAR AND GRAVES.

SECTION I.—PRISONERS OF WAR.

Articles 160–170 are identical with Articles 214–244 of the German Treaty, with the exception of the substitution of the words Austria, Austrian, etc., for Germany, German, etc.

SECTION II.—GRAVES.

Articles 171 and 172 are identical with Articles 245 and 246 of the German Treaty, with the exception of the substitution of the words Austria, Austrian Government, etc., for Germany, German Government, etc.

PART VII.—PENALTIES.

Article 173.—The Austrian Government recognises the right of the Allied and Associated Powers to bring before military tribunals persons accused of having committed acts in violation of the laws and customs of war. Such persons shall, if found guilty, be sentenced to punishments laid down by law. This provision will apply notwithstanding any proceedings or prosecutions before a military tribunal in Austria or in the territory of her allies.

The Austrian Government shall hand over to the Allied and Associated Powers, or to such one of them as shall so request, all persons accused of having committed an act in violation of the laws and customs of war, who are specified either by name or by the rank, office or employment which they held under the Austrian authorities.

Article 174.—Persons guilty of criminal acts against the nationals of one of the Allied and Associated Powers will be brought before the military tribunals of that Power.

And persons guilty of criminal acts against the nationals of more than one of the Allied and Associated Powers will be brought before military tribunals composed of members of the military tribunals of the Powers concerned.

In every case the accused will be entitled to name his own counsel.
Article 175.—The Austrian Government undertakes to furnish all documents and information of every kind and description of which may be considered necessary to ensure the full knowledge of the incriminating acts, the discovery of offenders and the just appreciation of responsibility.

Article 176.—The provisions of Articles 173 to 175 apply to the Governments of the States to which territory belonging to the former Austro-Hungarian Monarchy has been assigned, in so far as concerns persons of having committed acts contrary to the laws and customs of war who are in the power of the said States.

If the persons in question have acquired the nationality of one of the said States, the Government of such State undertakes to take, at the request of the Power concerned and in agreement with it, all the measures necessary to ensure the prosecution and punishment of such persons.

Article 177.—The Allied and Associated Governments affirm and Austria accepts the responsibility of Austria and her allies for causing the loss and damage to which the Allied and Associated Governments and their respective subjects have been subjected as a consequence of the war imposed upon them by the aggression of Austria-Hungary and her allies.

Article 178.—The Allied and Associated Governments recognise that the resources of Austria are not adequate for expediting and completing the payments of the damages referred to in the preceding Article, and for making compensation as hereinafter determined for damage done to the civil population of the Allied and Associated Powers by enemy action during the period of the belligerency of each as an Allied and Associated Power against Austria-Hungary by land, by sea, and from the air, and in general damage as defined in Annex I hereto.

The amount of such damage for which compensation is to be made by Austria shall be determined by an Inter-Allied Commission to be called the "Commission to consider the disturbances of economic life in Austria as a consequence of the war imposed upon them by the aggression of Austria-Hungary and her allies". The Commission shall constitute a Section to consider the special questions raised by the application of the present Treaty; this Section shall have consultative powers only, except in cases in which the Commission shall delegate to it powers of decision as may be deemed convenient.

The Reparation Commission shall consider the claims and give to the Austrian Government a just opportunity to be heard.

The Commission shall concurrently draw up a schedule of payments prescribing the time and manner for making and discharging the payments, and fixing the period of time in successive years from May 1, 1921, that part of the debt which shall be applied to her after the Commission has decided whether Germany is in a position to pay the balance of the total amount of claims presented against Germany and her allies and approved by the said Commission. If, however, within the period mentioned, Austria fails to discharge her obligations, any balance remaining unpaid may, within the discretion of the Commission, be postponed for settlement in subsequent years or may be handled otherwise in such manner as the Allied and Associated Governments acting in accordance with the procedure laid down in this Part of the present Treaty shall determine.

Article 180.—The Reparation Commission shall, after May 1, 1921, from time to time consider the resources of Austria, and, after giving her representatives a just opportunity to be heard, shall have discretion to extend the time and discharging the payments, and fixing the period of time in successive years from May 1, 1921, that part of the debt which shall be applied to her after the Commission has decided whether Germany is in a position to pay the balance of the total amount of claims presented against Germany and her allies and approved by the said Commission. If, however, within the period mentioned, Austria fails to discharge her obligations, any balance remaining unpaid may, within the discretion of the Commission, be postponed for settlement in subsequent years or may be handled otherwise in such manner as the Allied and Associated Governments acting in accordance with the procedure laid down in this Part of the present Treaty shall determine.

Annex I.

Annex I (1-10) is similar to Annex I of Part VIII of the German Treaty except that the word Austria is substituted for Germany throughout.

Annex II.

1. The Commission referred to in Article 179 shall be called the "Reparation Commission" and is hereafter referred to as the "Commission".

2. The Delegates to this Commission shall be appointed by the United States of America, Great Britain, France, Italy, Japan, Belgium, Greece, Poland, Roumania, the Serb-Croat-Slovene State and Czecho-Slovakia. The United States of America, Great Britain, France, Italy, Japan and Belgium shall each appoint a Delegate. The other five Powers shall appoint a Delegate to represent them all under the conditions indicated in the third sub-paragraph of paragraph 3 hereafter. At the time when each Delegate is appointed there shall also be appointed an Assistant Delegate who will take his place in case of illness or necessary absence, but at other times will only have the right to be present at the proceedings without taking part therein.

On no occasion shall Delegates of more than five of the above Powers have the right to withdraw from the proceedings of the Commission and to record their votes. The Delegates of the United States, Great Britain, France and Italy shall have this right on all occasions other than those referred to below. The Delegate of Belgium shall have the right to withdraw from all occasions other than those referred to below. The Delegate of Japan will have this right when questions relating to damage at sea are under consideration.

Each of the Governments represented on the Commission shall have the right to withdraw after twelve months' notice to the Commission and confirming it six months after the date of the original notification.

3. Such of the Allied and Associated Powers as may be interested shall have the right to name a Delegate to be present and act as assessor only while their respective claims and interests are under examination or discussion, but without having a vote.

The Section to be established by the Commission under Article 179 of the present Part shall include representatives of the following Powers: the United States of America, Great Britain, France, Italy, Greece, Poland, Roumania, the Serb-Croat-Slovene State and Czecho-Slovakia. This composition of the Section shall in no way prejudice the admissibility of any claims in voting, the execution of the Treaty of November 21, 1918, by the Allied Powers, America, Great Britain, France and Italy and each shall have two votes.

The representatives of the five remaining Powers mentioned above shall appoint a Delegate to represent them all, who shall preside over the Reparation Commission in the circumstances described in paragraph 2 of the present Annex. This delegate, who shall be appointed for one year, shall be chosen successively from the nationals of each of the said five Powers.

4. In the case of death, resignation, or recall of any Delegate, Assistant Delegate or Assessor, a successor to him shall be nominated as soon as possible.

5. The Commission shall have its principal permanent bureau in Paris, and shall hold its first meeting in Paris as soon as practicable after the coming into force of the present Treaty, and shall transact its business in such place or places and at such times as may be deemed convenient and as may be necessary for the most expeditiously discharge of its duties.

6. At its first meeting the Commission shall elect from among the Delegates a President, a Chairman and a Vice-Chairman, who shall hold office for a year and shall be eligible for re-election. In case of vacancy in the Chairmanship or Vice-Chairmanship, the Commission, during the annual period, the Commission shall proceed to elect a new President or such other person as the claimants may fix their remuneration; to constitute Sections or Committees, whose members may be necessary be members of the Commission, and to take all executive steps necessary for the purpose of discharging its duties; and to delegate obligations for reparation also, with the approval of the said Governments, be paid for out of the amount due for reparation.

* * * * *
8. All the proceedings of the Commission shall be private unless on particular occasions the Commission shall otherwise determine for special reasons.

9. The Commission shall be expected to have the Austrian Government so desire, to hear within a period which it will fix from time to time evidence and arguments upon which it may be willing to base its decision, and to give any and all information it may request, and it is understood that the decision of the Austrian Government upon such matters shall be final and binding upon the Commission.

10. The Commission shall consider the claims and give the Austrian Government a just opportunity to be heard, but not to take any part whatever in the decision of the case. The Commission may afford a similar opportunity to the allies of Austria when it shall consider that their interests are in question.

11. The Commission shall not be bound by any particular rule of law of a particular case or by any particular rule of evidence or of procedure, but shall be guided by public policy, equity and good faith. Its decisions must be subject to the conditions and provisions:

(a) Whether any of the full amount of the claimed claims shall be paid in gold or in ships, securities, commodities or otherwise, Austria shall be required, under the terms of the present Treaty, the Commission may not be required to cover any claim for an equivalent amount of the claims, obligations or other property in the territory of the said Governments and the actual costs of the territory of the said Governments of the territory of the said Governments and the actual costs of the territory of the said Governments.

(b) In periodically estimating Austria's capacity to pay, the Commission shall determine the capacity to pay in accordance with the decisions of the powers represented on the Commission.

The Commission shall receive instructions to account for:

(a) The economic and financial position of Austrian territory as delimited by the present Treaty;

(b) The diminution of its resources and of its capacity for payment resulting from the clauses of the present Treaty.

As long as the position of Austria is not modified by the Commission, the Commission shall take account of these considerations and the obligations to be imposed on Austria, the payment of which is to be considered as that of the service or discharge of any domestic loan, and, secondly, as to satisfy itself that in general the payment of the territory of the said Governments of the territory of the said Governments, and the actual costs of the territory of the said Governments of the territory of the said Governments, for payment.

(c) The Commission shall, as provided in Article 181, take from Austria, by way of security for and acknowledgment of the debt, gold bearer bonds free of all taxes or charges of every description established or to be established by the Austrian Government or by any authorities subject to them. These bonds will be delivered at any time that may be agreed upon by the Commission, and in the event that the respective amounts are to be paid, the Commission will be paid in gold, in conformity with Article 181 of this Treaty. The Commission shall have the right to exchange for new bonds of the same type as those provided for below (paragraph 12, c).

12. A first issue in bearer bonds payable not later than May 1, 1921, without interest. There shall be specially applied to the amortisation of these bonds the proceeds of which Austria is pledged to make in conformity with Article 181 of this Part, after deduction of the sums used for the reimbursement of the expenses of payment, the interest and the other costs of the territory of the said Governments, and the actual costs of the territory of the said Governments.

13. A first issue in bearer bonds payable at 2½ per cent. between 1921 and 1926, and thereafter at 5 per cent. with an additional 1 per cent. for amortisation beginning in 1926 on the whole amount of the issue.

14. An undertaking in writing to issue, when, and not until the Commission shall otherwise determine for special reasons, the further instalments of bearer bonds bearing interest at 5 per cent. per annum, the time and mode of payment of the interest to be determined by the Commission.

The dates for the payment of the interest shall be determined by the manner of employing the amortisation fund and all other questions relating to the issue, management and regulation of the bond issue shall be determined by the Commission from time to time.

Further issues by way of acknowledgment and security may be required as the Commission shall subsequently determine from time to time.

15. In case the Austrian Government is required to pay additional sums of the common charges to be borne by Austria as a result of the claims of the Allied and Associated Powers, the Commission shall immediately annul all bonds which have been issued in excess of this sum.

(d) In the event of bonds, obligations or other evidence of indebtedness issued by Austria by way of security or for acknowledgment of her reparation debt being disposed of outright, not by way of pledge, to persons other than the several Governments in whose favour Austria's original reparation debt is recorded, an amount of such reparation indebtedness shall be deemed to be extinguished corresponding to the nominal value of the bonds, etc., so disposed of outright, and the obligation of Austria in respect of such bonds shall be confined to her being the holder of the bonds, as expressed upon their face.

(e) The damage for repairing, reconstructing and re-building property situated in the invaded and devastated districts, including re-installation of furniture, machinery and other equipment, and according to the cost at the date when the work is done.

(f) Decisions of the Commission relating to the total or partial cancellation of the financial and interest of any of the verified debt of Austria must be accompanied by a statement of its reasons.

16. As to voting the Commission shall observe the following rules:

(a) When a decision of the Commission is taken, the votes of all the Delegates entitled to vote, or in the absence of any of them, of their assistant Delegates, shall be recorded. abstention from voting is not to be treated as a vote against the proposal under discussion.

Assessors shall have no vote.

17. No questions of unanimity are necessary:

(a) Questions involving the sovereignty of any of the Allied and Associated Powers or the cancellation of the whole or any part of the debt or obligations of Austria;

(b) Questions of determining the amount and conditions of bonds or other obligations to be issued by the Austrian Government and the fixing of the time and manner of selling, negotiating or distributing such bonds;

(c) Any postponement, total or partial, beyond the end of 1930, of the payment of instalments falling due beyond May 2, 1921, and the end of 1926 inclusive.

(d) Any postponement, total or partial, of instalments falling due after 1926 for a period exceeding three years.

(e) Questions of applying in any particular case a method of measuring damages different from that which has been previously applied in a similar case.

(f) Questions of the interpretation of the provisions of this Part of the present Treaty.

18. Any question which may be submitted to the Commission for decision by the President of the same shall be decided by the vote of the majority.

In the case of any difference of opinion among the Delegates, which cannot be resolved by reference to their Governments, the question whether a given case is one which requires an unanimous decision or not, such difference shall be referred to the immediate arbitration of some impartial person to be agreed upon by their Governments, whose decision the Governments of the Allied and Associated Governments shall accept.

19. Decisions of the Commission shall have the powers conferred upon it, shall forthwith become binding and may be put into immediate execution without further proceedings.

20. The Commission shall issue to each of the interested Powers in such form as the Commission shall fix:

(a) A certificate stating that it holds of principal amount of the said Power bonds of the issues mentioned above, the said certificate on the face thereof shall be divided into a number of parts not exceeding five.

(b) From time to time certificates stating the goods delivered by Austria on account of her reparation debt which it holds for the account of the said Power.
Such certificates shall be registered and, upon notice to the Commission, may be transferred by endorsement. When bonds are issued for sale or negotiation, and when they are transferred, the Commission, of sale or transfer, to an equivalent value must be withdrawn.

(c) Deliver to the Reparation Commission in respect of such vessels, or portions thereof, evidencing the transfer to the Commission of the entire property in the vessel, free from all encumbrances, charges and liens of all kinds as the Commission may require.

The Commission, in fixing on May 1, 1921, the total amount of the debt of Austria, may take into account of interest due on sums arising out of reparation and of material damage as from November 3, 1918, up to May 1, 1921.

In case of default by Austria in the performance of her obligations under this part of the present Treaty the Commission will forthwith give notice of such default to each of the interested Powers and may make such recommendations as to the action to be taken in consequence of such default as it may think necessary.

The Powers shall have the right to take, in the case of voluntary default by Austria, and which Austria agrees may be regarded as acts of war, including financial prohibitions and reprisals and in general such of the measures as may be adopted by the respective Governments which may determine to be necessary in the circumstances.

Payments required to be made in gold or its equivalent, shall be made in accordance with the rates of exchange prevailing in England. The Allied and Associated Powers may at any time be accepted in the Commission on the form of clauses, provisions, commodities, businesses, rights, concessions, within or without Austrian territory, ships, bonds, and all other financial or currencies of Austria or other States, the value of such substitutes for gold being fixed at a fair and just amount by the Commission.

The Commission in fixing or accepting payment in specified properties or rights shall have due regard for any legal or equitable interests of the Allied and Associated Powers or of their nationals therein.

None of the Allied and Associated Governments assumes any responsibility in respect of any other Government.

The decisions of the Commission shall be responsible, except to the Government appointing him, for any action or omission as such member. No one of the Allied and Associated Governments assumes any responsibility in respect of any other Government.

When all the sums due from Austria and her allies under the present Treaty or any of the decisions of the Commission at any time or the interests of the Commission have been discharged, and all sums received, or their equivalents, have been distributed to the Powers interested, the Commission shall be dissolved.

ANNEX III.

1. Austria recognises the right of the Allied and Associated Governments to acquire, for purposes of navigation (gross tonnage) and class for class of all merchant ships and fishing boats lost or damaged owing to the war.

Nevertheless in spite of the fact that the tonnage of Austrian ships present in existence is greater than that lost by the Allied and Associated Powers in consequence of the aggression of Austria and her allies, the right of recognition will be granted on the Austrian ships and boats under the following conditions:

The Austrian Government on behalf of themselves, and so as to bind all other persons interested, cede to the Allied and Associated Governments the property in all merchant ships and fishing boats belonging to nationals of the former Austrian Empire.

2. The Austrian Government will, within two months of the coming into force of the present Treaty, deliver to the Reparation Commission all the ships and boats mentioned in paragraph 1.

3. The ships and boats in paragraph 1 include all ships and boats which (a) may be flown or may be equipped with the Austrian merchant flag and are registered in a port of the former Austrian Empire, or (b) are owned by any national, company or corporation of the former Austrian Empire by any company or corporation belonging to a country other than an Allied or Associated country and under the control or direction of nationals of the former Austrian Empire: or (c) which are now under construction (1) in the former Austrian Empire, or (2) in other than Allied or Associated countries for the account of any national company or corporation of the former Austrian Empire.

4. For the purpose of providing documents of title for the ships and boats to be handed over as above mentioned, the Austrian Government will:

(a) Deliver to the Reparation Commission in respect of such vessels, or portions thereof, evidencing the transfer to the Commission of the entire property in the vessel, free from all encumbrances, charges and liens of all kinds as the Commission may require.

(b) Take all measures that may be indicated by the Reparation Commission for ensuring that the ships themselves shall be placed at its disposal.

5. Austria will, to the extent of her power, and in normal condition of upkeep to the Allied and Associated Powers within two months of the coming into force of the present Treaty in accordance with procedure to be laid down by the Reparation Commission any boats and other movable appliances belonging to inland navigation which, since July 28, 1914, have by any means whatever come into her possession or into the possession of any of her nationals.

With a view to make good the loss in inland navigation tonnage from whatever cause arising which has been incurred during the war by the Allied and Associated Powers, and which cannot be made good by means of the restitution prescribed above, Austria agrees to cede to the Reparation Commission a portion of the Austrian river fleet up to the amount of the loss mentioned the such cession shall not exceed 20 per cent of the river fleet as it existed on November 3, 1918.

The conditions of this cession shall be settled by the arbitraries referred to in Article 300 of Part XII of the Treaty (1) of Paris, in accordance with the principles on which the Powers are charged with the settlement of difficulties relating to the apportionment of river tonnage resulting from the new industries to certain river systems or from the territorial changes affecting those systems.

Austria agrees to take any measures that may be indicated to her by the Reparation Commission for obtaining a full title to the property which the Powers have, during the war, been bestowed or are in process of transfer to neutral flags without the consent of the Allied and Associated Governments.

7. Austria waives all claims of any description against the Allied and Associated Governments and their nationals in respect of the detention, employment, loss or damage of any Austrian ships or boats.

Austria renounces all claims to vessels or cargoes sunk by or in consequence of naval action and subsequently salvaged, or to any of the Allied and Associated Governments or their nationals may have any interest either as owners, charterers, insurers, or otherwise, notwithstanding any decree of condemnation which may have been made by a Prize Court of the former Austro-Hungarian Monarchy or of its allies.

ANNEX IV.

1. The Allied and Associated Powers require and Austria undertakes that in part satisfaction of her obligations expressed in this Part and in this Annex, after provided, devote her economic resources directly to the physical reconstruction of the former Austrian Empire and the Allied and Associated Powers to the extent that these Powers may determine.

2. The Allied and Associated Governments may file with the Reparation Commission lists showing:

(a) Animals, machinery, equipment, tools and like articles of a commercial character which have been seized, consumed or destroyed by Austria, or destroyed in direct consequence of military operations, and which such Governments, for the purpose of meeting immediate and urgent needs, desire to have replaced by animals and articles of the same nature which are being in use in the territory of the coming into force of the present Treaty.

(b) Reconstruction materials (stones, bricks, refractory bricks, tiles, wood, window glass, steel, lime, cement, etc.) in the present Treaty, bearing to the Reparation Commission all the ships and boats mentioned in 2 above shall be filed within sixty days after the date of the coming into force of the present Treaty.

3. The lists required in 2 above shall be filed on or before December 31, 1919.

The lists shall contain all such details as are customary in such contracts, and the subject-matter, including specifications, dates of delivery, quality of the goods, quantities, prices of delivery, but not values or prices, which shall be fixed as hereinafter provided by the Commission.

4. Immediately upon the filing of such lists with
the Commission, the Commission shall consider the amount and number of the materials and animals mentioned in the lists provided for above which are to be received. In reaching a decision on this matter the Commission shall take into account such domestic requirements of Austria as it deems essential for the welfare of Austrian economic life, the prices and dates at which similar articles can be obtained in the Allied and Associated countries as compared with those to be fixed for Austrian articles, and the general interest of the Allied and Associated Governments. The Commission shall give representatives of Austria an opportunity and a time to be heard as to their capacity to furnish the said materials, articles and animals.

The decision of the Commission shall thereupon and at the earliest possible moment be communicated to the Austrian Government and to the several interested Allied and Associated Governments.

The Austrian Government undertakes to deliver the materials, articles and animals as specified in the said commissariat and the interested Allied and Associated Governments severally agree to accept the same, provided they conform to the specification given or are of a quality and condition at least equal to that of the Commission, unless to be utilised in the work of repair.

5. The Commission shall determine the value to be attached to the materials, articles and animals to be delivered in accordance with the foregoing, and the Allied or Associated Power receiving the same agrees to be charged with such value, and the amount thereof shall be treated as a payment by Austria to be divided in accordance with Article 183 of this Part of the present Treaty.

In case of the right to require physical restoration as above provided is exercised, the Commission shall ensure that the amount to be credited against the reparation obligation of Austria shall be fair value for work done or material supplied by Austria, and that the claim made by the interested Power in respect of the damage so repaired by physical restitution shall be discharged to the extent of the proportion which the damage thus repaired bears to the whole of the damage thus claimed for.

6. As an immediate advance on account of the animals referred to in paragraph 2 above, Austria undertakes to deliver in equal monthly instalments in the three months following the coming into force of the present Treaty the following quantities of live stock:

TO THE ITALIAN GOVERNMENT.

4,000 milk cows of from 3 to 5 years;
1,000 oxen;
50 bulls from 18 months to 3 years;
1,000 calves;
1,000 working bullocks;
2,000 sows.

TO THE SERB-CROAT-SLOVENE GOVERNMENT.

1,000 milk cows of from 3 to 5 years;
300 heifers;
25 bulls from 18 months to 3 years;
1,000 calves;
500 working bullocks;
1,000 draught horses;
1,000 sheep.

TO THE BULGARIAN GOVERNMENT.

1,000 milk cows of from 3 to 5 years;
500 heifers;
25 bulls from 18 months to 3 years;
1,000 calves;
500 working bullocks;
1,000 draught horses;
1,000 sheep.

The animals delivered shall be of average health and condition.

Austria undertakes to deliver during the six months following the coming into force of the present Treaty in equal monthly instalments such supplies of furniture in hard and soft wood intended for use in Austria as the Allied and Associated Powers shall ask for by month through the Reparation Commission and which the Commission shall consider constitute a part of the reparation obligation of Austria. The supplies at the disposal of Austria shall be furnished to Austria under the conditions provided for in paragraph 5 of this Annex.

ANNEX V.

1. Austria shall give, as partial reparation, to the Allied and Associated Governments severally an option during the five years following the coming into force of the present Treaty for the annual delivery of the raw materials hereinafter enumerated: the amounts delivered to bear the same relation to their annual importations of these materials before the war from Austria-Hungary as the resources of Austria as now delimited by the present Treaty bear to the resources before the war of the former Austro-Hungarian Monarchy.

Timber and timber manufactures;

cloth;

tin and iron manufactures;

Machinery and the like, and all similar manufactures in iron and iron alloys;

Machinery and other similar implements of agriculture.

2. The price paid for the products referred to in the preceding paragraph shall be the same as the price paid by Austrian nationals under the same conditions of shipment to the Austrian frontier, provided no advantage can be taken by any advantages which may be accorded similar products furnished to Austrian nationals.

3. The foregoing options shall be exercised through the intervention of the Reparation Commission, which subject to the specific provisions hereof shall have power to determine all questions relative to procedure and qualities and quantities of products and the times and modes of delivery and payment. In giving notice to the Austrian Government of the foregoing options, the Commission shall give at least 120 days' notice of deliveries to be made after January 1, 1920, and at least 30 days' notice of deliveries to be made between the coming into force of the present Treaty and January 1, 1920. If the Commission shall determine that the full exercise of the foregoing options would interfere unduly with the industrial requirements of Austria, the Commission is authorised to postpone or to cancel deliveries and in so doing to settle all questions of priority.

ANNEX VI.

Austria renounces on her own behalf and on behalf of her nationals in favour of Italy all rights, titles or privileges of whatever nature in any submarine cables or portions of cables connecting Italian territory, including the territories which are assigned to Italy under the present Treaty.

Austria also renounces on her own behalf and on behalf of her nationals in favour of the Principality of Liechtenstein all rights, titles and privileges of whatever nature in the submarine cables and in any submarine cables connecting the territories ceded by Austria under the terms of the present Treaty to the various Allied and Associated Powers.

The States concerned shall provide for the upkeep of the installations and the proper working of the said cables.

As regards the cable from Trieste to Corfu, the Italian Government shall enjoy in its relations with the company owning this cable the same position as that held by the Austro-Hungarian Government.

The value of the cables or portions of cables referred to in the two first paragraphs of the present Annex, calculated on the basis of the original cost, less a suitable allowance for depreciation, shall be credited to Austria in the reparation account.

SECTION II.—SPECIAL PROVISIONS.

Article 191.—In carrying out the provisions of Article 184 of this Part Austria undertakes to surrender to each of the Allied and Associated Powers all records, documents, objects of antiquity and of art and all scientific and bibliographical collections, all records, documents and objects of all kinds taken away from the invaded territories, whether they belong to the State or to provincial, communal, charitable or ecclesiastical administrations or other public or private institutions.

Article 192.—Austria shall in the same manner restore objects of the same nature as those referred to in the preceding Article which may have been taken away since June 1, 1914, from the ceded territories,
WAR, EUROPEAN — THE PEACE TREATIES (18)

with the exception of objects bought from private owners.

The Reparation Commission will apply to these objects the Art 208 of Part I (Financial Clauses) of the present Treaty, if these are not otherwise provided for.

Article 193.—Austria will give up to each of the Allied and Associated Governments respectively all the records, documents and historical material possessed by public institutions which may have a direct bearing on the history of the codified territories and which have been removed during the last ten years. This last mentioned period as far as concerns Italy, shall be extended to the date of the proclamation of the Kingdom (1861).

The new States arising out of the former Austro-Hungarian Monarchy and the States which receive part of the territory of that Monarchy undertake on their part to hand over to Austria the records, documents and material dating from a period not exceeding twenty years which have a direct bearing on the history of administration of the territory of Austria and which may be found in the territories transferred.

Article 194.—Austria acknowledges that she remains bound, as regards Italy, to execute the obligations referred to in Article 15 of the Treaty of Zurich of November 10, 1859, in Article 16 of the Treaty of Vienna of October 3, 1919, and in the Convention of Florence of July 14, 1868, concluded between Italy and Austria, in so far as the Articles referred to have not in fact been executed in their entirety and in so far as the documents and objects in question are still deposited in the territory of Austria or her allies.

Article 195.—Within a period of twelve months after the coming into force of the present Treaty a Committee of three jurists appointed by the Reparation Commission shall examine the conditions under which the said objects or manuscripts in possession of Austria enumerated in Annex 1 hereto, were carried off by the House of Hapsburg and by the other Houses which have reigned in Italy. If it is found that the said objects or manuscripts were carried off in violation of the rights of the Italian provinces the Reparation Commission, on the report of the Committee referred to, shall order their restitution. Italy and Austria agree to accept the decisions of the Commission.

Belgium, Poland and Czechoslovakia may also submit claims for restitution, to be examined by the same Committee of three jurists, relating to the objects and documents enumerated in Annexes II, III and IV hereto. Belgium, Poland, Czechoslovakia and Austria undertake to accept the decisions taken by the Reparation Commission as the result of the report of the said Committee.

Article 196.—With regard to all objects of artistic, archeological, scientific, or historic character forming part of collections which formerly belonged to the Government or the Crown of the Austro-Hungarian Monarchy and are not otherwise provided for in this Treaty Austria undertakes:—

(a) To negotiate, when required, with the States concerned about an equitable arrangement whereby any portion thereof or any objects belonging thereto which ought to form part of the intellectual patrimony of the said countries returned to their districts of origin on terms of reciprocity, and
(b) For twenty years, unless a special arrangement is provided for, to allow the storage or dispersal of the said collections or to dispose of any of the above objects but at all times to ensure their safety and good condition and to make them available, together with inventories, catalogues and administrative documents relating to the said collection, at all reasonable times to students who are nationals of any of the Allied and Associated Powers.

ANNEX I.

TUSCANY.

The Crown jewels (such part as remains after their dispersion); the private jewels of the Princess Electress of Medici; the medallia which form part of the Medici honorary orders and other precious objects— all being domanial property according to contractual agreements and testamentary dispositions— removed to Vienna during the last War.

Furniture and silver plate belonging to the House of Medici and the Medail of Aspasia in, payment of debts owing to the Italian Government to the Crown of Tuscany.

The ancient instruments of astronomy and physics belonging to the Academy of Cimento at Lorraine and sent as a present to the cousins of the Imperial House of Vienna.

Modena.

A "Virgini" by Andrea del Sarto and four drawings by Correggio belonging to the Pinacothek of Modena and removed in 1859 by Duke Francis V.

The three following MSS. belonging to the library of Modena:

Biblia vulgata (Cod. Lat. 421/23),
Breviary (Cod. Lat. 424) and
Officium Beatæ Virginis (Cod. Lat. 262),
carried off by Duke Francis V in 1859.

The braziers carried off under the same circumstances in 1859.

Certain objects (among others two pictures by Salvator Rosa and a portrait by Cassetta Dossi) claimed by the Duke of Modena in 1868 as a condition of the execution of the Convention of June 20, 1868, and other objects given up in 1872 in the same circumstances.

Palermo.

Objects made in Palermo in the twelfth century for the Norman kings and employed in the coronation of the Emperors, which were carried off from Palermo and are now in Vienna.

Naples.

Ninety-eight MSS. carried off from the Library of S. Giovanni a Carbonara and other libraries at Naples in 1718 under the orders of Austria and sent to Vienna.

Various documents carried off at different times from the State Archives of Milan, Mantua, Vienna, Modena and Florence.

ANNEX II.

I. The Triptych of S. Ildefonse, by Rubens, from the Abbey of Saint-Jacques sur Couwdenberg at Brussels, bought in 1777 and removed to Vienna.

II. Objects and documents removed for safety from Belgium to Austria in 1794:

(a) Arms, armour and other objects from the old Arsenal of Venice.
(b) The Treasure of the "Toison d'or" preserved in previous times in the "Chapelle de la Cour" at Brussels.
(c) Coinage, stamps, medals, and counters by Theodore van Bercken which were an essential feature in the archives of the "Chambre des Comptes" at Brussels.
(d) The original manuscript copies of the "carte chorographique" of the Austrian Low Countries drawn up by Lient-General Comte Jax de Ferraria between 1770 and 1777, and the documents relating thereto.

ANNEX III.

Object removed from the territory forming part of Poland subsequent to the first partition in 1772:

The gold cup of King Ladislas IV, No. 1,114 of the Court Museum at Vienna.

ANNEX IV.

(1) Documents, historical memoirs, manuscripts, maps, etc. from the present State of Czechoslovakia, which Thaulow von Rosenthal removed by order of Maria Theresa.

(2) The documents originally belonging to the Royal Aulic Chancellory of Bohemia and the Aulic Chamber of Accounts of Bohemia, and the works of art formed part of the installation of the Royal Chateau of Prague and other royal castles in Bohemia, which were removed by the Emperors Mathias, Ferdinand II, Charles VI (about 1718, 1723 and 1737) and Francis Joseph I; all of which are now in the archives, Imperial castles, museums and other central public institutions at Vienna.

PART IX.—FINANCIAL CLAUSES.

Article 197.—Subject to such exceptions as the Reparation Commission may make, the first charge upon all the assets and revenues of Austria shall be the cost of reparation and all other costs arising under the present Treaty or any treaties or agreements supplementary thereto, or under arrangements concluded between Austria and the Allied and Associated Powers during the Armistice signed on November 3, 1918.

Up to May 1, 1921, the Austrian Government shall not export or dispose of, and shall forbid the exportation or disposal of, gold without the previous approval of the Allied and Associated Powers acting through the Reparation Commission.

Article 198.—All objects removed shall be paid by the Government of Austria the total cost of all armies of the Allied and Associated Governments occupying territory
WAR, EUROPEAN — THE PEACE TREATIES (18) 583

within the boundaries of Austria as defined by the present Treaty from the date of the signature of the Armistice of November 3, 1918, and subsequent Armistices and agreements in respect of the Allied and Associated Powers to such material.

There shall be credited to the Government of Austria for the losses due to the Allied and Associated Powers for repair, the value, as assessed by the Reparation Commission, of such of the above property as has been lost or damaged, and credit shall be allowed to the Government of Austria under the present Treaty for the property credited to the Government of Austria.

Article 199.—The priority of the charges established by this Article over all other claims against the Austrian Government, and the resumption by the Government of Austria of the property within its jurisdiction at the date of the coming into force of the present Treaty shall be essential to enable Austria to meet her obligations under the present Treaty.

Article 200.—Nothing in the foregoing provisions shall prejudice in any manner chargers or mortgages lawfully effected in favour of the Allied and Associated Powers or their nationals respectively before the date at which a state of war existed between Austria-Hungary and the Allied and Associated Powers concerned by the former Austrian Government or by nationals of the former Austrian Empire on assets in interest on assets at that date, except in so far as variations of such charges or mortgages are provided for under the terms of the present Treaty or conventions supplementary thereto.

Article 201.—Each of the States to which territory of the former Austro-Hungarian Monarchy is transferred, and each of the States arising from the dismemberment of that Monarchy, including Austria, shall assume responsibility for a portion of the debt of the former Austrian Government which is specifically secured on railways, salt mines or other property, and which was in existence on July 28, 1914, and which portion shall be in accordance with the principles and provisions of this Part of the present Treaty.

The amount of the liability in respect of secured debt so assumed by each State, other than Austria, shall be valued by the Reparation Commission, on such basis as it shall consider equitable, and the value so ascertained shall be deducted from the amount payable by the State in question to Austria in respect of the real property of the former Austrian Monarchy which the State acquires with the territory.

Each State shall be solely responsible and liable for payment of the portion of the secured debt for which it assumes responsibility under the terms of this Article, and holders of the debt for which they are responsible by States other than Austria shall have no recourse against the Government of any other State.

Any property which was specifically pledged to secure any debt referred to in this Article shall remain specifically pledged to secure the new debt, but in case the property so pledged is situated as the result of the present Treaty in more than one State, that portion of the property which is situated in a particular State shall constitute the security only for that part of the debt which is ascribed to that State, and not for any other part of the debt.

For the purposes of the present Article there shall be regarded as secured debt payments due by the former Austrian Government in connection with the purchase of railways or similar property; the distribution of such property to the Allied and Associated Powers shall be in the same manner as the case of secured debt.

Debts for which the responsibility is transferred under the terms of this Article shall be expressed in terms of the currency of the State which assumes responsibility, if the original debt was expressed in terms of Austro-Hungarian paper currency. For the purpose of the conversion of the currency unit in which the bonds are expressed shall be subject to the approval of the Reparation Commission, which shall, if it thinks fit, determine this conversion in the currency of the assuming State by that State when it first substituted its own currency for the Austro-Hungarian kronen at the rate at which these kronen were exchanged into the currency of the assuming State by that State when it first substituted its own currency for the Austro-Hungarian kronen.

If the foreign exchange value of the currency unit in which the old bonds are expressed is substantially less at the date of this conversion than the foreign exchange value of the original currency unit, such bonds shall be expressed in terms of the foreign currency or foreign currencies, the new debt shall be expressed in terms of the same currency or currencies.

If the original Austro-Hungarian debt was expressed in terms of Austro-Hungarian gold coin, the new debt shall be expressed in terms of American dollars, British pounds, or British sterling and gold dollars of the United States of America, the equivalents being calculated on the basis of the average rate of gold offered on the London foreign exchange markets for the same dates as enacted by law on January 1, 1914.

Any foreign exchange options, whether at fixed rates or otherwise, embodied in the obligations in the old bonds shall be embodied in the new bonds also.

The responsibilities in respect of bonded debt to be assumed under the terms of this Article shall be discharged in the manner laid down in the Annex hereto.

The Austrian Government shall be solely responsible for all the liabilities of the former Austrian Government incurred prior to July 28, 1914, other than those evidenced by the bonds, bills, securities and currency notes which are specifically referred to in the present Treaty or conventions supplementary thereto.

Neither the provisions of this Article nor the provisions of the Annex hereto shall apply to securities of the former Austrian Government deposited with the Bank of Austria-Hungarian Bank as security for the currency notes issued by that bank.
ANNEX.

The amount of the former unsecured Austrian Government Bonded Debt, the responsibility for which is to be assumed as provided in Article 182, shall be the amount of that debt as it stood on July 28, 1914, after deducting that portion which represents the liabilities of the former Hungarian Government for that debt as provided by the additional Convention relating to the contribution of the countries of the South Slav Race to the charges of the general debt of the Austro-Hungarian State approved by the Austro-Hungarian Law of December 30, 1907, B. L. L. No. 378.

Each State assuming responsibility for the old unsecured Austrian Government Bond shall, within three months of the coming into force of the present Treaty, if it has not already done so, stamp with the stamp of its own Government all the Bonds of that debt existing in its own territory. The distinguishing number of the Bonds so stamped shall be recorded and shall be furnished, together with the other records of the stamping, to the Reparation Commission.

In the event of a State which is required to stamp old Austrian Bonds under the terms of this Annex, the Bonds of that State only, and they shall have no recourse against the Government of another State.

Each State which, under the terms of Article 203, is required to assume responsibility for a portion of the old unsecured Austrian Government Debt, and which is engaged in the means of stamping the Austrian Bonds that the Bonds of any particular issue of such old Austrian Bonds held within its territory were smaller in amount than the amount of that issue for which, in accordance with the assessment of the Reparation Commission, it is held responsible, shall demand from the Reparation Commission new Bonds equal in amount to the difference between the amount of the issue for which it is responsible and the amount of the same issue recorded as held within its own territory. Such new Bonds shall be of such denominations as the Reparation Commission may require. They shall bear the same rights as regards interest and amortisation as the Bonds on which they are substituted, and in all other respects the conditions of the new Bonds shall be fixed subject to the approval of the Reparation Commission.

If the original Bond was expressed in terms of Austro-Hungarian paper currency, the new Bond by which it is replaced shall be expressed in terms of the currency of the State issuing the new Bond, and for the purpose of this currency conversion, the currency of the new State shall be valued in terms of Austro-Hungarian paper currency at the rate at which the same was exchanged for the currency of the new State by that State when it first substituted, of its own currency for Austro-Hungarian paper currency. The basis of this conversion shall be the currency unit in which the Bonds are expressed shall be subject to the appropriate securities of the Reparation Commission, which shall, if it thinks fit, require the State effecting the conversion to modify the terms thereof. Such modification shall only be required if, in the opinion of the Commission, the foreign exchange value of the currency unit or units substituted for the currency unit in which the old Bonds are expressed is substantially less at the date of the conversion than the foreign exchange value of the original currency unit.

If the original Bond was expressed in terms of a foreign currency or foreign currencies, the new Bond shall be expressed in terms of the same currency or currencies. If the original Bond was expressed in terms of Austro-Hungarian gold coin, the new Bond shall be expressed in terms of equivalent amounts of pounds sterling and gold dollars of the United States of America, the equivalents being calculated on the basis of the weight and fineness of gold of the three coins so enacted by law on January 1, 1914.

All foreign exchange of the former Austrian Government either in the fixed rates or otherwise, embodied explicitly or implicitly in the old Bonds shall be embodied in the new Bonds.

Each State which under the terms of Article 203 is required to assume responsibility for a portion of the old unsecured Austrian Government Debt, which has been ascertained by means of stamping the old Austrian Bonds that the Bonds of any particular issue of such old Bonds held within its territory were larger in amount than the amount of that issue for which it is responsible in accordance with the assessment of the Reparation Commission, shall receive from the Reparation Commission its due proportionate share of each of the new Bonds issued in exchange for their surrendered Bonds under the provisions of this Annex.

The share of each State or private holding entitled to a share in any new issue of Bonds issued in accordance with the provisions of this Annex shall bear such proportion to the total amount of Bonds of that new issue as the holding of the State or private holder of the old issue of Bonds bears to the total amount of the old issue presented to the Reparation Commission for exchange into new Bonds in accordance with the provisions of this Annex. Each such participating State or private holder will also be entitled to its rite of a Bond which is required to stamp old Austrian Bonds under the terms of this Annex shall, from the date of the coming into force of the present Treaty, be creditors in respect of these Bonds of that State only, and they shall have no recourse against the Government of another State.

The Reparation Commission shall, if it think fit, arrange with the holders of the new Bonds provided for by this Annex a consolidation of each debtor State, the money due of which will be paid to the holder of the various different issues of Bonds on such terms as may be agreed upon by the Commission and the bondholders.

The State assuming liability for any Bond of the former Austrian Government which is not in exchange for an old Bond in accordance with the provisions of this Annex shall bear such proportion to the total amount of Bonds of that new issue as the holding of the State or private holder of the old issue of Bonds bears to the total amount of the old issue presented to the Reparation Commission for exchange into new Bonds in accordance with the provisions of this Annex. Each such participating State or private holder will also be entitled to its rite of a Bond which is required to stamp old Austrian Bonds under the terms of this Annex shall, from the date of the coming into force of the present Treaty, be creditors in respect of these Bonds of that State only, and they shall have no recourse against the Government of another State.

The share of each State or private holder entitled to a share in any new issue of Bonds issued in accordance with the provisions of this Annex shall bear such proportion to the total amount of Bonds of that new issue as the holding of the State or private holder of the old issue of Bonds bears to the total amount of the old issue presented to the Reparation Commission for exchange into new Bonds in accordance with the provisions of this Annex. Each such participating State or private holder will also be entitled to its rite of a Bond which is required to stamp old Austrian Bonds under the terms of this Annex shall, from the date of the coming into force of the present Treaty, be creditors in respect of these Bonds of that State only, and they shall have no recourse against the Government of another State.

Article 204.—1. In case the new boundaries of any States, as laid down by the present Treaty, shall divide any local area which was a single unit for borrowing purposes and which had a legally constituted public debt bearing interest, the new divisions of the area shall be made in accordance with the principles laid down for the reparation of Government Debts under Article 203, and the responsibility so assumed shall be discharged in such a manner as the Reparation Commission shall determine.

2. The public debt of Bosnia and Herzegovina shall be regarded as the debt of a local area and not as part of the public debt of the former Austro-Hungarian Monarchy.

Article 205.—Within two months of the coming into force of the present Treaty, each one of the States to which the former Austro-Hungarian Monarchy is transferred and each one of the States arising from the dismemberment of that Monarchy, including it in its new boundaries, shall, on the other hand, stamp the Bonds of the former Austro-Hungarian Monarchy, in the same manner as the Bonds of the said Monarchy, and shall, if it think fit, require the State effecting the conversion to modify the terms thereof. Such modification shall only be required if, in the opinion of the Commission, the foreign exchange value of the currency unit or units substituted for the currency unit in which the old Bonds are expressed is substantially less at the date of the conversion than the foreign exchange value of the original currency unit.

The securities thus stamped shall be withheld and replaced by certificates, their distinguishing numbers shall be recorded, and any securities withdrawn, together with the documents regarding the transaction, shall be sent to the Reparation Commission.

The stamping and replacement of a security by a certificate under the provisions of this Article shall not imply that the State so stamping and replacing a security thereby assumes or recognises any obligation in respect of it, unless the State in question desires that the stamping and replacement should have this implication.

The aforementioned States, with the exception of Austria, shall be free from any obligation in respect of the war debt of the former Austrian Government, whether that debt may be held, but neither the Governments of the States to which the said Bonds are transferred shall have recourse under any circumstances whatever against any other States including Austria in respect of the war debt bonds of the former Austrian Government or owners thereof.

The war debt of the former Austrian Government which was prior to the signature of the present Treaty in the beneficial ownership of nationals or Governments of States other than of the former Austro-Hungarian Monarchy is assigned shall be a charge upon the Government of Austria only, and no one of the aforementioned shall be held responsible for any part thereof.
The provisions of this Article shall not apply to the securities of the former Austrian Government deposited by that Government with the Austro-Hungarian Bank as security for the said bank.

The existing Austrian Government shall be solely responsible for all securities of the former Austrian Government incurred during the war, other than those evidenced by the bonds, bills, securities and currency notes which were circulating in the territories of the former Monarchy, and which are described in the Annex hereto, with respect to the securities deposited herewith.

2. Within two months of the coming into force of the present Treaty, each one of the States to which territory of the former Austro-Hungarian Monarchy was ceded, shall deposit with the Austrian Government the currency notes of the Austro-Hungarian Bank existing in its territory.

3. The Governments of such States as have already converted the currency notes of the Austro-Hungarian Bank into the new currency, and in carrying out this operation have withdrawn the old currency and all the currency notes circulating in their territory, shall either stamp the notes so withdrawn or hold them at the disposal of the Reparation Commission.

4. Within fourteen months of the coming into force of the present Treaty, each one of the States which have or have not yet exchanged the currency notes circulating in their territory, shall either stamp the notes so withdrawn or hold them at the disposal of the Reparation Commission.

5. Within the period of two years from the coming into force of the present Treaty, the currency notes which have been withdrawn shall be deposited with the Reparation Commission.

6. The Austro-Hungarian Bank shall be liquidated as soon as possible after the day succeeding the day of the signature of this Treaty.

7. The liquidation shall be conducted by receivers specially appointed for that purpose by the Reparation Commission. In conducting the liquidation of the bank, the receivers shall follow the rules laid down in the Statutes or other valid instruments regulating the constitution of the bank, subject however to the special provisions of this Article. In the case of any doubts as to the interpretation of the rules concerning the liquidation of the bank, whether laid down in these Articles or in the Statutes of the bank, or in the decision of the Reparation Commission or any supplemental agreement thereto, the decision of the Reparation Commission shall be final.

8. The currency notes issued by the bank subsequent to October 27, 1918, shall have a claim on the securities deposited by the Austrian and Hungarian Governments, both former and existing, and deposited with the bank by the former Governments as security for the various note issues.

9. The securities deposited by the Austrian and Hungarian Governments, both former and existing, with the bank as security for the currency notes issued on or prior to October 27, 1918, shall be cancelled to the extent that they represent the notes issued in the territory of the former Monarchy and may be used, excluding the portion already used, by the Reparation Commission in accordance with paragraph 4 of this Article, and secondly all notes of this description which may be held elsewhere and are presented to the receivers of the bank in accordance with the Annex hereto.

12. No claims on account of any currency notes issued on or prior to October 27, 1918, shall rank against the general assets of the bank or against the securities deposited by the Austrian and Hungarian Governments, both former and existing, as security for the notes, and any balance of such securities remaining after the amount of securities mentioned in paragraphs 10 and 11 has been calculated and deducted shall be cancelled.

13. All securities deposited by the Austrian and Hungarian Governments, both former and existing, with the bank as security for currency note issues and which are maintained in force shall be the obligations respectively of the Governments of Austria and the present Hungary only and not of any other State.

14. The holders of currency notes of the Austro-Hungarian Bank shall have no recourse against the Governments of any other Government in respect of any loss which they may suffer as the result of the liquidation of the bank.

ANNEX.

1. The respective Governments, when transmitting to the Reparation Commission all the currency notes of the Austro-Hungarian Bank belonging to their respective States, shall indicate the nature and amounts of the various note issues.

2. The Reparation Commission, after examining the records, shall deliver to the said Governments separate certificates stating the total amount of currency notes which the Government has contracted to:

(a) within the limits of the former Austro-Hungarian Monarchy as they existed on July 28, 1914;

(b) elsewhere.

These certificates shall entitle the bearer to lodge a claim with the receivers of the bank for the notes thus converted which are entitled to share in the assets of the bank.

3. After the liquidation of the bank is completed, the Reparation Commission shall destroy the notes thus withdrawn.

4. No notes issued on or prior to October 27, 1918, whatever they may be held, will rank as claims against the bank unless they are presented through the Government of the country in which they are held.

Article 207.—Each one of the States to which territory of the former Austro-Hungarian Monarchy is transferred, and each one of the States arising from the dismemberment of that Monarchy, including Austria, shall deal as it thinks fit with the petty or token coinage of the former Austro-Hungarian Monarchy existing in its territory.

No such State shall have any recourse under any circumstances, on behalf of its nationals, against any other State with regard to such petty or token coinage.

Article 208.—States to which territory of the former Austro-Hungarian Monarchy is transferred and States arising from the dismemberment of that Monarchy shall acquire all property and possessions situated within their territories belonging to the former or existing Austrian Government.

For the purposes of this Article, the property and possessions of the former or existing Austrian Government shall be deemed to include the property of the former Austrian Empire and the interests of that Empire in the joint property of the Austrian Monarchy, as well as all the property of the Crown, and the private property of members of the former Royal Family of Austria-Hungary.

These States shall, however, have no claim to any property of the former or existing Government of Austria situated outside their own respective territories.

The value of such property and possessions acquired by States other than Austria shall be determined by the Reparation Commission and placed by that Commission to the credit of Austria and to the debit of the State acquiring such property on account of the sums due for reparation. The Reparation Commission shall deduct from the value of the property transferred, both by States other than Austria, such amount as it shall require an amount proportionate to the contribution to the compensation in money, land or material made directly by any province or commune or other authority towards the cost of such property.

Without prejudice to Article 209 relating to secured Debt, in the case of each State acquiring property under the provisions of this Article, the amount placed to the credit of Austria and to the debit of the State acquiring such property shall be in accordance with the preceding paragraph shall be
reduced by the value of the amount of the liability in respect of the unsecured Debt of the former Austrian Government, as assessed by that Government under the provisions of Article 203 which, in the opinion of the Reparation Commission, represents expenditure upon the property so acquired. The value shall be fixed by the Reparation Commission on such basis as the Commission may consider equitable.

Property of the former and existing Austrian Governments shall be deemed to include a share of the real estate in Bosnia-Herzegovina of all descriptions for which, under Article 5 of the Convention of February 26, 1878, the Government of the former Austro-Hungarian Monarchy paid $2,500,000 to the Ottoman Government. Such share shall be proportionate to the share which the former Austrian Empire contributed to the above payment, and the value of this share, as assessed by the Reparation Commission, shall be credited to Austria on account of reparation.

As exception to the above, there shall be transferred without limitation:

1. The property and possessions of provinces, communes and other local autonomous institutions of the former Austro-Hungarian Monarchy, including those in Bosnia-Herzegovina which did not belong to the former Austro-Hungarian Monarchy.
2. Schools and hospitals the property of the former Austro-Hungarian Monarchy.
3. Yacht flags which belonged to the former Kingdom of Poland.

Furthermore, any building or other property situated in the respective territories transferred to the States referred to in the first paragraph whose principal value lies in the proceeds and associations, and which formerly belonged to the Kingdom of Bohemia, the Kingdom of Poland, the Kingdom of Croatia-Slavonia-Dalmatia, Bosnia-Herzegovina, the Republic of Ragusa, the Venetian Republic or the Episcopal Principalities of Trent and Bresanone, may, subject to the approval of the Reparation Commission, be transferred to the Government entitled thereto without payment.

Article 208.—The Austrian Government, so far as it is concerned, all rights according to her or her nationals by Treaties, Conventions, or Agreements, of whatsoever kind, to representation upon or participation in the control or administration of Commissions, State Banks, Agricultural or economic organisations of an international character exercising powers of control or administration and operating in any of the Allied or Associated States, or in Germany, Hungary, Bulgaria or Turkey, or in the dependencies of these States, or in the former Russian Empire.

Article 210.—1. The Austrian Government agrees to deliver within one month from the coming into force of the present Treaty, to such authority as the Principal Allied and Associated Powers may designate, a sum in gold deposited in the Austrian Bank in the name of the Council of Administration of the Ottoman Public Debt as security for the first issue of Turkish Government currency notes.
2. Without prejudice to Article 244 of Part X of the present Treaty, Austria renounces so far as she is concerned all rights, claims or interests disclosed by the Treaties of Bucharest and Brest-Litovsk and by the Treaties supplementary thereto.

Austria undertakes to transfer either to Roumania or to the Principal Allied and Associated Powers, as the case may be, all movable instruments, specie, securities and negotiable instruments or goods which she has received under the aforesaid Treaties.

Austria recognises any transfer of gold provided for by Article 259 (5) of the Treaty of Peace concluded at Paris, 1919, between the Allied and Associated Powers and Germany, and any transfer of claims provided for by Article 261 of that Treaty.

Article 211.—Without prejudice to the renunciation of any rights by Austria on behalf of herself or of her nationals in the other provisions of the present Treaty, the Reparation Commission may, within one year from the coming into force of the present Treaty, demand that the provisions of any rights and interests of her nationals in any public utility undertaking or in any company operating in Russia, Turkey, Germania, Hungary or Bulgaria, or in the possessions or dependencies of these States, or in any territory formerly belonging to Austria, be transferred to the Austrian Government, or to her allies in any State, or be administered by a mandatory under any Treaty entered into with the Allied and Associated Powers, and will regulate their Austrian Government transfers, within six months of the date of demand, to the Reparation Commission all such rights and interests and any similar rights and interests in respect of any Austrian Government.

The Austrian Government shall be responsible for indemnifying her nationals so dispossessed, and the Reparation Commission shall credit Austria on account of sums due for reparation with such sums in the respective States of the transferred rights and interests as may be assessed by the Reparation Commission, and the Austrian Government shall, within six months from the coming into force of the present Treaty, communicate to the Reparation Commission whether or not it is prepared to accept such indemnification, whether already granted, contingent or not yet exchanged, and shall renounce on behalf of itself and its nationals in favour of the Allied and Associated Powers all such rights and interests which have not been so communicated.

Article 212.—The Austrian Government undertakes to refrain from preventing or impeding such acquisition by the German, Hungarian, Bulgarian or Turkish Governments of any rights and interests of German, Hungarian, Bulgarian or Turkish nationals in public utility undertakings or concessions operating in Austria as may be required by the Reparation Commission under the terms of the Treaty of Peace or supplementary Treaties or Conventions concluded between the Allied and Associated Powers and the German, Hungarian, Bulgarian or Turkish Governments respectively.

Article 213.—Austria undertakes to transfer to the Allied and Associated Powers all claims in favour of the former or existing Austrian Government for payment or reparation by the Governments of Germany, Hungary, Bulgaria or Turkey, or by the Venetian Republican or the Episcopal Principalities of Trent and Bresanone, claims which may arise now or hereafter in the fulfillment of undertakings made after July 28, 1914, until the conclusion of the present Treaty of Peace.

The value of such claims shall be assessed by the Reparation Commission, and shall be transferred to the Reparation Commission for the credit of Austria on account of the sums due for reparation.

Article 214.—Any monetary obligation arising out of the present Treaty and expressed in terms of gold coin shall, unless some other arrangement is specifically provided for in any particular case, be expressed in the terms of this Treaty or conventions supplementary thereto, by paying or by the option of the creditors pounds sterling payable in London, gold dollars of the United States of America payable in New York, gold francs payable in Paris, or gold lire payable in Rome.

For the purposes of this Article, the gold coin mentioned above shall be defined as being of the weight and fineness of gold as enacted by law on January 1, 1914.

Article 215.—Any financial adjustments, such as those relating to any banking and insurance companies, savings banks, postal savings banks, land banks, mortgage companies or other similar institutions, operating within the territory of the former Austro-Hungarian Monarchy, necessitated by the partition of that Monarchy and the resettlement of public debts and the payment of claims provided for by these Articles, shall be regulated by agreement between the Governments of the respective States in such manner as shall best secure equitable treatment to all the parties interested. In case the Governments concerned are unable to come to an agreement, adjustment arising out of this financial adjustment, or in case any Government is of opinion that its nationals have not received equitable treatment, the Reparation Commission shall, on the application of any one of the Governments concerned, appoint an arbitrator or arbitrators, whose decision shall be final.

Article 216.—The Government of Austria shall be under no liability in respect of any or all pensions granted to nationals of the former Austrian Empire who have been recognised as nationals or other States or who become so under the provisions of the present Treaty.

PART X.—ECONOMIC CLAUSES.

SECTION I.—COMMERCIAL RELATIONS.

Chapter I.—Customs, Regulations, Duties and Restrictions.

Article 217.—Austria undertakes that goods the produce or manufacture of any one of the Allied or Associated Powers shall enter the territories of whatever place of arrival, shall not be subjected to either or higher duties or charges (including internal charges) than may be applied to goods the produce or manufacture of any other such State or of any other foreign country are subject.

The above provisions may be applied to the importation into Austrian territory.

Chapter II.—Public Utilisation of Public Property.

Article 218.—Austria undertakes not to appropriate in any manner whatsoever the public property of the former Austrian Monarchy which has been nationalised or otherwise vested in the Allied and Associated Governments or their agents.

Chapter III.—Railways and Other Communication Works.

Article 219.—Austria undertakes to adhere to the present Treaty of Peace in regard to the railways and other communication works in the territory of the former Austrian Monarchy, and shall not interfere in any manner with the occupation, management and working of these undertakings by the Allied States and the Associated Governments and their agents.
of any goods the produce or manufacture of the territories of any one of the Allied or Associated States, from whatsoever place arriving, which shall not equally compete or furnish, in the said State or in any other such State or of any foreign country, as the like or like produce or manufacture of any other such State or of any foreign country.

Article 218.—Austria further undertakes that, in the matter of the régime applicable on importation, no discrimination shall be made between the goods, natural products or manufactures, exported from the Austrian territory to the territories of any one of the Allied or Associated States, shall not be subjected to other or higher duties or charges (including internal charges) than those paid or to be like paid or exported to any other State or to any other foreign country.

Austria will not maintain or impose any prohibition or restriction on the exportation of any goods sent from her territory to any one of the Allied or Associated States which shall not equally extend to the exportation of the like or like products or manufactures, sent to any other such State or to any other foreign country.

Article 219.—In all that concerns exportation, Austria undertakes that goods, natural products or manufactured articles, exported from Austrian territory to the territories of any one of the Allied or Associated States, shall not be subjected to other or higher duties or charges (including internal charges) than those paid or to be like paid or exported to any other State or to any other foreign country.

Article 220.—Every favour, immunity, or privilege in regard to the importation, exportation or transit of goods, shall be extended to any Allied or Associated States or to any other foreign country whatever shall simultaneously and unconditionally, without request and without regard to all the Allied or Associated States.

Article 221.—By way of exception to the provisions of Article 220 of Part XII (Ports, Waterways and Railways), products in transit by the ports which before the war were situated in the territory of the former Austro-Hungarian Monarchy shall, for a period of three years from the coming into force of the present Treaty, enjoy in importation, exportation, manufacture, distribution, sale or offering for sale in her territory of all goods bearing upon themselves or their usual get-up or wrapping any marks, names, devices, or descriptions whatsoever which are calculated to convey directly or indirectly a false indication of the origin, type, or nature of the characteristics of such goods.

Article 222.—Austria undertakes, on condition that reciprocity is accorded in these matters, to respect any law, or any administrative or judicial decision given in conformity with such law, in force in any Allied or Associated State and duly communicated to her by the proper authorities, defining or regulating the right to any regional appellation in respect of wine or spirits produced in the State to which the region belongs or the conditions under which the use of any such appellation may be permitted, and the importation, exportation, manufacture, distribution, sale or offering for sale of products or articles bearing any marks, names, devices, or descriptions whatsoever which are calculated to convey directly or indirectly a false indication of the origin, type, or nature of such goods.

Chapter III.—Unfair Competition.

Article 225.—Austria undertakes to adopt all the necessary legislative and administrative measures to protect the goods the produce or manufacture of any one of the Allied and Associated Powers from all forms of unfair competition in commercial transactions.

Austria undertakes to prohibit and repress by a severe and by other appropriate penalties, the importation, exportation, manufacture, distribution, sale or offering for sale in her territory of all goods bearing upon themselves or their usual get-up or wrapping any marks, names, devices, or descriptions whatsoever which are calculated to convey directly or indirectly a false indication of the origin, type, or nature of such goods.

Chapter IV.—Treatment of Nationals of Allied and Associated Powers.

Article 226.—Austria undertakes—
(a) not to subject the nationals of the Allied and Associated Powers to any prohibition in regard to the exercise of occupations, professions, trade and industry, which shall not be equally applicable to all aliens without exception;
(b) not to subject the nationals of the Allied and Associated Powers in regard to the rights referred to in paragraph (a) to any regulation or restriction which might contravene directly or indirectly the stipulations of the said paragraph, or which shall be other or more disadvantageous than those which are applicable to nationals of the most favoured nation;
(c) not to subject the nationals of the Allied and Associated Powers, their property, rights or interests, including companies and associations in which they are interested, to any charge, tax or impost, direct or indirect, other or higher than those which are or may be imposed on her own nationals or their property, rights or interests;
(d) not to subject the nationals of any one of the Allied or Associated Powers to any restriction which was not applicable on July 1, 1914, to the nationals of such Powers unless such restriction is likewise imposed on her own nationals.

Article 227.—The nationals of the Allied and Associated Powers shall enjoy a constant protection for their persons and for their property, rights and interests, and shall have free access to the courts of law of the said States.

Article 228.—Austria undertakes to recognize any new nationality which has been or may be acquired by

the war to present Austrian territory from Upper Silesia and from the territory of the former Austrian Empire transferred to the Czechoslovak State and Poland in accordance with the decisions of the Reparation Commission. Quantities now available for export from those countries, Austria shall in return furnish to Czechoslovak State and Poland supplies of the raw materials referred to in paragraph (2) in accordance with the decisions of the Reparation Commission.

(2) The Czechoslovak State and Poland further undertake during the same period to provide in a sufficient quantity of materials, as soon as the economic regulations or procedure, methods of verification or analysis concerning duties, means of taxation or interpretation, or the operation of monopolies.

In case of disagreement in the execution or interpretation of any of the provisions of the Reparation Commission shall decide.
her nationals under the laws of the Allied and Associated Powers, and in accordance with the decisions of the competent authorities of these Powers pursuant to naturalisation laws or under treaty stipulations, and to regard, in consequence of the acquisition of such new nationality, in all respects severing their allegiance to their country of origin.

Article 231.—The Allied and Associated Powers may appoint consuls-general, consuls, vice-consuls and consular agents, whose requisitions shall be notified hereto, and to admit them to the exercise of their functions in conformity with the usual rules and customs.

Chapter V.—General Articles.

Article 232.—The obligations imposed by Austria by Chap. I above shall cease to have effect five years from the date of the coming into force of the present Treaty, unless otherwise provided in the text, or unless the Council of the League of Nations shall, at least twelve months before the expiration of that period, decide that these obligations shall be maintained for a further period with or without amendment.

Nevertheless it is agreed that unless the League of Nations otherwise decide, an Allied or Associated Power shall not after the expiration of three years from the coming into force of the present Treaty be entitled to require the final settlement by Austria of their claims for damages and indemnities of Article 217, 218, 219 or 220 unless that Power guarantees to Austria the most charitable treatment to Austria.

Article 228 of Chapter IV shall remain in operation, with or without amendment, after the period of five years from the expiration of the period, if any, not exceeding five years, as may be determined by a majority of the Council of the League of Nations.

Article 233.—If the Austrian Government engages in international trade, it shall not in respect thereof have, or be deemed to have, any rights, privileges or immunities of sovereignty.

SECTION II.—TREATIES.

Article 234.—From the coming into force of the present Treaty and subject to the provisions thereof the multilateral Treaties, Conventions and Agreements of an economic or technical character concluded by the former Austro-Hungarian Monarchy and enumerated below and in the subsequent Articles shall henceforth be applied as between Austria and those of the Allied and Associated Powers party thereto:

(1) Conventions of March 14, 1884, December 1, 1886, and March 23, 1887, and Final Protocol of July 7, 1897, regarding the protection of submarine cables.

(2) Convention of October 11, 1909, regarding the international circulation of motor-cars.

(3) Agreement of May 15, 1886, regarding the sealing of railway trucks subject to customs inspection, and Protocol of May 18, 1907.

(4) Agreement of May 15, 1886, regarding the technical standardisation of railways.

(5) Convention of July 4, 1909, regarding the publication of customs tariffs and the organisation of an international Union for the publication of customs tariffs.

(6) Convention of April 25, 1907, regarding the raising of the Turkish customs tariff.

(7) Convention of March 14, 1897, for the redemption of toll dues on the Sound and Belt.

(8) Convention of June 28, 1901, for the redemption of the Stade Toll on the Elbe.

(9) Convention of July 16, 1863, for the redemption of the Toll dues on the Scheldt.

(10) Convention of October 29, 1888, regarding the establishment of a definite arrangement guaranteeing the free use of the Suez Canal.

(11) Conventions of September 23, 1910, respecting the unification of certain regulations regarding collisions and salvage at sea.

(12) Convention of December 21, 1904, regarding the evacuation of hospital ships from dues and charges in ports.

(13) Convention of September 26, 1906, for the suppression of nightwork for women.

(14) Conventions of May 18, 1904, and May 4, 1910, regarding the suppression of the White Slave Traffic.

(15) Convention of May 4, 1910, regarding the suppression of obscene publications.

(16) Sanitary Convention of December 3, 1903, and following Conventions dated January 10, 1892, April 15, 1893, April 3, 1904, and March 19, 1897.

(17) Convention of May 20, 1875, regarding the uniformation and improvement of the metric system.

(18) Convention of November 29, 1906, regarding the unification of pharmacopœial formulae for potent drugs.

(19) Convention of November 16 and 19, 1885, regarding the establishment of a concert pitch.

(20) Convention of June 7, 1899, regarding the creation of an International Agricultural Institute at Rome.

(21) Conventions of November 3, 1881, and April 19, 1889, regarding precautionary measures against epidemics.

(22) Convention of March 19, 1902, regarding the protection of birds useful to agriculture.

(23) Convention of June 12, 1902, regarding the guardianship of minors.

Article 235.—From the coming into force of the present Treaty the High Contracting Parties shall apply the conventions and agreements hereinafter mentioned, in so far as concerns them, Austria undertaking to comply with the special stipulations contained in this Article.

Postal Conventions.

Conventions and agreements of the Universal Postal Union concluded at Vienna, July 4, 1891.

Conventions and Agreements of the Postal Union signed at Washington, June 15, 1877.

Conventions and Agreements of the Postal Union signed at Rome, May 26, 1906.

Telegraphic Conventions.

International Telegraphic Conventions signed at St. Petersburg, July 10, 1859.

Regulations and Tariffs drawn up by the International Telegraphic Conference, Lisbon, June 11, 1908.

Austria undertakes not to object to the conclusion by the new States of the special arrangements referred to in the Conventions and Agreements relating to the Universal Postal Union and to the International Telegraphic Union, to which the said new States have adhered or may adhere.

Articles 236–237 are identical with Articles 384–385 inclusive of the German Treaty with the exception that the words Austria, Austro-Hungarian Monarchy are substituted for the words Germany, etc., in the latter treaty.

SECTION III.—DEUTS.

Article 248 with Annex is the same as Article 296 and Annex of German Treaty with the exception that the words Austria, Austrian are substituted for Germany, German, etc., of the latter.

SECTION IV.—PROPERTY, RIGHTS AND INTERESTS.

Articles 249–250 with Annex are identical with Articles 297 and 298 and Annex to the latter of German Treaty with the exception that the words Austria, Austrian are substituted for Germany, German, etc.

SECTION V.—CONTRACTS, PRESCRIPTIONS, JUDGMENTS.

Articles 251–255 inclusive are identical with Articles 299–303 with Annex of German Treaty with the exception of the substitution of the word Austria for Germany, etc.

SECTION VI.—MIXED ARBITRAL TRIBUNAL.

Articles 256–257 inclusive are identical with Articles 304–305 of the German Treaty with the exception of the usual substitution of the word Austria for Germany.

SECTION VII.—INDUSTRIAL PROPERTY.

Articles 258–262 of this Treaty are identical with Articles 306–310 inclusive of the German Treaty with the exception that the words Austria, Austrian, etc., are substituted for the words Germany, German, etc.

SECTION VIII.—SPECIAL PROVISIONS RELATING TO TRANSFERRED TERRITORY.

Article 263.—Of the individuals and juridical persons previously nationals of the former Austrian Empire, including Bosnia-Herzegovinians, those who acquire the status of a subject under the present Treaty, the nationality of an Allied or Associated Power are designated in the provisions which follow by the expression "nations of the former Austrian Empire"; and the remainder are designated by the expression "Austrian nationals."

Articles of the provisions transferred by virtue of the present Treaty shall, notwithstanding this transfer and the change of nationality consequent thereon, continue to be applicable to Austria all the rights in industrial, literary and artistic property to which they were entitled under the legislation in force at the time of the transfer.
WAR, EUROPEAN — THE PEACE TREATIES (18)

Article 265.—The questions concerning the nationals of the former Austrian Empire, as well as Austrian nationals possessing property, which are not dealt with in the present Treaty, or in the Treaty prepared for the purpose of regulating certain questions between the States concerned, to which the territory of the former Austro-Hungarian Monarchy has been transferred, or arising from the dismemberment of that Monarchy, shall be subject to special conventions between the States concerned, including Austria, in accordance with the provisions of the present Treaty. For this purpose it is agreed that three months from the coming into force of the present Treaty, the delegates of the States in question shall take place.

Article 266.—The Austrian Government shall without delay restore to nationals of the former Austrian Empire their property, rights and interests situated in Austrian territory.

The amount of taxes and imposts on capital which have been levied or increased on the property, rights and interests of nationals of the former Austrian Empire, from the coming into force of the present Treaty, shall be returned to them.

Cash assets shall be paid in the currency and at the rate of exchange provided for the case of debts under Articles 259 and 271.

Legacies, donations and funds given or established in the former Austro-Hungarian Monarchy shall be subject to any tax levied in respect of any other property in Austria. All the produce of such donations or of the income arising from funds so given or established shall be restored to their owners free from any such tax.

The property rights and interests of such donations or of such income as are subject to any tax shall be restored to the owners, and such tax shall be refunded, or in case the owners are not Austrian nationals, to the Austrian nationals to whom such property, rights and interests shall be transferred.

The property, rights and interests here referred to shall not include property which is the subject of Article 308 of Part IX (Financial Causes).

Nothing in this Article shall affect the provisions laid down in Part VIII (Reparation), Section I, Annex 111, Articles 249 and the Annex to Section IV the property, rights and interests of Austrian nationals or companies controlled by them situated in territories which have been taken into the possession of the Trusteeship of the United Nations or in territories which have been occupied by the Allied or Associated Powers in case of aggression from any of the belligerents of the War and in case of occupation by the forces of the Allied or Associated Powers.

The property, rights and interests here referred to shall not include property which is the subject of Article 308 of Part IX (Financial Causes).

All contracts for the sale of goods for delivery by sea concluded before January 1, 1917, between nationals of the former Austrian Empire and other States or nationalities or between nationals of the former Austro-Hungarian Monarchy, Austria, or Bosnia-Herzegovina, and nationals of the other party shall be null, except in respect of any debt or other pecuniary obligation arising out of any act done or monies paid or transferred prior to the coming into force of the present Treaty.

With regard to prescriptions, limitations in time, the provisions of Articles 252 and 253 shall be applied with substitution for the expression "outbreak of war" of the word "date of the Peace Treaty", or of "duration of the war" of the expression "period between the coming into force of the present Treaty and the coming into force of the present Treaty."
whom shall be appointed by the Austrian Government, one by the other interested Government and three by the International Labour Organization from the nationals of other States. This Commission shall by majority vote within three months after appointment recommend appointment of the Commission to the Council of the League of Nations, and the decisions of the Council shall forthwith be accepted as final by Austria and the other Government concerned.

PART XI.—AERIAL NAVIGATION.

Articles 276—283 inclusive of this Treaty are identical with Articles 241—248 of the German Treaty, with the exception that the words "Austria, Austrian, etc.", take the place of the words "Germany, German, etc.

PART XII.—PORTS, WATERWAYS AND RAILWAYS.

SECTION I.—GENERAL PROVISIONS.

Articles 284—289 inclusive are identical with Articles 321—326 of the German Treaty, with the exception that the word "Austria" is substituted for "Germany, etc.

SECTION II.—NAVIGATION.

Chapter I.—Freedom of Navigation.

Article 290.—The nationals of any of the Allied and Associated Powers as well as their vessels and property shall enjoy full and unimpeded access to the inland waterways of Austria the same treatment in all respects as Austrian nationals, vessels and property.

In particular the vessels of any one of the Allied or Associated Powers shall be entitled to transport goods of any description, and passengers, to or from any ports or places in Austrian territory to which Austrian vessels may have access, under conditions which shall not be more onerous than those applied in the case of national vessels. They shall be entitled to a footing on an equality with national vessels as regards port and harbour facilities and charges of every description, including facilities for storage, loading and unloading, and duties and charges of tonnage, harbour, pilotage, light-house, quarantine, and all analogous duties and charges of whatsoever nature, levied in the name of or for the profit of the Government; public functionaries, private individuals, corporations or establishments of any kind.

In the event of Austria granting a preferential regime to any of the Allied or Associated Powers or to any other Foreign Power, this regime shall be extended immediately and unconditionally to all the Allied and Associated Powers.

There shall be no impediment to the movement of persons or goods across the borders of Austria, the conditions of which are not more onerous than those prevailing for nationals of other States.

Chapter II.—Clauses Relating to the Danube.

Article 291.—The following river is declared international: the Danube from Ulm; together with all navigable parts of this river system which normally provide more than one State with access to the sea, with or without transhipment from one vessel to another, as well as the portion of the course of the Morava (March) and the Thaya (Theresia) forming the frontier between Carinthia and Austria, the canal and navigable sections of the Danube.

The same shall apply to the Rhine-Danube navigable waterway, should such a waterway be constructed, under the conditions laid down in Article 308.

2. The Rhine-Danube River System which is not included in the general definition may be declared international by an agreement between the river States.

Article 292.—On the waterways declared to be international, in the preceding Article, the national property and flags of all Powers shall be treated on a footing of perfect equality, no distinction being made to the benefit of the nationals of the nation, property or flag of any Power between them and the nationals, property or flag of the riparian State itself or of the most favoured nation.

Article 293.—Austrian vessels shall not be entitled to carry passengers or goods by regular services between the ports of the Austrian Empire without special authority from such Power.

Article 294.—Where such charges are not provided by any existing legal provision, the riparian States may levy on such vessels, as a basis of such expenditure, there shall be levied in the ports. These charges shall be levied in such a manner as to render any detailed examination of cargoes unnecessary, except in cases of suspected fraud or contravention.

Article 295.—The transit of vessels, passengers and goods on these waterways shall be effected in accordance with the general conditions prescribed for transit in Section I above.

When the two banks of an international river are within the sphere of the State and the riparian States agree, the transit shall be exempt from all customs formalities, the loading and unloading of goods, and the embarkation and disembarkation of passengers, shall only take place in the ports specified by the riparian States.

Article 296.—No dues of any kind other than those provided for in the preceding Article shall be levied on or at the mouth of these waterways.

This provision shall not be affected by the riparian States of customs, local octroi or consumption duties, or the creation of reasonable and uniform charges levied in accordance with public tariffs, for the use of cranes, elevators, quays, warehouses, and other similar constructions.

Article 297.—In addition to any special organisation for carrying out the works connected with the upkeep and improvement of the national portions of a navigable system, each riparian State shall be bound to take the necessary measures to remove any obstacle or danger to navigation and to ensure, so far as possible, the maintenance of good conditions of navigation.

If a State neglects to comply with this obligation any riparian State, or any State represented on the International Commission, may appeal to the tribunal instituted for this purpose by the League of Nations.

Article 298.—The same procedure shall be followed in the case of a riparian State undertaking any works of a nature to impede navigation in the international section. The tribunal mentioned in the preceding Article shall be entitled to impose the suspension of such works, making due allowance in its decisions for all rights in connection with irrigation or navigation, other water-power, for the purposes of which the necessary works are to be executed, which, with the consent of all the riparian States or of all the States represented on the International Commission, shall be regulated by agreement between riparians.

Appeal to the tribunal of the League of Nations does not require the suspension of the works.

Article 299.—The regime set out in Articles 292 and 294 to 298 above shall be supplemented by rules laid down in a General Convention drawn up by the Allied and Associated Powers, and approved by the League of Nations, relating to the waterways recognised in such Convention as having an international character. This Convention shall apply in particular to the whole or part of the above-mentioned river system of the Danube, and such other parts of that river system as may be covered by a general definition.

Austria undertakes, in accordance with the provisions of Article 331, to adhere to the said General Convention.

Article 300.—Austria shall cede to the Allied and Associated Powers concerned, within a maximum period of three months, all property and facilities necessary to the Allied and Associated Powers concerned for the utilisation of that river system.

The number of the tugboats, and the amount of the material so ceded, and their distribution, shall be determined by the parties concerned, with due regard being had to the legitimate needs of the parties concerned, and particularly of the United States of America, due regard being had to the legitimate needs of the parties concerned.

All craft so ceded shall be provided with their fittings and gear, shall be in good state of repair
and in condition to carry goods, and shall be selected from among those most recently built.

The terms made under the present Article involve a change of ownership, the arbitrator or arbitrators shall determine the rights of the said States, on October 15, 1918, and the amount of the compensation to be paid to them, and shall also direct the manner in which said compensation shall be effected in each case. If the arbitrator or arbitrators for any part of this sum will receive the shares directly or indirectly to States from whom separation is due, they shall decide the sum to be placed under the care of the said States.

As regards the Danube the arbitrator or arbitrators referred to in this Article will also decide all questions as to the permanent allocation and the conditions thereof of the vessels whose ownership or nationality is in dispute between States. Pending final allocation the control of these vessels shall be vested in a Commission consisting of Representatives of the United States of America, the British Empire, France and Italy, who will be empowered to make provisional arrangements for the working of these vessels in the general interest by any local organisation, or failing such arrangements by themselves, without prejudice to the final settlement. As far as possible these provisional arrangements will only be on a commercial basis and not be pre-arranged by the Commission and the hire of these vessels being disposed of as directed by the Reparation Commission.

2. Special Clauses Relating to the Danube.

**Article 303.**—The European Commission of the Danube reasserts the powers it possessed before the war, and as an additional measure, only representatives of Great Britain, France, Italy and Romania are to constitute this Commission.

**Article 304.**—From the point where the competence of the European Commission ceases, the Danubian system referred to in Article 293 shall be placed under the administration of an International Commission composed as follows:

2 representatives of German riparian States;
1 representative of each other riparian State;
1 representative of each non-riparian State, representative in the future on the European Commission of the Danube.

If certain of these representatives cannot be appointed at the time of the coming into force of the present Treaty, the decisions of the Commission shall nevertheless be valid.

**Article 305.**—The International Commission provided for in the preceding Article shall meet as soon as possible after the coming into force of the present Treaty, and shall undertake provisionally the administration of the river in conformity with the provisions of Articles 292 and 293 of this Convention. As a definitive statute regarding the Danube is concluded by the Powers nominated by the Allied and Associated Powers, the decisions of this International Commission shall be binding on the riparian States, the Commissioners shall be fixed and paid by their respective countries.

As a general provision any deficit in the administrative expenses of this International Commission shall not be borne equally by the States represented on the Commission.

In particular this Commission shall regulate the licensing of vessels, charges for pilotage and the administration of the pilot service.

**Article 306.**—The Austrian agrees to accept the regime which shall be laid down for the Danube by a Conference of the Powers nominated by the Allied and Associated Powers, which shall meet on one year after the coming into force of the present Treaty, and which shall be represented.

**Article 307.**—The mandate given by Article 57 of the Treaty of Berlin of July 13, 1878, to Austria-Hungary, for a period of 10 years to construct works at the Iron Gates, is abrogated. The Commission entrusted with the administration of this part of the Danube is to be set up by agreement of accounts subject to the financial provisions of the present Convention, which shall be necessary in no case to be levied by Hungary.

**Article 308.**—Should the Czechoslovak State, the Serbs or the Byelorussian Free State be designated by the International Commission as being unable to make necessary improvements, wef, or other works on a part of the river system which forms a frontier, these States shall enjoy on the same basis as the States which are outside their territory, all necessary facilities for the survey, execution and maintenance of such works.

**Article 309.**—Austria shall be obliged to make to the European Commission of the Danube all restitutions, reparations and indemnities for damages inflicted on the Commission during the war.

**Article 310.**—Should a deep-draught Rhine-Danube navigable waterway be constructed, Austria hereby undertakes to accept the application in the Rhine valley of the waterway of the same regime as that prescribed in Articles 293 and 294 to 299 of the present Treaty.

**Chapter III.**—Hydraulic System.

**Article 311.**—In default of any provisions to the contrary, when as the result of the fixing of a new frontier the hydraulic system (canalisation, inundations, irrigation, drainage, or similar matters) in a State is dependent on works executed within the territory of another State, or when use is made on the territory of a State, in virtue of pre-war use of water or hydraulic power, the source of which is on the territory of another State, an agreement shall be made between the States concerned to safeguard the interests and rights acquired by each of them.

If an agreement fails, the matter shall be regulated by an arbitrator appointed by the Council of the League of Nations.

**Article 312.**—Unless otherwise provided, when use is made for municipal or domestic purposes in one State of electricity or water, the source of which as the result of the fixing of a new frontier is within the territory of another State, an agreement shall be made between the States concerned to safeguard the interests and rights acquired by each of them.

Pending an agreement, central electric stations and waterworks shall be required to continue the supply up to an amount corresponding to the undertakings and contracts in force on November 3, 1918. Failing an agreement, the matter shall be regulated by an arbitrator appointed by the Council of the League of Nations.

**SECTION III.**—RAILWAYS.

**Chapter I.**—Freedom of Transit to the Adriatic for Austria.

**Article 313.**—Free access to the Adriatic Sea is accorded to Austria, who with this object will enjoy freedom of transit over the territories and in the ports severer from the former Austro-Hungarian Monarchy.

Freedom of transit is the freedom defined in Article 284 until such time as a General Convention on the subject shall have been concluded between the Allied and Associated Powers, whereupon the dispositions of the new Convention shall be substituted therefor.

Special Conventions between the States or Administrations concerned will lay down the conditions of the exercise of the right of transit and will settle in particular the method of using the ports and the free zones existing in them, including international (joint) services and tariffs including through tickets and waybills, and the maintenance of the Convention of Berne of December 18, 1890, and its supplementary provisions until its replacement by a new Convention.

Freedom of transit will extend to postal, telegraphic, and telephonic services.

**Chapter II.**—Clauses Relating to International Transport.

**Article 314.**—Goods coming from the territories of the Allied and Associated Powers, and arriving at Austria, or in transit through Austria from or to the territories of the Allied and Associated Powers, shall enjoy on the Austrian railways as regards rates and drawbacks being taken into account, facilities, and all other matters, the most favourable treatment applied to goods of the same kind on any Austrian line, either in internal traffic, or for export, import or in transit, under conditions of transport, for example as regards length of route. The same rule shall be applied, on the request of one or more of the Allied and Associated Powers, to goods specially designated by such Power or Powers coming from Austria and going to their territories.

International tariffs established in accordance with the provisions referred to in the preceding paragraph and involving through-waybills shall be applied by one of the Allied and Associated Powers shall require it from Austria.

However, without prejudice to the provisions of Articles 288 and 289, Austria undertakes to maintain on her own lines the regime of tariffs existing before the war as regards traffic to Adriatic and Black Sea.
ports, from the point of view of competition with North German ports.

Article 314.—Austria shall be bound to co-operate in the establishment of through ticket services (for passengers and their luggage) which shall be rendered by any of the Allied and Associated Powers to ensure their communication by rail with each other and with all other countries by transit across the territories of Austria; in particular Austria shall, for this purpose, accord the same facilities and restrictions that the railways of the Allied and Associated Powers shall for the same purpose accord to Austria; and for this purpose Austria shall accord to the railways of the Allied and Associated Powers, on such rates as may be agreed to, the same rates for goods in transit as for goods going to or coming from any other ports.

Article 315.—Austria shall not apply specially to such through services, or to the transportation of emigrants going to or coming from the ports of the Allied and Associated Powers any technical, fiscal or administrative measures, such as measures of customs examination, general police, sanitary police, and control, the result of which would be to impede or delay such through services.

Chapter III.—Rolling-Stock.

Article 317.—Austria undertakes that Austrian railways shall be fitted with apparatus allowing:

(a) of the inclusion in goods trains of the lines of such of the Allied and Associated Powers as are parties to the Berne Convention of May 15, 1886, as modified in 1890, without hampering the action of the continuous brake which may be adopted in such countries within ten years of the coming into force of the present Treaty, and

(b) of the inclusion of wagons of such countries in all goods trains on Austrian lines.

The rolling-stock of the Allied and Associated Powers shall enjoy on the Austrian lines the same treatment as Austrian rolling stock as regards movement, upkeep and repairs.

Chapter IV.—Transfers of Railway Lines.

Article 318.—Subject to any special provisions concerning the transfer of ports, waterways and railways situated on the territories transferred under the present Treaty, and to the financial conditions relating to the concessionnaires and the pensioning of the personnel, the transfer of railway lines shall take place under the following conditions:

(a) The working and installations of all the railroads shall be handed over complete and in good condition.

(b) When a railway system possessing its own rolling stock is transferred to Austria from any of the Allied and Associated Powers, such stock shall be handed over complete, in accordance with the last regulations known to Austria and in normal state of upkeep.

The parties regard without any special rolling stock, the distribution of the stock existing on the system to which these lines belong shall be made by Commissions of experts designated by the Allied and Associated Powers, on which Austria shall be represented. These Commissions shall have regard to the amount of the material registered on these lines in the last inventory, the length of track (sideings included), and the nature and amount of the locomotives, carriages and wagons to be handed over in each case; they shall decide upon the conditions of their acceptance, and shall make, if necessary, provisional arrangements necessary to insure their repair in Austrian workshops.

Stocks of materials, fittings and plant shall be handed over under the same conditions as the rolling stock.

The provisions of paragraphs 3 and 4 above shall be applied to the lines of former Russian Poland converted by the Austro-Hungarian authorities to the normal gauge, such lines being regarded as detached from the Austrian and Hungarian State systems.

Chapter V.—Provisions Relating to Certain Railway Lines.

Article 319.—When as a result of the fixing of new frontiers it is necessary to make connection between the two parts of the same country without another country, or a branch line from one country has its terminus in another, the conditions of working, if not specifically provided for in the present Treaty, shall be laid down in a convention between the States concerned. If the administrations cannot come to an agreement as to the terms of such convention, the points of difference shall be settled by a Commission of experts composed as provided in the preceding Article.

The establishment of all the new frontier stations between Austria and the countries of the Associated States, as well as the working of the lines between those stations, shall be settled by agreements similarly concluded.

Article 320.—With the object of insuring regular utilization of the railroads of the former Austro-Hungarian Monarchy owned by private companies which, as a result of the stipulations of the present Treaty, will be situated in the territory of several States, the administrative and technical reorganization of the said lines shall be regulated in each instance by an agreement between the owning Company and the States territorially concerned.

Any provisions on which agreement is not reached, including questions relating to the interpretation of contracts concerning the expropriation of the lines, shall be submitted to arbitrators designated by the Council of the League of Nations.

This arbitration may, as regards the South Austrian Railway Company, be required either by the Board of Management or by the Committee representing the bond-holders.

Article 321.—Within a period of five years from the coming into force of the present Treaty, any State which may require the construction or improvement on Austrian territory of the new transalpine line of the Col de Reichen and the St. Gotthard, shall be entitled to decide to pay for the works herself, the cost of construction or improvement shall be paid, on the basis of an agreement arrived at by the arbitrator appointed by the Council of the League of Nations, after the lapse of such period as may be fixed by the Council, determine the portion of the cost of construction or improvement which must be repaid by Austria to Italy on account of the increase of revenue on the Austrian railway system resulting from these works.

Austria shall hand over to Italy gratuitously the surveys, with their annexes, for the construction of the following railway lines:

The line from Tarvis to Trieste by Raibl, Plezzo.
Caporetto, Canale and Gorizia;

The local line from S. Lucia de Tolmino to Caporetto;

The line from Tarvis to Plezzo (new scheme);

The Reichen line connecting Landeck and Mals.

Article 323.—With view of the importance to the Czechoslovak State of free communications between that State and the Adriatic, Austria recognises the right of the Czechoslovak State to run its own trains over the sections included within her territory of the following lines:

(a) From Bratislava (Pressburg) towards Fiunne via Sopron, Szemtaboly and Mura Kereust, and a branch from Mura to its railway by a line to Graz via Klagenfurt, and

(b) From Budayevic (Budweis) towards Trieste via Linz, S. Michael, Klagenfurt, and Assling, and the branch from Klagenfurt to Vienna.

On the application of either party, the route to be followed by the Czechoslovakian line need be either permanently or temporarily by mutual agreement.
between the Czecho-Slovak Railway Administration and those of the railways over which the running powers are exercised.

Article 323.—The trains for which the running powers are used shall not engage in local traffic, except by agreement between Austria and the Czecho-Slovak State.

Such running powers will include, in particular, the right to establish round trips with through sleeping cars for minor repairs to locomotives and rolling-stock, and to appoint the necessary persons necessary to supervise the working of Czecho-Slovak trains.

Article 324.—The technical, administrative and financial conditions under which the rights of the Czecho-Slovak State shall be exercised shall be laid down in a Convention between the Railway Administration of the Czecho-Slovak State and the Railway Administrations of the Austrian systems concerned. If there is no agreement within a reasonable time on the terms of this Convention, the points of difference shall be decided by an arbitrator nominated by Great Britain, and the decisions shall be binding on all parties.

In the event of disagreement as to the interpretation of any provision of this Convention or of difficulties arising unprovided for in the Convention, the same form of arbitration will be adopted until such time as the League of Nations may lay down different rules.

Chapter VI.—Transfer Provision.

Article 325.—Austria shall carry out the instructions given her, in regard to transport, by an authorized body acting on behalf of the Allied and Associated Powers, providing for the movement of troops under the provisions of the present Treaty, and of material, ammunition, and supplies, and for the transport, and for the organization of postal and telegraphic services.

Chapter VII.—Telegraphs and Telegraphs.

Article 326.—Notwithstanding any contrary stipulations in existing treaties, Austria undertakes to grant freedom of transit for telegraphic correspondence and telegraphic communications coming from or going to any one of the Allied and Associated Powers, whether neighbours or not, over such lines as may be most suitable for international transit in accordance with the tariffs in force. This correspondence and these communications shall be subject to no unnecessary delay or restriction; they shall enjoy in Austria national treatment in regard to every kind of facility and especially in regard to rapidity of transmission. No payment, facility or restriction shall depend directly or indirectly on the nationality of the transmitter or the addressee.

Article 327.—In view of the geographical situation of the Czecho-Slovak Railroad, Austria agrees to the following modifications in the International Telegraph and Telephone Conventions referred to in Article 323 of the Peace of Paris:

(1) On the demand of the Czecho-Slovak State Austria shall provide and maintain trunk telegraph lines across Austrian territory. The annual rent to be paid by the Czecho-Slovak State shall be calculated in accordance with the provisions of the above-mentioned Conventions, but unless otherwise agreed shall not be less than the sum that would be payable under those Conventions for the number of messages laid down in those Conventions as corresponding to the right to demand a new trunk line, taking as a basis the reduced tariff provided for in Article 29, paragraph 5, of the International Telegraph Convention as revised at Liége.

(2) So long as the Czecho-Slovak State shall pay the above minimum permanent charge, there shall be no further charge on telegraphs or telephones used for the communication of the Austrian Government with the Czecho-Slovak Government, with the exception of the transmission of messages between the Prince of Monaco and the French Post Office, which shall be sent through the österreichische Post in accordance with the conditions of the Peace of Paris.

(3) The line shall be reserved exclusively for transit traffic to and from the Czecho-Slovak State.

Article 328.—It is laid down in Article 8 of the International Telegraph Convention of July 22, 1875, to suspend international telegraph services shall not apply.

(4) Similar provisions will apply to the provision and use of lines as the above-mentioned Conventions provide, the rent payable by the Czecho-Slovak State for a trunk telephone circuit shall, unless otherwise agreed, be determined in accordance with the reduced tariffs provided for in the above-mentioned Conventions.

(5) The particular lines to be provided together with the above provision and conditions not provided for in existing International Conventions or in this Article shall be fixed by a further agreement under which the parties shall fix by an arbitrator appointed by the Council of the League of Nations.

(6) The stipulations of the present Article may be varied at any time by agreement between Austria and the Czecho-Slovak State. After the expiration of ten years from the coming into force of the present Convention, the parties shall be agreed to all the present provisions by the parties, be modified at the request of either party by an arbitrator designated by the Council of the League of Nations, and the League of Nations shall be notified of any such agreement by the parties to the Convention referred to in paragraph 5, this Article shall be submitted for decision to the Permanent Court of International Justice to be established by the League of Nations.

SECTION IV.—Disputes and Revision of Permanent Clauses.

Article 329.—Disputes which may arise between the Allied and Associated Powers as to the interpretation or application of this Article or of the Convention referred to in paragraph 5, this Article shall be submitted for decision to the Permanent Court of International Justice to be established by the League of Nations.

Article 330.—The stipulations of Articles 290, 293, 312, 314 to 316, and 326 shall be subject to revision by the Council of the League of Nations at any time after three years from the coming into force of the present Treaty.

Failing such revision, no Allied or Associated Power can claim after the expiration of the above period of three years the benefit of any of the stipulations in the Articles enumerated above on behalf of any portion of its territory in which reciprocity is not accorded in respect of such stipulations. The period of three years during which reciprocity can be demanded may be prolonged by the Council of the League of Nations.

The benefit of the stipulations mentioned above cannot be claimed by States to which territory of the former Austro-Hungarian Monarchy has been transferred, or which have arisen out of the dismemberment of that Monarchy, except upon the footing of giving in the territory passing under their sovereignty reciprocal treatment to Austria.

SECTION V.—Special Provision.

Article 331.—Without prejudice to the special obligations imposed on her by the present Treaty for the benefit of the Allied and Associated Powers, Austria undertakes to adhere to any General Conventions regarding the international regime of transit, waterways, ports or railways which may be concluded by the Allied and Associated Powers, with the approval of the League of Nations, within five years of the coming into force of the present Treaty.

PART XIII.—Labor.

(Labor Clauses are similar to those of Part XIII of the Treaty of Geneva.)

PART XIV.—Miscellaneous Provisions.

Article 332.—Austria undertakes to recognize and to accept the conventions made or to be made by the Allied and Associated Powers or any of them with any other Power as to the traffic in arms and in spirituous liquors, and also as to the other subjects dealt with in the General Acts of Berlin of February 26, 1854, and of Brussels of July 7, 1890, and the conventions completing or modifying the same.

Article 333.—The High Contracting Parties declare and place on record that they have taken note of the Treaty signed by the Government of the French Republic on July 17, 1918, with His Divine Majesty the Prince of Monaco defining the relations between France and the Principality.

Article 334.—The High Contracting Parties, while they recognize the guarantees stipulated by the Treaties of 1815, and especially by the Act of November 20, 1815, in favour of Switzerland, constituting international obligations for the maintenance of peace, declare nevertheless that the provisions of these treaties, conventions, declarations and other supplementary Acts concerning the neutralized zone of Savoy, as laid down in paragraph 9 of Article 92 of the Final Act of the Congress of Vienna and in paragraph 1 of Article 1 of the Treaty of Peace of November 20, 1815, are no longer consistent with the present conditions. For this reason the High Contracting Parties take note of the agreement reached between the Government and the Swiss Government for the abrogation of the stipulations relating to this zone which are and remain abrogated.
WAR, EUROPEAN — THE PEACE TREATIES (18)

The High Contracting Parties also agree that the stipulations of the Treaties of 1815 and of the other supplementary acts relating to the free zones of Upper Savoy and the Gex district are no longer consistent with present conditions, and that it is for France and Switzerland to come to an agreement on a new project which, in their view to settling between themselves the status of these territories under such conditions as shall be considered suitable by both countries.

ANNEX.

I. The Swiss Federal Council has informed the French Government on May 19th, 1919, that after examining the provisions of Article 443 of the Peace conditions presented to Germany by the Allied and Associated Powers in a like spirit of sincere friendship, it has happily reached the conclusion that it was possible to transform it under the following conditions and reservations:

(a) The neutralised zone of Haute-Savoie:

(1) The nationalization of Savoy, nothing will be definitively settled, on one side, or the other, in regard to this subject.

(2) The ascent given by the Swiss Government to the nationalization of the above-mentioned stipulations pre-supposes in conformity with the text adopted, the recognition of the guarantees formulated in favour of Switzerland by the Treaties of 1815 and particularly by November 20, 1815.

(3) The agreement between the Governments of France and Switzerland on the nationalization of the above-mentioned stipulations will only be considered as valid if the Treaty of Peace contains this Article in its present wording. In addition, the Parties to the Treaty of Peace should undertake to observe the stipulations of the Treaties of 1815 and of the Declaration of May 20, 1815, which are not signatories of the present Treaty of Peace.

(b) Free zone of Haute-Savoie and the district of Gex:

(1) The Federal Council of Switzerland makes the most express reservations to the interpretation to be given to the statement mentioned in the last paragraph of the above Article for insertion in the Treaty of Peace, which provides that "the stipulations of the Treaties of 1815 and other supplementary acts concerning the free zones of Haute-Savoie and the Gex district are no longer consistent with present conditions." The Federal Council would not wish that the acceptance of the above wording should lead to the conclusion that it would agree to the suppression of a system intended to give to the neighbouring territory the benefit of a special regime which would be different from the geographical and economical situation and which has been well tested.

(2) The Federal Council has not been consulted by the Federal Council in the question of the modification of the customs system of the zones as set up by the Treaties mentioned above, but only in the conclusion in a manner appropriate to make the economic conditions of the present day of the terms of the Treaty of Peace between the regions in question. The Federal Council has been led to make the preceding observations by the perusal of the draft Convention, which uses the fullest of the zones, which was annexed to the note of April 26 from the French Government. While making the above reservations the Federal Council declares its readiness to examine in the most friendly spirit any proposals which the French Government may deem it convenient to make on the subject.

(3) It is conceded that the stipulations of the Treaties of 1815 and other supplementary acts relating to the free zones will remain in force until a new arrangement is come to between France and Switzerland to regulate matters in this territory.

II. If the French Government have addressed to the Swiss Government, on May 18, 1919, the following note in regard to the conclusions and arrangements set out in the preceding paragraph:

In a note dated May 19th, 1919, the Swiss Government has informed the French Republic that the Federal Government adhered to the conclusion set forth in the preceding Article to be inserted in the Treaty of Peace between the Allied and Associated Governments and Germany.

The French Government have taken note with much pleasure of the agreement thus reached, and, at their request, have proposed a new project which has been accepted by the Allied and Associated Governments, has been inserted under No. 434 in the Peace conditions presented to the German Peace Conference.

The Swiss Government, in their note of May 5 on this subject, have expressed various views and reservations.

Concerning the observations relating to the free zones of Haute-Savoie and the Gex district, the French Government have the honour to observe that the provisions of the last paragraph of Article 443 of the Peace conditions, their purport cannot be misapprehended, especially where it implies that no other Power but France and Switzerland will in future be interested in that question.

The French Government, on their part, are anxious to protect the interests of the Swiss people concerned, and, with that object, having their special situation in view, they bear in mind the desirability of extending this provision so far as they judge suitable to the interests of the Swiss people. In order to accomplish this, they will proceed in a manner better suited to present conditions, the methods of exchanges between these territories and the adjacent Swiss territories, while taking into account the reciprocal interests of both regions.

It is understood that this must in no way prejudice the rights of France or Switzerland to adjust their customs line in this region in conformity with their political frontier, as is done on the other portions of their territorial boundaries, and as was done by Switzerland long ago on her own boundaries in this region.

The French Government are pleased to note on this subject in what a friendly disposition the Swiss Government take this opportunity of extending their willingness to consider any French proposals dealing with the system to be substituted for the present régime of the said free zone and which the French Government intend to formulate in the same friendly spirit.

Moreover, the French Government have no doubt that the provisional maintenance of the régime of 1815 as to the free zones referred to in the above mentioned paragraph of Article 443 of the Peace conditions, of May 5, whose object is to provide for the passage from the present régime to the conventional régime, will cause no delay whatsoever in the establishment of the new situation which has been found necessary by the two Governments. This is recommended by the ratification of the Federal Chambers, dealt with in paragraph 7 (2) of the Swiss note of May 5, under the heading "Neutralized zone of Haute-Savoie and Gex.

Article 376.—The Allied and Associated Powers agree that where Christian religious missions were being maintained by Christian societies or persons in territory belonging to them, or of which the government is entrusted to them in accordance with the present Treaty, the property which these missions or missionary societies possessed, including that of trading societies whose profits were devoted to the support of missions, shall continue to be devoted to missionary purposes. In order to ensure the due execution of this undertaking the Allied and Associated Governments will hand over such property to boards of trustees appointed by or approved by the Governments and composed of persons holding the faith of the Mission whose property is involved.

In the Allied and Associated Governments, while continuing to maintain full control as to the individuals by whom the Missions are conducted, will safeguard the interests of such property, wherever it may be located. Austria, taking note of the above undertaking, agrees to accept all arrangements made between the regions in question. Austria undertakes not to put forward directly or indirectly against any Allied or Associated Power, signatory of the present Treaty, any pecuniary claim based on events which occurred at any time before the coming into force of the present Treaty.

The present stipulation will bar completely and finally all claims of this nature, which will be thenceforward extinguished, whoever may be the parties in interest.

Article 377.—Austria accepts and recognises as valid and binding all decrees and orders concerning Austro-Hungarian citizens and settled property in Austria, under the provisions of the Peace Treaty between the Allied and Associated Governments and the German Empire.

The Allied and Associated Powers reserve the right to examine in such manner as they may determine all decisions and orders of the authorities of the Austrian Empire, whether affecting the property rights of nationals of those Powers or of neutral Powers, which have been accepted by the Allied and Associated Governments, and undertaken to put forward any claim arising out of such decrees or orders on behalf of any Austrian national.

The Allied and Associated Powers reserve the right to examine, in such manner as they may determine, all decisions and orders regarding Austrian property, real or personal, in Austria, as well as all orders relating to the payment of costs made by any Prize Court of any of the Allied and Associated Powers, and undertake not to put forward any claim arising out of such decrees or orders on behalf of any Austrian national.

The Allied and Associated Powers reserve the right to examine in such manner as they may determine all decisions and orders concerning Austrian property, whether real or personal, in Austria, as well as all orders relating to the payment of costs made by any Prize Court of any of the Allied and Associated Powers, and undertake not to put forward any claim arising out of such decrees or orders on behalf of any Austrian national.
WAR, EUROPEAN — THE PEACE TREATIES (18)

PART III.—POLITICAL CLAUSES.

SECTION I.—SERB-CROAT-SLOVENE STATE.

Bulgaria recognizes the Serb-Croat-Slovene State and renounces in favour of that State all rights and title over the territories of the Bulgarian Monarchy. All other Bulgarians resident in those territories will acquire Serb-Croat-Slovene nationality ipso facto and lose their Bulgarian nationality.

SECTION II.—GREECE.

Bulgarian renounces in favour of Greece all rights and titles over the territories assigned to Greece, which are situated outside the frontiers of Bulgaria as laid down in the sections dealing with frontiers and recognized by the present Treaty as forming part of Greece. Bulgarian nationals habitually resident in the territories assigned to Greece in accordance with the present Treaty will obtain Greek nationality ipso facto and will lose their Bulgarian nationality. They will, however, be entitled within a period of two years from the coming into force of the present Treaty, if they so desire, to opt for Bulgarian nationality, but all such rights will be accorded to Bulgarians over 18 years of age who are Bulgarian nationals habitually resident in Bulgaria who may wish to opt for Greek nationality. The proportion and nature of the financial obligations of Bulgaria which Greece will assume on account of the territory placed under her sovereignty will be determined in accordance with the financial clauses of the present Treaty.

SECTION III.—THRACE.

Bulgarian renounces in favour of the Principal Allied and Associated Powers all rights and title over the territories in Thrace which are assigned to Thrace and Associated States and to the Associated Powers. Bulgaria undertakes to accept whatever settlement may be made by the Principal Allied and Associated Powers in regard to these territories and the Principal Allied and Associated Powers undertake, on the other hand, to ensure economic outlets for Bulgaria to the Aegean under the conditions which will be fixed at a later date.

SECTION IV.—PROTECTION OF MINORITIES.

The provisions for the protection of minorities reproduce exactly those laid down in the Austrian Treaty, adding the proviso that all persons not nationals of any other State habitually resident in Bulgaria at the date of the coming into force of the present Treaty, as well as all persons born in Bulgaria who are not born nationals of another State, ipso facto become Bulgarian nationals.

SECTION V.—GENERAL PROVISIONS.

Bulgaria undertakes to recognize all Treaties or agreements which may be entered into by the Allied and Associated Powers with States now existing or coming into existence in future in the territories of the former Empire of Russia as it existed on 1 Aug. 1914, and to recognize the frontiers of any such States as determined therein.

Bulgaria accepts definitely the abrogation of the Brest-Litovsk Treaties and of all Treaties, Conventions, and Agreements entered into by her with the Maximalist Government in Russia.

The Allied and Associated Powers formally reserve the rights of Russia to obtain from Bulgaria restitution and repatriation based on the principles of the present Treaty. Bulgaria undertakes to recognize the Treaties of Peace and additional Conventions which have been or may be concluded by the Principal Allied and Associated Powers with the Powers who fought on the side of Bulgaria.

Bulgaria declares that she recognizes the Protektorate proclaimed over Egypt by Great Britain on 18 Dec. 1914, and that she will make no claim on behalf of herself.
er her nationals to the benefits or immunities derived from the capitulations in Egypt regarding all Treaties, agreements, and contracts concluded by Bulgaria and proclaimed as from 11 Oct. 1915.

Bulgaria declares that she recognizes the French protectorate in Morocco, and that she will make no claim to her nationals to the benefits or immunities derived from the régime of the capitulations in Morocco regarding all Treaties, agreements, and contracts concluded by Bulgaria and proclaimed as from 11 Oct. 1915.

Part IV—Military, Naval, and Air Clauses.

Section I.—Military Clauses.

The military terms for the total number of effective of the Bulgarian Army, the sole function of which shall be to maintain internal order and control frontiers, are 250,000 men. It is anticipated that there will be no other military forces raised outside this figure. This army shall be recruited both as regards officers and men on a voluntary basis; in the case of officers (who shall not be retired before the age of 40), for not less than 20 years' service, and in the case of non-commissioned officers and men, for not less than 12 years' service. The number of customs, forests, and police officials shall be fixed by a mutual agreement between the Inter-Allied Commission of Control, and in no case shall the number of these officials who are armed with rifles exceed 10,000, so that the total number of rifles in use in Bulgaria shall not exceed 30,000.

The population of the country, including soldiers, non-commissioned officers, staffs, and special services, shall not exceed one-twentieth of the total effective with the colours, and that of non-commissioned officers and men shall not exceed one-fifteenth of the total effective with the colours. The effects of this provision shall be computed between the maximum and minimum figures laid down in the Treaty.

On the expiration of three months from the coming into force of the Treaty, there must only exist in Bulgaria one military school for the sole purpose of the recruitment of officers for the authorized units. The number of students admitted to instruction in any school shall be strictly in proportion to the vacancies to be filled in the officer cadets, and both cadets and students shall be reckoned as part of the effective of the Bulgarian Army.

Within three months of the coming into force of the present Treaty, the Bulgarian Government shall destroy or dispose of all officers' and troops' horses. Any surplus of armament and munitions exceeding the figures fixed per thousand men in the present Treaty, and not included in the dispositions referred to in the Inter-Allied Commission of Control, will be destroyed or disposed of in such a way that the number and calibre of guns constituting the fixed normal armament of fortified places existing at present in Bulgaria shall constitute the maximum amount which may not be exceeded. When the coming into force of the present Treaty, the maximum stock of ammunition for these guns will be reduced to and maintained at the rate of 500 rounds per gun per year, and under, and 500 rounds per gun of higher calibre.

No new fortifications shall be constructed in Bulgaria. No war material in the shape of quick fire shall be manufactured or imported, nor any tanks nor armoured cars, and within three months of the coming into force of the present Treaty, all arms, munitions, and war material of whatever origin or kind existing in Bulgaria in excess of the authorized quantity shall be handed over to the principal Allied and Associated Powers at such point in Bulgarian territory as they may appoint. The Allied and Associated Powers shall also decide on the disposal of such material.

The manufacture of arms, munitions, and of war material shall only be carried on in one single factory, controlled by and belonging to the State, whose output shall, or may be limited to such manufacture as is sanctioned above.

Section II.—Naval Clauses.

The naval terms provide that from the date of the coming into force of the Treaty, all Bulgarian warships, including submarines, existing or under construction, which are not surrendered to the principal Allied and Associated Powers or broken up, shall be disposed of for non-commercial purposes. All naval arms, munitions, and other war material belonging to Bulgaria at the date of the Armistice, mentioned in the armistice, and all Bulgarian warless station at Sofia will be under Allied supervision and not to be used for commercial or naval purposes. Bulgaria states that during the period of three months after the coming into force of the present Treaty, all Bulgarian warships, including submarines, existing or under construction, which are not surrendered to the principal Allied and Associated Powers or broken up, shall be disposed of for non-commercial purposes. All naval arms, munitions, and other war material belonging to Bulgaria at the date of the Armistice, mentioned in the armistice, and all Bulgarian warless station at Sofia will be under Allied supervision and not to be used for commercial or naval purposes. Bulgaria states that during the period of three months after the coming into force of the present Treaty, Bulgaria will destroy all more powerful wireless stations.

Section III.—Air Clauses.

The air clauses provide that the armed forces of Bulgaria must be demobilized within two months. The aircraft of the Allied and Associated Powers is to be used for the control of the Treaty of Peace with Germany. All military and naval air forces, including dirigible and aeronautical material, are to be delivered on the ratification of the present Treaty.

Section IV.—Inter-Allied Commissions of Control.

All Military, Naval, and Air Clauses contained in the present Treaty for the execution of which a time limit is prescribed shall be executed by Bulgaria under the control of Inter-Allied Commissions appointed for this purpose by the Principal Allied and Associated Powers.

The Inter-Allied Commissions of Control may establish their organisations at Sofia and shall be entitled to proceed as often as they may think fit to any point in Bulgarian territory or to send sub-commissions to any such point. The Bulgarian Government must furnish to the Inter-Allied Commissions of Control such information and documents as the latter may think necessary to ensure the execution of their mission, and to means (both in personnel and equipment) by which Commissions may need to ensure complete execution of the Treaty. The Military, Naval, or Air Control, Allied, or Associated Government must also attach a qualified representative to each Inter-Allied Commission of Control with the duty of receiving and transmitting to the Commissions which the Commission may have to address to the Bulgarian Government and of furnishing it with or procuring all information or documents demanded.

The upkeep and cost of the Inter-Allied Commissions of Control and the expenses involved by their work shall be borne by Bulgaria.

Section V.—Reparation and Financial Clauses.

This section follows the similar one in the Austrian Treaty, except for one article, which in the case of Bulgaria, provides for an Inter-Allied Commission of Inquiry into offences against the laws of war committed by the Bulgarian authorities and to search for non-repatrated Allied and Associated nationals.

Parts VII and VIII.—Reparation and Financial Clauses.

Reparation.

The Allied and Associated Governments, while recognizing that the resources of Bulgaria are insufficient to enable the State to accept from Bulgaria such reparation as she can make, and fix the sum of 246,900,000 gold francs, in addition to the compensation already made. The Reparation Commission shall have power at any time to dispose of either by sale or otherwise, of any or all of the material on the payments to be made by Bulgaria, the nominal amount of which bonds shall be fixed by it in accordance with the Inter-Allied Commission, but shall in no case exceed the total capital sums then outstanding. In such case the Government undertakes to deliver to the Reparation Commission through the Inter-Allied Commission the necessary bonds in such form, number, and denomination as the Commission may determine. Bonds so delivered shall be direct obligations of the State, and all arrangements for the service of the bonds shall be made by the Inter-Allied Commission. The Inter-Allied Commission shall pay all interest, sinking fund,
and other charges connected with the bonds out of the proceeds to be made by Bulgaria in accordance with this Treaty. Any surplus shall continue to be paid to the order of the Reparation Commission.

The Inter-Allied Commission shall have discretion to regulate the Reparation Commission either the reduction of any particular payment due or a reduction of the total capital sum to be paid by Bulgaria, and the Commission shall have power by a majority of votes to make any such reduction or postponement up to the extent recommended by the Inter-Allied Commission. Bulgaria, on the other hand, shall have power at any time to make immediate payments of the total capital sum due over and above the half-yearly payments.

While Bulgaria recognizes the transfer to the Allied and Associated Powers of any financial or real property which her late allies may have against her, particularly those claims which have been taken into account in fixing the amount of the financial reparation to be paid by Bulgaria.

Bulgaria undertakes to return to Greece, Roumania, and the Serb-Croat-Slovene State respectively all records, archives, and collections of archaeological or artistic interest which have been taken away from the territories of these countries during the present war or in the former war, and in any numbers set out in the Treaty, in restitution for the animals taken away by her during the war from the territories of the countries named. Bulgaria undertakes by way of special compensation for the destruction of prisoners situated on Serbian territory by the Bulgarian armies to deliver to the Serb-Croat-Slovene State during five years from the coming into force of the present Treaty, twenty thousand tons of coal a year from the output of the State mines at Pelinka, provided these deliveries are sanctioned by the Inter-Allied Commission, which shall require to be satisfied that such deliveries of coal will not unduly interfere with the economic life of Bulgaria.

The Inter-Allied Commission referred above shall be established at Sofia as soon as possible after the coming into force of the present Treaty. It shall consist of three members, to be nominated respectively by the Governments of the United States, France, and Italy. Bulgaria shall be represented at the Commission by a Commissioner who shall take part in the sittings whenever invited by the Commission to do so, but shall not have the right to vote.

In the law relating to the Commission there shall be laid down a list of the taxes and revenues (now existing or hereafter to be created) estimated to be sufficient to produce the sums above referred to. This list shall include all revenues or receipts arising from concessions made or to be made for the working of mines and quarries, or for the carrying on of any works of public utility, or of any monopolies for the manufacture or sale of any articles in Bulgaria. This list shall be altered from time to time with the unanimous consent of the Commission.

Bulgaria in the performance of her obligations the Commission shall be entitled to the extent, and for the period it may determine, to assess and undertake the collection of such taxes and sources of revenue, and to hold and disburse the proceeds thereof, and to apply any net proceeds after meeting the cost of administration and collection to the satisfaction of reparation obligations of the Empire, subject to any priorities laid down in this Treaty.

FINANCIAL.

Bulgaria is required to make the following payments in the order of priority:

1. Cost of military occupation.

2. The services of such part of the external Ottoman Public Debt as a Commission appointed for the purpose may attribute to Bulgaria.

3. The cost of reparation as prescribed by the present Treaty.

PART IX.—ECONOMIC CLAUSES.

The Economic Clauses are virtually identical with those in the Austrian Treaty. In the section on property, rights, and interests, a modification is made of the principle that the property of Allied and Associated Powers are declared final and binding, Bulgaria, in a series of new provisions, is made responsible for certain obligations incurred by her owing to her acquisition of certain property after the Balkan War.

PART XI.—PORTS, WATERWAYS AND RAILWAYS.

The section dealing with Ports, Waterways, and Railways follows almost exactly the lines of the Austrian Treaty.

PART XIII.—MISCELLANEOUS PROVISIONS.

This section follows the similar one in the Austrian Treaty, except for a few minor points.

(4) The Polish Treaty. The treaty with Poland was the first of the formal agreements through which the Entente and Associated Powers bound the new states of eastern Europe to maintain institutions of modern political freedom under the general supervision of the League of Nations. By this treaty Poland was bound to protect minorities against discrimination, and to assume payment of part of the Russian debt.

M. Clemenceau, President of the Peace Conference, transmitted the treaty to the Polish Government on 24 June 1919, in a long letter to Paderewski, the Polish premier, in which were set forth the reasons for the various conditions, unusual to such a document, expressed in the treaty. The salient features of this letter are given below, followed by the text of the treaty as signed by the Allied and Associated Powers on 28 June 1919:

On behalf of the Supreme Council of the principal allied and associated powers, I am the bearer of communicating to you herewith, in its final form, the text of the treaty which, in accordance with Article 93 of the treaty of peace with Germany, is to be submitted to the Imperial Senate of the Republic of Germany to sign on the occasion of the confirmation of her recognition as an independent State and of the transference to her of the territories included in the former German Empire which are assigned to her by the said treaty.

The principal provisions were communicated to the Polish delegation in Paris in May last and were subsequently communicated direct to the Polish Government through the French Minister at Warsaw. The council since has had the advantage of the suggestions which you were good enough to convey in the memorandum of June 16, and as the result of a study of the suggestions modifications have been introduced into the treaty. The council believes that it will be found that, by the modification, the principal points to which your attention was drawn in your memorandum have, so far as they relate to specific provisions of the treaty, been adequately covered.

In formally communicating to you the final decision of the principal allied and associated powers in this matter I should desire to take this opportunity of expressing in a more formal manner than has hitherto been employed the conditions by which the principal allied and associated powers have been guided in dealing with the question.

GUIDING PRINCIPLES.

One.—In the first place, I would point out that the treaty does not constitute any fresh departure. It has for long been the established procedure of the public law of Europe that when a State is created, or even when large accesses of territory are made to an already established State, the joint and formal recognition by the great powers should be accompanied by the requirement that such State should, in the form of a binding international convention, undertake to comply with certain principles of government. This principle, for which there are numerous other precedents, received the explicit sanction when, at the last great assembly of European powers—the Congress of Berne—the sovereignty and independence of Serbia, Montenegro, and Rumania were recognized. It is desirable to recall the words used on this occasion by the British, French, Italian and German plenipotentiaries, as recorded in the protocol of that day:

Two.—The principal allied and associated powers are of the opinion that they would be false to the principles which they have maintained if on this occasion they departed from what has become an established tradition. In this connection I must also recall to your
consideration the fact that it is through the endeavors and sacrifices of the powers in whose name full and final addressing you that the Polish Nation owes the recovery of its ancient freedom, and that it is by these very powers that sovereignty is being re-established over the territories in question, and that the inhabitants of these territories are being assigned to the Polish Nation. It is by the support which these powers will afford to the League of Nations that the future Poland will have, to a large extent, the ground for the preservation of the new sovereignty.

IX. — Clauses 10 and 11 deal with the Jews, in connection with the Jews of Poland. The information that the disposal of the principal Allied and associated powers as to the destinies of the Jews and of the lands they inhabit has led the Jews to the conclusion that, in view of the historical development of the Jewish question and the great animosity aroused by it, special protection is necessary for the Jews of Poland. These clauses limit the disposition on the cardinal principles enunciated therein.

X. — Clauses 12 to 14 deal with the Jewish citizens of Poland. The information that the disposal of the principal Allied and associated powers as to the destinies of the Jews and of the lands they inhabit has led the Jews to the conclusion that, in view of the historical development of the Jewish question and the great animosity aroused by it, special protection is necessary for the Jews of Poland. These clauses limit the disposition on the cardinal principles enunciated therein.

XII. — The impossibility of the execution of similar provisions was vested in the great powers. Experience has shown that this is in practice inefficient, and it was also open to the criticism that it might give to the great powers, either individually or in combination, a right to interfere in the internal constitution of the States affected, which could be used for political purposes. Under the new system the guarantee is intrusted to the League of Nations. The clauses dealing with this guarantee are here carefully drafted, so as to make it clear that Poland will not be in any way under the tutelage of those powers who are signatory to the treaty.

I should desire, moreover, to point out to you that provision is made in the treaty by which disputes arising out of its provisions may be brought before the court of the League of Nations. In this way differences which might arise will be removed from the political sphere and placed in the hands of a judicial court. It is hoped that thereby an impartial decision will be facilitated, while at the same time any danger of political interferences by the powers in the internal affairs of Poland will be avoidable.

Four. — The particular provisions to which Poland and the other States will be asked to adhere differ to some extent from those which were imposed on the new States seeking recognition have at all times varied with the particular circumstances.

The situation with which the powers have now to deal is new, and experience has shown that new provisions are necessary. The territories now being transferred to Poland and the other States inevitably include a large population speaking languages and belonging to races different from that of the whole with whom they will be incorporated. Unfortunately, the races have been estranged by long years of bitter hostilities. It is believed that these populations will be more readily reconciled to their new position if they know that from the beginning they have assured protection and adequate guarantees against any danger of unjust treatment or oppression. The very knowledge that these guarantees exist will, it is hoped, materially help the reconciliation which all desire, and will, indeed, do much to prevent the necessity of its enforcement.

Five. — To turn to the individual clauses of the present treaty, Articles 7 and 8 are designed to insure that all the genuine residents in the territories now transferred to Polish sovereignty shall in fact be Poland, and from the Polish citizens who by their religion, their language, or by their race differ from the large mass of the Polish population. In case of any objection to the manner of the articles, the Polish Government have already, of their own accord, declared their readiness to institute proceedings on the cardinal principles enunciated therein.

Six. — Clauses 10 and 11 deal with the Jewish citizens of Poland. The information that the disposal of the principal Allied and associated powers as to the destinies of the Jews and of the lands they inhabit has led the Jews to the conclusion that, in view of the historical development of the Jewish question and the great animosity aroused by it, special protection is necessary for the Jews of Poland. These clauses limit the disposition on the cardinal principles enunciated therein.

It is believed that these stipulations will not create any obstacle to the political unity of Poland. They do not constitute any recognition of the Jews as a separate political power in Poland. The educational provisions contain nothing beyond what is in fact provided for in the educational institutions of many other countries. The object of the intentions of the principal Allied and associated powers to encourage a spirit of national separation have been provided for in the express acknowledgment in the clauses of the present treaty do not prevent the Polish State from making the Polish language obligatory in all its schools and among all its various nationalities.

In conclusion, I desire to express to you, on behalf of the allied and associated powers, the very sincere satisfaction which the feel at the re-establishment of an independent Polish Nation; and to the Polish Nation and the whole of the allies, the assurance that the voice of Poland will add to the wisdom of their common deliberations in the cause of peace and harmony, that its influence will be used to further the spirit of freedom and justice, both in internal and external affairs, and that thereby it will help in the work of reconciliation between the nations which, with the conclusion of peace, will be the common task of humanity.

TEXT OF THE POLISH TREATY.

THE UNITED STATES OF AMERICA, THE BRITISH EMPIRE, FRANCE, ITALY, AND JAPAN, THE PRINCIPAL ALLIED AND ASSOCIATED POWERS, THE ONE HAND; AND POLAND, ON THE OTHER HAND:

WHEREAS, The allied and associated powers have, by the said treaty, declared Poland and the other States to be free of their arms, and have granted to Poland the independence of which it had been unjustly deprived;

WHEREAS, By the proclamation of March 30, 1917, the Government of Russia assented to the re-establishment of an independent Polish State; and

WHEREAS, The Polish State, which now, in fact, exercises sovereignty over those portions of the former Russian Empire which are inhabited by a majority of Poles has already been recognized as a sovereign and important State by the principal allied and associated powers;

WHEREAS, Under the treaty of peace concluded with Germany by the allied and associated powers, a treaty of which Poland is a signatory, certain portions of the former German Empire will be incorporated in the territory of Poland; and

WHEREAS, Under the terms of the said treaty of peace, the Polish State, according to the said treaty limits as a sovereign and independent member of the family of nations and being anxious to insure the rights and guarantees of all inhabitants, those elementary rights which are, as a matter of fact, secured in every civilized State. Clauses 3 to 8 are designed to insure that all the genuine residents in the
to give a sure guarantee to the inhabitants of the territories over which she assumed sovereignty that her representatives would respect the rights of each contracting party.

The President of the United States of America; his Majesty the King of the United Kingdom of Great Britain and Ireland and of the British Dominions beyond the seas, or of the Emperor of the French Republic; his Majesty the King of Italy; his Majesty the Emperor of the Holy Roman Empire; and the President of the Polish Republic, after having exchanged their full powers, found in good and due form, have agreed as follows:

CHAPTER I.

Article 1.—Poland undertakes that the stipulations contained in Articles 2 and 6 of this chapter shall not be recognized as a violation of the laws, regulations, or official actions as having or as being in force in any of the territories which are the subject of the present treaty, and that there shall be no power or authority to which they are subject other than that of the government of the Polish Republic.

All inhabitants of Poland shall be entitled to the free exercise of all public or private, of any creed, religion, or belief, which practices are not inconsistent with public order or public morals.

Article 2.—Poland undertakes to ensure full and equal protection to life and liberty to all inhabitants of Poland, without distinction of birth, nationality, language, race, or religion.

Article 3.—Poland admits and declares to be Polish nationals the persons born in Poland or joining the Polish nation, whether of foreign or of Polish extraction, and of the persons of the Russian nationality who have been naturalized in Poland.

Persons who have exercised the above right to opt for the freedom of Poland shall have the same rights and privileges as Polish nationals, and shall be entitled to retain their movable property in Poland.

The provisions of this chapter shall apply to all persons born in Poland or acquiring Polish nationality by naturalization, and to all persons who have been naturalized in Poland.

The chapter shall be valid for a period of ten years from the date of its promulgation.

CHAPTER II.

Article 5.—Poland undertakes to put an end to the acquisition of Polish nationality by persons born in foreign countries, and to the naturalization of persons born in Poland.

The provisions of this chapter shall apply to all persons born in Poland or acquiring Polish nationality by naturalization, and to all persons who have been naturalized in Poland.

The chapter shall be valid for a period of ten years from the date of its promulgation.

CHAPTER III.

Article 6.—Poland undertakes to put an end to the acquisition of Polish nationality by persons born in foreign countries, and to the naturalization of persons born in Poland.

The provisions of this chapter shall apply to all persons born in Poland or acquiring Polish nationality by naturalization, and to all persons who have been naturalized in Poland.

The chapter shall be valid for a period of ten years from the date of its promulgation.

CHAPTER IV.

Article 7.—Poland undertakes to put an end to the acquisition of Polish nationality by persons born in foreign countries, and to the naturalization of persons born in Poland.

The provisions of this chapter shall apply to all persons born in Poland or acquiring Polish nationality by naturalization, and to all persons who have been naturalized in Poland.

The chapter shall be valid for a period of ten years from the date of its promulgation.
WAR, EUROPEAN — THE PEACE TREATIES (18)

Consul Generals, Consuls, Vice Consuls, and Consular Agents, however, shall not enter upon their duties until they have been admitted in the usual manner by the Government in the territory of which they are stationed.

Consul Generals, Consuls, Vice Consuls, and Consular Agents shall enjoy all the facilities, privileges, exceptions, and immunities of every kind which are or shall be granted to Consular officers of the most favored nation.

Article 14.—Pending the establishment of a permanent tariff in the Polish Government, goods originating in the allied and associated State shall not be subject to any higher duties on importation into Poland than the most favorable rates of duty applicable to goods of the same kind under either the German, Austro-Hungarian, or Russian customs tariffs on July 1, 1914.

Article 15.—Poland undertakes to make no treaty, convention, or arrangement, and to take no other action, which will prevent her from joining in any general agreement for the equitable treatment of the commerce of other States that may be concluded under the auspices of the League of Nations, five years from the coming into force of the present treaty.

Poland also undertakes to extend to all the allied and associated States any favors or privileges in customs matters which they may grant during the same period of five years to any State with which, since August 1, 1914, the Allies have been at war, or to any State which may have concluded with Austria special arrangements as provided in the treaty of peace to be concluded with Austria.

Article 16.—Pending the conclusion of the general agreement referred to above, Poland undertakes to treat on the same footing as national vessels, or vessels of the most favored nation, the vessels of all the allied and associated States which accord similar treatment to Polish vessels.

By way of exception from this provision, the right of Poland or any other allied or associated State to confine her maritime coastal trade to national vessels is expressly reserved.

Article 17.—Pending the conclusion, under the auspices of the League of Nations, of a general convention to secure and maintain freedom of communications and of transit, Poland undertakes to accord freedom of transit of persons, goods, vessels, carriages, wagons, and mails in transit to and from any allied or associated State over Polish territory, including territorial waters, and to treat them at least as favorably as the persons, goods, vessels, carriages, wagons, and mails respectively of Polish or of any other more favored nationality, origin, importation, or ownership, as regards facilities, charges, restrictions, and all other matters.

All charges imposed in Poland on such traffic in transit shall be reasonable having regard to the conditions of the transit. Goods in transit shall be exempt from all customs or other duties. Tariffs for transit traffic shall be on the same basis and tariffs between Russia and any allied or associated power, involving through tickets or waybills, shall be established at the request of that allied or associated power.

Freedom of transit will extend to postal, telegraphic, and telephonic services.

It is understood that no allied or associated power can claim the benefit of these provisions on behalf of any part of its territory in which reciprocal treatment is not accorded with respect to the same subject matter.

If within a period of five years from the coming into force of the present treaty no general convention as aforesaid shall have been concluded under the auspices of the League of Nations, Poland shall be at liberty at any time thereafter to give twelve months' notice to the Secretary General of the League of Nations to terminate obligations of this article.

Article 18.—Pending the conclusion of a general convention on the international regime of waterways, Poland undertakes to apply to the river system of the Vistula (including the Bug and the Nariefl) the regime applicable to international waterways set out in Articles 332 to 337 of the treaty of peace with Germany.

Article 19.—Poland undertakes to adhere, within twelve months of the coming into force of the present treaty, to the international conventions specified in Annex I.

Poland undertakes to adhere to any new convention, concluded with the approval of the Council of the League of Nations, within five years of the coming into force of the present treaty, to replace any of the international instruments specified in Annex I.

The Polish Government undertakes within twelve months to notify the Secretary General of the League of Nations whether or not Poland desires to adhere to either or both of the international conventions specified in Annex II.

Until Poland has adhered to the two conventions last specified in Annex I she agrees, on condition of reciprocity, to protect by effective measures the industrial, literary, artistic, and commercial property of nationals of the allied and associated States. In the case of any allied or associated State not adhering to the said conventions, Poland agrees to continue to afford such effective protection on the same conditions until the conclusion of a special bilateral treaty or agreement for that purpose with such allied or associated State.

Pend with her admission to the other conventions specified in Annex I, Poland will secure to the nationals of the allied and associated States the advantages to which they would be entitled under the said conventions.

Poland further agrees, on condition of reciprocity, to recognize and protect all rights in any industrial, literary, or artistic property belonging to the nationals of the allied and associated States now in force or which, but for the war, would have been in force in any part of her territories before their transfer to Poland. For such purposes they will accord the extensions of time agreed to in Articles 307 and 308 of the treaty with Germany.

ANNEX I.

Telegraphic and Radio-Telegraphic Conventions.

International Telegraph Convention signed at St. Petersburg July 10—22, 1875.

Regulations drawn up by the International Telegraph Conference signed at Lisbon June 11, 1908.

International Radio-Telegraphic Convention, July 5, 1912.

Railway Conventions.

Agreement on May 15, 1886, regarding the sealing of railway trucks subject to custom inspections, and protocol of May 18, 1907.

Agreement of May 15, 1886, regarding the technical standardization of railways, as modified on May 18, 1907.

Sanitary Convention.

Convention of Dec. 3, 1903.

Other Conventions.

Convention of Sept. 26, 1906, for the suppression of night work for women.

Convention of Sept. 26, 1906, for the suppression of the use of white phosphorus in the manufacture of matches.

Conventions of May 18, 1904, and May 4, 1910, regarding the suppression of the white slave traffic.

Convention of May 4, 1910, regarding the suppression of obscene publications.

International conventions of Paris of March 20, 1883, as revised at Washington in 1911, for the protection of industrial property.

International convention of Sept. 9, 1886, revised at Paris in 1895, for the protection of literary and artistic works.

ANNEX II.

Agreement of Madrid of April 14, 1891, for the prevention of false indications of origin on goods, revised at Washington in 1911, and agreement of Madrid of April 14, 1891, for the international registration of trademarks, revised at Washington in 1911.

Article 20.—All rights and privileges accorded by the foregoing treaties to the allied and associated States shall be accorded equally to all States members of the League of Nations.

The present articles, which the French and English texts are both authentic, shall be ratified. It shall come into force at the same time as the treaty of peace with Germany.

The deposit of ratifications shall be made at Paris.

Powers of which the seat of Government is outside Europe will have within five years of the coming into force of the present treaty, to inform the effective Government of the French Republic through their diplomatic representatives at Paris that their ratification has been given. In that case they must transmit the instrument of ratification as soon as possible.
WAR, EUROPEAN — THE PEACE TREATIES (18)

A procès-verbal of the deposit of ratifications will be drawn up.

The French Government will transmit to all the signatory powers a certified copy of the procès-verbal of the deposit of ratifications.

Poland agrees to assume responsibility for such proportion of the Russian public debt and other Russian public liabilities of any kind as may be assigned to it in consideration of the services which it has rendered to the principal allied and associated powers on the one hand and Poland on the other, to be prepared by a commis-

sion to be appointed by the principal allied and associated powers. In case the commission not arriving at an agreement, the point at issue shall be referred for immediate arbitration to the League of Nations.

In faith whereof the above-named plenipotentiaries have signed the present treaty.

Done at Versailles, [June 28, 1919, in a single copy which will remain deposited in the archives of the French Republic, and of which authenticated copies will be transmitted to each of the signatory powers.

(5) Franco-American-British Treaty. On 28 June 1919 treaties were concluded at Versailles between Great Britain and France, and between the United States and France, by the terms of which these two great powers pledged immediate aid to France in the event of an unprovoked act of aggression by Germany. The treaties were signed at the same time as the German treaty and were published to the world on 2 July. The treaties are to be a part of the League of Nations, which will decide if they are in conformity with the Covenant of the League. Italy was resentful because she was not included and hints were given out that an offensive would be to drive Italy into a conflict with Germany. In the United States those who opposed the League of Nations pointed to these treaties as proof of their contention that the proposed League of Nations was ineffective. The text of the treaty between France and the United States is as follows:

Considering that the United States of America and the Government of the French Republic are equally anxious by a desire to maintain the peace of the world, so harmlessly restored by the treaty signed at Versailles on June 28, which put an end to the war begun by the aggressive acts of Germany and terminates by the defeat of that power, and,

Considering that the United States of America and the Government of the French Republic are equally anxious that the treaties signed at Versailles, June 28, which put an end to the war begun by the aggressive and victorious acts of Germany against France, should be faithfully and promptly carried into execution, and that the effectiveness of such treaties should be enhanced by the contributions of foreign powers.

Considering that the United States of America and the Government of the French Republic are equally anxious that the peace of the world, so fairly and justly restored by the treaty signed at Versailles, June 28, which put an end to the war begun by the aggressive and victorious acts of Germany against France, should be faithfully and promptly carried into execution, and that the effectiveness of such treaties should be enhanced by the contributions of foreign powers.

(6) The Brest-Litovsk Treaty. Soon after the coup d'etat in Russia which resulted in the overthrow of the Kerensky government and the rise to power of the Maximilists (Bolsheviki), the German government took the initiative in peace conferences with the new government. On 15 Dec. 1917 an armistice was signed by Germany, Austria-Hungary and the Bolsheviki, which was to last until 17 Feb. 1918, during which period of two months the terms of peace could be discussed and finally signed by treaty.

The demands of the Central Powers, that the Russian Soviet government refused to grant them. On 10 Feb. 1918 the Russians announced that they had withdrawn from the war without signing a peace and Russian troops on all fronts were ordered to mobilize at once.

To this unprecedented attitude of a nation negotiating peace the Central Powers answered that Russia's abrupt withdrawal from the discussions at Brest-Litovsk constituted a breach of the armistice conditions and consequently a state of war existed. On 17 February Germany began a new invasion of Russia, and Turkey invaded the Caucasus on the 23d. Trotsky, the People's Commissioner (Bolshevik Minister of War) urged the peasants of Russia to resist, but Lenin, the Russian Premier, was able to induce the Central Soviet Committee to accept the terms offered by Germany. The Germans ended their advance on 3 March 1918 and on the same day the Treaty of Brest-Litovsk was signed. The Entente obliged Germany to renounce this treaty under the drastic terms of the Treaty of Versailles signed 28 June 1919.

1919, by the United States of America, by the Government of the French Republic, and by the British Empire, among other powers:

Article 42. — Germany is forbidden to maintain or construct any fortifications either on the left bank of the Rhine or on the right bank of the Rhine. A line drawn fifty kilometers to the east of the Rhine.

Article 43. — In the area defined above the mainte-

nance and the assembly of an armed force, permanent or temporary, and military manoeuvres of any kind, as well as the upkeep of all permanent works for mobilization, are in the area of the Rhine.

Article 44. — In case Germany violates in any man-

ner whatever the provisions of Articles 42 and 43 she shall be regarded as committing a hostile act against the powers signatory of the present treaty and as calcu-

lated to disturb the peace of the world.

In case these stipulations should not assure imme-

diately to France appropriate security and protection, the United States of America shall be bound to come immediately to her aid in case of any unprovoked act of aggression directed against her by Germany.

Article 5. — The present treaty, couched in terms analogous to those of a treaty concluded on the same date and to the same end between Great Britain and the French Republic, a copy of which is hereto annexed, will not enter into force until the moment when the latter is ratified.

Article 6. — The present treaty must be submitted to the Council of the Society of Nations and must be recognized by the council, deciding by majority, as an engagement in conformity with the covenant of the society. It will remain in force until, upon demand of one of the parties to the treaty, the council deciding if occasion arise by a majority, finds that the society itself assures sufficient security to the League of Nations.

Article 7. — The present treaty shall be ratified for the Chambers of the French Parlia-

tment for approval and it shall be submitted to the Senate of the United States of America at the same time as the treaty of Versailles shall be submitted for ascertainment to ratification. Ratification shall be exchanged at the time of deposit in Paris of the ratifications of the Treaty of Versailles or as soon afterward as possible.

Then follow the signatures of M. Clemen-

cetu, M. Pichon, Mr. Wilson and Mr. Lansin.

(6) The Brest-Litovsk Treaty. Soon after the coup d'etat in Russia which resulted in the overthrow of the Kerensky government and the rise to power of the Maximilists (Bolsheviki), the German government took the initiative in peace conferences with the new government. On 15 Dec. 1917 an armistice was signed by Germany, Austria-Hungary and the Bolsheviki, which was to last until 17 Feb. 1918, during which period of two months the terms of peace could be discussed and finally signed by treaty.

The demands of the Central Powers, that the Russian Soviet government refused to grant them. On 10 Feb. 1918 the Russians announced that they had withdrawn from the war without signing a peace and Russian troops on all fronts were ordered to mobilize at once.

To this unprecedented attitude of a nation negotiating peace the Central Powers answered that Russia's abrupt withdrawal from the discussions at Brest-Litovsk constituted a breach of the armistice conditions and consequently a state of war existed. On 17 February Germany began a new invasion of Russia, and Turkey invaded the Caucasus on the 23d. Trotsky, the People's Commissioner (Bolshevik Minister of War) urged the peasants of Russia to resist, but Lenin, the Russian Premier, was able to induce the Central Soviet Committee to accept the terms offered by Germany. The Germans ended their advance on 3 March 1918 and on the same day the Treaty of Brest-Litovsk was signed. The Entente obliged Germany to renounce this treaty under the drastic terms of the Treaty of Versailles signed 28 June 1919.
WAR, EUROPEAN — AMERICAN NEUTRALITY (19)

It is of more than passing interest in view of the fact that it was the only treaty resulting from the Great War that was based on the formula of "no annexations, no indemnities, and self-determination." The formula as interpreted by Germany during 1918 proved deceptive.

The chief provisions of the treaty are as follows:

I. The state of war between the Bolshevik and the Central Powers is terminated.

II. The high contracting parties agree to refrain from all agitation against the other signatory governments.

III. Russia cedes all claim to Estonia, Finland, Livonia Courland, Lithuania, Russian Poland, and Ukraine. Furthermore Russia promises not to interfere in the internal affairs of these districts. Germany and Austria, is to decide, their status agreeable to the wishes of their respective populations.

IV. After the conclusion of a general peace the Central Powers agree to evacuate all other Russian territory occupied by them. Russia agrees to evacuate all Anatolian provinces and return them to Turkey. Russian Armenia is also to be evacuated and evacuated self-determination in agreement with Turkey.

V. Russia will without delay carry out the complete demobilization of her army. Russia will further transfer her warships to Russian harbors and leave them there until a general peace or immediately disarm. Warships of states continuing in a state of war with the Quadruple Alliance will be handed to Russian warships in so far as they are within Russian control. Shipping routes are to be kept permanently free from floating mines.

VI. Russia undertakes immediately to conclude peace with the Ukrainian People's Republic and to recognize the present treaty between this state and the powers of the Quadruple Alliance. Ukrainian territory will be immediately evacuated by Russia. The Aland Islands fortifications are to be removed with all possible dispatch.

VII. The political and economic independence and territorial integrity of Persia and Afghanistan are to be respected by the contracting parties.

VIII. Prisoners of war of both sides will be repatriated.

IX. The contracting parties mutually renounce indemnification of their war costs.

X. Diplomatic and consular relations will be resumed immediately.

XI. The prescriptions contained in Appendices 2 to 5 shall govern the economic relations between the powers of the Quadruple Alliance and Russia.

XII. The restoration of public and private relations, interned civilians, etc., will be regulated by separate treaties with Russia.

XIII. This article is in regard to the authoritative texts, in German, Russian, Hungarian, Bulgarian and Turkish, embodying the decisions in which each shall govern.

XIV. The present treaty will be ratified and ratifications exchanged as soon as possible in Berlin. The treaty enters into force on its ratification.

The signatures of the plenipotentiaries are attached.

For the results of the operation of this treaty see THE EASTERN FRONT (p. 381) this section. For its renunciation by Germany see (1). Treaty with Germany in this article.

19. AMERICAN NEUTRALITY. When the European War broke out in August 1914, it immediately drew into the circle of its operations and influences all the civilized nations of the world. Eventually three powers were aligned with Germany and 27 states declared war upon her. Italy remained neutral for a year and China for four years: otherwise the only country significant in a military sense that kept out of the war was the United States; and the power over there found itself entangled in the net of European diplomacy, because it was not to the interest of the great belligerents to foster neutral rights, and because the intensity of the war made real neutrality almost impossible.

Attitude of the American People.— Some German-Americans would have liked to see the United States at least apply a brand of neutral-
who happen to be in belligerent countries are entitled to protection and to the advantage of commercial and other treaties with those belligerents.

(3) Neutrals on the other hand are bound to refrain from "neutral acts" which might give aid and comfort to any of the belligerents. No military expeditions are to be prepared on their soil; no ships of war to be built or fitted up; no vessels is permitted to belligerent troops across neutral territory; no hostilities allowed by land or sea within the territorial restrictions of the neutrals.

(4) Hospitals and Red Cross services are exempt from capture; and neutrals engaged in such service are to be respected.

(5) The neutral preserves the right of continuing intercourse in goods or persons, by land or sea, by railroad or by ship, with all the belligerents, subject to the limitations on sea commerce described below.

(6) Neutral vessels capturable at all are entitled to an adjudication by a prize court. The vessel is to be preserved if possible, and the passengers and crew must be taken off in safety.

(7) By the Declaration of Paris (16 April 1856), the signatory powers (not including the United States) agreed not to use privateers for the capture of merchant vessels.

(8) Enemy's vessels and enemy's property in such vessels are liable to capture anywhere on the high seas. The efforts to prohibit capture of private property at sea were unsuccessful.

(9) Enemy's property (except contraband) is safe from capture in neutral ships.

(10) Neutral goods (except contraband) are safe from capture in enemy ships.

C. Freedom of the Seas.—Neutral commerce is subject to three very important limitations as follows:

(1) Contraband, that is, commodities and persons directly or indirectly intended or adapted for military purposes, are capturable even if owned by a neutral or in a neutral ship.

(2) A blockade of any port or coast by a belligerent is considered directly a military operation and all neutral vessels bound in or out or which are subject to capture anywhere on the high seas. Blockades in order to be binding must be effective.

(3) Neutral goods, if contraband in nature, may by the doctrine of continuous voyages be captured if bound from one neutral port to another, where the ultimate destination is a belligerent port.

(4) The definition of contraband was uncertain in 1914. In the Conference of London in 1911, an international Declaration was drawn under the leadership of Great Britain, which made careful distinction between "contraband," "conditional contraband," and "non-contraband." But this document was subsequently withdrawn by the British government before ratification. The progress of the art of war has added many commodities to the group of materials plainly intended for war; and it has always been a debatable question whether food is necessarily contraband.

Not all of these principles were admitted by all nations; but, with the exception of privatisation, which played no part in the Great War, they were substantially held by the American government in 1914, and had been applied by it in the Spanish War of 1898 and claimed in other wars to which the United States was not a party. The statute books contained a series of provisions for enforcing the neutrality of the United States by penalties on those who might aid the belligerents. Unfortunately the neutrality statutes of the United States, as pointed out early in the war by the Attorney-General, were defective and inadequate. They date back to 1794 with a revision in 1797 and additions in 1818. This body of law was substantially incorporated into the revised laws of 1878 and was in force in 1914. In spite of the advice of the Department of Justice, the only new statute enacted during the period of the neutrality was that of 4 March 1915, authorizing the withholding of clearances where there was reasonable cause to believe that the cargo was intended to supply belligerent vessels of war at sea.

Diplomatic Intercourse.—At the outbreak of the war Great Britain, Austria and Germany requested the United States to represent them in enemy countries, and Turkey, Serbia and other countries made like requests. This threw upon the United States a large responsibility with reference to individuals and property of citizens of one state in the territory of the enemy, and also made the United States ministers intermediaries in questions relating to the status and treatment of prisoners of war and of civilians arrested and interned. In addition the American ministers in all the belligerent countries represented the general interests of the United States as a neutral, and were the channel for claims of the owners of ships and cargoes which were seized or captured.

An early duty thrown upon the officials and the government was that of aiding American travelers stranded in Europe, particularly in Germany and Austria, at the outbreak of hostilities. Congress appropriated $2,750,000, and the government chartered ships to bring home those who could not obtain passage on the regular lines. By these means all stranded travelers and others who wished to come to America were brought across the Atlantic.

Another unexpected service of American diplomatic and consular officials was in the territories, especially in western Europe, occupied by the Central Powers. Minister Daniel Whitlock was ordered to remain at his post in Brussels even when all but a fraction of the kingdom of Belgium was occupied by the Germans. Germany could not refuse to recognize him without admitting that Belgium was considered a conquered and extinguished nation. Official and unofficial agents of the vast system of relief organized for the people of Belgium and northern France were also unwillingly received by the Germans, who permitted both Belligerent England and United States to feed the population which was deprived of its means of life by the German invasion. Upon Ambassador James W. Gerard was thrown the heavy responsibility of representing the United States in Berlin. Efforts were made to cajole him and also to brow-beat him. On one occasion the emperor suddenly approached him with the remark: "America had better look out after this war. I shall stand no nonsense from America after this war." Upon the American ministers in Holland, Russia, Serbia, Bu-
garia, Rumania, fell very difficult duties. Ambassador Morgenthau in Turkey was toward the Armenians as a protector of oppressed peoples in its limits was considered these official representatives, Colonel House, the personal friend and representative of President Wilson, several times visited England, Germany and other countries upon special and private missions.

The representatives of the belligerent nations in the United States made it very clear that the raising of loans, and the Allied loans were very popular, because the proceeds were at once invested in the purchase of military supplies and food in the United States. The rising tide of feeling against Germany greatly interfered with the German loans. The diplomatic representation of the Central Powers was able. Count von Bernstorff, the German ambassador, made his legation the centre of public propaganda, but several of his subordinates were dismissed from the United States government. Dr. Dumba, the Austrian ambassador, was likewise dismissed. Several consuls of both countries were convicted of breaches of the neutrality laws and sent to prison, toward the end of the neutral period (19 Jan. 1917) Count Bernstorff sent to the German minister in Mexico an official order from the German foreign office to make an alliance with Mexico and if possible with Japan, for war on the United States, adding: "It is understood that Mexico is to reconquer the lost territories in New Mexico, Texas, and Arizona." The Turkish ambassador, Rustem Bey, was dismissed in 1914 for a criticism on the conduct of the State Department here. Various unofficial agents of the German government were sent over to work upon public opinion in the United States, particularly Bernhard Dernburg, who formerly lived in the United States. Several prominent unfallen Germans who made their homes in America, and a few who were naturalized, were open or secret agents of the German government.

Public Announcements of Neutrality. The general European War practically began when Germany declared war on Russia, 1 Aug. 1914. On 4 August, without waiting for the announcement of the final decision by the British government, President Wilson issued the first of a series of Proclamations of Neutrality. In them he set forth the friendship of the United States for the contending powers, the status of citizens of the United States in territories of the belligerents, and of belligerent subjects within the jurisdiction of the United States and the need of "inpartial neutrality." He then laid down a series of injunctions upon persons within the United States. They were warned not to accept a commission or to enlist in the service of either belligerent or induce other persons so to do; or to fit out vessels for the service of the belligerents, or to increase the force of any belligerent public ship entering the United States; or to prepare a military enterprise to be carried on from the United States. In addition, belligerent vessels of war were warned not to use the waters of the United States for hostile purposes. All citizens of the United States and all other persons within its limits were subject to contravention of treaties of the United States and the national statutes against neutral acts. All persons were warned that they would have no "protection from the Government of the United States" against the consequences of their misconduct. Two important limitations on these requirements were stated. In the opening sentences of the proclamation the reservation, "without interfering with the free expression of sympathy or with commercial manufacture or sale of arms or munitions of war," Toward the end the President reiterated the right to sell and ship contraband of war and to break a blockade, at the risk of capture and the resultant penalties.

Similar proclamations were issued from time to time as additional countries entered the war. In addition the President on 5 August began a series of special proclamations, the first prohibiting the radio stations from "handling messages of an unneutral nature." On 14 August a circular was issued in rather certain terms on the liability of former citizens of the belligerent powers to render military service. On the 17th instructions were sent out to diplomatic and consular officers in the belligerent countries. On the 18th an act was approved by the President permitting the registry of foreign-built ships in the United States, thus allowing the acquisition of an American status.

On 15 October the Department defined the attitude of the government on the shipment of contraband, reaffirming the doctrine that there was no duty under international law to prevent such traffic. Many additional proclamations set forth the position and the decrees of the government, and the President in public addresses insisted on the neutral policy of the country. He even went so far as to issue a proclamation (18 Aug. 1914), in which he urged his fellow countrymen to avoid that "deepest, most subtle, most essential breach of neutrality which may spring out of partisanship or out of passionately taking sides,—we must deal impartially in thought as well as in action." So far as precept could go, the United States did everything that was correct and traditional. Difficulties of Neutrality. Little paid to the President's injunction to preserve neutrality of thought. Most Americans from the beginning had a strong preference on one side or the other, and two positive causes created a strong current of public feeling against Germany. These were the occupation of Belgium in the early days of August; and the treatment of non-combatants in the portions of Belgium and France occupied by the German army.

The invasion of Belgium was contrary to the general principle of the right of a nation to remain neutral if it were not concerned in the outbreak of the war; and it was also a gross violation of belligerent or the obligation of treaties. The contemptuous phrase of the German chancellor that treaties were "only a scrap of paper" was a blow at the sanctity of all obligations of nations.

The United States, however, was not a signatory of the Treaty of 1839 by which both
WAR, EUROPEAN—AMERICAN NEUTRALITY (19)

Germany and Great Britain guaranteed the neutrality of Belgium. The Hague Conventions on the rights of neutral powers, though signed by the United States, could not be reasonably construed to require this country to make war on Germany. Otherwise the Germans had the legal power to compel the United States to go to war by interfering with a third power. The general right of belligerents to keep up commerce with neutral powers is of course subject to and conditioned by their physical ability to protect direct trade in their merchant ships. A few days after the beginning of the war the allied British and French navies showed such an overwhelming superiority at sea that the German shipping which could not reach home ports took refuge in any neutral waters that offered. Except on the Baltic and a little coasting trade in the German Ocean to Holland and the Scandinavian countries, the movement of German merchant ships ceased all over the world. A few German commerce destroyers were let loose, but all of them were eventually captured or driven to port. No transoceanic or Mediterranean commerce could be kept up by Germany and her allies. The change in the conditions put a strain on American neutrality. Goods could still be shipped to Germany in neutral vessels, but contraband cargoes were liable to capture by the Allied cruisers. This introduced a complication in the trade in arms and military supplies which quickly sprang up from the United States. Shippers had the same legal right to ship to Germany or to England, but none of the German cargoes could reach their destination if contraband; while practically all the English cargoes went safely.

Without altering a syllable of the proclamations, without any deviation from the received principles of international law, this state of things was very advantageous to the Allies as against the Central Powers. As a great exporter it was clearly the interest of the United States to liberal construction of contraband. Cargoes of food not earmarked for military consumption were considered in the United States to be free from capture; and, if sent in American bottoms, also free from search or detention, even if paid for. The Allied powers at once began to create difficulties for shipments of all kinds from the United States even to other neutral powers. The result was confusion in the treatment of American cargoes and vessels, and controversy over the right to ship munitions of war.

Another and very serious difficulty was the conduct of the German and Austrian diplomatic and consular officials and secret agents, who entered on a propaganda intended to rouse the German-Americans, both aliens and citizens, and to put a pressure on the government in Washington to take ground with regard to neutrality which would be favorable to Germany.

A further complication was bringing forward the "law of necessity." Both groups of belligerents argued that their victory was so necessary for the welfare of mankind that they were justified in cutting down the privileges of neutrals; and that it was no time to stand on the niceties of international law, when the keeping up of the German army or the British navy was at stake.

Above all, the contest in Europe speedily became so terrible that it was impossible for the people of the United States to ignore the plain fact that the interests of their country were involved and that the success of one side would mean a great change in international relations. The war soon ceased to be European. It aroused every thinking man and woman. It revived influences of race and birth. Nobody was really neutral, nobody felt indifferent as to the outcome of the struggle, and therefore, no voter and no statesman could be vitally neutral.

Freedom of the Seas.—During the Civil War, from 1861 to 1865, the United States, as a belligerent, set precedents of restricting the movement of neutral commerce. In 1914 the American foreign trade amounted to nearly $2,500,000,000 in exports and nearly $2,000,000,000 in imports. Hence the natural tendency of the administration was to insist on the "freedom of the seas." This phrase in time of peace means simply that by the common consent of all nations, the open sea, outside a line of territorial jurisdiction, usually stated as three marine miles beyond the low-water mark, was free to everybody for fisheries and for passage.

So far did this principle go that certain narrow, as for example the straits leading from the North Sea into the Baltic, though less than six miles wide, were parts of territorial seas. Associated with this idea was the right of approach to the coast of every country for purposes of trade, and the right of vessels to be received in foreign harbors. Attempts of nations like China and Japan to forbid the approach of foreign vessels were repelled by threats and even by war.

In time of war the freedom of the seas was much more significant, for it included the right of a neutral to use the high seas as a free waterway to the ports of other neutrals or belligerents, and also to navigate in areas where belligerent vessels were moving about.

As soon as the war began, a series of limitations was placed by both belligerents on this free use of the world's waterway. In the first place, all the vulnerable coasts of the belligerents were protected by mine fields extending far beyond the three-mile limit, thus reserving long belts of water from commerce. Gaps and lanes were left in these belts, however, through which vessels could pass in and out under pilotage. The next disturbance was due to the presence of vessels in the war in the North Sea and Mediterranean. Where fighting was going on, it was plain that merchant vessels must move at their own risk. Great Britain (13 Oct. and 4 Nov. 1914) announced that "owing to the discovery of mines in the North Sea, the whole of that sea must be considered a military area. Merchant shipping of all kinds will be exposed to the gravest dangers." All ships were warned not to pass a line drawn from Iceland to the British coast.

The Germans made this an excuse for a
proclamation (4 Feb. 1915) to the effect that the waters surrounding Great Britain and Ireland including the whole English Channel are hereby declared to be a war zone. Enemy merchant vessels in the war zone could be destroyed without rescuing passengers and crews. An accompanying "memorial" held that Great Britain had in various ways violated the international law of naval warfare, the neutral powers had not insisted on their own rights, and the German government would not be responsible if one of them should become the victim of an attack intended to be directed against the vessels of the enemy.

One highly important stretch of water, the Straits of Dover and the English Channel, was throughout the war treated by the British government as in their sole military possession. Commerce was first restricted, and then compelled to find its way around the north of Scotland, which was a serious detriment to the trade of and with Holland.

The German assertion of sole control of broad areas of the sea was combined with aggressions on the rights of neutral vessels to humane treatment if captured. The British zone did not seriously interfere with American commerce, and no protest was ever lodged against it by the United States government. Vigorous protests, however, were made against the German theory of the war zone by several European neutrals and (10 Feb. 1915) by the United States. The matter was somewhat complicated by the attempt of Germany to prevent the use of a friendly flag, particularly the American, by the British. It appeared that this ruse, which had for centuries been frequent and was generally considered by international law to be innocent, gave offense to the United States which (22 February) asked both parties to discontinue the practice. No further trouble arose upon that question. The real grievance of Germany was that cargoes of American-made munitions were freely passing into English and French ports. Since it was not possible to stop them by capturing the vessels, they demanded the cessation of the shipments. In the correspondence on the war zone the German government warily complained (1 March 1915) of the export of munitions of war to any country; a long controversy followed as to the munition trade. The manufacture of powder, rifles, great guns, military equipment and machinery was an industry active in most of the great nations of the world. It had been a practice for many years that neutrals could supply belligerents with arms. In the wars of 1912 and 1913 in the Balkans the German Krupp firm sold cannon to the Turks and the French Creusot works sold to the Serbians.

International law was absolutely clear that there was no responsibility resting upon any government to forbid the manufacture and sale of munitions to any belligerent. Nevertheless, during the Mexican difficulties, under an act of Congress (14 March 1912) President Taft issued a proclamation "prohibiting the export of both arms and munitions from any port in the United States to Mexico." This was held by the State Department, however, not to apply to shipments consigned to the Mexican government. Subsequently (4 Feb. 1914) the order was rescinded by President Wilson.

The German government seized this prece-
of soldiers for foreign service within the territory of the United States. The collapse of the German sea power at once put a stop to the wholesale transfer of these men; and the few who got out and tried to reach their home countries. Emigration by roundabout routes were nearly all picked up by Allied cruisers, who took the ground (accepted by the United States) that "reservists" were rightfully considered as in the military service of their own country and were, therefore, contraband of war. The United States, however, took themselves undisturbed to England or crossed the border into Canada and enlisted there.

With them went thousands of American citizens who paid no attention to the President's proclamation against entering the military service of one of the belligerents. Some of them accepted commissions in the Canadian or British service, and thereby, under the terms of the United States statutes, forfeited their citizenship. This penalty was not applied at the time; and after the United States joined in the war, an act of Congress was obtained permitting such men to retain or resume their citizenship. In a few cases overseas cruisers seized men who claimed to be American citizens as German or Austrian subjects. In the case of Piepenbrink (April 1915) the United States successfully maintained the right of protection, even though the man had only filed his first papers of naturalization, and was not yet admitted to citizenship. Several thousand Germans were employed as seamen or otherwise on board German ships that were in American ports when the war broke out or entered for refuge. Practically all these men were liable for naval service in Germany; but they were allowed to remain on board their ships or to stay off into the general population. A few of them found their way home and entered the German service.

Five German ships of war took refuge in American ports and their crews were interned to the end of the war. These were the Geier and Loki (June 2, 1914), the Condor (November 14, 1914), the Prinz Eitel Friedrich (Newport News, March 1915) and the Kronprinz Wilhelm (Newport News, April 1915). A considerable number of the officers and some of the men broke the parole that they had given and escaped. The German embassy and the German government approved this breach of faith and excused it on the ground that the wording of the parole did not make the pledge equivalent to the German "Ehrenwort."

Several thousand Americans took part actively on the side of the Allies, and a few on the other side, by joining ambulance, medical and relief corps which were organized in America by individuals and societies, including the magnificent Red Cross Society. While not enrolled in the active armies, many of them served close up to the lines and under fire, and some were killed or wounded. Many entered the similar services and put on the uniforms of the belligerents. Others formally enlisted in the fighting branches.

Allied Restrictions on Neutral Trade.—The United States government as a neutral power found itself called upon to prevent certain forms of American trade, such as the sending out of provisions or other supplies to cruisers near the American coast. Several Germans were prosecuted and one of them (Buenz, agent of the Hamburg-American line) was convicted, for swearing to false manifests of the cargoes of ships expecting to leave the port of New York. Steps were also taken to prevent the dispatch of submarines was completed, although the shipment of fabricated parts to Canada, there to be assembled into submarines, was permitted. By an order of 14 Sept. 1914, the United States refused to give clearances to any merchant ships armed for self-defense, although such arming had been usual in earlier wars. Vessels, however, were allowed to carry a few small guns which could be used against a stern chase. Warships of all the powers were free to enter and leave port without augmenting their force; but the only German ship of war that was able to make use of this privilege was the fighting submarine U. 53, which put into Newport for a few hours in 1916. The merchant submarine Deutschland entered and cleared from Baltimore and from New London. The German merchant ship Odenwald attempted to put to sea from San Juan, Porto Rico (March 1915), but was compelled to return by the American batteries.

Nominally both the Central and Allied powers admitted the ships and commerce of the United States to their ports; actually, after the first few months of the war, very few ships reached German or Austrian ports; and it proved difficult to send cargoes to neutral ports, if of such a nature that they were likely to be re-exported to Germany or Austria.

The first serious controversy between the United States and Great Britain arose out of the detention of steamers in Gibraltar, and elsewhere, on the theory that it took time to go through the cargoes and select the contraband. Another grievance was that the British government seized neutral vessels and "illegally brought them within its territorial jurisdiction, compelling them to submit to the laws and regulations of that nation."

In a dispatch of 25 Oct. 1915, the United States assumed a championship for general neutral rights, in accordance with established rules of international conduct upon which Great Britain in the past had stored the United States to account. The State Department further declined to yield to the plea that "the exceptional geographical position of the enemies of Great Britain require or justify oppressive and illegal practices." The British government was referred to the policy of the United States upon this subject during the Civil War. There was further complaint that the British prize courts did not make their decisions upon the general principles of international law, but were guided by the Orders in Council of the British government from time to time.

On the question of unreasonable delays, the British government gave way, by directing more expedition and discrimination in the search of cargoes. The same result was reached, after some effort, with regard to interference with parcels and letter mail. The British government set up a regular practice of taking off the mails in either direction between the United States and Dutch and Scandinavian ports. This led to a formal protest by Secretary of State
WAR, EUROPEAN — AMERICAN NEUTRALITY (19)

(4 Jan. 1916) insisting that *mails are not to be censored, confiscated or destroyed on the high seas, even when carried by belligerent mails only.* The German government (4 April 1916) replied with the not very convincing argument that as much as 800 pounds of rubber had been sent in a single parcel post; they insisted on a right to open any sealed package which appeared to contain goods; but promised no longer to seize *real contraband.* Similar protests were made against the censorship of telegrams transmitted by cable and wireless, including money transfers. This whole question was complicated by the seizure of dispatches and private papers of unofficial agents who in many cases were spies of the German government. The documents of accepted ambassadors and agents were not thus restricted; though when the German Ambassador, von Bernstorff, returned to Germany in April 1917, under safe conduct, his baggage was searched at Halifax and correspondence which, in the judgment of the British authorities, was unofficial was seized.

Another difficulty arose from the seizure of certain subjects of the Allies on board American vessels. The most serious case was that of a party of German and Austrian subjects bound from the Orient to the United States on board the United States merchant ship China (1916). They were not military officials, and on the protest of the United States, they were eventually released.

**Controversies over Contraband.** — The failure of Great Britain to give sanction to the report of the London Conference of 1911 on contraband left that subject in a state of confusion at the outbreak of the war; for there was no clear understanding as to the status either of military material or of food. As the war progressed it became evident that many articles in common use in time of peace were also essential to the conduct of the war, such as automobiles, copper, flying machines, rubber and iron; and also that where all the available male population was enlisted in the army the distinction between food intended for the civil population and that intended for the army or navy was lost.

With the Central Powers there was little opportunity to test new theories of contraband. The only significant case was that of the sailing vessel William P. Frye, an American ship which, 27 Jan. 1915, was captured by the Germans loaded with wheat from Portland, Ore., the property of an American citizen, bound to English ports for orders. The German officers at first decided that the food cargo was non-contraband, and began to throw it overboard. They then changed their minds and sunk the ship with most of the cargo. The American government forthwith protested (31 March 1915) and demanded full damages for the value of the ship and the destruction of the cargo. The German government (5 April) held that the cargo was *conditional contraband* according to the Declaration of London. It then took up the Prussian-American treaty of 1828, under which it admitted that it was not authorized to capture the property of Americans even though contraband, although the United States had made no claim under the treaty. A tedious correspondence followed. The German prize court justified the seizure of the cargo and the destruction of the ship under international law, but admitted responsibility under the treaty. Arbitration was proposed, but no settlement was reached prior to the declaration of war by the United States in April 1917, which superseded any other proceedings.

Much more serious were the difficulties over contraband with the Allies, and especially with Great Britain, which became the recognized agent for the Allied Powers. On 6 Aug. 1914, the American government proposed to both groups of belligerents to adopt the definitions of contraband in the Declaration of London; with its classification into *absolute contraband* — arms, military equipment and warships; *conditional contraband* — food, clothing and materials for transportation by land and sea; and *non-contraband* — raw cotton and other textiles, rubber, hide, ores, paper, soap, etc., and also articles to aid the sick and wounded. The Germans accepted this proposal and that is why they tried to apply the Declaration of London to the Frye case.

The British reserved the right to make *additions and modifications* to the list in the Declaration. Their first serious move was that of Oct. 1914 much more stringent rules were laid down as to the effect of the destination of neutral vessels. From time to time thereafter, the British altered the lists to the growing disadvantage of Germany. Oil, being the fuel for motors and air ships, was early made contraband, raw cotton (21 Aug. 1915), wool, tin, castor oil, paraffin wax, lubricants, hides and ammonia (11 March 1915), and many other articles. France, Russia and Italy followed in the same path. The Germans abandoned the Declaration of London, and made up lists closely resembling the British (18 April 1915).

Had the British lost control of the sea, it would have gone hard with the American export trade under this severe doctrine of contraband; but England and France offered good cash markets for almost anything the Americans had to sell, irrespective of contraband. The pinch came when the British began to use nominal principles of contraband to cut off non-contraband trade. On 28 Dec. 1914 the American State Department lodged a protest against the extension of contraband, which, however, carefully refrained from discussing increases in the number of articles held contraband; it confined itself to the stoppage of ships bound on what Americans claimed were innocent voyages to neutrals. The British argument was that it was necessary to retaliate against and undercut the German practices; and that the statistics of export from the United States to Holland, Scandinavian powers and Italy showed vast increases, which could only be available for re-export to Germany. They also justified the stoppage of food shipments, when applied to a nation in arms like Germany, as necessary for the success of the policy of starving out Germany.

The prohibition of cotton was a heavy blow to the American producer, though the argument that cotton was raw material for explosives proved to be justified. The United States continued to insist that ordinary food shipments were not contraband; that to seize shipments and then reimburse the owners did not
relieve Great Britain from responsibility to our government; and that there was no right to seize cargoes simply because they might eventually reach the enemy. Later on Great Britain treated moments of time, which, up to this time, had not been definitely looked on as subject to capture in neutral vessels and was a striking addition to the ordinary principles of international law. There was, however, no redress from any of these seizures during the period of time when the United States associated itself in 1917 with the Allied Powers, any claim for later adjustment or indemnity on the ground that the British system was contrary to international law and the rights of the United States became exceedingly unlikely.

The Submarine Question.—The question of blockade did not stand by itself; in its extensions and applications it was adopted by Great Britain as a practical means of meeting a new and dangerous system of commerce war. For many years American inventors followed by Europeans had been working on a practicable form of submarine boat, which could discharge a self-propelling torpedo under water. When the war broke out, Great Britain had a large number of warships disposed of the German commerce and it was found impracticable to use the submarines in attacks on the German coast, chiefly because of mines. Since the Germans were unable to stop commerce destroyers at sea, except in a few cases and for a brief period, they sought to employ their submarines against Allied commerce. The German war-zone order of 4 Feb. 1915 was a prelude to a systematic policy of hunting out belligerent merchantmen with submarines. The British held this to be an unauthorized and illegal form of warfare, and President Wilson later laid down the rule that any use of submarines as commerce destroyers was contrary to international law. To this the German reply was that it was lawful to employ new means of warfare, and that it was justified further as a retaliation for the illegal action by the British.

The British Order in Council (11 March 1915) on that subject professed to be founded on a German war-zone of 26 January, by which a government agency was created to take entire charge of and distribute corn, wheat and flour. The British declared that this system nationalized the German food supply and made legal a policy of intercepting all food cargoes. Both the German and the English practices seriously affected the export trade of the United States, and the controversy was further aggravated by the seizure by the British government of the ship Wilhelmina (9 Feb. 1915) on a voyage from New York to Hamburg. Much of the cargo was not entitled to American register, but that question did not enter into the early proceedings. To the principle of the right to stop all food supplies going to Germany by any captures necessary to that end, the British government adhered to the last. Other important cases of American vessels seized or detained, which became the subject of diplomatic controversy, were the Neches (July 1915) bound from Rotterdam to the United States; the Seguranca (April 1915) bound to Holland but not consigned to the Netherland Trust, and the Wico (March 1915) with oil for Sweden. In all these cases the United States lodged a protest.

The submarine controversy quickly took on a new form through official requests from the German government to destroy belligerent merchant ships without the safeguards of capture at sea required by international law. No hail nor demand for surrender was thought necessary by the Germans; no chase was required; no examination of the contents in ascertaining the character or cargo of the ship; no attempt to put a prize crew on board and send the capture into a German port for the action of a prize court; no opportunity to the crew and passengers to save their lives was obligatory on the German commanders. These bold deviations from the accepted law of nations could not fail to involve neutral vessels, for no proper precautions were taken to distinguish between neutrals and belligerents. The Entente Allies at once protested that these methods were illegal and barbarous. The United States was speedily drawn in by the sinking of the British ship Falaba in Saint George's Channel (28 March 1915), causing the loss of 111 lives, including an American citizen. On 28 April, the American ship Cushing in the Irish Sea was sunk by a German airship. On 1 May the American steamer Gulflight was torpedoed without notice. On 2 and 10 April the steamer Greenbrier was destroyed by a mine near the German Coast. On 10 April the Harpole, a British ship bearing relief to the Belgians from the United States, was sunk on her return voyage, apparently by a submarine.

Protests were at once lodged and the Germans appeared disposed to make some repatriation, when (7 May 1915) the British steamer Lusitania was torpedoed without notice off the Irish Coast, and sank in a few minutes with a loss of 1,195 lives, of whom 114 are believed to have been American citizens. As soon as the facts were established the United States government protested. President Wilson in a public address (11 May) tried to calm the excitement, saying "There is such a thing as a man being too proud to fight"; but on the same day he completed a note (issued 13 May), absolutely denying the right to destroy either belligerent or merchant ships without notice, and calling on Germany to disavow the sinking. The President added, "The Imperial German Government will not expect the Government of the United States to omit any word or act necessary to the performance of its sacred duty of maintaining the rights of the United States and its citizens and of safeguarding their free exercise and enjoyment."

This was the beginning of a long diplomatic controversy. (The principal American dispatches are dated 13 May to 1 June). To each of these the Germans replied, beginning with a defense of the sinking of the Lusitania on the general ground of the right to destroy an enemy vessel in the only way that was safe for the crew of the submarine, and insisting that the Lusitania was a public armed vessel, carrying contraband. The Germans laid down the doctrine that neutrals who traveled on belligerent ships took their chance of destruction and particularly insisted that Germany had no responsibility to the United States,
for a printed notice had been sent out by the German Embassy warning Americans not to take passage on that particular ship.

Secretary Bryan soon found himself out of agreement with the President's strong remonstrance and repeated suggestion that such acts would lead to war; and he resigned (9 June 1915). Mr. Robert M. Lansing was appointed Secretary of State, but from this time it was understood that the vital dispatches on international questions were drawn by President Wilson. A decision by the Federal District Court of New York (In re Cunard Steamship Company 15 Aug. 1915) held that in fact and law the Lusitania was an unarmed merchant vessel.

The main point at issue in the controversy was the insistence by the United States that submarines must submit to the usual processes of boarding a prize, and must send the capture in for adjudication, unless (as was usually the case in captures by submarines) circumstances made it impossible to prevent the destruction of the ship. Only after the crew and passengers were given a reasonable opportunity of escape did the United States also stand by the principle that, as in times past, neutrals were entitled to avail themselves of belligerent merchant ships for employment or for passage.

In the face of this persistent assertion of rights the Germans slowly gave way, although the negotiations were interrupted (19 Aug. 1915) by the torpedoing without warning of the British ship Leinster, causing the loss of three American lives; for this act the German government made an apology. On 1 Sept. 1915 the German ambassador filed a memorandum in Washington in the following words: "Liners will not be sunk by our submarines without warning and without safety of the lives of non-combatants, provided that the liners do not try to escape or offer resistance." This was accepted as a German withdrawal from the submarine policy. On 8 Nov. 1915 the ship Ancona was sunk by an Austrian submarine, and Austria immediately apologized. During the next few months there were some minor cases, in which the facts were less clear. The controversy blazed up again on the torpedoing without notice of the British packet Sussex in the English Channel (24 March 1916) with loss of American lives. With great reluctance the German government at last admitted that a German submarine was responsible and promised amends.

Doctrine of Continuous Voyages.—More than a century ago the United States was engaged in a controversy with Great Britain over the question whether carrying a cargo from a belligerent port to a port of the United States (then a neutral) and thence to another belligerent port was a "continuous voyage" which would justify the capture of an American carrier. The United States stood for the principle that "free ships make free goods"; and insisted that if the cargo was actually unloaded and reloaded in the American port it was the object of the voyage, both of which were presumably innocent.

In the Civil War a similar question came up and the United States now took the ground that a cargo carried from Europe to a European colony and thence shipped, either in the same vessel or in another bottom, to a port of the Southern Confederacy, was engaged in an unneutral voyage and was subject to capture. The courts of the United States upheld such captures in the two cases of the Danmark, the Stephen Hart, the Volant, the Springbok, and others. The Supreme Court of the United States confirmed the principle of these captures.

Most of these decisions justified the captures on two grounds: the nature of the cargo if contraband, and the ultimate destination whether the cargo was contraband or innocent, if on the way to a blockaded port. All the captures of vessels not actually proceeding to or from a blockaded port which were approved finally by the Supreme Court, were for transfers in which both legs of the travel were on the sea, and the ultimate destination was an enemy belligerent (Confederate) port. In the Volant and Peterhof cases the destination was Matamoros, Mexico, whence the goods were to be carried over land to the Confederacy. In both these cases only the capture of the absolute contraband part of the cargo was justified; the ship and remainder of the cargo were released.

A very different system was inaugurated by Great Britain by a succession of Orders in Council and diplomatic notes beginning 1 March 1915. It was put forth first as "an embargo" and at no time was there a formal proclamation of a "blockade" although Sir Edward Grey (13 March 1915) asserted that "the British fleet has instituted a blockade effectively controlling by cruiser 'cordon' all passage to and from Germany by sea." This process, however, could not properly be called a blockade because it included restrictions on the entry of vessels into Scandinavian and Dutch ports, which being neutral could not possibly be subject to technical blockade. Furthermore, the Order in Council would constitute a practical assertion of unlimited belligerent rights over neutral commerce within the whole European area and an almost unqualified denial of the sovereign rights of those nations now at peace." Nevertheless, this remonstrance was not pressed home upon England, even when a list was drawn up by the American government, showing that from 30 to 55 American vessels had been compelled to interrupt their voyage at the British observation port of Kirkwall in the Orkney Islands. The controversy with Germany over the Lusitania turned public attention in another direction; and the United States practically submitted to the British interpretation of international law.

The policy of embargo, for it was not entitled to be called or applied as blockade, was vigorously followed. The British government refused to allow American vessels to coal unless
WAR, EUROPEAN — AMERICAN NEUTRALITY (19)

they would enter arrangement as to the nature of their cargo. It unloaded cargoes at its will and contented itself with paying the owners for them. It refused to permit shipments to neutral ports, and would not agree to re-exportation. As a military measure the English policy was completely successful. It cut off practically all neutral trade from overseas to Germany and Austria, not only in munitions and foodstuffs, but all commodities from the outside world, and thus prepared the way for the eventual defeat of the German nation and army. When the United States entered the war in April 1917 it forbore to press questions of injury or damages against its associates.

Breaches of Neutrality by the Belligerents.—At the beginning of the war, the British and French made little effort to influence public sentiment in the United States, and carefully refrained from raising international questions by using the United States Coast as a base; but when complaint was made that provisions were being sent from the port of New York to Allied cruisers at sea, the practice was at once stopped. On the other hand the Germans and Austrians found a sympathetic audience on the system of attempts to create public sentiment in their favor, and thence proceeded to engage in acts hostile, not only to their public enemies, but to the people and government of the United States. Before the war broke out a group of "spelbinders" was sent over under the command of Dr. Heinrich Albert, a German official. He engaged in secret propaganda, many of the details of which were later discovered and spent about $35,000,000 in hiring agitators, furnishing material for the press, buying newspapers, and so far as he could, organizing the German-Americans.

Albert and his agents were in constant communication with the diplomatic and consular officials of the Central Powers; but they were careful not to give any evidence of connection with the official propaganda for breaking up the munitions trade and setting on foot military and semi-military enterprises. They worked through a German University League, a Krieger Verein, and German Alumni associations. In some States they attempted to set up a German-American party and to defeat candidates not favorable to the Germans, and they did their best to marshal the German voters and aliens in the United States in a movement for urging Congress to put an embargo on the export of munitions.

An official cohort for propaganda and more active measures was managed primarily by Count von Bernstorff and Dr. Dumba, the Austrian ambassador and included also Captain von Papen and Captain Boy-Ed, military attachés. Many consuls-general and other consular officers were in constant touch with this organization. The first effort was to buy up the munitions factories or their products, and thus make them unavailable to the Allies. Next they attempted to send secret expeditions or aid to German cruisers at sea. They also made a systematic effort to get German and Austrian workmen out of the munitions factories and egged on some of them to go on strike. They planned several expeditions to destroy means of communication in Canada. They furnished aid and comfort to East Indians who were plotting on American soil against the British government in India. They subsidized secret factories of bombs intended to destroy ships leaving American ports. They ordered the sabotage of the German vessels in port, just as the United States entered the war.

The United States government made every effort to penetrate and break up these criminal conspiracies, and secured convictions in a considerable number of cases. Socially the most revealing: Captain Fritzzen, a German reservist, for an attempt to blow up the Welland Canal; Carl A. Luederitz, German Consul at Baltimore, for aid in securing a fraudulent passport; Captain Kleist, a naturalized American citizen, and Carl Schmidt, chief engineer of the German ship Friedrich der Grosse, making bombs on board that ship for the purpose of destroying vessels. Major von der Govtz, a German spy, gave evidence of another attempt to blow up the Welland Canal. Werner Holm, a German officer, received money from von Papen which enabled him to blow up a bridge connecting Maine with New Brunswick on the Canadian Pacific road. Paul Koenig, an official of the Hamburg-American Lines, was convicted of swearing to false affidavits that he had seen cannon on board the Lusitania. Wolf von Igel was an active agent in corrupting the journalists and buying up agitators; his papers were seized, and the German Embassy claimed them as official documents but declined to identify any of the papers. Franz von Rintelen, who had been active in founding an anti-munition organization called Labor's National Peace Council, was convicted of illegal attempts to prevent the shipping of munitions.

The United States government demanded and secured the recall of Captain von Papen and Captain Boy-Ed because of illegal acts for which they could not be tried on account of their diplomatic immunity. Dumba, the Austrian Ambassador, was dismissed (8 Sept. 1915) for conniving to get a false passport for one of his spies, and also for attempting to organize a strike to break up the munition manufacture. In addition to these offenses, which were proved by open court, the Government unofficially, were engaged in a tissue of plots which were subsequently revealed through documents of Albert, von Papen and others which were unearthed by the Department of Justice.

The Crisis of 1917.—The various phases of American neutrality here discussed were interwoven with each other. The war zone, submarine warfare, extension of contraband, blockade, continuous voyages, and control of neutral vessels in British waters were all different phases of the determination of the two groups of belligerents to destroy each other's commerce without reference to the previous restrictions of international law. In that process the commercial rights of all neutrals were certain to be restricted, and both parties were willing to push captures and condemnations to the farthest point that neutral governments would permit.

The British, however, were heavy and solvent buyers of American products; they are not chargeable with the sacrifice of a single life of an American citizen (as British, if not German) at the bottom of the Lusitania, nor with 320 destroyed by German submarines. In addition the British government paid for seized cargoes and in some cases for vessels or dam-
ages for detention, thus relieving the pressure of owners for action by the United States government. Even when from February 1916 to February 1917 the Germans restrained their submarine vessels from sinking ships without notice, they were sinking large quantities of Allied shipping. Occasionally, as in the Sussex case, they failed to give due warning. Their treatment of non-combatants, in Belgium, France, Poland, Serbia, Rumania, and their responsibility for the massacres of Armenians by the Turks created a rising animosity against them in the United States. The pressure was to some degree relieved by the efforts of the American government to facilitate peace, particularly the proposals of 8 Dec. 1916, formulated by President Wilson. This was followed (22 Jan. 1917) by President Wilson's address on "Peace without Victory." The Germans, however, had decided to return to submarine warfare in its most destructive form. On 31 January 1917 the German government gave notice at Washington that any ships found in a "zone" which included the seas adjacent to Britain, France, and Italy, "will be stopped with every available weapon, and without further notice." By an added presumption, lanes were described upon the Atlantic over which one American steamer would be permitted to pass every week.

It has sometimes been charged that this renewal of warfare was a violation of a promise made by the Germans in 1915. Reference to the discussion on this point above will show that the pledge was conditioned on the withdrawal of the embargo by Great Britain, which was never secured. Renewal of extreme submarine warfare was not, therefore, a breach of faith, but it was a clear breach of humanity and a denial of the accrued rights of neutral commerce. The argument that it was a retaliation for illegal British behavior had no force against the United States. Retaliation by one belligerent against another cannot be invoked to destroy a third and neutral power. The ground of the United States was that the freedom of the seas was not granted by or dependent upon the will of particular nations either in time of war or peace.

The renewal of warfare which was directed to the American government, and most of the American people, seemed murderous, was destined to lead to war. A suggestion had been made earlier that the difficulty might be avoided by forbidding Americans to accept employment or take passage on a belligerent ship liable to destruction by a submarine. In February 1916 McLeomore, a member of the House of Representatives, introduced a resolution to the effect that Americans ought not to travel on any armed merchant ship. This resolution was laid on the table by a vote of 276 to 142. When, in February 1917, the difficulty returned in a startling form, the President came forward with a plan for turning the tables by arming American merchantmen. A bill was proposed by the President (Feb. 1917) "to supply our merchant ships with defensive arms . . . and to employ any other measures or instruments that may be necessary to protect our ships and people in their legitimate and peaceful pursuits on the sea." The bill was defeated by a filibuster in the Senate; but on 12 March the State Department gave notice that "The Government of the United States has determined to place upon all American merchant vessels sailing through barred areas an armament sufficient for the protection of the vessels and the lives of the persons on board."

This armed neutrality was powerless to stop the progress of the war, and in any case could only have resulted in a sea fight which would have been the prelude to war. The German government made a frantic attempt (February 1917) to induce Ambassador Gerard to agree to a "protocol" for enlarging the guarantees of the treaty of 1828, which could operate only if there were war between the countries. On 3 Feb. 1917 the President informed Congress that he had broken off diplomatic relations and dismissed the German ambassador, a broad intimation to the Germans that the United States was not too pacific to accept its challenge.

The 31 Jan. 1917, the second inaugural address (5 March 1917) indirectly suggested war. The next step was to call Congress in extra session (9 March 1917). The Germans were already beginning to sink vessels on which Americans were passengers or members of the crew. On 2 April the President announced the protection of Congress to declare war; and on 6 April 1917 Congress passed a joint resolution to the effect that "the state of war between the United States and the Imperial German government which has thus been thrust upon the United States is hereby formally declared." The President thereupon issued a proclamation of war, and the long period of neutrality terminated. On 7 Dec. 1917, a formal act of war was passed against Austria-Hungary, but no such action was ever authorized against Bulgaria or Turkey, the Allies of the two Central Powers.

ALBERT BUSHNELL HART,
Professor of Government, Harvard University.

20. NEUTRALS AND THE WORLD WAR. The nations of the modern world are bound together so closely by political, social, economic and intellectual ties that any great war is inevitably felt everywhere. To a lesser degree this has been the case in the past, and much of international law is concerned with the rights and duties of neutrals. The interests of neutrals and belligerents constantly conflict. Neutrals wish to maintain as nearly as possible their ordinary relations with both sides; belligerents wish to prevent their enemies from receiving help from outside. Hence the discussions over blockades, contraband, the 'freedom of the seas' and violations of neutrality.

From the first day of the war each neutral nation faced the following problems: (1) that of keeping out of the war; (2) of avoiding neutrality acts by the government or its citizens; (3) of preventing any belligerent from violating its neutrality, and of securing satisfaction for unlawful acts; (4) of upholding its rights under international law of carrying on certain kinds of commerce with either belligerent; (5) of readjusting the whole economic life of ordinary times, meeting deficits, getting raw materials, providing for unemployment, etc.; (6) of keeping the people fed, clothed and warmed; (7) finally, of mediation, of helping to end the war, and in the meantime of mitigating its secondary effects.

In particular the neutrals have been affected by the use of mines on the high seas, the creation of war zones, the increasingly ruthless use of submarines by Germany, the lengthening lists of contraband, blacklists, interference with mails, use of neutral flags by belligerents, the forcing of concessions by the withholding of imports and compelling neutral ships to enter belligerent ports. The Allies through their command of the sea could control a large part of the imports and exports of the neutrals, particularly the Scandinavian countries and Holland. Germany through open land frontiers and across the Baltic had access to these northern neutral markets. Both belligerents tried to prevent supplies from reaching their enemies indirectly through neutrals, and demanded concessions or threatened reprisals whenever the other side seemed to be profiting.

The Netherlands.— At the outbreak of war Holland was on a defensive footing. The Dutch knew that German expansionists had long desired to control the mouth of the Rhine, the Dutch sea-coast and their colonies in the East Indies. For years Pan-German propagandists had been urging the Dutch to join a greater Germany. German capital had secured a tremendous economic hold in Holland. In court, army and business circles there were numerous German sympathizers. The nation as a whole, however, was firmly resolved to maintain its neutrality and independence. To join Germany meant the loss of the colonies to the Allies; to join the Allies meant to risk the fate of Belgium and Serbia. The spectacle of martyred Belgium made a deep impression on Holland, exciting sympathy, indignation and alarm. While many were pro-Ally, Dutch patience was sorely tried by British restrictions on trade, interference with mail and cables and use of coaling privileges to control the movements of Dutch shipping. German methods of search and seizure were also regarded as illegal. Protests were made to both sides on these matters, and also as to mines in the North Sea. Specific instances of violation of territorial neutrality by warships, aircraft or troops were resisted, or apologies were secured. Early in the hostilities the government forbade all belligerent warships to enter Dutch waters. This was extended to cover armed merchantmen. Soldiers who crossed the border were interned.

The government refused to publish its specific reasons for keeping a considerable force mobilized. Obviously by conquering Holland, Germany would have gained additional submarine bases and valuable rail lines to northern France; on the other hand a neutral Holland protected the vital Rhine industrial districts. On several occasions the Dutch suspected that Germany was trying to force a quarrel. At times, as in March 1916, it was rumored that the Allies planned to attack Germany through Holland. The most serious controversies were those with the German government over its submarine policy. Losses from mines and submarines began in 1914 and became steadily worse. Particularly critical were the sinking of the Katawo April 1915, the Tubantia and the Palembang, March 1916, and of six grain ships, February 1917. In some cases Germany apologized and offered damages, in others responsibility was disclaimed, or the sinkings justified.

Finally Holland, with Germany's consent, took over German shipping in the East Indies to replace some of the lost tonnage. On 20 March 1918 all Dutch ships in American and Allied ports were taken over, after German threats had prevented an agreement as to chartering them. Holland was to be paid and any losses made good. The Dutch government protested, but the measure though unusual was legal. Germany protested Holland's final acquiescence as an unnatural act, and brought on a crisis by demanding the right to ship grain and other supplies through Holland to Belgium. The previous autumn the government had brought pressure on Holland to stop such shipments. Holland yielded to Germany only in part.

The heavy expenses of mobilization and relief work necessitated emergency loans and increased taxes. At first business was disorganized. Stock exchanges closed and a moratorium was declared. Many industries, like the diamond-cutting of Amsterdam, were paralyzed. Later readjustments resulted in some war prosperity, but the profits were not
widely distributed. It was especially difficult to secure raw materials, food and fuel, to control re-exports to belligerents and to maintain trade relations with the Dutch East Indies. The government at different times took action to prevent the export of necessities, to fix prices and to ration the food supply. Poor crops (1915) and floods (1916) and through a food difficulties. Much discontent was caused by the government's failure to solve all these problems satisfactorily. The question of imports was largely solved by the formation in November 1914 of the Netherlands Overseas Trust, an organization of Dutch importers who were allowed by the Allies to receive goods on their guarantee that they would not be re-exported to Germany, or used to replace Dutch goods so exported. While some smuggling continued, the great flow of goods to Germany was checked. In spite of food shortage at home the Dutch managed to export some meat, fish and dairy products to both Germany and England in return for coal and other necessities.

Holland was naturally keenly interested in peace, and through Dutch intermediaries occasional informal attempts were made to initiate discussions. Pacifist groups, like the International Congress of Women (April 1915) convened in Holland to denounce the war, and to demand peace. Holland did much to relieve suffering. Besides caring for her own poor and unemployed, and the families of her soldiers, Holland supported over a million Belgian refugees, though many of them returned home later. Through Holland there went great quantities of mail and food packages for prisoners, particularly English prisoners in Germany. English-German exchanges and repatriations took place largely through Holland.

Switzerland.—Of the Swiss population of nearly 3,800,000, about 2,600,000 speak German, 800,000 French and 300,000 Italian. While the Swiss were patriotically united in their determination to resist attacks from whatever quarter, their sympathies were divided roughly along the lines of language. Some German-speaking Swiss, however, were alienated by the invasion of Belgium and by the whole German conduct of the war.

Although the neutrality of Switzerland had been guaranteed, the Swiss citizen army was promptly mobilized, and the larger part of it kept on guard throughout the war, in spite of increasing protests from the radical labor leaders. Occasionally alarming rumors were current that one side or the other planned a flanking movement through Swiss territory; but if such a plan was ever seriously considered the prospect of determined resistance, the mountainous character of the country, the moral disadvantage of an unprovoked attack and the doubtful military value of the step prevented its being undertaken. On several occasions when Allies, for German avails, territorial apologies were made. The government tried to maintain a strict neutrality, censoring press expressions that might cause trouble. In 1916 anti-German riots at Lausanne were suppressed and an apology tendered. In January 1916, much excitement was caused by the trial of two Swiss officers accused of betraying Swiss and Allied military information to the Central Powers, but they were acquitted.

The government early (1914) protested against Allied interference with Swiss imports, particularly grain. Protests were also made against the German submarine blockade, though at first it purported to allow shipments to Switzerland through the Faehnli point. Switzerland keenly felt the loss of the profitable tourist trade. Industry also suffered. Unemployment was for a time serious, calling for government action. Normally Switzerland imported chiefly foodstuffs, silk, coal and cotton, and exported manufactures of cotton and silk, watches and clocks, cheese and chocolate. The chief trade was with Germany. Much difficulty was encountered in securing these imports and in keeping industry going, neither group being willing to help Switzerland to help its enemies. In October 1915, the Swiss Surveillance Society was formed, corresponding to the Netherlands Overseas Trust, and in general agreements were concluded guaranteeing that manufactured goods should be sold to the enemies of the country furnishing the coal, raw materials and machinery that produced them. In spite of an increased use of electricity produced by water power, and the use of low-grade Swiss peat, Switzerland had to depend on Germany for coal, and in September 1916 obtained a supply in return for cattle, cheese and aluminum. In May 1918 Switzerland offered timber to the Allies in return for food concessions. Soon afterward came a negotiation exchanged with Germany for coal. France objected. The food question became increasingly serious. At the outset the government forbade food exports, and later there developed constant negotiation for supplies from outside, regulating prices and controlling distribution. By 1917 the Swiss were on compulsory rations. The Swiss were almost entirely dependent on the United States for grain, which was allotted to them and sent through in spite of submarines which sank it when possible, even in Spanish ships.

As a neutral adjacent to both groups of belligerents Switzerland offered opportunities for espionage and intrigue, and also for informal peace negotiations. German, relief efforts were most remarkable. Doctors and nurses served in the Red Cross on both sides. Belgian and Serbian refugees were cared for. Exchanges of seriously wounded prisoners were arranged for (1915) and carried out. Swiss societies located missing prisoners and reunited scattered refugee families. The Post Office forwarded great quantities of mail and food packages for prisoners. Through Swiss intermediaries went money for relief in Turkey. Invalid prisoners, especially those suffering from tuberculosis, were certified by Swiss doctors and interned in Swiss sanatoria. Through Switzerland civilians and occupants of invaded territories were repatriated.

Denmark.—In the memory of Prussia's seizure of Schleswig-Holstein and the fear of German conquest made most of the people suspicious of and unfriendly to the Central Powers. Long continued Pan-German propaganda, however, had made some impression. In spite of the hopelessness of all single-handed resistance, Denmark mobilized part of
the army, and strengthened the frontier de-

defense. A few violations of Danish neutrality

were apologized for, the most flagrant being

the destruction by Germany of the stranded

British submarine E13 in 1916. Danish ship-

ping early began to suffer from mines and sub-

marines. Early sales of food and supplies to

the belligerents brought a profit of about 20 per

cent to Germany, the rest for home use. Ex-

port butter was divided evenly; England re-

ceived five-eighths of the fish and Germany

three-eighths. Under government supervision

a considerable number of swine have been

slaughtered because of the scarcity of fodder.

On the whole Denmark fared much better as

to food supply than most other European

countries. During the war (1915) a more
democratic constitution was adopted granting

women suffrage. In 1916 the Danish West

Indies were sold to the United States. Added

expenses called for extra taxes and loans. In

1917 Denmark agreed to care for 1,200 invalid

prisoners (Russian, German, Austrian).

Norway.—Through common liberal institu-
tions, economic ties and intermarriage of the

royal families, Norway has been bound to En-

gland. Though sometimes the Allied blockade

aroused resentment, the chief anger of the

nation—at times bringing it to the verge of

war—was directed against Germany because of

the losses of shipping and life caused by sub-

marines. Some of the earlier losses were

apologized and paid for. By June 1915 34

vessels had been sunk. In March 1916 14

ships, including a German warship, were sunk.

By the summer of 1916, 769 ships had been

sunk, with a loss of 1,008 lives, and 53 were

missing with 704 on board, two-thirds of them

probably "spurious versenkten" by Germany. In

1916 all submarines were forbidden to enter

Norwegian waters. The trade, power of the

large Norwegian merchant marine proved
directly and indirectly of great service to the

Allies. Shipbuilding was greatly stimulated,

and shipping stocks earned large profits. By

1916 Norwegian merchants were signing con-
tracts against re-exporting articles allowed to

pass by the Allies. In 1917 England cut off

Norway's supply of coal, because of the ex-
port of pyrites to Germany, and only furnished

it again on condition that Norwegian ships

should sail as well as to Norway. Efforts were

made to develop Norwegian water power and

coal. In 1916 the British government contracted for 85 per cent of the

Norwegian fish catch. In 1918 the contract

was taken over by the Norwegian government.

With less than 4 per cent of its area

under cultivation Norway has always imported

a large part of the necessary grains. Since

1914, by the use of tractors, the home produc-
tion has been considerably increased. Govern-
ment control of food, and ultimately strict
rationing, were found necessary. Whale oil

was refined and used to make vegetables. In

May 1918 a treaty with the United States

allowed Norway to import, for home consump-
tion only, foodstuffs, coal and farming

machinery. In return timber, wood-pulp, fish,

metals for munitions and nitrates were to go to

France. While the bulk of Norwegian exports

got to the Allies, some were permitted to go
to Germany. Norway feared German resent-
ment, and as a matter of fact the German Cen-
tral Trade Board attempted to retaliate for the

American agreement. Internally, Norway has

seen further liberalization of the constitution.

In 1916 there were serious labor disturbances.

Sweden.—Of the Scandinavian countries,

Sweden has shown the strongest pro-German

sentiment. Long and close economic and eco-
nomic associations made most members of the

court (the queen is German), of army and

business circles, of the universities and of the

Conservative party generally, sympathetic to

the Central Powers. For years the fear of a

Russian advance across Sweden and Norway to

warm water, and apprehension of Russian

aggression in the Baltic, had made Sweden look
to Germany for protection. This feeling was
carefully stimulated from Germany. In the

war, however, Sweden declared for neutrality,
mobilized part of the army and made common

cause with Norway and Denmark in defending

their neutrality and their rights. A small but

aggressive "activist" party advocated interven-
tion on the side of the seemingly victorious

Central Powers, with the hope of securing the

Aaland Islands and Finland from Russia. The

Socialists and Liberals were strongly for peace.

Most of the people, even the Conservatives,

whatever their sympathies, favored neutrality,

if possible. In January 1918 export of atomic

ations was forbidden. In 1916 submarines were

forbidden to enter Swedish waters. Apologies

were secured for several violations of neutral-

ity, as in 1915, when Russian ships destroyed

a German warship inside Gotland, and in 1916

when a German cruiser fired on a Swedish

submarine. In July 1916 Sweden closed the exit
from the Baltic through Swedish

waters, but reopened it after a strong Eng-

lish protest. Perhaps by way of compensation,

10,000 horses were sold to Germany. The

action of Swedish diplomats in transmit-
ing German correspondence, notably the Lux-
burg dispatches from Argentina, aroused much

unfavorable comment, and was not approved by

Swedish opinion. Swedish-Russian relations

improved somewhat in the course of the war.

Trade was brisk. Railroad connections, long

delayed for strategic reasons, were made.

Through Sweden thousands of German and

Russian invalided prisoners were exchanged,

and much relief work was done. A crisis was

caused (1916) when Russia fortified the Aaland

Islands, but it passed when Russia and England

guaranteed that the fortifications would be re-

moved after the war. The collapse of Russia

removed the fear of that power. Sweden was
particular interest in Finland, where an important minority is Swedish. Beyond assisting refugees to escape, however, the Swedish government did not intervene. To preserve order, the Aaland Islands were occupied 19 Feb., 1918, and the action of Germany in displacing Sweden on 13 March increased the dislike and fear of Germany which had been growing since the submarine campaign grew more ruthless. To have the Baltic made a German lake, as for a time seemed inevitable, would have seriously threatened Swedish security.

Sweden also objected to British interference with imports and the mails, and by stopping mail for Russia (1915) became involved in a serious controversy. An arrangement was finally made reserving Sweden's right to claim damages later. Until 1916 Sweden refused to permit merchants to make the usual contracts with the Allies as to re-exports, and finally agreed only on condition that the Swedish government should supervise the working of the scheme in Sweden. In 1915 a limited amount of cotton and coal was allowed to pass by England. England and Germany both wanted Swedish iron ore. By treaty Sweden was bound to furnish a certain amount to Germany, and the government refused to stop this export. England however took an increasing share of the output. To England Sweden exported timber for mine-props, in spite of the fact that Germany declared this contraband and seized it whenever possible.

The food shortage was serious. Ordinarily over 12,000,000 bushels of cereals were imported, chiefly from Russia and Germany. Now four-fifths of this had to come from the United States, the rest from Argentina. Prices rose enormously. The government took control, forbidding exports, arranging for imports, selling food to the public at less than market prices, attempting to fix prices, requisitioning stores, rationing various articles, and finally adopting bread and sugar cards. The rye crop of 1916 was poor, partly because of lack of fertilizer. Fodder was scarce, dairy products fell off and many cattle had to be killed. A little food (butter and pork) was exchanged with Germany for coal. When England cut off the supply of oleomargarine, butter had to be kept for home use. At home increased use of wood and development of water power helped the fuel shortage. Some coal was produced by the Spitsbergen mines. Coal imports for the first six months of 1916 were 2,859,750 tons; in the same period in 1917 they fell to 634,138 tons.

In 1916–17 England cut off the supply of tanbark, thus crippling factories which had been making army shoes for the Central Powers. While many individuals made money out of war trade, and while bank deposits, imports and exports all showed an increase, the country as a whole suffered in many ways more than England. Part of the war profits were used to buy out foreign owners of Swedish securities.

Some Swedish Socialists were active in trying to bring the working classes of all the belligerents together, particularly after the Russian Revolution. Stockholm was proposed as a place to this meeting, but Allied opposition prevented it. An internal controversy, which had begun before the war, raged around the question of national preparedness and over the degree to which the king might act independently of the Ministry. Taxes and loans were needed to meet deficits. The elections of September 1917 gave a strong Socialist-Liberal majority and led to somewhat better relations with the Allies by June 1919. A trade agreement with the Allies and the United States, Sweden allowed 400,000 tons of shipping to be chartered to the Allies, and promised to facilitate the export of wood-pulp, steel and iron ore. In return import of food, leather, oil, cotton, etc., principally from Argentina and Australia, were permitted. Re-export of course was forbidden.

The war strengthened the ties between the Scandinavian countries. At several conferences of the three kings and their advisers questions of common interest were discussed, and programs of action decided upon. On several occasions identical notes were issued by the three governments (protesting against blockades and submarines, agreeing to Wilson's peace-terms note), thus emphasizing Scandinavian solidarity. By interchange of products (e.g., Swedish sugar to Norway, Danish butter to Sweden) the economic distress was somewhat relieved.

Spain.—Spain was more fortunate than the northern neutrals in being further removed from actual fighting. Nevertheless there was some danger of being drawn into the war, particularly through the German submarine campaign. Spain had interests and sympathies with both groups. A common Latin culture and an interest in Mediterranean questions binds her to France and Italy. Colonial interests in North Africa make it imperative to keep on good terms with the Entente naval powers. (The queen is English). A larger proportion of Spanish trade has been with the United Kingdom and France than with any other country. On the outbreak of war, Spain took over French interests in Germany and Austria-Hungary. In 1916 Spain gave assurance to France as to the Pyrenees boundary and Morocco, and withdrew some garrisons from the boundary of Portugal, then fighting as England's ally. On the other hand, trade relations with Britain had been getting closer. More German capital was being invested in Spanish enterprises. During the war it was thought that Germany was planning to make Spain a base from which to recover lost trade after the war. Thousands of Germans in Spain, directed from the embassy, carried on an energetic propaganda with considerable success. England's hold on Gibraltar and the French advance in Morocco were emphasized. German victory was spoken of as certain. A number of Englishmen were suspected of receiving German money.

The mass of the people were strongly in favor of neutrality. The war affected them chiefly through higher prices, unemployment and scarcity of food, against which was pressed resentment by occasional riots and strikes. Though the sympathies of the better educated classes were strong on one side or the other, relatively few advocated joining in the war. The Liberals, Republicans and Socialists, through their sympathies with radical and revolutionary France, were pro-ally, as were part of the professional classes. Partly through dislike of French anti-clericalism, the Church leaders, the
Clericals and the Conservatives, together with most of the army officers, were pro-German. Since the war materials were spent against the outrages in Belgium. The King personally appeared to favor the Allies, but he maintained a correctly neutral official attitude. He individually established a bureau to locate missing persons in the neutral zone. The government tried to be neutral and curbed violent outbreaks of sympathy for either side. It was repeatedly charged that German submarines were getting supplies at unattended places along the coast, which it was hard to guard properly. Several damaged submarines were interned in Spain, but one or two later escaped, apparently through the connivance of local officials. The Allied restrictions seemed to the Spanish irksome and illegal, but still greater resentment was aroused by the German submarine campaign, particularly after February 1917. By August 1918, one-fifth of the Spanish tonnage had been sunk, much of it outside the area covered by German decrees, some of it even in Spanish waters, with considerable loss. Out of the dilemmas, Cabinet finally announced that future losses would be made good temporarily by using equivalent German tonnage interned in Spanish ports. Germany would not agree to this. In October 1918 preliminary steps were taken for carrying out the Spanish plan, but hostilities ended before much was done. During the war there were a number of Cabinet changes, due largely to differences over internal questions. In foreign affairs, Liberal and Conservative and coalition governments alike adhered to a policy of neutrality, though Romanones rather favored intervention on the side of the Allies. The government was forced to resort to extra taxes and to loans, the latter being floated with difficulty. In 1916 Spain refused to join President Wilson in suggesting to the belligerents that they state their war aims, suggesting however the formation of an entente among neutrals to uphold their rights.

Internal problems had to do with the development of a more genuinely democratic government, administrative decentralization, the inauguration of a program of social and economic reform, the development of Spanish resources, the strengthening and reform of the army and the control of the committees of army officers, and the formulation of a more satisfactory Moroccan policy. These difficulties were of course intensified by war conditions. Internal economic problems caused much anxiety. At times embargoes on foodstuffs and raw materials were laid, and then relaxed. Scarcity of coal crippled factories and railroads. In March 1918 coal was selling at $45 a ton. The food shortage, though at times serious, was less so than in most other European countries. Part of the difficulty was caused by extensive exports of foodstuffs, including grain, sugar and wine, amounting in 1916 to $1,065,000,000 and in 1917 to $1,010,000,000. Imports of food were from one-third to one-half of these amounts. Part of the food scarcity, a number of which followed the United States, was unconnected with German activities—the United States brought pressure to bear by holding up the export of much-needed raw materials. In March 1918 an agreement was reached by which Spain was to send supplies to Pershing, and was to give France a credit for supplies, receiving in return permission to import oil and cotton from the United States.

South America.—The economic effect of the war were immediately felt in South America. As a continent, South America exports foodstuffs and raw materials, and imports coal, oil, foodstuffs and manufactured goods from Europe and the United States. South American countries are largely in debt and continue to rely on outside capital for further economic development of their resources. For some months the interruption of normal trade and the disarrangement of international credit caused depression and distress. Nearly everywhere a moratorium was declared. In Chile new taxes and additional loans were needed to meet governmental deficits. In Chile the export of nitrates was crippled, and with it the finances of the government. In Brazil, already suffering from a fall in price of rubber and coffee, disorders broke out among unemployed rubber collectors. By 1915 conditions began to improve somewhat. A determined effort was made by the United States and Great Britain to capture the large trade formerly done by the Central Powers. The increasing demands of the Allies for sugar, hides, copper, tin, rubber and nitrates caused a revival of exporting. By 1916 the Chile nitrates industry was more prosperous than ever. The Argentine had a market for all the grain for which transportation could be secured. The chief difficulty was with shipping, owing to the increased losses by submarines and the diversion of ships to more pressing uses. Freight rates rose very high. South American imports fell from $1,033,000,000 in 1913 to $889,840,000 in 1914, rising to $646,000,000 in 1916. Before the war between 15 per cent and 16 per cent of these imports came from the United States. In 1916 the percentage rose to 36, and 34 per cent of South American imports fell from nearly $1,160,000,000 in 1913 to $889,840,000 in 1914, rising to $1,233,000,000 in 1916.

Some questions of South American neutrality were raised. German cruisers in the early days attempted—sometimes with success—to obtain supplies and wireless information from South America. Britain protested. Chile, Ecuador and Colombia denied any neutral activities. The German cruiser Dresden was sunk (14 March 1915) by the British in Chilean waters. England explained and apologized.

South American shipping was not large, but it suffered its share of losses. The German submarine campaign of 1917 led to protests from most of the South American republics, a number of which followed the United States in breaking relations with Germany (Brazil, Peru, Ecuador, Bolivar, Paraguay, Uruguay). The action of Brazil, the Argentine and Chile was watched with particular interest. In both the Argentine and Brazil there were hundreds.
of thousands of German settlers among whom an active Pan-German propaganda had long been carried on. Germany's hope of extending political control over parts of these two states was well known. There were also hundreds of thousands of Italian settlers, many of whom — perhaps 50,000 — had been called back to fight in 1915. Their loss, and the stoppage of immigration, increased the labor shortage. In Chile the German trained army was said to be Teutonic in sympathy, but public opinion was divided. Argentina, which had a large German population, and Brazil, April 1917, Brazil a few weeks later "revoked her neutrality" in order to show Pan-American solidarity, and seized German shipping. On 26 October, following the sinking of the Macau, Brazil declared war. The Brazilian navy assisted in hunting for raiders and submarines. The Germans in southern Brazil made some trouble, but it did not prove serious. In the course of the negotiations between Argentina and Germany as to the safety of Argentine shipping, the German Ambassador, Count Luxburg, advised his government that two small ships then at sea should either be spared or "sunk without leaving any trace." The publication of this dispatch by the United States led Argentina to dismiss Luxburg. In September Congress voted to break relations with Germany, but on the repudiation of Luxburg by Berlin, President Irogoyen refused to take further action. A reference in another of the correspondences to "re-organizing" southern Brazil aroused anger in that country. By the end of the war South America had not recovered entirely from the initial depression. On the whole, however, the governments came through financially in better shape than might have been expected. Home manufacturing and the use of home resources were stimulated. The need of greater diversity of home products was realized. Germany's commercial hold was for the time broken, and the menace of political aggression ended. Pan-American co-operation and solidarity were increased, and closer political and economic ties with the United States established.

Assistant Professor of History, University of Chicago.

21. THE WAR AND THE SMALL NATIONS OF CENTRAL AND EASTERN EUROPE.

I. INTRODUCTORY.

One of the most important results of the World War is the political emergence and independence of several small national states which had previously been suppressed and denied a separate political existence or the full realization of their national aspirations. These new or greatly augmented national states include the Finns of Finland, Estonia and northern Livonia; the Letts and Lithuanians of the Baltic provinces of southern Livonia, Courland and their hinterland; the Poles of Russia, Prussia and Austria; the Czecho-Slovaks of Bohemia and Moravia; the Magyars of Hungary; the Rumanians of Transylvania, Moldavia and Wallachia; the Bulgars of the southeastern Balkan regions; the Jugo or southern Slavs, including the Slovenes, Croats and Serbs; the Albanians on the coast of the lower eastern Adriatic; and the Greeks in the extreme south of the Balkan districts and about the islands and shores of the Aegean Sea. It must be understood at the outset, of course, that the above-mentioned peoples were not all equally suppressed during the period before the war. Some had enjoyed at least partial political emancipation, while others remained entirely submerged in a political sense. But as a group they do constitute the "small nations" that figure prominently in current international problems. The general background of the emergence of the national aspirations of these peoples is discussed in the article on NATIONALISM, THE HISTORICAL DEVELOPMENT, in this Encyclopedia.

II. THE HISTORICAL AND ETHNOGRAPHIC BACKGROUND OF THE PROBLEMS OF THE SMALL NATIONS IN THE WORLD WAR AND AT THE PEACE CONFERENCE.

1. The Finnish Peoples.—The northernmost of these suppressed nations are the Finnish peoples of Finland, Estonia and northern Livonia. Originally constituting a portion of that early Nordic stock which inhabited most of the great plains and highlands from which the Teutonic and Scandinavian peoples, as well as the Finns, Letts and Lithuanians, have subsequently been differentiated, they have been forced north against the Lapps by the successive invasions of the Russian Slavs from the south. They were converted to Christianity by Bishop Henry, an English missionary, in the middle of the 12th century. In the 14th century Finland was annexed to Sweden and about 1350 Denmark, which had controlled Estonia, surrendered it to the Teutonic Knights. At the beginning of the 17th century, the vigorous Swedish monarch, Gustavus Adolphus, obtained for Sweden both Estonia and Livonia. While the Swedes were able to control the Finns politically for a considerable period, they were never able to impose their culture upon their Finnish subjects beyond inducing them to accept Swedish Protestantism. In 1721, by the Treaty of Nystad, Peter the Great obtained for Russia Estonia, Livonia and Courland, and by 1809 Russia had secured complete political control of all the Finnish peoples. For some 90 years thereafter the Finns enjoyed practical cultural autonomy, but in 1899 the advocates of the Russification policy of Pan-Slavism induced Nicholas II to extend these measures to Finland. The Finns, however, took advantage of the weakness of the tsar in the revolution of 1905 and compelled him to restore the Finnish constitution and to control the many liberal political reforms proposed by the Finns. A revival of Russification policy by the Russian bureaucracy in 1913–14 was partially terminated by the outbreak of the World War, but was probably instrumental in inducing the Finns to declare their independence from Russia in December 1915. From the racial standpoint the Finns are the leading authority on the racial distribution of Europe, holds that the Finns are a branch of that primitival Nordic stock which inhabited the region now known as Russia and from which they have been differentiated the Teutonic, Letto-Lithuanian and Finnish types. The Nords were pressed north by the invasions of the Alpine Slavs from the southwest. The Finns, having been massed against the extreme
broad-nosed Lapps in the north and intermar-ried with them, have acquired a tendency to-ward the best preserved representative of the so-called "Aryan" type. It is said that the intelli-
gent Lithuanian peasant has little difficulty in reading Sanskrit. The Letts, having been brought into proximity with the Lapps, are of the Estonian, the Swedish in commercial and inter-
national relations, and to a considerable degree in culture and religion; the Russian as the offi-
cial speech, and the Finnish as the national lan-
guage. The Finns number about 3,500,000, of whom about 2,500,000 live in Finland. In 1910
an authoritative estimate put the proportion of
Finnish-speaking peoples at 88 per cent and at
least that proportion are of a definite Finnish
stock. In religion the Finns are overwhelm-
ingly Lutheran. The strength of the national bond between the Finns of Finland and their
kinsmen in the Baltic provinces can only be
determined when the confusion and conflicting
claims growing out of the present war have sub-
side.

2. The Letts and Lithuanians.—Living next
to the Finns of Estonia are the Letts and the Lithuanians who inhabit the Baltic provinces
of southern Livonia and Courland and their
neighbor. The Letts dwell in the Baltic coast
region and the Lithuanians in the adjacent inland districts. While the Letts and Lithuan-
ians are physically identical and linguistically
and culturally closely allied, their history
has been at times widely dissimilar. That this variation began only after they had been pushed
upward to the Baltic by the oncoming Slavs can-
not be doubted. The conquest and colonization of the Letts by the Teutonic Knights was begun
in the 13th and 14th centuries. The Letts fol-
lowed the order into an acceptance of Luther-
anism, but after the order was dissolved in 1526
the Letts were later partitioned between Poland
and Sweden. It was not long, however, until
the Letts were united with the Lithuanians in a
common subjection to Russian rule. By the Treaty
of Nystad, in 1721, Livonia was ceded by Sweden
to Russia, and Courland was obtained by the
third partition of Poland. Lithuania has had
a much more distinguished history. At the opening of the 14th century there were three
Christian duchies stretching from the Baltic
provinces on the north to the Black Sea on
the south. In 1386 its grand duke, Jagello, married
Jadwiga, daughter of the king of Poland, ac-
cepted Roman Catholicism for himself and his
subjects and became king of Poland as Wladys-
law II. This purely personal union was
changed into a constitutional one by the Union
of Lublin in 1569. The merger with Poland was
never popular, however, with the Lithuanians,
and in accordance with the principle of national
self-determination this historical union could in
no way be used as a basis for a claim to Lith-
uania on the part of the restored Polish state.
Lithuania constituted the majority of that part
of Poland which was to the north of the partitions
from 1772 to 1795. Until 1876 it was al-
lowed a large amount of cultural autonomy, but
after that date the Russianification policy was pur-
sued with the usual result of only increasing the
national antagonism. In 1872, still more reso-
cnificantly, the Letts and Lithuanians are identical, both
being branches of the same primordial Nordic
race from which the Teutons and Finns were
also differentiated. The Lithuanian language is
one of the most interesting in Europe, being
the best preserved representative of the so-called "Aryan" type. It is said that the intelli-
gent Lithuanian peasant has little difficulty in
reading Sanskrit. The Letts, having been brought into proximity with the Lapps, are of the Estonian, the Swedish in commercial and inter-
national relations, and to a considerable degree in culture and religion; the Russian as the offi-
cial speech, and the Finnish as the national lan-
guage. The Finns number about 3,500,000, of whom about 2,500,000 live in Finland. In 1910
an authoritative estimate put the proportion of
Finnish-speaking peoples at 88 per cent and at
least that proportion are of a definite Finnish
stock. In religion the Finns are overwhelm-
ingly Lutheran. The strength of the national bond between the Finns of Finland and their
kinsmen in the Baltic provinces can only be
determined when the confusion and conflicting
claims growing out of the present war have sub-
side.

3. The Poles.—Of all the nations freed by
the war Poland can, perhaps, claim the most
notable and romantic past. Aside from non-
Polish elements, it once included Russian Pol-
land, Posen, East and West Prussia, and Galicia. Little is known of the origins of the
Poles—a Slavic people—before the founda-
tion of the vast Polish kingdom embracing most
of central Europe by Boleslaw the Brave (992-
1025). This abortive domain was divided in
1139 and not reunited until 1320. In the middle
of the 13th century the Teutonic Knights began
their missionary work and colonization among
the Poles and succeeded in converting them to
Roman Catholicism. The military success of
the Knights was not as marked as their theo-
logical progress; 24 years after the personal
union with Lithuania under Jagello, the Poles
and Lithuanians utterly defeated the Knights
in the battle of Tannenberg. In 1683 John So-
bieski, king of Poland, relieved Vienna and
saved central Europe from the Mohammedans.
The complete union with Lithuania at Lublin,
in 1569, gave Poland assurance of an ample ter-
ritory, but the state was so beset with fatal
weaknesses that decline and eventual exter-
nation extinction invited. The kingdom was ex-
tensive but lacked distinct or defensible bound-
aries; there were serious religious and racial
diversities; gross political, social and economic
unfairnesses existed; the partitions of 1772,
1793 and 1795 invited anarchy; and the control by for-
ign kings resulted in the exploitation of Polish
interests. The first partition between Prussia,
Austria and Russia in 1772, while unjustified on
the part of the partitioning powers, can stir lit-
tle sympathy, but not so with the second and
third partitions in 1793 and 1795. In the 21
years that had intervened the Poles had elimi-
nated many of the fatal economic and political
weaknesses that had previously endangered their
national existence and had given promising evi-
dence of being on the eve of a far-reaching
political renaissance, but the avaricious empress,
Catherine II, would tolerate no strong Slavic
state obstructing Russian contact with the west.
She arranged the partition of 1793 and 1795 which terminated the political in-
de,pendence of Poland. The national hopes of
the Poles were temporarily revived by Napo-
leon's creation of the grand duchy of Warsaw,
but that state did not last. After the fall of the
state, in November of 1815, of a kingdom of
Poland by the then liberal tsar, Alexander I.
This embraced much of the old kingdom of
Poland and was favored with the most liberal political constitution then in existence in Europe, but the Poles desired complete political independence and could not resist the contagion of the revolutionary movement that swept over Europe in 1830. Their revolt was speedily suppressed and the shortened kingdom was united with Russia. Encouraged by the growth of nationalism in Germany and Italy and by the benevolent but treacherous attitude of Napoleon III, the Poles made one last desperate attempt in 1863 to obtain their freedom. This rebellion was crushed with even greater ease than the revolt of 33 years earlier and a most brutal and thorough-going punishment was meted out to the gallant rebels. That policy of Russification then began, by means of which the Russians have since tried without avail to crush the national aspirations of their Polish subjects. The one exterminating compensation which the Poles have enjoyed since 1863 has been the fact that the coming of the industrial revolution to Russia made Belostok the centre of Russian economic life. That part of the Polish nation which was included within the kingdom of Prussia—a part of upper Silesia, Posen, West Prussia and the Masurian district of East Prussia—has met with oppression only less severe than that which their kinsmen received from Russia. But the rigorous religious, educational and agrarian policy of Bismarck and Bülow only served to stir the resentment of the Poles and to reanimate of their national spirit. Only in Austrian Galicia were the Poles accorded that degree of autonomy and liberal treatment which has made them partially satisfied to dwell in political subjection to another state. The Poles are a branch of the Slavic division of the Alpine race, but are much less broad-headed than their Czech and Slovak neighbors on the south, or even the Russians to the east. Their contact with so many different peoples has caused a considerable prevalence of racial amalgamation, and their language is a distinct western Slavic dialect. In religion over three-fourths of the Poles are Roman Catholic. The only notable exception is to be found in the 300,000 Protestants in the Masurian Lake district of East Prussia. The estimate of the number of Poles in Europe at the outbreak of the war vary from about 15,000,000 to 20,000,000, of whom some 3,500,000 lived in Germany, about the same number in Austria and the remainder in Russia.

4. The Ruthenians.—Stretching from southeast Poland to the sea of Azov is the district of the Ukraine, eastern Galicia, and part of Bukowina, the home of the Little Russians or Ruthenians. Roughly this is the region included between the Dniester and Dnieper rivers and coincides with the fertile "black-earth" district of Russia, the most productive cereal growing region in Europe. The Little Russians or Ruthenians of the Ukraine have had a most varied history. Settling in southern Russia in one of the most recent waves of Slav immigration, they were first welded into something like a southern Russian state, with Kiev as their capital by Yaroslaff in the first half of the 11th century. It was made a principality at least a veneer of Byzantine civilization. The kingdom lasted little more than a generation and the eastern part of the region was overrun by the Tatar invasion of the 13th century. In the 14th century the majority of the Ukraine was conquered by the expanding Lithuanian principality and was later included in the joint kingdom of Poland and Lithuania. In the middle of the 17th century an unsuccessful rebellion of the Ukraine led to the placing of the eastern portion under the suzerainty of Russia, but most of it remained with the Polish-Lithuanian kingdom until the partitions. Austria obtained the Ruthenians of eastern Galicia by the first partition in 1772, and Russia secured the remaining portion by the partitions of 1793 and 1795. Within the last 40 years there has developed a determined Ukrainian movement for independence from Russia which has been greatly stimulated by the same Russification policy that has been applied to the Finns, Letts, Lithuanians and Poles. The ruthless repression of Ukrainian national sentiment and activities by Russia in the early part of the war was probably responsible for the immediate growth of the independence movement in the Ukraine after the Russian revolution of 1917. Especially the Ruthenians are the purest of the Russian Slavs and the best Russian representatives of the Alpine race. They speak the truest of the Slavic dialects. Most of the inhabitants of the Ukraine are in the western part, in the Uniate Church. This was created in 1595 by the union of Brest-Litovsk, according to the terms of which the Ukrainians of the Polish-Lithuanian kingdom were made to accept the supremacy of the Uniate patriarch, while at the same time they were allowed to retain their Greek orthodox liturgy, ritual, ceremonial and organization. Farther east the Ruthenians are divided between the Uniate and the Orthodox churches. Liberal estimates place the total number of Ruthenians at about 30,000,000, of whom some 3,500,000 reside in Galicia, 700,000 in the Carpathian district of Hungary and about 50,000 in Bukowina. The others are, of course, found in southern Russia.

5. The Germans.—The east and west of the home of the Poles and Ruthenians is found the land of the Czechs of Bohemia and Moravia and of the Slovaks of western Hungary. Like the Poles, these peoples have had a distinctive history. The Czechs entered this district during the 6th century and were organized into the first Bohemian state during the second quarter of the 7th century. Absorbed by the transitory Great Moravian empire in the 9th century, Bohemia regained its independence in the 10th after the Magyars had overthrown the Moravians and absorbed the Slovaks. In 1086 it became an independent kingdom and during most of the 14th century its dynasty headed the Holy Roman empire. The height of its prosperity was probably attained under Charles IV (1347-78). The Hussite wars of the 15th century were not only of a religious nature, but were also a great national movement. In 1526, to gain the strength of unity against the Turks, the Bohemians accepted the personal leadership of the house of Hapsburg. Almost exactly a century later, as a result of the first episode of the Thirty Years' War, Bohemia lost its independence and there was a period of religiously imposed forcible conversion to Catholicism, which for nearly two centuries seemed to have crushed out the national life of the Czechs. In the first half of the 19th century, however, this was re-
kindled by the reaction of the nationalism aspects of the Napoleonic period upon Bohemia and by the arousing of Czechof interest in their national culture and history by a number of brilliant scholars, among them the linguist and philologist, Dobrovsky; the philosopher, Kolár; the archeologist, Safarik, and, above all, the historian, Fačík. The national movement in the early part of the century brought to a speedy and tragic end, but since 1868 the Czechs have maintained a steady campaign for the recognition of their national rights and aspirations by Vienna, the old Czech party demanding that Emperor Franz Joseph be formally crowned king of Bohemia at Prague, and the young Czech party looking forward to the more aggressive and ambitious program of uniting with the Slovaks, Ruthenians and Jugo-Slavs in the attempt to make the dual-monarchy a Slavic state. Racially the Czechs are much taller and more broad-headed than the Poles and, to a lesser degree, than the Ruthenians. In Bohemia and Moravia, however, there are large minorities of Germans which constitute about 36 per cent of the total population; in Moravia and 29 per cent in Moravia. Czechs and Slovaks use the Slavonic dialect of the Czechs as their national literary language. In religion the great majority of the Czechs are Roman Catholic, while the Slovaks are fairly evenly divided between Catholic and Protestant. Religion plays little part in the present national complex of the Czecho-Slovaks. In 1910 it was estimated that there were about 6,500,000 Czechs in Bohemia and Moravia and slightly more than 2,000,000 Slovaks in the Tatar districts of northwestern Hungary.

6. The Magyars.—Though the Magyars of Hungary and Transylvania are normally and quite correctly regarded as a dominating or governing nation, it is at the same time true that since 1335 they have been in varying degrees subject to the House of Hapsburg. The Hungarians, presumably an off-shoot of the Finns, came into the great plain of Hungary in the 9th century. They tried to push farther westward into Germany, but were decisively defeated by Otto I in 955. Hungary was divided among the Magyars as a wedge separating the northern and southern Slavs of central Europe and were organized into a stable state by their first king, Saint Stephen (997–1038). In the 12th century they began their expansion southward through Croatia to the Adriatic. By 1200 they had been converted to Roman Catholicism and had very generally adopted European customs and institutions. In 1222 King Andreas II issued the famous Golden Bull which served as the constitution of Hungary until the revolution of 1848. In the 13th century Hungary was overrun by the great Mongol invasion from Asia; the Hungarian army was crushed in 1241 and the country devastated. Recovering from this disaster, the Hungarians met the Hapsburgs in a number of Magnificent, the leader of the Turks, some three centuries later at the battle of the Mohacs, 1526. The Turks occupied the most of Hungary and turned the remainder over to the Hapsburgs. After the tragic war the Hapsburgs, with the help of the Huns, never regained their complete independence until the end of the present World War. In 1699, by the terms of the Treaty of Karlowitz, that part of Hungary taken by the Turks was returned to Austria and until 1848 the Hungarians enjoyed a large degree of autonomy under the Hapsburg emperors of the house of Austria. The promising revolution of 1848 failed primarily because the Magyars were unwilling to grant to the other nations of Hungary the same concessions from Budapest that the Magyars had succeeded in extracting from Vienna. After the creation of a temporarily independent Hungarian republic in the spring of 1849 the Magyars were overwhelmingly defeated by the Austrians and their Russian allies and were severely punished for their uprising. When the Hapsburgs were humbled by the double defeat of 1866, they found it necessary to placate the Hungarians by the arrangements of the Ausgleich of 1867, which created the dual-monarchy and raised Hungary nearly to a plane of equality with Austria. This important concession did not, however, give Hungary independence and it was most unjust to the non-Magyar majority in Hungary. The Ausgleich was framed to make possible the German-Magyar repression of the Slavs, and the rule of the Magyars over the Croats, Serbs and Rumanians in the attempt to Magyarize all of Hungary has been more brutal and severe than that of any other state except Russia. The exact nature of the racial derivation of the present Magyar population of Hungary is unknown. Ripley holds that they are the products of the intermixture of an original Slavic population with a Finnish minority which entered the plain of Hungary in the 9th century, conquered the Slavs and imposed their Finnish language and culture. He believes that in the mixture of the two races the Slavs were much the more numerous and that the modern Magyar is about one-eighth Finn and seven-eighths Slav, a fact which accounts for the present broad-headedness of the Magyars. The Hungarian language is a Germanic language and has considerable evidence of borrowing from the Turks. In religion the Magyars have since their conversion to Roman Catholicism been overwhelmingly adherents to this cult though there are a few Protestants. In 1910 there were about 10,000,000 Magyars in Hungary. Receding during the war, the Magyars were over 40 per cent of the total population. This number includes some 800,000 Magyars in Transylvania, which is chiefly inhabited by Rumanians. The most important repressed races were something over 3,000,000 Rumanians, 2,000,000 Germans, about 5,000,000 Slovaks, Croats, Slovenes and Serbs, 1,000,000 Jews, and over 500,000 Ruthenians. The readjustment of central Europe according to the principle of nationality at the Paris Peace Conference leaves Hungary one of the *small nations* of the future.

7. The Rumanians.—To the east of the Magyars and occupying the northern half of the great plain of the lower Danube are the Rumanians of Moldavia, Wallachia, Transylvania, eastern Bukowina, and part of the district known as the Banat of Temesvár. The product of a considerable mixture of races, these people were gathered under a political organization in the Danubian principalities of Moldavia and Wallachia after the retreat of the Turks who invaded this district in the 13th century. Under the leadership of Stephen the Great of Moldavia (1457–1504) they had become a power-
ful military state and for a time fought off the Turks with success, but were later overcome by these Asiatic invaders. According to the terms of the Treaty of Kuchuk Kainarji (1774) between Russia and the Turks, the latter were ordered to improve their rule in this region and to make amends for the wrongs done to the Rumanians by the Treaty of Adrianople in 1829 which secured for these two principalities practical autonomy from Turkey. In 1859 the inhabitants of Moldavia and Wallachia defied the Great Powers and united these two states in the Rumanian principality which attained complete independence in 1878 by the Treaty of Berlin and declared itself a kingdom in 1881. In recent years Rumanian nationalism has been greatly stimulated by the study of the Roman colonization of Dacia and the attempt of Xénopol and the Rumanian historians to trace the relationship between the ancient Romans and the modern Rumanians. The racial composition of the Rumanians is a complicated question, Ripley believes that the central substratum of the Rumanian people was an ancient Eurafican population that which originally settled Russia and constituted the progenitors of the Nordic race. Among these there settled a considerable number of Rumanian colonists in the 2d century. In the west the Slavs came in very large numbers following the 6th century. In the 13th century the Mongols swept over this district, and in the 16th the Turks conquered it. As a consequence Rumania is not homogeneous racially, but shows the predominant influence of the Slavs in the west and of the primordial long-headed Eurafican stock in the east. The Rumanians vary from very broad-headed in the Transylvanian district of Hungary to relatively long-headed in the region of the delta of the Danube, and are uniformly short and stocky in stature. The language of modern Rumania is a Romance dialect resembling classical Latin almost as much as some of the variations of medi eval Latin. This is in well-nigh universal use to-day among Rumanians. Perpetuated in parts of this region from classical times, this language has become a vital element of recent Rumanian nationalism and has been systematically ext erted and adopted since 1880, to the general exclusion of the previous Slavic and Turkish dialects. In religion the Rumanians are chiefly Greek Orthodox. There are about 10,500,000 Rumanians, some 6,250,000 living in Rumania proper, 3,000,000 in Transylvania, a little over 1,000,000 in Bessarabia, 275,000 in the eastern Bukowina and about 40,000 in northeastern Serbia. Added to these there are about 1,250,000 non-Rumanians living in what constituted the pre-war Rumanian state.

8. The Bulgarians.—Across the Danube to the south of Rumania are to be found the Bulgarians of the pre-war Bulgaria, and of southern Macedonia, southern Dobrudja, and eastern Thrace. Populated originally by the same long-headed Eurafican race that had settled the Rumanian portion of the lower Danubian plain, this district was invaded in the latter part of the 7th century by the Bulgars, an off-shoot of the Finns. They founded, in 679, the first Bulgarian capital which endured until the conquest of Bulgaria by the Byzantine empire in 1018. Under Tsar Simeon (893-927) the Bul garian kingdom developed to considerable proportions and became the strongest of the Balkan states. Recovering from the Byzantine conquest the Bulgars established a second king dom in 1186 which reached the height of its power under Ivan Asen II (1218-41). In the middle of the 13th century Bulgaria was ravaged by the Mongols and was finally conquered by the incoming Turks between 1340 and 1396. The beginning of the Bulgarian national revival dates from about 1830. The brutality of the Turks in Bulgaria in 1876 precipitated the momentous Russian-Turkish War of 1877-78. By the Treaty of Berlin of 1878 Bulgaria was granted autonomy from the Turk, but was un naturally separated into two principalities, Bul garia and East Rumelia. In 1885, the Bulgars broke down this artificial division and formed the united principality of Bulgaria. Twenty-three years later the Bulgars took advantage of the embarrassment of the Turks during the civil war of 1908 and declared their independence of Turkey and proclaimed Bulgaria as a kingdom. As the unhappy sequel to Balkan War of 1913 Bulgaria was estranged from the other Balkan states. Racially the Bulgarians are highly composite. In the west the contact with the Slavs has made the Alpine racial characteristics most prominent, while in the east the traits of the primordial Eurafican are more in evidence. The Slav is the most prominent of the Slavic races of the Balkan region. The Slavic occupation has left traces of the Asiatic racial traits. Swarthy in complexion and short in stature, the Bulgars vary from extreme broad-headedness in the west to long headedness in the east. The Bulgarian language is now a definite Slavonic dialect, the original Finnish language having disappeared centuries ago. In religion the Bulgarians are essentially Greek Orthodox, but the Bulgarian church is independent of the organization of the Greek Church. The best estimates put the truly Bulgarian population of Bulgaria at about 4,000,000 at the outbreak of the World War, which number constituted over 75 per cent of the total population, the remainder of the group being Turks. In addition to these there were about 1,250,000 Bulgarians in southern Macedonia under Serbian rule and a very considerable number in the hinterland of the northern Egean, in the Dobrudja district and in the portion of Turkey adjoining Bulgaria.

9. The Jugo-Slavs.—Extending eastward from the western boundary of Bulgaria to the head of the Adriatic Sea is found the home of the Jugo-Slavs (i.e. the Southern Slavs), the Slovenes of Carinthia, Styria and Kustenland; the Croats of Croatia; the Serbo-Croats of Slavonia, Bosnia and Herzegovina; and the Serbs of Serbia, Montenegro and a portion of the Banat of Temesvar. The Jugo-Slavs are the southern flank of the general Slav incursion into central Europe in the 6th and 7th centuries. They were separated from their northern kinsmen in the 9th century by the Magyar invasion which drove a wedge between the two branches of the vanguard of the Slavs. The Slovenes have never created an independent state, but have alternated between German and Italian control and are to-day primarily Germanic in most phases of their culture other than their language.
Croatia was the first of the Jugo-Slav districts to develop a strong and coherent political organization. From 800 to about 1100 Croatia enjoyed a distinguished existence as an independent duchy and then as a kingdom, but from the beginning of the 12th century to the present time it has been a part of the Austrian Empire. Serbia became a powerful kingdom in the 13th century and under Stephen Dushan (1351-55) developed into the most extensive Balkan power that has existed since the decline of the Macedonian empire. The independent Serbian kingdom was overthrown by the Turks at the Battle of Kossovo in 1389, and by 1459 the southern Slavs were completely conquered by the invading Turk. Serbia remained in a condition of subjection until the beginning of the national revolt in 1804. The right of self-government was obtained in 1830 and complete independence recognized in 1878. In 1903 the corrupt and Austrophile Obrenovitch dynasty was eliminated by the brutal assassination of the royal family. The Karadjordjevic dynasty which succeeded to the throne, in spite of its disgraceful mode of regaining power, brought to Serbia a more liberal and efficient political system and encouraged a revival of Serbian sentiment, which had been intensified by Austrian aggression in the annexation of Bosnia and Herzegovina in 1908 and the creation of Albania in 1912. The little mountain kingdom of Montenegro can boast of having been the Slavic state of the Balkan Peninsula to defy Turkish conquest. After three centuries of ineffectual attempts to conquer these warlike Serbs the Turks recognized their autonomy in 1799 and their complete independence in 1878. From the standpoint of race the Jugo-Slavs are the purest and finest type of Alpine Slavs. This is probably due to their more isolated habitat which has prevented as much intermixture of races as in central and eastern Europe. They are very tall and broadheaded brunettes, no finer of whom about 12,000,000 are Jugo-Slavs. Of the Jugo-Slavs a little over 8,000,000 are Serbs and 4,000,000 are Croats and the remainder mainly Slovenes. A recent estimate has summarized the distribution of the Jugo-Slavs as follows: Serbia, 4,500,000; Croatia and Slavonia, 3,000,000; Montenegro and Herzegovina, 1,900,000; Slovenia, 1,600,000; Dalmatia, 650,000; Istria, 403,000; and Montenegro, 440,000.

10. The Albanians.—To the southwest of Serbia are mountain districts of Albania, inhabited by a group of hardy, primitive and warlike mountaineers. Albania, a flat of the Austrian government, was advanced in 1913 from a tribal condition to independent statehood, in the effort of Vienna to shut off Serbia from an outlet to the Adriatic. Albania has had no distinct history but has existed as a group of warring tribes since classical days. Racially the Albanians are regarded by Ripley as identical with the Serbo-Croats, but other authorities hold that they are of Pontic and Thraco-Macedonian stock, the older pre-Slavic Mediterranean or Eurafri-can race. In culture the Albanians are a strange mixture of Greek, Slav, Turk and Italian. In religion the Albanians are divided between the Mohammedans, Greeks, Catholics, the Moslems being the most numerous. Certainly southern Albania or northern Epirus belongs to the Greeks on the basis of both culture and national feeling. It is estimated that there are about 1,000,000 Albanians living in the Albanian state, though there are many Albanians scattered about in adjacent districts.

11. The Greeks.—The southernmost extension of the Balkan Peninsula and its adjacent territory and island groups is inhabited by the Greeks of Greece, Epirus, western Thrace, Cyprus, the islands of the Aegean and the western coast of Asia Minor, who, whatever the actuality, regard themselves as the descendants of the Greeks of the Greek empire and the Ottoman Empire. The Greeks were conquered by the Romans in 146 a.d., but retained most phases of their culture and imposed it upon the Byzantine empire, founded by Constantine in 330 a.d. The Greeks of southeastern Europe and the Balkan Peninsula were converted to Christianity by Missionary St. Cyril, instead of being annihilated by the Turks. The Greeks of the Balkan Peninsula, wearing the costume of the nation, continued to use a language that is the same as that of Attic Greek in its basic form, although much modified. The Greeks speak a language which is a debased form of the ancient Attic Greek, but since the Hellenic revival of the last century it has been greatly improved and brought back closer to the classical form. In religion the Greeks belong almost without exception to the Greek Orthodox Church. There are about 4,500,000 Greeks
in the Greek state, about 2,000,000 in the Aegean Islands and along the coast of Asia Minor, some 150,000 in Egypt, nearly 200,000 in Macedonia, about 350,000 in the city of Constantinople and about 400,000 in western Thrace, where they constitute a majority of the population.

III. THE SMALL NATIONS IN THE PERIOD OF THE EUROPEAN WAR.

Only the briefest summary of the salient facts involved in the participation of the small nations in the hostilities of the World War can be attempted here. For a more detailed account the reader must be referred to the sections dealing with the military operations in the war. While there were many signs of the old national separatism among the Finns from the outbreak of the war, they participated in the military operations to a greater or less degree along with the other portions of the Russian empire, though the traditional enmity of the Finns toward Russia early led them into negotiations with Sweden and intrigues with Germany. The outbreak of the active revolt against Russian domination, which followed the March Revolution of 1917 in Russia, began in August of that year. In December 1917 the Finns declared their independence of Russia, and by the forced Treaty of Brest-Litovsk, March 3, 1918, Russia was obliged to recognize the full independence of Finland and to agree to evacuate Estonia and Livonia. Great Britain and the United States recognized the independence of Finland on 5 May 1919 and on 25 July of that year the Finns elected as their president the liberal statesman and publicist, Professor Stalberg. Down to the period of the German conquest the state of affairs in the districts inhabited by the Letts and Lithuanians was not widely different from that which obtained in Finland, as far as their relations with the Russian empire were concerned. Most of Lithuania was conquered by the Germans in 1915, but the Letto-Lithuanians were not yet disposed to accept the change of masters. The Teutonic conquerors stimulated the desire for independence, which was declared by the Lithuanians at Vilna in January 1918. They elected a king and requested recognition by the other states. The tsar had already made a proclamation promising autonomy to Russian Poland after the war, and also to German and Austrian Poland, in case Russia should conquer and hold them in the course of the war. The tsar’s anticipations as to conquest were not realized and the Germans began to occupy portions of Poland very soon after the outbreak of hostilities. Hindenburg’s severe defeat of the Russians at Tannenberg in September 1914 opened the way for the German advance and Poland was occupied in the summer of 1915, following the famous retreat of Grand Duke Nicholas in August of that year. By the Treaty of Brest-Litovsk Russia was forced to abandon Russian Poland.

The new state was soon recognized by several powers and a general recognition of the independence of Poland was included and implied in the Treaty of Peace submitted by the Allied powers to Poland on 28 June 1919. Following the Russian Revolution of 1917 the Ruthenians of the Ukraine showed signs of restlessness, promoted by the severity of the Russification policy during the early years of the war, and later in the year began a definite movement for independence. The Treaty of Brest-Litovsk provided for the Russian recognition of the independence of the Ukraine, but the Ruthenians suffered severely as a result of the accompanying Teutonic invasion. The Czecho-Slovaks fought in the early years of the war on the side of the Austrians, though without great enthusiasm. The nucleus of the Bohemian revolt was the group of Czecho-Slovaks who captured the Russians during General Brusilov’s great drive into Galicia and detained in Siberia. They refused to abide by the terms of the Treaty of Brest-Litovsk and rebelled and conquered the city of Vladivostok when the Bolshevist government refused them transit across Siberia to join the Allies. On 18 October 1918 the Czecho-Slovak National Council, sitting at Paris, drafted a declaration of independence. On 28 October a republic was declared, and on 14 November Thomas G. Masaryk, the distinguished statesman, publicist and Slavonic scholar, was elected the first president. The Poles, Ukrainians and Czecho-Slovaks entered into an armed conflict over disputed boundaries, and the Czecho-Slovaks were also involved in a disastrous conflict with the Soviet government of Hungary during the summer of 1919. The Magyars fought loyally with the Austrians during the greater part of the period of hostilities, but the development of the ultimate defeat for the Central Powers produced a separatist spirit in Hungary. On 17 October 1918 the Hungarian Diet declared itself independent of all bonds of union with Austria, save only the personal union and recognized the right of the independent Kingdom of Hungary. Charles of Austria was also the king of Hungary. On 3 November the Hungarians declared their complete independence of Austria and on 16 November a republic was formally proclaimed. The liberal régime established under Count Karolyi was overturned by the failure of the Allies to protect Hungary from invasion and by what the patriotic Hungarians regarded as the severe terms likely to be imposed upon Hungary at the Peace Conference, and a Soviet government was formed by Bela Kun and his associates. The refusal of the Allied Powers to deal with this government did much to retard the final settlement of territorial problems in central and southern Europe.

Rumania entered the war on 28 August 1916, when it looked as though an early defeat of the Central Powers was assured.
Rumania's action was also hastened by a practical ultimatum from France demanding her entry into the war on the Allied side. Poorly equipped and not taking sufficient care to guard their communications, the Rumanian forces rapidly invaded Transylvania as they had been directed by France in the military agreement, but in very speed, combined with the failure of the Allies to co-operate as they agreed, proved their undoing. They were attacked on their flanks and rear by Generals Falkenhayn and Mackensen with the armies of the Germans, Austrians, and Bulgarians. So swift was the reversal of the Rumanian fortunes that by January the enemy had driven the Rumanians out of Transylvania and had captured the most fertile portion of Rumania, its valuable oilwells, and the capital, Bucharest. A separate peace was forced upon Rumania, compelling the cession of the Dobrudja to Austria and Bulgaria, though Rumania was in part compensated by the addition of Bessarabia. With the triumph of the Allies at the close of 1918 the German forces were withdrawn, and the pro-German party ousted from power.

After a long period of haggling with the contending groups over the most favorable terms, Bulgaria went into the war on the side of the Central Powers in October 1913. The loss of Bulgaria was one of the most stupid and tragic blunders of Allied diplomacy, as about all that Bulgaria asked in return for aid to the Allies was the undoing of the injustices of the Balkan Wars, another serious error on the part of the Allies was the failure to carry through the only sane alternative policy, namely, to allow the Serbian army to anticipate the Bulgarian attack by a Serbian invasion of Bulgaria and the capture of Sofia, the key to the Balkans. The aid of the Bulgarian army helped materially to alter the whole military situation in the Balkans. Serbia and Albania were overrun, the pro-German party in Greece was strengthened and a year later the Bulgarians gave important assistance in the conquest of Rumania. The collapse of the Bulgarian military power, however, was rapid at the end. By a vigorous attack of the Allied forces which had been long in training at Salonica, the Bulgarian armies were divided and defeated in detail. The attack began on 15 Sept. 1918 and on the last day of the month Bulgaria surrendered unconditionally to the Allied forces.

Serbia was the first of the Balkan states to enter the war, the Austrian ultimatum of 23 July 1914 being the immediate occasion of the outbreak of hostilities. Austria declared war on Serbia on 28 July. Montenegro joined Serbia in the war against Austria on 8 August. The success of the Serbians varied in the opening campaigns. At first the Serbians successfully resisted Austrian invasion and themselves invaded Bosnia. In November the Austrians were able to capture Belgrade, but were driven out of Serbia in the following month. No important further developments came until the entry of the Bulgarians in the fall of 1915. Austro-German-Bulgarian forces invaded Serbia on 6 Oct. 1915. The Serbs fought brilliantly, but were forced to retire before superior numbers, and by 12 December the Serbian army had been forced to flee into Albania and Montenegro, from which a nucleus of about 125,000 made their way to Salonica and became the most active element in the Allied forces operating from that base. The Serbian disaster was due to the failure of the Allied military authorities to land a sufficiently large force at Salonica to intimidate the Bulgarians, win over the Greeks and save Serbia, and to the failure of the Allies to allow an aggressive campaign by Serbia by the moment of the discovery of the evident intention of Bulgaria to join the Central Powers. The fall of Serbia cleared the way from Germany to Turkey. Serbia was overrun by the Bulgarians, the royal family fled to France and the government was re-established, first at Corfu and later at Salonica. The Serbian army was reorganized and re-equipped at Salonica and participated with great distinction in the defeat of the Bulgarians in September 1918, and subsequently cleared the enemy out of Serbia and Albania. On 1 Dec. 1918 a union of all the Jugo-Slavs, including Montenegro, was proclaimed, though there has been some subsequent indication of restless over Serbia's annexation. In a considerable period before Italy's entry into the war she landed forces in Albania, 25 Dec. 1914. After the Serbian debacle the Bulgarians and Austrians overrun Albania in January and February 1916. In the winter of 1916-17 the Italians began to recover Albania, and by July 1918 they had joined with the Allied forces operating from Salonica. At the close of the war the Allied army was rapidly clearing Albania of the armies of the Central Powers. There has been as yet little evidence among the Albanians of any unified sentiment as to the type of government or mode of political union which shall prevail after the war.

Premier Venizelos of Greece made vigorous efforts to get Greece into the war on the side of the Allies, but King Constantine was notoriously pro-German in his sympathies and Venizelos was compelled to resign with his cabinet on 7 Oct. 1915. Venizelos continued to criticize the inactivity of the king and his party and on 28 Sept. 1916 he fled to Salonica and established a provisional government, which he regarded as in a state of war with Bulgaria and Turkey. His government was recognized by the Allies on 16 Oct. 1916 and it formally declared war on Turkey and Bulgaria, 25 Nov. 1916. The pro-Ally sentiment grew in Greece and on 12 June 1917 King Constantine abdicated, along with the pro-German crown prince, leaving the throne to his second son, Alexander. On 27 June Venizelos returned as premier of the new government. In the final Balkan campaign of September-October 1918 the Greek army took an honorable part. It will, of course, be understood that all occupied territory in the region of the small nations was treated with a varying degree of savagery and existed in a state of utmost physical suffering and economic deploration, especially in the cases of Poland, Serbia and Rumania.

IV. THE PEACE CONFERENCE AND THE ATTEMPT AT A RECONSTRUCTION OF THE SMALL NATIONS ACCORDING TO THE PRINCIPLE OF NATIONAL SELF-DETERMINATION.

1. The Difficulties in Applying the Principle of Nationality to the Reconstruction of Europe.——The principle of national self-
determination as applied to the reconstruction of Europe meant, in its most fundamental and in a general sense, the redrawing of the map of Europe, so that state lines would coincide with the ethnographic boundaries of the distinct national units which had been heretofore either thwarted in obtaining complete political unity or had been denied even political independence and existence whatever. This guiding tenet of nationality had, however, to be accepted by the Peace Conference with reservations and had to be governed by good judgment and by the enforcement of its enforcement would have resulted merely in a return to something near complete political anarchy. As Mr. Zimmern has pointed out:

“If the sentiment of nationality were admitted as a sole and sufficient claim for change of government, French Canada would pass to France, Wisconsin to Germany, and part of Minnesota to Norway, while the New York police would become agents of the new Home Rule government in Ireland. The theory which makes national feeling the criterion of Statehood can easily be reduced to an absurdity.”

Were there available space it would be most instructive to summarize what is known about the claims presented by the small nations at the Peace Conference. It is perfectly obvious that in many, if not most cases, the claims have embraced all the territory to which the most shadowy pretensions could be advanced, apparently in the hope that after extensive reductions in the original claims the territory assigned would be somewhat more than what each nation could hope to receive on the basis of the facts in the case. Such representative conflicting claims as those of Jugoslavia to Dalmatia, Istria, Fiume and Trieste; of Albania and Greece to Epirus; of Greece and Bulgaria to Macedonia and Thrace; of Greece and Italy to the Dodecanesian Islands; of Rumania and Bulgaria to the Dobrudja; of Serbia and Bulgaria to western Macedonia; of Rumania and Serbia to the Banat; of Rumania and the Ruthenians of Galicia to Bukowina; of Poland, Czechoslovakia and the Ukraine to eastern Galicia; of Poland and the Ukraine over their boundary line; of Poland to Lithuania; of Czechoslovakia and Poland to upper Silesia; and of the Poles and Germans to Posen and West Prussia afford overwhelming proof that the principle of strict fairness and a conciliatory and compromising policy have not guided these states or potential states in their negotiations at Paris. They have apparently decided to stake the future of their nations upon the success which might attend their haggling in the boundary market of Paris. While these extreme claims put forth by the small nations have created political and diplomatic problems of the first magnitude, they are so obviously out of accord with a true application of the national principle in the contested regions that they may be passed over without further mention. Attention may be given to a brief survey of what has so far been achieved by the Peace Conference in distributing the territory inhabited by the peoples of the Council for granting political independence to the suppressed nations.

2. The Achievements of the Peace Conference.—Any summary at the present time of the reconstruction of boundaries in central and eastern Europe must necessarily be unsatisfactory on account of the absence of a final and definite settlement of the problem by the Peace Conference in many of the areas where some sort of a redistribution of territory was rendered inevitable by the war. In particular does this statement apply to regions formerly a part of Russia or Hungary, for the Allies have steadily refused to enter into formal peace negotiations with the Soviet government of Russia or the late Soviet government of Hungary. In addition to this cause for delay in the settlement, there have been many others, especially the above-mentioned conflicting claims of the small nations and the secret agreements made among the Allied states during the progress of the war, which have been most difficult of fulfillment in harmony with the principle of national self-determination. Finally, the necessity of taking many plebiscites to determine exact boundary demarcation, and the difficulties inherent in this process through racial and national complications have operated further to obstruct progress.

As was stated in a previous paragraph the Finnish peoples have declared their independence from Russia and their statehood has been recognized by leading Allied powers. The exact details of the Russo-Finnish boundary cannot be determined, however, until the final settlement is arranged with Russia, and these negotiations manifest an unwillingness to treat with the existing Soviet government. The final arrangement of relations between Finland and Esthonia is still unsettled, though it seems certain that ultimately a single Finnish state will be established out of a unitary or semi-unitary character, though from the declaration of 1918 up to the present time Esthonia has asserted independence of both Russia and Finland. The Finns in both provinces have been involved in a serious difficulty in defending themselves against invasion by the Soviet government of Russia, which has shown as ardent a spirit of Russification and Pan-Slavism as was exhibited by Pobiedonostsef and Nicholas I. The Letts of Courland and the Latvians declared their independence of Russia in 1918 as the new state of Letvia. While the final disposition of the Lettish question must await the settlement with Russia, Mr. Balfour, speaking for the Allies, declared that until the ultimate settlement the Allies were willing to ‘grant provisional recognition to the Lettish National Council as a de facto independent body.’ The Letts, like the Finns, were attacked by the Bolshevik forces, and later their territory was occupied by the Germans under von der Goltz. He was compelled to begin withdrawal by an Allied ultimatum of 28 Sept. 1919, but the Letts have been obliged to resort to force of arms to insure and expedite the evacuation. Lithuania declared her independence in January 1918, and on 4 April 1919 proclaimed herself a republic and elected M. Smatona as the first president. The Peace Conference, however, failed to recognize Lithuanian independence. The aggressive Pan-Polish party supporting the Conference have urged the incorporation of Lithuania within the new Polish state on the ground of the historic union of the two nations before the partitions. The final adjustment will doubtless wait upon the Russian settlement, but it has been clearly shown above that neither the facts
of ethnography nor the principle of self-determination would warrant the inclusion of Lithuania within the new Poland. In spite of no formal recognition by the old Poland, none of the Allied powers have recognized the independence of Lithuania, the independence of Estonia and Latvia, and some lesser powers and Great Britain have recognized the independence of Lithuania. The action of the United States in delaying the adjustment of the Baltic situation is hard to defend; the only excuse stated being that it means a dismemberment of Russia, a process which has not actually depressed the representatives of the United States when it has taken place in other parts of the former Russian empire.

Of all the new states created or recognized by the Peace Conference Poland has advanced the most ambitious claims and has succeeded best in getting them recognized by the Conference. From Germany Poland has received about 28,000 square miles of territory, including most of Posen and West Prussia and some of southeastern Silesia. A plebiscite is to decide the settlement of the question of the territorial status of part of Lithuania and the Ukraine has prevented the Conference from agreeing to Polish annexation of Lithuania and absorption of eastern, or Ruthenian, Galicia. In spite of such opposition it seems likely that the Allies will allow a far greater Polish occupation of Lithuanian, Russian and Galician territory than ethnographic facts would justify. Confirmation of this opinion is to be found in the action of the Peace Conference on 21 Nov. 1919, when it turned over eastern Galicia to Poland for 25 years, in spite of the fact that the district is overwhelmingly Ruthenian in population. Poland, Germany and Czecho-Slovakia have engaged in a struggle of arms over the disposition of southeastern Silesia, prized by the contending parties on account of its mines and factories. The general treaty of peace submitted to the Poles by the Allies on 28 June 1919 was opposed by the former on account of the guarantees to subject nationalities living within Poland. The ultimate fate of the Ukraine was not definitely decided by the Peace Conference, but will be included in the Russian settlement. The Allied treaty with Germany abrogated the terms of the Treaty of Brest-Litovsk, and the Poles and Pan-Slavists have thus far prevented the Conference from recognizing the independence of the Ukraine by representing the Ukrainians as in sympathy with Bolshevism. It would seem, however, that the independence of the Ukraine will be sooner or later confirmed by the Allies, though there will be difficult boundary problems to settle, particularly the Galician boundary with Poland and the agreement with Russia over the disposition of Odessa. The Russian situation is still further complicated by affairs in Western Siberia. Bulgaria has, with the consent of this area, and there has also developed a distinct movement for independence.

The solution of the Czecho-Slovak problem has been in part reached by the Peace Conference. Its independence has been confirmed and some of its boundaries settled. The German treaty provided that the boundary with Germany should be the old boundary, with some slight cessions in Silesia to Czecho-Slovakia. The Austrian treaty, signed on 10 Sept. 1919, included the Austrian recognition of the independence of Czecho-Slovakia and the delimitation of the boundary with Austria, which followed, in general, the old boundary of Bohemia and Moravia, with some slight gains for the Czecho-Slovaks, especially on the east. It was also stipulated that Czecho-Slovakia should have access to the sea through Austrian and Hungarian territory. The boundaries with Poland and Hungary are still to be fixed. The nature of the union with Slovakia is unsettled. The Czechs desire the incorporation of Slovakia with Bohemia and Moravia; the Czecho-Slovaks desire independence, and the Magyars urge autonomy under Hungarian oversight. It is probable that the outcome will be some sort of a union with the Czechs. The settlement with Hungary has been greatly delayed by the effects of the depopulation and the defensible treatment of Carpathian Ruthenia and his government by the Allies, which resulted in the establishment of a Soviet government with which the Allies would not deal. The Austrian treaty gave to Austria certain of the German districts of western Hungary. The remaining boundaries will await final determination until the Hungarian treaty is presented. It seems generally admitted, however, that Hungary will have to surrender the Jugo-Slav districts, Transylvania, Bukowina, the Banat and Slovakia, and is certain to become one of the lesser of the "small nations."

The reconstruction of the boundaries of Rumania has not as yet advanced to any definite stage, owing to the failure of the Allies to adjust matters with Russia and Hungary, from which states Rumania hopes to receive her chief cessions of territory. At the present time it seems generally conceded that the Conference will grant to Rumania the Rumanian portions of the Banat and Bukowina, Transylvania, and a part of Bessarabia. Rumania has occupied both Transylvania and Bessarabia and has treated the latter with considerable severity. The pro-Russian party in Bessarabia protested against Rumanian methods to the Peace Conference on 23 Sept. 1919. The Rumanians in Transylvania have expressed a desire for union with Rumania and were annexed on 11 Jan. 1919. It is doubtful, however, if the Allies will assign to Rumania any more of Bessarabia than can be shown to be predominantly Rumanian in nationality, and thus far the Conference has refused to grant any of Bessarabia to Rumania. On 1 Nov. 1919, however, Rumania formally announced to the Peace Conference the annexation of Bessarabia. The relations between the Allies and Rumania may be somewhat altered on account of the recent Rumanian occupation of Hungary and the refusal of the Rumanians to evacuate it after Allied requests for such action. Among all the small nations of the Balkan peninsula Bulgaria has, with the consent of the Allies, received the most severe treatment at the hands of the Peace Conference. Instead of attempting to undo the injustices to Bulgaria which were included in the treaty following the
second Balkan War of 1913, the treaty handed by the Allies to Bulgaria on 19 Sept. 1919 actually intensified and increased the unfairness. While application of the principle of nationality to the readjustment of Bulgarian boundaries would require the cession to Bulgaria of Macedonia south of the Shar Mountains, of much of the hinterland of the northwestern coast of the Ægean, of Dobrudja south of Constanza and of eastern Thrace and Adrianople, the peace terms provide for an insignificant extension of Bulgarian territory whatever, but rather for some considerable contraction of Bulgarian boundaries. At four places on the Bulgarian-Serbian boundary slight rectifications are made in favor of Serbia, and Bulgaria is forced to give up to the Allies for subsequent allotment a large portion of Thracian territory on the northern coast of the Ægean. This temporary postponement of a final award of Thrace led to a vigorous Greek propaganda directed toward proving the rectitude and justice of the claims of Greece to this area. The Rumanian boundary remains unchanged, though there have existed some hints to the effect that Rumania will be urged to return to Bulgaria the strictly Bulgarian Dobrudja. In addition to territorial cessions, heavy economic burdens are imposed on Bulgaria by the peace terms and her army is reduced to an insignificant force of 20,000 men. An indefinite period of commercial access to the Ægean is included in the treaty. It is the opinion of the most alert and critical authorities that the peace treaty with Bulgaria was designed to make her continued independence so difficult, if not so intolerable, that she will seek union with the new Jugo-Slav state. While the situation will not be determined until the signing of the treaty with Hungary it seems certain that the Jugo-Slavs will attain unto complete political independence. The Austrian treaty recognizes the independence of the Serbo-Croat-Slovene State. Montenegro is to be merged with Serbia and the emancipated provinces in the new state. While the Serbian hegemony in the Jugo-Slav state seems likely to be unanimous opposition to Serbian methods, particularly on the part of the royal party in Montenegro and on the part of the Croats. Jugo-Slavia and Rumania seem destined to become the two great powers on the Adriatic, and they have already begun to quarrel over the disposition of the Banat. The fate of Albania has not been decided upon, but it would seem that the intense Albanian hatred for all of her neighbors will by a sufficient barrier to annexation by any of them and will require autonomy under the mandate of some great power other than Italy. While Greece presented to the Peace Conference an ambitious and not unreasonable aspiration (a section of Epirus, Thrace, Constantinople, the eastern coast of Asia Minor and a number of Ægean islands, including the Dodecanese islands held by Italy, she has not as yet been able to realize her aims. She seems destined to remain as the subject of a mandate of Thrace, the Asia Minor coast and most of the islands claimed. She appears to be blocked in the desire to obtain all of Thrace and Constantinople by the present Allied plan to constitute out of the remainder of Thrace a free state with Constantinople as its capital under a mandatory power. A sinister Italian intrigue in regard to Albania has prevented Greece from receiving her wholly just allotment in northern Epirus. But if Greece fails on account of Italian jealousy to obtain all she set out to secure there is no doubt that she will issue from the war stronger and more populous than at any other time since the fall of the old Byzantine empire.

If space were available one might carry this discussion into a consideration of the disputed territory in the extreme southeastern Europe and in western Asia, such as Kouban, North Caucasus, Azerbaijan, Georgia, Armenia, Syria, Mesopotamia, Persia, Arabia and the new proposed Jewish colony in Palestine, but this territory involves problems of so widely different a character and such relative ease of solution that they may be passed over with this mere allusion. The principle of nationality might in justice be applied to the reconstruction of western Asia, which has been freed from the rule of the intolerable Turk. While the Turk can claim, under cover of the national principle, a more or less independent state in Asia Minor, national independence should certainly be extended to Georgia, Armenia, Aria, Palestine, Arabia and Persia, and, if a sufficient demand exists, to the Zionist settlement in Palestine. The internal peace and order of these new states and their security against foreign aggression should, and doubtless will, be guaranteed through their supervision by a more advanced and powerful state according to the mandatory system. From the Anglo-Persian Agreement of 9 Aug. 1919 and the Anglo-French Agreement of 16 Sept. 1919 over Syria it would appear clear that France and England plan to take over the districts of western Asia which were dominated before the war by Turkey, Germany and Russia. It is difficult at present to predict how far they will respect the principle of national self-determination in this area. The candid analyst of political reconstruction on the basis of nationality will also be likely to be skeptical of any reasons brought forward for maintaining the mandate of the League of Nations to Egypt and Korea, though it might readily be conceded that the mandatory power in these cases should be exercised by Great Britain and Japan, respectively. As the Monroe Doctrine is recognized by the mandate of the League of Nations, it will devolve upon the United States to compel the respect of the principle of nationality in the western hemisphere and to require the small nations of this half of the world to abide by the dictates of international law and morality.

V. The League of Nations and the Small Nations.

In view of the fact that the League of Nations has not begun to function completely, it is obvious that its relation to the small nations can only be inferred from the sections of the Covenant which relate directly to this matter and from the interpretative discussions of the subject by leading publicists in Great Britain. It will very likely be apparent that the most fundamental relation of the League to the problem of the small national states which have been recently created or extensively increased in territory is its contributions to the lessening of the probability of
more wars resulting from the emergence of a greater number of national states. To bring into being more politically independent nations than have hitherto existed, without at the same time making provision for reducing the probability of war arising out of their mutual disputes, would be but an invitation to a recurrence of the interminable warfare which accompanied the rise of the national dynastic states of the 16th and 17th centuries. The probable causes of an increase of warfare arising from the addition to the number of independent states are chiefly disputes of a general nature between states, and quarrels among them or with greater states over matters connected with their boundaries. The League endeavors to reduce the probability of wars among all states, including the smaller states, which would arise out of general causes for open conflict by the provisions of Article VIII of the Covenant, providing for the reduction of armaments, and by Articles XI-XVII of the Covenant with the object of instituting the arbitration of disputes for the cruder method of adjustment through armed conflict. The reduction of friction which would inevitably arise over boundary disputes is met by the provisions of the much discussed and equally misinterpreted Article X of the Covenant, to the effect that "the members of the League undertake to respect and preserve as against external aggression the territorial integrity and existing political independence of all members of the League." If this article is enforced, as it must be if the League possesses any vitality whatever, the small states will be protected from the aggression of the larger states and of combinations of smaller states which desire to acquire their territory or terminate their political independence. No such policy as that contemplated by the Central Powers toward Serbia in 1914 would be possible if Article X were effectively enforced. It has been frequently argued that the obvious injustices in the redistri- bution of territory among the small states at the Peace Conference make it undesirable that the existing boundaries be maintained and that the perpetuation of the settlement arranged at Paris is vitally objectionable. In view of the fact that the present adjustment was the best that could be had under the circumstances and that its immediate disruption would bring a vastly greater disaster than is involved in the existing injustices, it is clear that the guarantying of the present arrangement against forcible violation is one of the most indispensable policies which could be devised in the interests of the advancement of peace. It is generally agreed by the authoritative interpreters of Article X that it does not mean that the present arrangement must remain permanent and inflexible, even in the face of voluntary desire to readjust boundaries. Some even maintain that it would be possible for the League to readjust its boundaries at any time it seemed desirable, but it would also appear that the large majority required for effective action in any such procedure would protect any small state against arbitrary intervention, whatever it might involve in the boundaries. One of the obviously desirable modes of future peaceable readjustment of boundaries by the League is the encouragement of voluntary and mutually beneficial unions among the small states which would increase their economic power and resources and harmonize with the admitted tendency of political evolution to produce large political entities, though care should be taken not to promote the formation of larger states of a distinctly antagonistic character. Again, in light of the consideration that these small states existed as a result of the oppression of minorities within greater states before the war, it is plain that they should not be allowed after their own emancipation to proceed to a similar oppression of lesser national minorities within their boundaries. While there is no specific guaranty of the rights of minorities included in the Covenant of the League, this important matter is provided for in the various treaties of peace arranged by the Paris Conference, which specifically and often in great detail stipulate the protection of minorities, and which will be enforced by the League if it becomes operative.

In regard to the organization and administration of the duties of the League there is an aspect which particularly relates to the small states, namely, the representation of the states in the various organs of the League. It has in the past invariably proved true that one of the chief obstacles to the efficient functioning of international bodies has been the difficulty of the smaller states to possess an equality of voting power and their equally evident aim to avoid assuming the impossible equality of duties and responsibility. That this weakness has not been wholly avoided in the present arrangement of the League of Nations is certain from the provision that "at meetings of the Assembly each member of the League shall have one vote," while at the same time it declares that "the expenses of the Secretariat shall be borne by the members of the League in accordance with the apportionment of the expenses of the International Bureau of the Universal Postal Union." It will be evident, further, that the small states will not contribute an equal number of soldiers or a similar amount of money to the cause of enforcing the actions of the League. It can be said, however, that this weakness is to some extent offset by the preponderance of the greater states on the Council. In view of this it will be apparent, therefore, in conclusion, that through the instrumentality of the League of Nations, and in that way only, can the lesser national states be emancipated and elevated to a position with a very considerable benefit to the totality of civilization and with no serious or dangerous drawbacks resulting therefrom.

Bibliography.—In view of the fact that the rise of nationality and its problems was the most important political development in the 19th century, the literature bearing upon the subject of national problems and disputes leading to and growing out of the World War embraces nearly all the political histories, general and special, dealing with the events and movements of the last century. The most serviceable guides which have yet appeared in English indicating the more important books in this whole field are E. B. Krehbiel's 'Nationalism, War and Society,' (1916); George Mathews, 'Great Britain's Boundaries and Critical Bibliography of Publications in English Relating to the Great War,' published as Part V of Albert E. McKinley's 'Collected Materials for a Study of the Great War' (1918); and 'The Causes of the War: What to
Read, published by the Council for the Study of International Relations (London 1918). Professor Dutcher’s bibliography contains much more critical comment on the books enumerated, but his list is limited to English and American publications. The English bibliography contains little critical discussion of the volumes enumerated, but is much more comprehensive, including the more important foreign, especially German, pamphlets and magazine articles. Each pamphlet covers the whole field of the modern history of both the great and small nations. See also Nationalism.

The meaning of the term Nationality and its allied concepts is dealt with in a number of books and pamphlets. A very clear discussion of its nature and relationships is contained in Ramsay Muir’s ‘Nationalism and Internationalism’ (1917), pp. 37 ff., and in Theodore Ruysen’s ‘The Idea of a Nationality’ translated by John Mez as Bulletin No. 112 of the ‘Publications of the American Association of International Conciliation,’ March, 1917. The best scientific demonstration of the lack of any correlation of race and land is contained in William Z. Ripley’s ‘Races of Europe’ (1899), Chapter ii. The whole subject of nationality is analyzed by Israel Zangwill in his little book, ‘The Principle of Nationalities’ (1917), a work of real literary merit and considerable critical acumen. A very clear demonstration that nationality in essence is a psychological and cultural fact rather than political is to be found in A. E. Zimmerman’s ‘Nationality and Government’ (1918), pp. 32-60. The principle of nationality is analyzed with great power, if in an unfavorable light, by Lord Acton in his essay on ‘Nationality,’ reprinted in his ‘History of Freedom and Other Essays’ (1909). An admirable syllabus indicating the most significant problems connected with nationality and giving the more important literature dealing with each field is to be found in Edward Krebs’s ‘Nationalism, War and Society’ (Part i).

On the history of the development of the national principle and system, see Nationalism, The Historical Development of. The most extended general discussions of the history of nationalism are to be found in Ramsay Muir’s ‘Nationalism and Internationalism’ (1917), and J. Holland Rose’s ‘Nationality in Modern History’ (1916), which admirably supplement each other. A good review of the development of national unity and national spirit in modern Europe since 1815 is provided in the brilliant volume on ‘The War and Democracy’ (1918), by R. W. Seton-Watson and others. While most of these writers are not unfair in their arraignment of the development of German nationalism, they create a very inaccurate impression by ignoring the exuberant development of an ardent national spirit in France and England in the last generation, and by dealing softly with the brutal and aggressive Pan-slavism of Pobiedonostseff and Pan-Germanism. The exuberant and aggressive and imperialist history of nationalism is yet to be produced, but there are three brilliant and incisive critical discussions: the above-mentioned work of Zangwill; ‘What is National Spirit?’ by James Harvey Robinson (Century Magazine, 1916); and ‘The War of the Nations’ by H. L. Haynes (Political Science Quarterly, 1914). For the details of the political history of Europe, in which the development of nationalism plays so large a part, the reader may be referred to the English Historical Review and to the standard manuals of Lynn Thorndike, J. H. Robinson, C. M. Andrews, C. D. Hazen, Ch. Seignobos, Robinson and Beard, C. J. H. Hayes and J. S. Schapiro. Andrews and Seignobos have produced works which are especially valuable for their synthesis of the economic and political factors producing the world of to-day. The recent period is covered more fully in Holt and Chilton’s ‘European History, 1862-1914’ (1917), and H. A. Gibbons’ ‘New Map of Europe’ (1915). Extensive treatments of the whole field are to be found in the volumes of the Cambridge and Oxford Historical Series.

The best general introduction to the problem of the small nations in its territorial and international aspects is, perhaps, the temperate and comprehensive essay by James Bryce ‘The Principle of Nationalities’ in his American lectures ‘Essays and Addresses in Wartime’ (1918), chapter vii. A moderate and well-reasoned plea for the political emancipation of the more advanced small nations is embodied in Thomas G. Masaryk’s ‘The Problem of the Small Nations in the European Crisis’ (1916). An excellent brief survey of the obstacles to the realization of this program is contained in chapters iv-vi of ‘War and Democracy.’ The best compendium of information in the English language relating to the formerly repressed and recently emancipated European nationalities, as well as those in western Asia, is Lothrop Stoddard and Glenn Frank’s ‘The Stakes of the War: a Summary of the Various Problems, Claims and Interests of the Nations at the Peace Table’ (1918). This work takes up in succession the various national and boundary problems in Europe and the Near East, gives a brief survey of the historical, economic, racial and territorial factors involved and then discusses the possible solutions which have been proposed, indicating in each case the elements of strength and weakness in the proposal. It is not a readable narrative, but frankly a semi-encyclopedic compilation, generally accurate and quite impartial. A more detailed analysis of the same field, with the author’s own solution of the problems involved in the reconstruction of the map of Europe, according to the principle of nationality, is set forth in Arnold J. Toynbee’s ‘Nationality and the War’ (1915). While not always recognizing the standards of impartiality, this is probably the most satisfactory work yet contributed in English to the analysis of the problems of national self-assertion. A work which purports to deal mainly with the linguistic basis of national units in Europe, but which in reality is a general survey, though not well proportioned, of the territorial, economic and political factors involved, is Leon Dommier’s ‘The Frontier and Nationality in Europe’ (1917). While not always accurate in the refinement of detail this is a most valuable work, giving a thorough analysis of the language problems involved in the question of the small nations, and supplying a large
amount of historical data. The National Geographic Magazine for December 1918, is wholly devoted to a long and interesting article on the "Races of Europe" by Edwin A. Grosvenor. While inaccurate in many matters of statistical detail and hopelessly confusing the terms "nation" and "race," this is a very interesting and valuable study with the admirable illustrations for which this publication is so justly famed.

Among the most valuable works of the detailed treatments of specific areas are the chapters devoted to the small nations in the appropriate volumes of the Cambridge Modern History; Reade, A., Finland and the Finns (1915); Lewinski-Corwin, E. H., Political History of Poland (1917); Hill, N., Poland and the Polish Question (1915); Phillips, W. A., Poland (1915); Gibbons, H. A., Poland and the Reconstruction of the Near East (1917); Sands, B., The Ukraine (1914); Steed, H. W., The Hapsburg Monarchy (1913); Von Schierbrandt, W., Austria-Hungary and the Allies (1917); Maurice, C., Germany and Her Allies (1917); de Besche, E., "The Case for Independence" (1917); Seton-Watson, R. W., "Racial Problems in Hungary" (1908); id., "Rumania and the Great War" (1915); id., The Rise of Nationality in the Balkans (1917); id., The Balkans, Italy and the Adriatic (1915); Mariott, L. W., The Eastern Question (1917); Miller, W., The Ottoman Empire (1913); Taylor, A. H. E., The Future of the Southern Slavs (1917); Peacock, W., Albania (1914); Savic, V. R., Southeastern Europe (1915); Waller, W. H., "Bulgaria and Her People" (1914); Petrovich, W. M., Serbia (1915); Forbes, Toyne, et al., The Balkans (1915); Polibius, G., "Greece before the Conference" (1918); Cassavetti, D. J., "Hellas and the Balkan War" (1914); Brailsford, H. N., Macedonia (1906); and Lupu, N., Rumania and the War (1919). The only scientific comprehensive analysis of the races of Europe and the Near East is contained in Ripley's (of the American Museum of Natural History) work, which needs a revision bringing it down to date and including the valuable ethnographic investigations conducted in the last 20 years. The problem of the disputed boundaries and the matter of establishing boundaries of different types is discussed by Holdich, Sir Thomas, in his Boundaries in Europe and the Near East (1917); and by Lyde, L. W., Some Frontiers of To-Morrow (1915). G. De Greef's important discussion of the futility and danger of purely political frontiers in his La organisation et la généralité des Sociétés (1908) is not available in English, but a general summary of his position is presented by A. A. Tenney in the Political Science Quarterly, September 1912, pp. 502-515. The geographical problems complicating the settlement of national claims are fairly well discussed by Dominian, but a detailed treatment of the geography of the Balkans in its nationalistic bearings is provided in Newbiggin, Marion L., "The Geographical Problems of the Balkans in their Relation to the Great European War" (1915), and in Hogarth, D. G., The Nearer East (1902).

The periodical literature dealing with these problems is very large in volume, especially since the Balkan Wars of 1912-13 and the World War. First and foremost in the list of periodicals discussing national problems in Europe must be put the recently founded New Europe, edited by a group of the ablest and most liberal of the English and other European historians. Its articles have given evidence of the best scholarship and a generally liberal and impartial spirit. The Journal of Race Development (now The Journal of International Relations), edited by Dr. H. J. Wilamowitz-Moellendorff, has given special attention to these problems during the progress of the European War. The National Geographic Magazine has published a large number of elaborately illustrated articles on the chief repressed nations of Europe during the last few years. Many of these have been of a high order. Most of them are referred to in the footnotes of Dr. Grosvenor's above-mentioned article in the issue of December 1918. The Geographical Review, published by the American Geographical Society, has recently printed several valuable articles dealing with European boundary problems. The New York Times Current History Magazine has devoted many pages to the discussion of the various national and boundary problems involved in European settlement. The numbers since the signing of the armistice in November 1918 have been especially valuable in this connection. A new semi-monthly periodical devoted entirely to the area under discussion in this article and entitled Eastern Europe was founded in September 1919. The New Republic and The New York Nation have also given much space to these questions, which have been discussed in a uniformly liberal and constructive manner.

Space does not allow a summary of the more important books dealing with the general problem of a League of Nations and its organization and functions. A good annotated bibliography on this subject by Frederick C. Hicks is to be found in Bulletin 134 of the Publications of the American Association for International Conciliation, January 1919. The standard treatment of the subject to date is the composite work edited by Stephen P. Duggan, The League of Nations: Its Principle and Practice (1919), with ample biography. Below is a list of references on the history of internationalism consult the bibliographies in Krehbiel, part III.

Harry Elmer Barnes,
Professor of History, New School for Social Research, New York City.

22. POST-WAR PROBLEMS AND RECONSTRUCTION IN THE BALKANS.

One of the greatest problems or series of problems which claim the attention of the statesmen of both the Old World and the New is to arrive at an equitable adjustment of the numerous and often conflicting claims of the Balkan states. These lands of southeastern Europe, so far from having reached a solution of their peculiar racial and territorial problems through the military operations in that theatre from 1914 to 1918, have emerged from the thrones of the conflict with greater and more puzzling complexities than ever before, with the possible exception of the new Serbo-Croat-Slovene State (Jugoslavia), formed from the kingdoms of Serbia and Montenegro, and the former Austrian crownlands of Bosnia, Herzegovina, Croatia, Dalmatia and Slavonia.

After the adjustment of the boundary and territorial claims of the several nationalities,
a most difficult problem in itself due to the fact that the populations of these states are more or less intermixed racially and linguistically, there remain for settlement the problems of providing adequate means for the transport of the produce of the agricultural and other products of these states and of affording to each an outlet for its commerce through a national seaport. Other problems of the period under discussion will be referred to in the course of the article.

The one great Balkan problem, past and present, is transportation. The elaborate system of Roman roads, improved and extended by the medieval republics of Venice and Ragusa, has well nigh disappeared. The Balkan lands to-day from the rest of central Europe chiefly because in the period during which the latter reached its most rapid development they lay prone under the heel of the Turk. As these Balkan peoples gradually freed themselves from the yoke of the Black interest, they found themselves economically strangled, partially because the most favorable trade outlets were in the hands of their powerful neighbors, Austria-Hungary and Russia, partially also because they were cut off from the sea through the natural obstacle in the shape of a mountain wall which separates the heart of the Balkan Peninsula from the Adriatic. This barrier (the Dinaric Alps) offers peculiar engineering difficulties to railroad and road construction from the interior to the coast, and such construction is also rendered impracticable by the fact that no amount of expenditure of labor and money can construct a good port along that coast. Piume is the logical outlet to the sea for Jugoslavia and is the only good port on that side of the peninsula. It is also the terminus of the one good railroad to the interior which reaches Belgrade through Agram. A railroad has been projected from Spalato to Sarajevo and thence inland to the heart of Old Serbia, but the capital needed is excessive in view of the probable returns, and the special construction problems it offers will require much time, hence this line does not promise a speedy solution of the Serbian transportation problem. A more promising line extends from Ragusa to Sarajevo, which renders valiant service subject to its limitations. To make this road of standard gauge is impracticable for the reasons already given. Another railroad project is the route from Prizren along the old road to the Gulf of San Giovanni di Medua. The objection to this from a Jugoslav viewpoint is that the latter port is Albanian territory. These routes practically exhaust the possibilities for a Jugoslav national seaport in Dalmatia, which is literally the lungs through which commercial Jugoslavia must breathe unless Salonica on the Aegean be opened to it through some arrangement after the manner of the German Customs Union or Zollverein. Such arrangement would naturally include Greece, within whose national territory the port of Salonica lies. Salonica is the only Jugoslav outlet to the sea apart from those on the Adriatic described at length above. A Balkan Customs Union would immediately make Salonica one of the most important ports in the Mediterranean system since it is the national outlet to the south for Thrace, Macedonia, Bulgaria and Jugoslavia. There has been proposed an inland waterway by canaizing the Vardar to the Morava and the latter to its junction with the Danube below Belgrade. Were such a waterway well developed it would become at once a large factor in the economic development of the countries concerned. A great extension must take place in the railway system of Serbia—even the Belgrade-Salonica main line is not a first-class road—to render it adequate for the heavy traffic of a modern state would entail a larger expenditure than the region concerned could well meet.

Bulgaria is in an equally bad position in regard to transportation facilities. The natural outlets for its overseas commerce are the ports of Salonica and Constantinople, neither of which lies within its borders. A trunk railway to Varna on the Black Sea affords considerable relief but the fact of its being located in the extreme eastern end of the country and on the Black instead of the Danube makes it inconvenient and expensive to use.

Salonica is the port of export for the new Greek territories acquired as a result of the Balkan Wars. It is not the logical port for most of the coast of Old Greece, in fact, it is really since 1914 that it has had much trade with Athens. There is a railway line from Salonica to Monastir through Ostrovo and it has been proposed to run a branch line from the last-named city to Avlova via Arygvrokastro and Kastoria.

Railroad and road building have progressed further in Rumania than in the other Balkan states (if we may classify Rumania as a Balkan state), and does not present the same difficulties. During the war, the great bridge near Tchernovoda, the only one on the lower Danube, was partially destroyed and for many winter months most of the country was cut off from the one port, Constanza (Kustendje), which is open the year round. During the war Rumanian and Serbian territory being the scene of actual campaigns, a large proportion of the bridges were destroyed. These were repaired temporarily but the transportation for a long time was greatly handicapped; floods and storms often carried off the temporary wooden structures and tied up traffic for days. In addition, about three-fourths of the rolling stock was either destroyed, worn out or carried away. The coming of peace did not secure the replacement of this stock from Germany and Austria-Hungary.

The Commerce Problem.—So much for the transportation problem; it now behooves us to inquire with whom are the Balkan countries to trade? These states cannot be expected to trade much with each other, since they produce for the most part similar commodities and their requirements are also somewhat similar. For the same reason there is no prospect of their developing a large volume of trade with Russia. Before the World War Germany and Austria-Hungary furnished the bulk of the imports, especially the manufactured goods, but they took no such proportionate part of the exports. Balkan merchants had become accustomed to the flexibility of the German credit system through their having transacted with German wholesalers for generations. Consequently at the end of the war they were unprepared to buy for cash in Allied countries, and
at the same time assume the burdens of an unfavorable exchange rate, shipping costs, risks and delays incident to commerce in countries prostrated by years of war. The Germans are beginning to recapture this business. Their opportunity to rejoin the world market is made more easy because of the stiff and antiquated credit systems and foreign trade methods of the principal Allied countries and also because of the existing trade routes and a network of railroads. Even Austria, that other great nation which had to be rest for a large part of the Balkan trade was going to the Allies through the port of Fiume was suddenly withdrawn and thrown open to central Europe over the old trade routes, when Italian soldiers occupied Fiume.

We might characterize as industrial parasitism the condition which already existed in the Balkans and was merely aggravated and brought into sharp relief by the war. The population had been rapidly increasing in size, externally at least, assumed a certain modernity through the use and on the basis of imported goods. Whole cities look in nearly all respects like those of western Europe—similar public buildings, railroad stations, parks, lights, etc. This is of ephemeral character because it is not a natural growth and these countries are unable to produce the goods on which it is based. Stop foreign trade for a considerable period and the railway cars and locomotives wear out and get out of repair. Not only is replacement, even of parts, impossible, but the mechanics themselves who do the work in normal times are very largely foreigners and their shop tools entirely so. The few shipyards get their engines and other machined parts from abroad. Dock machinery, cranes, all sorts of steel bridge materials, even railroad iron, must be imported, and these are only illustrative items out of myriads. This industrial dependency upon foreign nations causes the ruling classes in the Balkans to entertain perennial fears for the national existence and predisposes them toward diplomatic intrigue and militarism. Moreover, because of their lack of any considerable internal industrial base, these states lack the steadying and democratizing influence of a large, intelligent middle class.

Reconstruction.—Reconstruction is much simpler in the Balkans than in countries highly developed industrially like Belgium, France or Austria, because the population is still small enough to maintain itself without a very complicated organization. In the Balkans there existed neither a great aggregation of factory machinery to be carried off or destroyed as was the case in Belgium, nor in France, nor any highly articulated organization to derange by stopping production and killing large numbers of specially trained men. The total prostration of Austria following the war illustrates the point in question as does also the condition of the Balkan states during the same period. Austria needed food and raw materials from abroad to rehabilitate her industries while the chief wealth of the Balkans consists to-day as formerly in the produce of the soil. But here lies a difference year to year. Rumania and Serbia at the close of the war were about thoroughly stripped of the necessaries of life. In the towns people went without the most ordinary comforts—soap, thread, leather-goods, cloth and particularly every thing manufactured out of metal. In the villages life apparently had not been changed to any great extent mostly because its simplicity did not admit of change.

In the months following the close of the fighting many persons starved to death and more would have perished had it not been for the relief afforded by the American Food Commission and Red Cross. This must not lead us to suppose that these organizations saved the countries in question from complete starvation and Bolshevism. When there is a shortage of food, they reduce their already simple civilizations to still lower terms.

In the year following the close of the war the remarkable thing to note was that although many communities had lost practically all their draft animals and such rude farm implements as they possessed, in spite of mobilization and a pinching shortage of seed, both Rumania and Serbia managed to plant and harvest fairly large crops. In the months just preceding the harvest season the most extreme want existed all over Rumania, Serbia, Montenegro and Albania. Plenty of grain was harvested and much of it was available for export. A shortage of fats was pronounced but in many countries the poorer people always lack fats. Rumania, for example, has more pellagra than any other country in Europe. Americans have a tendency to overlook this superior resiliency of simple civilizations which are not mechanized to the extent that they are.

By the time Europe shall have resumed its full productive capacity industrially the Balkans will also have practically recovered their pre-war appearance (in fact none of them but Jugoslavia and Rumania really lost it). The great problem of European reconstruction here involved particularly affects the Balkan states because their population, while it has outgrown its primitive peasant stage, has not become industrially self-supporting. However, while Europe remains more or less crippled industrially, it is safe to say that the Balkans suffer less than the former great industrial centres of Europe.

The Race Problem.—Balkan race problems can be settled only by a general and naturally slow growth of tolerance. Redrawing the boundaries in Macedonia and Thrace has not solved the race problem because, as in most of the other disputed regions, the different races are settled by communities or villages and these hopelessly mixed up. In the lands allotted to Serbia from the former kingdom of Hungary are many communities of Magyars, Germans, Rumanians, and Jews as well as Serbs. In the new Rumanian lands are not only the same mixtures in different proportions, but in Bukowina are found Ruthenians as well, and in southern Bessarabia exists as variegated an assortment as in Macedonia itself. For territory to change hands is generally bad in itself, but when it has remained a long time in the possession of one state. An official language is adopted; postal, railroad and other officials of the new government assume their posts; and schools get under way. In the Balkans, however, a change of allegiance means a change of language, and this in turn involves the dismissal of a great part of the trained personnel, a serious matter in countries where illiteracy is general. The race problem of the Balkans can best be met by
a reasonable set of boundaries with a fair degree of permanency, and sufficient governmental liberalization in dealing with alien communities to make those boundaries tolerable. It must not be supposed, however, that such a couple will put an end to the race problem although it would do much to lessen friction arising therefrom.

Economic and Military Problems.—The race problem does not stand alone in the way of a peaceable settlement of Balkan ills; there are other elements, especially those of a military and economic nature, which enter into the problem and add to its complexity. With Turkey to the south, Hungary to the north and a mountain wall between them and the Adriatic, there was before 1913 little incentive or occasion for the Balkan governments to further the economic and commercial status of their countries, and they busied themselves chiefly with military affairs, politics and intrigue. In 1919 the jealousies between the states were particularly keen because the settlements ordered from Paris pretended to a certain finality and each state was anxious not to get the worst of an irremovable judgment.

During the sessions of the Peace Conference in 1919–20 these rivalries were exemplified by the numerous claims laid before that body by the Balkan states. For instance, Macedonia and Thrace of the Great European War were sought to be internationalized. These regions constitute one of the chief economic keys to the whole central Balkan region, of an interest at least equal to Constantinople itself to this particular section. A fertile strip of South Dobrudja of prime military importance was claimed by both Bulgaria and Rumania. The former claimed that if awarded to Rumania the latter would threaten the Rustchuk-Varna Railway and the chief Bulgarian port; while Rumania claimed that with this strip in the hands of Bulgaria the latter nation would be within easy striking distance of the Tchornavoda-Constanza Railway to the only port of Rumania which is ice-free. Both sides argued with historical phrases and presented more or less juggled race statistics, but the real reasons were chiefly military. A treaty of 1916 with the Allies gave Rumania the advantage here as also in the Banat to which the Yugoslavs laid claim; hence the treaty of 1917 of military and political importance was of almost equal importance with the racial.

The chief objection of both Rumania and Yugoslavia was to the proposal of the Peace Conference to limit their sovereignty over racial groups within their borders.

Hungary's attack on Rumania in July 1919 furnished the test case for the Balkans of the Paris Conference's ability and determination to enforce its decisions. After a brief but bloody struggle, the Rumanians defeated the Szekler troops in Paris forced the completion of this victory by the occupation of the Hungarian capital. This proscription the Rumanian army ignored, placed Budapest and eastern Hungary under martial law and requisitioned some 600,000 horses, 260,000 of them large, relatively — it is less than 5 per cent of what the Hungarians removed from Rumania during their two years' occupation. The big powers in charge of the Paris Conference apparently did not have the hundred thousand or so of available soldiers required to make a serious demonstration in Hungary; so the Balkans witnessed their failure to coerce either their enemies or their Allies. The Rumanians offered to withdraw if the Conference could send enough troops for police. It became morally impossible to use Italian troops in the Balkans, when D'Anunzio took possession of Fiume in defiance of the Conference, and the Italian government was evidently not able to make them obey that body. The United States Senate failed to ratify the peace treaty. Japan was too distant to be considered, and French diplomats showed no great hostility to the claims of either sister Latin power. Territorial ambitions being satisfied or laid aside as impossible, chauvinism will inevitably weaken for lack of focussed attention and the Balkan governments can and must at last turn their attention to the development and modernization of their respective countries.

Greece.—Greece was tranquil for the most part during 1919, perhaps because she had not the same immediate cause for concern over the settlement as had other Balkan states. Very little of her territory was devastated in the war. She is a maritime power, the first to be opened up to foreign trade after the armistice. She entered the war late, so that her human losses were small compared with those of Serbia or Rumania. The most important fact of all was that she remained financially solvent — Greek money being exchanged at uniformly higher rates than either French or Italian, at least during 1919.

Albania.—Albania lacks wholly a governmental system and its probable fate for a decade or more will be to remain under a mandate to one of the great powers. In this country there is a woful lack of communications and while the population is rather homogeneous as to race, it is divided among three religious faiths—Greek-Orthodox, Mohammedan and Roman Catholic — a potent source of friction in a backward state.

Bulgaria.—Bulgaria's payment of 2,250,000,000 francs under the provisions of the peace treaty does not seriously menace her financial solvency. The country was not devastated, and still contains incredible amounts of goods and livestock — a good deal of this of Rumanian and Serb origin. It is a country of small proprietors. The people are industrious and frugal, more favorably situated than were the French in 1870. Both the recent war and the most unfortunate one of 1913 are charged to the late King Ferdinand, who was a large factor in making the surprisingly liberal constitution, on paper, less so in practice. Both Bulgaria and Serbia have for years had single-chamber legislatures, elected by proportional representation. After Greece, Bulgaria probably will be the first Balkan country to recover from the war.

Serbia.—Serbia lost over half of her men in the war — about a fourth of the entire population. For all of Yugoslavia as at present constituted, about one-tenth of the population perished. The total number of $40,000,000 in the fall of 1915 have been added about $600,000,000 more by borrowings during the exile, while the country was being laid waste. Besides this $500,000,000 more in debts, the Jugoslovas formerly belonging to the Dual Monarchy must assume their proportion of
the Austro-Hungarian obligations. This is a crushing burden for the new state, and one billion dekaratnine for Transylvania, or 300 million for Bessarabia. The new government (led by M.M. Pribitchevitch and Davidovich), which stood for radical agrarian reform and a thorough amalgamation of all the elements of the nation, resigned in 1919 over the claim of the Peace Conference and League of Nations for partial sovereignty over national minorities within Jugoslavia. After two failures, the old Radicals (led by M. Protitch), managed to form a government; but Jugoslav politics may be regarded as very unstable. The Croatian Radical party is separate from the Old or Serbian Radicals. There is a Slovene Catholic party (old Serbia is Greek Catholic in religion). There are many socialists in the ex-Hungarian lands, and in Croatia, the National Club of the Right stands for autonomy.

Rumania.—Rumania’s internal affairs are perhaps the most inextricable of all. She had 220,000,000 lei ($44,000,000) in gold in the German Reichsbank, which sum was held by Germany to guarantee compliance with the treaty of Bucharest (May 1918). During the occupation, the Central Powers emitted through a private bank in Bucharest (Banca Generala Romana) over two billion francs (leu) in paper. Within the war, many purchases in the country, and even abroad, leaving the notes to the Rumanian government to redeem according to the peace of Bucharest. About three hundred and fifty million francs in gold and some securities, repurchased at the face value of the Crown, etc. (including the crown jewels), were sent to Moscow for safekeeping during the war. Nothing is known of the fate of this deposit. Presumably the Central Powers will eventually repay something of the stupendous sums they took from Rumania in money and goods, but the indemnities and reparations imposed upon them by the victorious Allies are so large in the aggregate as to make this a doubtful asset. Like Serbia, the occupied part of Rumania was stripped practically bare—the German official records, left behind, account for nearly four million tons, and livestock to a value of over six billion francs (pre-war valuation) have disappeared.

To cover over four billion francs in paper money alone (laying aside the question of a fairly large national debt and the financing of the reconstruction), there is in gold and securities a little over eight million francs, something like half of it in Russia—if it has not been stolen.

The Rumanian National Liberal party, led by Jan C. Bratianu, has divided all the crown and institutional lands among the peasants and also expropriated 2,000,000 hectares (nearly 5,000,000 acres) from the large proprietors, to be turned over to the peasants who actually work it. No proprietor can now hold over 500 hectares, and the only remaining estates even as large as this are those previously containing 10,000 hectares or more. The terms of the Bessarabian expropriation act were fixed by the local assembly, and are still more severe. Universal manhood suffrage was decreed for Rumania and Bessarabia in 1918; also a decree authorizing Jews who were actual residents to secure citizenship papers from the justice courts.

The chief opposition to the National Liberals comes from Take Jonescu. M. Jonescu began his career with the Liberals, seceded to the Conservatives in 1892, left that party to found a new one in 1908, returned to form a Conservative ministry in 1912, and is now leading a new split-off from the Conservatives known as the Conservative-Democratic party. He was strongly and consistently pro-French throughout the war. The old Conservatives are in bad odor because their leader, Marghiloman, formed a ministry under the Germans. General Ave- rescue’s “People’s League” has some following, especially among the peasants. It stands for mild reforms. The Social Democrats have been persecuted and prevented from maintaining any strong organization since the beginning of the war. There are many socialists in the cities of Transylvania and Bukovina, and communist doctrines flourish in the village communities all over the eastern part of what was Austria-Hungary. The Rumanian government has been handicapped in the persecution of radicals in these newly-acquired territories by the fear of making too many enemies. In Old Rumania there is less visible evidence of “Bolshevism” than in any country visited by the writer. In general, the Balkans are free from this, presumably because there are comparatively few town laborers, and the holdings in the country are generally small. For the moment, the main political issues in Rumania are the constitutionality of the Bratianu reforms and the question of whether foreign corporations shall be encouraged through large concessions to develop the country’s resources. One faction is favorable to Jonescu and opposed by the Bratianu government.

All the Balkan monarchies are decidedly limited, since the death of Carol of Rumania and the abdications of Constantine of Greece and Ferdinand of Bulgaria. King Ferdinand of Rumania is popular. He has maintained a scrupulously constitutional position since his accession in 1914. Prince Carol, who renounced the throne, had a number of escapades, and was regarded by many as erratic. Republican sentiment is strong in the lands taken from Austria-Hungary and Russia. This applies also to the ex-Hungarian parts of Jugoslavia. The Serbian king has had little power under the government since the assassination of King Alexander and Queen Draga in 1903, after an attempt at arbitrary rule. King Peter is popular in Serbia.

Reorganized Serbia and Rumania, the two great southeastern European states arising from the war, now have their political and economic centres of gravity on the fringe of the Balkan Peninsula, if not actually outside. The long-established trade habits and routes, political and economic machinery, centre in Budapest, Vienna and Berlin. They do not fit the new order; hence the future largely depends upon their necessarily slow reconstruction by the South Slavs and Rumanians. It is a stupendous task. If successfully accomplished, what we have called Balkan problems will be absorbed and integrated in the general European problem, and we shall hear no more of the "crude, raw races."

Bibliography.—The file of The New Europe for 1919 is the best written source: Consult especially Vak Primovac, ‘Economic Future of Jugoslavia’ (19 June); Jovan, Jovanovic, ‘The Jugoslavs in the New Europe’ (14 Au-
WAR, EUROPEAN—COSTS OF THE WORLD WAR (23)

gust); *P.3 'The Union of Montenegro' (4 September); Seton-Watson, R. W., 'Bulgaria Before the Conference' (28 August); also G. Clanton Logio's article (7 August); Lady Ellinor F. B. Grogan's (26 August) and a series by Constantine Stephanou—these three for the Balkan press of various nationalities. 

In The Balkan Review, beginning February 1919, the following are of interest: (1) On SERBIA: *The Adrastic, under 'Problems of Peace' (March); Vesinach, Mil. R., *The Aspirations of Serbia* (May); Yedowska, Dr. Yosep, 'Thoughts on the Adriatic Dispute' and Price, Crawford, 'Serbia's Financial Dilemma' (June). (2) On BULGARIA: *Thrace, under 'Problems of Peace' (April); Venizelos, M. E. K., 'Bulgaria and Thrace' (August). The August issue is called the 'Bulgarian Peace Number,' and contains much matter on that state, largely hostile, e.g., Price, Crawford, 'The Bulgarian Memoranda'; *Vardari* answers J. D. Bomrich's 'The Fate of Macedonia,' in the *Balkan Review* (April) and (2) On GREECE: The two articles cited above under Bulgaria, on Thrace; Politis, M. Nicholas, 'The Standpoint of Hellas' (May); Michalopoulos, M. A., 'The Economic Future of Greece' (June).

For recent economic information consult Economic Supplement to *Review of Foreign Press*, published fortnightly by London by the General Staff, War Office, especially 1919 numbers for 29 January, 12 February, 12 March, 29 April, 11 June, 25 June, 9 and 23 July. The issue for 24 Nov. 1918, contains a detailed exposition of the Bulgarian land situation. *Current History*, October 1919, summarizes United States Commercial Reports of 30 August on Rumania and 6 September on Serbia, under 'Among the Nations.' Under this heading will be found a monthly digest of Balkan events.

Marion Newbigging's *Geographical Aspects of Balkan Problems* (London 1915) gives a good general analysis of the transportation and other fundamentally geographical questions (does not include Rumania). For this and other Rumanian economic information, consult *Die Rumanische Volkswirtschaft,* a very fine, accurate little handbook published in Berlin, (1917), for the use of the German army in Rumania. The larger Austrian Army handbook, *Rumänien* (Vienna 1917, 785 pp.), is the most systematic statistical treatise on Rumania, but hastily compiled and not always accurate. The only way now to get up-to-date statistical information on the Balkans is to write or visit the appropriate ministry in the country, for the statistical annals of the Balkan countries are surprisingly good, but are always out of date even when issued—especially true now. The reports of the American Red Cross Commissions to the Balkans (Serbia, Montenegro, Greece, Albania, Rumania) contain valuable sections on economic and social conditions (so far available only in manuscripts). Dominiak's *Frontiers of Language and Nationality* (New York 1917) is a valuable and fairly accurate race handbook. Consult also Seton-Watson's *The Rise of Nationality in the Balkans* (London 1917).

Out of the flood of propagandist books and pamphlets incident to the Peace Conference, the following seem to have special merit: ALBANIA: *Memorandum to the Peace Conference* (International Conciliation, No. 128, New York, May 1919); in same issue, Mehmed Bey Konstant's article, 'The Albanian Question.' BULGARIA: Iaranaoff, Asaphage, *La Bulgarie economique,* (Lausanne 1919); Miszew, D., 'The Bulgarians in the Past' (Lausanne 1919); *America and Bulgaria and Their Moral Bonds,* (Berlin 1918); and *Public Instruction in Serbia* (Slovenia) (Lausanne 1919), statistical treatise; Stephanou, Constantine, 'We; The Macedonians' (Berlin 1919) and 'The Bulgarians and Anglo-Saxonism' (Berlin 1919).

JUGOSLAVIA: Jovan, Cvijic, has two very fine articles in the *Geographical Review:* "The Geographic Distribution of the Balkan Peoples" (Vol. V, No. 5, May 1915) and "The Zones of Civilization in the Balkan Peninsula" (Vol. V, No. 6, June 1915). The Hungarian views on both Jugoslavia and Rumania is ably discussed by Pivany, Eugene, *Some Facts about the Proposed Dismemberment of Hungary* (Cleveland, Ohio, 1919).

ROMANIA: Lugu, Nicholas, *Roumania and the War* (Boston 1919), contains a good discussion of peasant co-operatives and popular banks. Otherwise, it is rather trite, and the manuscript is evidently old.

M. M. Knight, *Lecturer on Political Science, Hunter College of the City of New York.*

23. COSTS OF THE WORLD WAR.

War costs are of two kinds, direct and indirect. Direct costs embrace all expenditures made by belligerents in carrying on hostilities; indirect costs include the economic losses resulting from deaths attributable directly or indirectly to the war, the value of property damaged or destroyed, the loss in production growing out of the transfer of men from civil to military pursuits, expenditures for war relief work, the costs of the war to neutral nations and the like. The direct costs of the European War, based on the latest available statistics, were $186,333,637,097; the indirect costs have been estimated at $151,646,942,560, making the total...
WAR, EUROPEAN — COSTS OF THE WORLD WAR (23) 647

war bill $337,980,579,657.* It has been possible to appraise the direct costs fairly accurately. Of necessity the indirect costs can only be estimated for there is no unit of measurement by which they may be computed, and it is obvious that they may be reduced to a dollar and cents basis. Even in trying to determine the direct costs of the conflict one encounters many obstacles. Some of the countries which declared war participated therein so slightly that they have not seen fit to segregate their war expenses from their general expenditures. Again, the figures given out by certain of the principal belligerents lack definiteness, and a tendency to exaggerate has been manifested in some of the statements. Furthermore, some of the big powers made expenditures which, for military reasons, have not been disclosed or with reference to which misleading information was given out. Nevertheless, the total of $186,333,637,097, mentioned above, is believed to be very nearly correct. The estimates of some statisticians, however, are higher. One authority has estimated that the seven major belligerents spent $475,000,000,000, and another, Edgar Crandall, in an address before the Institute of Bankers in London on 26 March 1919 asserted that the total direct costs of the war amounted to $210,175,000,000. Secretary of War, Newton D. Baker, has placed them at $197,000,000,000.

But notwithstanding all of these figures purporting to show how much money was spent to carry on the war, the fact is that it was fought primarily for the gold coin available at the outbreak of hostilities was not sufficient to have kept it going for more than 40 or 50 days. During the first three years of the war the average daily cost was $1,223,000,000. In 1918 it rose to $224,000,000. As will be shown by the following table, the amount of gold coin available in July 1914 was but slightly in excess of four and three-quarter billion dollars, or only a little over one-fifth of the sum that was spent for war purposes during the slightly more than four years of fighting.

### GOLD RESERVES AS OF JULY 1914.

These are but approximate figures. It is probable that the gold supply was considerably in excess of the total as shown above. In Great Britain, for example, there is supposed to have been about $615,000,000 in gold coin in excess of the reserve in the issue department of the Bank of England. France’s supply, likewise, appears to have been much greater than the table indicates. It is probable also that Germany had more gold at the outbreak of the war than she is credited with. Still, the war bill is so great as to make the fact apparent that had the nations been required to conduct the fighting on a cash basis it would have been impossible but a very short time. In order, therefore, to carry on the conflict for the more than four years it lasted, all of the belligerents had to resort to the issuance of notes, paper money and promises to pay. Considerable sums were raised for war purposes in some of the countries by taxation, but it has been estimated that almost nine-tenths of the money expended was raised by loans, that is, by the sale of government notes, bonds and other evidences of debt upon which, in certain cases, interest will have to be paid for more than 50 years.

Taking into consideration only net expenditures (determined by deducting from gross expenditures all advances to Allies) Germany’s war bill, exclusive of any indemnities she may be required to pay, exceeded that of any other belligerent. England’s bill was the next largest, France’s was third; that of the United States, seventh; Russia’s, eighth; Austria-Hungary’s, ninth; and Italy’s, seventh. These countries spent a combined total of $172,000,000,000, which when deducted from $180,000,000,000, the net costs of the war to all countries, leaves $14,000,000,000 to represent the combined expenditures of the minor belligerents. Below will be shown the war expenditures of each of the countries taking part therein.

### I. DIRECT COSTS OF THE WAR BY COUNTRIES.

#### Allied and Associated Powers.

**United States.**—Although the last great power to enter the conflict, the net war expenditures of the United States amounted to $22,625,252,843. This was almost 20 times as much as the pre-war debt of the country and, as has been said, almost enough to have paid the entire costs of the government from 1791 to the outbreak of the great European War. This represented an expenditure of over $1,000,000 an hour from the moment America became a belligerent down to April 1919, and was sufficient to have carried on the Revolutionary War for a thousand years at the rate of expenditure at that struggle. England, a participant from the beginning of the war, spent but a little over $12,000,000,000 more than did America; France, not quite $2,000,000,000 more, and Russia, about $30,000,000 less. These figures suggest that had the war lasted another year the expenditures of the United States would have equaled those of Great Britain and Germany. As it was, her gross expenditures (her net plus her advances to the Allies) totaled $32,000,000,968 and exceeded the gross expenditures of France by approximately $6,000,000,000. Her advances to the Allies amounted to $9,455,000,000 in round figures, and exceeded the advances made by Great Britain to other belligerents by about $1,000,000,000. About two-thirds of the gross amount expended by America was raised by loans; the remainder by taxation, the plan from the beginning having been to pay one-third of the war bill out of revenues. This policy necessitated tremendous increases in taxes. Very few things were omitted from the taxable list, but incomes and war and excess profits were made to carry the greater part of the burden. Among other

---

*These are the figures of Prof. Ernest L. Boyce of the attitude, "Direct and Indirect Costs of the Great War," published by the Council for International Peace, and are considered as perhaps the most authoritative work yet issued upon this subject.
increases the tax on distilled spirits was raised to $0.40 a gallon. Between the time America entered the war and May 1919 five government loans were issued. The first four were known as Liberty Loans and the fifth as the Victory Loan. The yield from these, to which will be added the approximate yield from the sale of War Savings Certificates, was as follows:

**UNITED STATES LIBERTY LOANS.**

<table>
<thead>
<tr>
<th></th>

</tr>
</tbody>
</table>

Subscriptions to the first loan amounted to $3,035,226,850, an over-subscription of $1,035,226,850. The second loan also was over-subscribed, the subscriptions totaling $808,766,150 more than was accepted. All subscriptions to the third and fourth loans were accepted, but the fifth (Victory) loan was over-subscribed to the extent of $749,908,300, the total subscriptions amounting to $5,249,908,300.

The United States began advancing money to the Allies very soon after she entered the conflict. The following is a list of the advances made by her together with the names of the countries to which such advances were made:

**Great Britain.**—Among the Entente Allies the war bill of Great Britain was the heaviest. Her expenditures totaled $44,029,011,868, but from this amount should be deducted advances to co-belligerents amounting to $8,695,000,000 leaving $35,334,011,868 to represent her net expenditures. About one-fourth of the money spent by her was raised by increased taxation. The greater portion of the remainder was raised by internal and foreign loans and by the sale of War Savings Certificates. Professor Bogart determines England’s war costs by deducting from her total governmental expenditures for the years 1914-15 to 1918-19, inclusive, an amount equal to five times her normal expenditures for the year preceding the war, thus:

**GREAT BRITAIN’S WAR EXPENDITURES.**

<table>
<thead>

</tbody>
</table>

Professor Bogart adds that these expenditures were met by revenues totaling $8,706,741,310 and borrowings amounting to $35,055,123,155. Of the $8,695,000,000 loaned by Great Britain to her Allies, $855,000,000 was advanced to her own dominions. The following table shows the advancements made by her:

**Great Britain’s Colonies.**—Despite the belief in German circles that Great Britain’s entrance into the war would be the signal for a revolt upon the part of some, if not most, of her colonies, the facts are that every one of those colonies sprang to the aid of the mother country with both men and means. The direct war expenditures of these colonies totaled $4,493,813,072, as follows:

<table>
<thead>

</table>

India’s expenditures included a gift of $500,000,000 to the British government, a gift from the Maharajah of Nabha of $100,000, another from the Gaikwar of Baroda of $33,000, and still another from the Maharajah of Mysore of $330,000.

**France.**—Estimates as to the financial burden the war imposed upon France vary widely. A report made to the Chamber of Deputies in February 1919 fixes her expenditures at $36,300,000,000. Professor Bogart places them at $25,812,782,800, less advances to her allies of $1,547,200,000, making her net expenditures $24,265,582,800. In determining the war costs of France, Professor Bogart adopts a method similar to that employed by him in determining the war costs of Great Britain, that is, he deducts from her governmental expenditures, ordinary and extraordinary, for the years 1914 to 1918, inclusive, five times the amount of her normal expenditures in 1913, as follows:

**FRANCE’S WAR EXPENDITURES.**

France resorted to various methods to raise the funds needed by her to carry on the fighting. She issued four loans which brought her in a total of $11,012,200,000. Advances made to her
by the Bank of France and the Bank of Algeria amounted to $3,430,000,000. Great Britain provided her $1,720,000,000 and the United States advanced her $2,852,000,000. Her revenues for the years 1914–18 amounted to $5,000,000,000, and yet when the end of the struggle came she had a floating indebtedness of almost $5,000,000,000 more.

Russia.—Broadly speaking, Russia may be said to have dropped out of the war in September 1917 when the Provisional Government, which supplanted the old Imperial Government, had to make way for the Bolshevik régime. Up to that time the country's war expenditures had reached a total of $22,593,950,000. She raised the money by various methods — by bond issues, by foreign borrowings, by issuing treasury bonds and short-term treasury notes, by increased taxation and by enormous issues of paper money. Seven internal loans yielded her $6,176,000,000, as follows:

<table>

From Great Britain Russia borrowed $2,840,000,000; from the United States $187,000,000; and from Japan $333,000,000. Her issues of paper money exceeded $8,000,000,000.

Italy.—The direct cost of the war to Italy was $12,413,998,000. Of this sum $607,840,000 represents her expenditures for mobilization and other military purposes between the outbreak of the war and 24 May 1915, the day she became a belligerent. Like all other belligerents, she increased taxes in order to raise war funds. She also borrowed large amounts from Great Britain and the United States. Five internal loans yielded as follows:

<table>

Belgium.—Statisticians have experienced great difficulty in trying to determine the direct costs of the war to Belgium. With most of her territory under hostile control she was not in a position either to raise revenues or issue loans. Perhaps her borrowings afford the best index of her expenditures. These totaled $1,210,125,090. England loaned her for war purposes $435,000,000; France, $434,125,090; the United States, $314,000,000. On 21 March 1919 the Belgian Minister of Finance asserted that Germany owed Belgium $1,930,000,000 for cash requisitioned during the war. However, as the Treaty of Versailles provides that Germany must restore to Belgium the amounts commandeered, these losses have not been included in Belgium's war costs.

Other Entente Allies.—The war expenditures of the other Entente Allies were as follows:

Central Powers.

Germany.—Whether or not Germany was primarily responsible for starting the war, one cannot survey her pre-war plans without arriving at the conclusion that, in the opinion of her statesmen, war was inevitable and that she was preparing for it financially as well as militarily. As far back as the days of Frederick the Great she created a fund known as the "War Chest." Into it she placed $30,000,000; in 1912 it was $32,000,000; in 1913, after France adopted compulsory military service, Germany enacted a law designed to raise $250,000,000 to be used in defraying the expenses of her own enlarged army. Soon after the outbreak of the war she enacted much legislation of a financial nature that undoubtedly was prepared in advance and for the purpose of meeting just such a contingency. Her gross war expenditures have been placed at $40,150,000,000 by her Minister of Finance. Her advances to co-belligerents totaled $2,375,000,000, leaving her net war costs $37,775,000,000. At first she did not materially increase taxation but raised most of the money expended by her through loans similar in many respects to the American Liberty loans. Before the war ended, however, necessity had driven her to the taxing of almost everything taxable. In the meantime she kept up her policy of issuing periodical loans, issuing nine all together. These yielded as follows:

<table>

Austria-Hungary.—The war cost Austria-Hungary $20,622,960,000, all of which she borrowed. Its outbreak found her in very bad financial conditions. Her debt in 1914 was extremely burdensome, and her credit was more or less impaired. During the preceding decade she had borrowed large sums of money, prac-
tically all of which had been used to increase her armaments. This suggests that she too expected war and was doing her best to prepare for it. In financing the war Austria and Hungary issued separate loans and made separate borrowings from the Austro-Hungarian and other banks. The following table shows the borrowings of the dual monarchy during the war:

The increases during the war in the national debts of the various belligerents afford another means of approximating the costs of the war. The table at the bottom of page shows these increases.

**II. INDIRECT WAR COSTS.**

**Loss of Human Life.**—Since, as Professor Bogart so truly tells us, the loss of human life and the race deterioration resulting from war are the most appalling and permanent costs of the war, for they affect not merely the present, but are traceable through future generations, the deaths resulting from the European War deserve first consideration in any attempted tabulation of the indirect costs of that great struggle. Professor Bogart cites official reports by the major belligerents and semi-official reports by most of the minor belligerents to prove that of the soldiers who took part in the European War, 9,986,771 made the supreme sacrifice. These appalling figures become even more appalling when it is remembered that the death toll of all of the wars fought during the preceding 150 years, beginning with the Napoleonic War of 1790 and ending with the Balkan War of 1912-13, was only about one-half as great. The tragic story of the deaths resulting from the European War, however, does not stop with the known dead. To that painfully long list must be added, according to various statisticians, 50 per cent of the soldiers reported as "prisoners or missing" to account for those who were so mutilated that they could not be identified or who were so blown to pieces that not even a trace of them was left. The "prisoners or missing" list, at the time the reports above referred to were given out, embraced 5,980,600 names. Fifty per cent of that number would add 2,991,800 to the total casualty list, bringing the total and presumed dead among the soldiers up to 12,990,570. Before one can recover from the shock occasioned by the contemplation of so many deaths among the very flower of the world's manhood, one learns from Professor

---

*These figures relating to the national debts of the different belligerents were supplied by O. P. Austin, statistician of the National City Bank of New York.

† October, 1917.
Bogart that to the deaths among the soldiers must be added 10,000,000 more to cover the deaths among civilians resulting from causes attributable directly or indirectly to the war. All wars have been accompanied by an increase in the civilian death-rate, but, as Professor Bogart says, 'it is for the Great War to establish a new record in this, as in so many other aspects.' Various causes were responsible. Famine and cold cost hundreds of thousands of lives. Epidemics took their toll — the Spanish influenza, responsibility for which has been laid at the war's door — is said to have caused 6,000,000 deaths, 1,200,000 of which occurred in the United States. More than 4,000,000 Armenians, Syrians, Jews and Greeks are said to have been massacred while the war raged. One-third of the population of Poland is said to have been wiped out; 2,000,000 Russians are said to have perished; deaths among the Rumanians numbered 800,000. Germany also lost 800,000 civilians, while deaths from famine in Austria and Serbia numbered nearly 1,000,000. In the occupied areas of France there was a tremendous increase in the death-rate; in Belgium, strange as it may seem, the increase was nothing like so pronounced. Approximately 100,000 fishermen and sailors lost their lives in mined waters or from other causes for which the war was directly responsible.

In determining the value of the human lives lost during the war Professor Bogart has adopted the figures of M. Barriol, the noted French actuary, who 10 years ago, estimated the average social value of an individual in the six leading countries to be as follows:

<table>
<thead>
<tr>
<th>Country</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>United States</td>
<td>$4,720</td>
</tr>
<tr>
<td>England</td>
<td>421</td>
</tr>
<tr>
<td>Germany</td>
<td>3,380</td>
</tr>
<tr>
<td>France</td>
<td>2,500</td>
</tr>
<tr>
<td>Austria-Hungary</td>
<td>2,750</td>
</tr>
<tr>
<td>Russia</td>
<td>2,020</td>
</tr>
</tbody>
</table>

After saying that these valuations probably err on the side of understatement, Professor Bogart extends their application by affixing the French valuation to Belgium and the Russian valuation to Italy and the minor belligerents. Unioning in conjunction with the casualty lists, he gives the following table to show the costs of the war resulting from deaths among the soldiers:

<table>
<thead>
<tr>
<th>Country</th>

Total lives lost: $33,568,471,280

Estimated loss resulting from deaths among civilians (the number of such deaths being supposed to equal the number of deaths in the armies): 33,568,471,280

Total valuation of lives lost: $36,136,942,560

Property Losses. — Estimating the losses of the European War growing out of the destruction of and damage to property is an exceedingly difficult task. Very few of the authorities agree upon the subject. Professor Bogart estimates the total property losses at $36,760,000,000, placing the losses on land at $29,960,000,000 and the maritime losses at $6,800,000,000. The vessels sunk, totaling 15,398,392 gross tons, represent a loss of $3,000,000,000 and the cargoes sunk with the vessels a loss of $3,800,000,000. The land losses are divided among the different countries as follows:

<table>

Loss in Production. — One of the big indirect costs of the war was the loss in production growing out of the withdrawal of millions of men from commercial pursuits and service in the armies and navies. In 1917 there were 38,000,000 men under arms. Professor Bogart believes that an average of 20,000,000 served in the armed forces during each of the four and a half years of the war. Assuming to these men an average earning capacity of $500 a year, he estimates the loss in production resulting from their withdrawal from civil pursuits at $45,000,000,000.

War Relief Costs. — The relief work made necessary by the war is estimated to have cost.
While, as stated above, no figures for other countries are available, it is believed that their expenditures, coupled with certain unreported expenditures of Great Britain, were sufficient to bring the total costs of war relief up to the estimated figure of $1,000,000,000.

Cost of War to Neutral Nations.—According to Professor Bogart’s estimate, the war cost the neutral nations $1,750,000,000. This represents the sums expended by them in guarding their frontiers and otherwise maintaining their neutrality, and are reflected in their increased public expenditures. The following table shows the cost of the war to each of the neutrals:

24. WAR CASUALTIES.—The official reports and estimates of dead, wounded and missing, in the Great War of 1914–18, show that it was far the bloodiest in history, from every point of view. The battle deaths alone form the amazing total of 7,553,600, a larger number than the total of slain in all wars between 1793 and 1914, although this period included the Napoleonic wars. These figures include those dying of wounds, probably a fourth of the total. In previous wars the deaths from disease far exceeded the deaths on the battlefields, frequently as four to one, while in this war the deaths from disease were inconsiderable in comparison, being high only during the “flu” period in October and November 1918. The total of armed men in the war being about 56,000,000, of whom probably 30,000,000 were actually engaged, it follows that one in four of the totals at the front perished. The losses fell most heavily on Russia, Germany, France, Great Britain and Austria, in the order named, 6,385,000 dead being credited to these five nations. The official estimates, as made by Col. Leonard P. Ayres, in his

Later reports have constantly added to these figures. The totals computed by the United States War Department in January 1920 show the losses to the American army and the Marine Corps on all fronts as follows:

- Killed in action: 35,585
- Dead of wounds: 16,742
- Dead of disease: 58,073
- Dead of accidents and other causes: 8,092
- **Total dead**: 116,402
- **Total wounded**: 230,074
- **Total casualties**: 346,466

A review of the casualty lists collected during the war, published by a Majority Socialist, in January 1920, shows that the German army lost in killed and wounded 1,718,246 men, including 62,693 officers; in wounded, 4,234,000 men, including 116,015 officers; in missing, 1,073,619 men, including 23,104 officers. The total losses of the army, therefore, amounted to 7,025,972 men.

The losses of the navy are estimated at 78,342, including 24,112 killed and 29,830 wounded. Germany's army casualties have hitherto been estimated at 1,600,000.

Appalling as are the above totals they do not show the entire mortality. It should be remembered that at least 100,000 civilians among the Allies perished through brutality in Belgium and Northern France, U-boat warfare and bombing excursions. The massacres of the Armenians, Syrians, Jews and Greeks by the Turks were probably close to 1,000,000, and a moderate estimate of deaths among civilians in war areas from influenza, pneumonia, starvation and exposure is 4,000,000; or at least 5,000,000 deaths, a grand total of 12,618,000 deaths chargeable to the Great War.

The principal reason why American losses were so comparatively light is that they were engaged in heavy fighting only 200 days. The American losses never reached 500 a week until the third week in July 1918 at Chateau-Thierry; in the following three weeks, they were 2,700, 2,352 and 2,232, respectively. Thereafter they fell to about 1,000 per week until October, when the Meuse-Argonne struggle brought them up about 2,500 a week. In percentages the American infantry and machine-gun men suffered most heavily, the air service next, followed by the tank, engineer and artillery corps.

</table>
The loss by disease among the American Expeditionary Forces was about 27,000, but there were also 35,500 deaths in the home army during the war period, so that the total number of deaths in the army from the declaration of war to 1 May 1919 was 112,432, or including the every man killed in battle seven were wounded. Five out of every six sent to the hospitals returned to duty cured. In the expeditionary forces the battle losses were twice as great as the losses from disease. The American hospital facilities were always equal to or in excess of the army’s needs. War was declared with 200,000 men in the army, and the total of dead and wounded at the close was nearly 300,000.

CHARLES H. COCHRANE

25. REPATRIATION OF PRISONERS.

When the great European War ended on 11 Nov. 1918, one of the big problems confronting the nations which had participated therein was that of repatriating hundreds of thousands of prisoners. At that time, according to information supplied by the statistics branch of the War Department of the United States, Germany held, exclusive of Russians for whom it is asserted, no information is available, a total of 885,116 prisoners, as follows:

PRISONERS HELD BY GERMANY AT CLOSE OF WAR.

</tr>
</tbody>
</table>

Total 615,922

Estimates of the Russian prisoners held by Germany at the close of the war place the number at more than 1,200,000. She is supposed also to have held at that time 90,000 Rumanians. On 1 July 1919 it was estimated by the United States War Department that there were 163,308 German, Austrian and Turkish prisoners still in Siberia. Another estimate which includes Hungarians and Bulgarians, in addition to Germans, Austrians and Turks, places the number at 212,000.
Under the terms of the armistice, Germany was required immediately to begin the repatriation of the prisoners of war held by her, including any that might then be under trial or who had been previously convicted. The repatriation of the German prisoners held by the United States and the Allies, however, the armistice stated, should be regulated at the conclusion of the preliminaries of peace. On 8 Jan. 1920, Col. A. Gibson, of the General Staff of the United States Army, acting chief of the Statistics Branch of the War Department, asserted that practically all of the prisoners held by Germany, exclusive of Russians, had been repatriated by 30 April 1919, and that repatriation of the German prisoners held by the United States and England had been practically completed some time before his letter was written. He added that large numbers of German prisoners still were being held by France pending final acceptance by Germany of the Peace Treaty and for fear of receiving a new armistice. Germany simply by turning them loose experienced but little trouble in getting rid of all of her prisoners except the Russians. The latter, however, presented an exceedingly difficult problem. While the German forces at the Russian frontier soon encountered the Bolsheviks who gave them their choice between death and service in the Red armies. Some joined the Reds; thousands were massacred. The situation finally became so bad that the Allies took cognizance of it. Germany was forbidden to send any more Russians to the frontier, and the United States and the Allies sent a commission to Berlin to direct the repatriation. This commission also had its troubles. It rounded up about 250,000 of the Russians and placed them in concentration camps in East Prussia, but the Reds balked practically every attempt to get them to their homes. Several thousand were eventually gotten through but as late as 11 Oct. 1919 it was said that there were still 150,000 Russians in Germany who could be located. Late in the fall of 1919 it was stated that 50,000 of the Rumanians who were supposed to have been in Germany at the close of the war had never been accounted for. The theory was that they had perished without any records being left.

The first of the unwounded German prisoners sent home by England reached Cologne, 2 Sept. 1919. England thereafter delivered about 3,000 Germans at Cologne daily and also sent back 3,000 each week by way of Rotterdam, until repatriation had been completed. The first German prisoners held in the United States to be sent home sailed from New York on 26 Oct. 1919. There were 1,600 in the party. Of these about 1,200 had been interned in Georgia. Approximately 150 of the Germans who were interned in America applied for naturalization papers. Of these, probationary citizenship was granted to 73. On 9 Aug. 1919 the Chinese government set free the crews of the German cruiser Dresden and the German raider Seeadler who had been interned in Chile for a long period — the crew of the Dresden since 1915. See PRISONERS OF WAR.

A. H. McDANALD,
Managing Editor, Encyclopedia Americana.

26. PSYCHOLOGY OF THE WAR.

(1) American. — The war psychosis of all countries is declared by authorities to fall into a pattern typical of group behavior anywhere under stress or during crisis. This pattern has been clearest in the United States of America for the reasons that it was physically remote from the scene of action, and that its component groupings are both more specific and more fluid than those of countries with greater ethnic homogeneity and more stable economic and social castes. In August 1914, the United States of America nearing the end of the first half of a liberal political administration. Events and legislation had both exhibited tendencies toward liberalism in industry and interaccommodation in society. On the surface America ethnically was held to be a "melting pot," politically and economically a land of equal opportunities. Immigrants and newcomers were declared automatically to "Americanize" and to find their status in the economic system according to their talents. The tradition and forces of these had been republican and pacific. Life had on the whole been secure from famine within and assault from without. Individuals and groups, consequently, were preoccupied with the fate of their own precarious cultural position, their local and national and religious organizations. They were patriotic when they thought of it, but nothing had arisen to make them think of it often. Labor unions, financial and industrial corporations, ethnic and religious societies, political parties and such, absorbed their attention, held their active allegiance and involved them in reciprocal conflicts. Beneath the unity imposed by the "herd-dogma" of "melting pot" and "democracy," there was the strain of unconscious ethnic antipathies and conscious economic rivalries, pressing for free expression and inhibited by the "herd-dogma." The war supplied the liberating opportunities. During its first period in Europe the inhabitants of the United States were in the position of spectators. They took sides according to their European affiliations, their intellectual and moral interests, their economic or political advantage. Thus, New England, and the Atlantic Coast were generally sympathetic to the Old World and her allies; the Middle West sympathized with Central Europe; so did groups of intellectuals, college professors and such, who had studied in Germany; Socialists again denounced both sides, regardless of extraction; and Republicans and Democrats took attitudes determined entirely by their relations to the policy of the administration. The administration, on the other hand, demanded neutrality even "in deed and thought." Responsible for the whole country, it could ask for nothing less, and for nothing more impossible. It was subjected, therefore, to accusations of the partisan groups of both sides — "pro-German," according to one; "pro-English" to another; and "capitalist" to a third.

These accusations accompanied activities which turned "Americanism"— i.e., the interest of the totality of the inhabitants of the country— into a social and political issue. The President made his famous speech on the "hyphenated American." At the same time American financiers who had been making extensive loans to the Entente grew somewhat disquieted by the character of the campaign and the effects of the enormous profits made by American manufacturers and others on the sale of war
materials to the Entente showed themselves in a strong desire to maintain the source of supply and in a corresponding antagonism to anything that might hurt it. Wages rose, moreover, and the demand for labor grew. And all the while German agents were plotting against the neutrality of American citizens and the neutrality of the American government. These events together served to alter the pattern of the American group-arrangement. They brought into being a new and forceful alignment deriving from the attitude of groups toward the parties at war. The change became quite manifest in 1916 when Mr. Wilson was re-elected on the slogan "he kept us out of war" on a vote contrary to all the precedents of American presidential elections, the result remaining in doubt until the very last returns were in.

The program of neutrality was, however, itself being destroyed by events. There appeared on the field interested military proponents, like the National Security League, the Navy League and the American Defense Society. German naval policy came smack against international law and American interests. To continue keeping America out of war it became necessary to get speedy peace — from the "peace without victory" to all the other varieties. When war finally was declared, it was declared on two grounds, to avenge the wrongs suffered by the United States at the hands of Germany and to keep the world safe for democracy. The Council of National Defense, the Espionage Law, the Draft Law, the War Industries Board, the War Labor Policies Board, the Food Administration, the Fuel Administration, the Bureau of Public Information, came into rapid existence. Loyalty leagues and other spy-hunting organizations appeared all over the country, headed usually by "business" men. The interest of all America had at last been fused with the particular interest of one group of the belligerents and one social class.

This identification does not appear to have been the result of the active will of the great mass of American citizens. The malfeasance of the Germans appears to have had less influence than the effective will of two organized and interested minorities, business men and intellectuals. The mass required to be argued, sung and whipped into enthusiasm. Instruments of propaganda for this purpose were both official and voluntary, and they used all the methods known to the advertising agent and a good many new ones. They played upon fear, vanity, the blood-lust, greed and hatred, certainly not less than on the nobler emotions. But the new waves of feeling thus aroused and integrated acquired a reliable base only with the application of the draft laws, the operations of the food and fuel regulations and the reports of the casualties. With these a definite change in the American mood was to be observed — an intensity of sentiment in which all the emotional elements mentioned above were active. This sentiment was still in crescendo when the armistice came. For over a year feeling was far from normal. It was, however, without the object on which, under a state of war, it would have spent itself. Its manifestations, consequently, are taking the form of what is called "unrest" for one group, and "law and order" for another.

"War psychology" began to develop with the appearance of "Americanism" as an issue. Up to that time, social life in the United States had been determined by the usual motives of the peace-time routine. Its overruling psychological factors are the instincts involved in the individual's activities of self-preservation and self-expression. These instincts operate the functions of food-getting, mating, self-assertion, play, and so on. Their inhibition and repression involve unpleasantness, pain, anger, fear, and the other emotions of repression and disintegration. The milieu in which they work is a society or herd whose solidarity is expressed in a like-mindedness established and maintained upon either or both of two conditions — the internal one of a common specific heredity and common social organization and tradition from infancy, and the external one of a natural and man-made environment imposing common vocational, religious, political, military or other purposes. This like-mindedness has been attributed in recent literature to an "instinct of the herd" which establishes and defines the background and limitations against which and within which the competitive individualities of the members of the group operate. Its force varies inversely with its extent and it is most overruling in the family and the tribe. It is a distinguishing mark of primitive societies in which the individual's struggle for survival and expression is limited to any one type of association under the conditions of conflict which are normal to such groups; his virtue or his wickedness becomes that of the group, and his responsibility the group's responsibility: blood-guilt and blood-vengeance are the social inheritances passed on by the generations. The state of war between one group and another compels and reinforces the state of harmony and solidarity within each group. When the pressure of such a state relaxes, the individualities within each group expand. In times of peace, on the other hand, the society, individualism is maximal.

The maximum, nevertheless, is not an absolute one. Individuality is required to conform to the "herd-dogmas" which is the overt expression of like-minded, irreducible rivalries of individuals within the group in a state of perpetual compromise and repression — sex, prestige and power conflicts never get quite fought out to a decision. An indefinite number of impulses, instinct and appetites may be added to these three, to fill out the psychological picture of a normal peace-time society. Such a society was the United States in 1914. The groupings in which individuals formed themselves were primarily ethnic and economic, and these to a large extent reinforced each other. The prestige and position of the British strain was opposed and threatened by the growing importance and self-assertion of other strains, and reinforced again by the law of imitation whereby "lower" social types get assimilated to the standard of the "higher" ones. The war in Europe served to release the emotional and ideational systems involved in the situation. Groups that could not fight each other accepted as pro-English and pro-German. The war of words that was carried on between 1914 and 1917 in-
tensified the oppressions of each group and accelerated the emotional fixation within the land. As feeling grew, two processes became apparent. On the one hand, each opposing group belittled the other; on the other, it converted the enemy into an all-powerful monster of evil. The chief subjects of the processes were the Germans and the English: the other peoples in the war being mere background, of significance only in their relation to the protagonists; who again symbolized the chief division in America. There was no reason too improbable or impossible for either to believe of the other. Since the country's official neutrality functioned as an inhibition upon the release of the emotional tensions involved in this condition, the government, particularly the President, became the object of ill-feeling. This feeling was, among the pro-English, however, not primarily a reaction to the nation's neutrality; it was a resentment against the liberal domestic policies which the President had sponsored and a wish to continue and to increase the gains which the war had brought. Not being expressible directly, it found its release indirectly through a denunciation of neutrality.

The war itself threatened to shut off this channel of expression. In recompense, however, it released and gratified all the other lusts, impulses, appetites and resentments which in normal times are held in leash within the group. It released the group by appearing to give them an objective beyond the group, in its enemy: toward the Germans no attitude and no expression could be too immoral or too inhuman. It gratified them by enabling the business classes and associations involved to identify the interests of their own opponents within the group with the interests of the whole group's enemy outside. Thus, notably, although the President's popularity became enormous and the solidarity of the country unprecedented, the opposition of the business classes grew intenser and took the form of a criticism of the conduct of the war, particularly with reference to the administration's attitude toward labor. Violence began to appear in many forms, from pacific and radical to race riots, and a patriotic terrorism, engineered and led by members of the business class, became manifest part of the war psychosis. Examples are the Mooney case, the Bisbee outrage, the I.W.W. prosecutions, the Liberty Loan intimidations in Wisconsin and elsewhere, the assault on the Non-Partisan League in Minnesota. Incitements to violence became recurrent in the newspapers and were later chronic. Any appearance of free spirit or independent judgment in industry or politics was declared "pro-German" and proscribed. Particularly did the Russian revolution and sympathy with it come in for hysterical denunciation. The underlying cause of this phenomenon was the functioning of the War Labor Policies Board upon the basis of collective bargaining and of a wage-scale determined by the standard of living. The repression of pacifists, liberals and other minorities, the persecution of the minority foreign, the suspension of the civil liberties of the common mummer, which is usually made in war psychology were only incidental to this more basic transference of the combative and aggressive emotions.

This was possible because the "herd-instinct" usually acting as a check upon the various conflicting personal and group wishes, impulses and feelings had under the conditions of war released them, and had integrated them into its own processes. Inasmuch as the execution of the national purpose fell naturally into the hands of the business class, the "herd-dogma" was identified with the interests and preferences of this class. "Americanism" thus acquired a meaning not at all intended by the President nor implicated in the institutions and principles of American polity. The meaning was reinforced by two novel phenomena in the conduct of war; one was the necessary integration of the industrial basis of modern war, the other was propaganda usually called "public information." From April 1917 to November 1919 and longer, the feeling evoked by these conditions and agencies exhibits a steady acceleration in mass and intensity. The armistice came long before the height of this movement had been reached, long before the "herd-feeling" had been used up by enchainment in the standardized types of feeling, the warring countries of Europe, long before war-weariness could set in. The armistice abolished the foe whose existence had been the initiating occasion of war-behavior and the war-psychosis. The country behind its charged wire with a loose end; a menace to almost anything that might draw its feeling. The premature removal of the external occasion and the lack of a new one meant a reversion of this feeling inward, bringing "dis- unrest" and "law and order" into play. Bolshevism replaced Germany as an object of hatred, and was used as a synonym for any attitude other than one favoring the perpetuation of the dominance of the business class. "Americanism" became synonymous with the suppression of labor activities, liberalism in politics, liberalism of any kind. All these were extruded from the body politic by the epithet "foreign" or by being attributed to "foreign"agitators.

The same relation of emotion and condition obtained among the drafted men returning to civilian life. By propaganda and training their minds had been set to military activity covering a larger period than was actually required of them. While at the same time, military life had repressed all the appetitions which the purpose of that life aroused. They came back, thus, ripe for violence. Organized in the American Legion, and led by persons of the business class, they also seek objects by which the emotional tension might be released. They function violently against anything "foreign" or "Bolshevist.

Because of the discrepancy between the intensity of the war feeling and the length of the war the whole country is, in fact, in a condition of intellectual confusion and emotional instability. The war having from the point of view of the emotional change in society stopped too soon, the emotions accompanying it disintegrate on all sides the unity they had established. The pre-war rivalries are more explicit and more intense; the conflict between the economic groups is now avowed and final. This state will endure at least until the last trace of emotion is consumed. It may endure much longer if the appropriation of "Americanism" by one class is not repudiated and common purposes of construction posited effectively enough to create a new national morale.
Broadly speaking, the same things are true for all other countries. See Psychiatry and War; Havelock Ellis, The Psychology of Conflict; Freye, Psychopedagogics; Zoegemans über Krieg und Todt; Jones, Ernest, War and Individual Psychology; Trotter, Instincts of the Herd in Peace and War; Possee, William, A Moral Equivalent for War; MacCurdy, J. F., The Psychology of War; Kalten, H. M., 'The Psychology of War.'

Horace Meyer Kallen,

(2) European. — The catastrophe of 1914 and the psychic reactions to it present the student a distinctive problem. The readjustments demanded by the World War appear psychologically as contributions to the genesis of conviction. When we attempt to view the World War as conditioned by psychic conditions, this is not only the look below and beyond outward manifestations, to the underlying phenomena, and then to see these reflected in the convictions of men under the coercion of a violent reconstruction of their already adjusted outlooks upon the world formed during a period of peace.

It is only by confining oneself to generalities that one can discuss group mentality and sentimental states. For though all groups doubtless possess a certain number of common characteristics, many partial differences divide them, and even various provinces possess strongly marked similarities, which distinctions, however, do not in the least preclude the existence of many common characteristics.

In former wars as in the late struggle it was not each nation's desire for national expression which made the continuance of peace impossible. It is the fact that thus far in the world's history such desire has been bound up with navalism and militarism. Any national group whose frontier bristles with engines of war is not unlike the individual with a magazine pistol ready for instant action. Both make for murder: and in their hearts, both really mean murder. This war was occasioned by too many nations with a desire to overstep some self-imposed limits set by naval conditions and only one planet upon which they might expand. Psychologically, war is mere instinctive action. The Great War cannot have been dependent upon the will of any one man. It was brought about by deep-seated, remote, and varied causes, which had been accumulating until now when their effects emerge suddenly, as it were, into our ken. We have been surprised, and our mental peace has been taken from us by the revelations of, say, a preparedness, so far surpassing ours, that we do not see ourselves so much of a world power as we had imagined ourselves. The Great War revealed the souls of men. The leading European representatives of Western civilization — Germans, Englishmen and French — are oppressed by a paralyzing astonishment in regard to each other's real nature. They did not know each other — and yet considered themselves as members of a single ancestral stem.

In the olden days, the world has been seething with suppressed but none the less destructive activities that have at last laid it low with the worst case of universal nervous prostration ever known. This state is called war. The world could not avoid war as long as it remained on the level of warfare. Ours was not a Christian world. And while the national psychology of nations eyed each other, ready for blood. The powers that move one mass of humanity against its brethren are deep and subtle; so deep and subtle that we are constantly substituting surface and relatively unimportant causes for the real ones.

One of the plainest lessons to be learned by the world is that one of those substantially verified by the late conflict, is that nations are not ruled by realities, but by more or less illusory ideas which they have, intellectually, misformed of realities. The truth about an historical event is seldom, very seldom, known at the time of its occurrence.

Wars are not the expression of reason but of instinct. And there is in consequence no such thing as 'culture' or 'civilization' on the level of reasonless instinct. There is a relationship which on one side is devotion and loyalty, on the other the side hate and bigotry; the instinct of dominance which makes the strong love to assert their power over rivals, and the instinct of pugnacity urge men to fungus of war. Most great wars are fratricidal. The worst wars and the worst misunderstandings, prejudices and hatreds bred by war are between strong nations closely akin. War has the rest of action at terrific intensity. It is the very intoxication of instinctive life and is as tempting as strong drink.

As a result of the war the attitude of the human mind toward many things has changed radically. The relations of life and death — life's value and death's meaning — are considered to-day much as primitive men considered them. The world as a whole felt a sense of disappointment as the war progressed. Our disappointment was not, however, justified, for the reason that it was based on the destruction of an illusion. Before the war began, illusions as to the nations soon to be at war, commended themselves to the world at large because an illusion saves us pain and allows us to enjoy pleasure which a true appreciation of our position would tend to destroy. A sense of disappointment brought about by the war came into existence with the shock which followed when our illusions collided with reality — the reality, namely, that civilized nations are still capable of reverting to what we have been wont to regard as savagery.

Many phases of the mystical spirit glided into our ken as the war progressed. We beheld the odd behavior of sovereigns appealing to their gods and rendering them thanks for victories put down to their aid. A tsar held up an ikon to be gazed at by his kneeling squadrons, as they worshipped. A Kaiser made speeches and issued proclamations about the motives and purposes of the god of the Fatherland and of his royal house. And even George V we find to have retained some of his sacred war functions. He vowed not to touch a drop of liquor during the war; and this vow is an act of religion.

A few considerations will help to state the relations which such behavior bears to piety. Piety is unconcerned about human relations for themselves. But, as the sense of union with deity is immensely strengthened by the sense
of community in worship, the pious are in fact concerned about the body of the faithful as well. Consider Christianity. It arose lonely in a lonely land. It developed the dogma of the "brotherhood" of man, quite as mystical a dogma as "nationality" or any other principle of grouping within human society. In these centuries, when Christianity was adopted as a "state" religion, the Christian's gregarious instinct was satisfied in another way. His sense of participation with mankind became superfluous. It began to atrophy. One with his "state-church," the Christian rose up against the "heretic" and the "infidel"—his pristine brethren! Warfare with the enemies of the Christian Church but intensified his sense of the participation with the Father of Mankind.

With the Crusades came the movements historians call "nationalistic"—a series of movements which subordinates church to state, the faithful to the patriotic; a movement, in short, which made of God at most a National hero. A nation's god is thus the synthetic personality of a whole people, the expression of its history. "Its god is thus the attribute of a specific nationality; and thus a people is the body of a god. With such information one can easily understand the anachronism in the behavior of the aforementioned sovereigns."

"This war is queer," wrote Wells the English sociologist on his return from the front. All have remarked the silence of many returned men who experienced some of the most awful things witnessed in the war. In France one beheld an impressionable, volatile and undisciplined nation suddenly transformed into a resolute and tenacious body of men, exposed for months together to an underground existence in cruel trenches and to the constant menace of an obscure and awful death. From English shores men saw boys go off blithely to experience the storm for themselves, these came back sobered, which is intelligible; and silent, which is unintelligible. That they and their French and Belgian brethren spoke modestly of their deeds was not untypical. It is not surprising that a scheme of government so strangely reticent in speaking the grim total fact and of their minor reactions was unnatural. They had been willing to communicate a few items of their adventures; but of their total experience they would not and could not speak.

Wells saw them in the trenches; and found them "weary, rather sullen, intempered," with shoulders drooped. Their very outline was, as it were, a mark of interrogation: on their faces they wore the expression personified as thoughtful. How strangely they inhibited thought and speech. These men of the Front! Puzzled, thoughtful, speculative intempered: a mind as yet unable to grapple with the dominance of an unexpressible fact. Such men feel themselves conscious of some new spiritual fact.

When one meets one of these returned men, mud, shrapnel, rats, gas and the like will no doubt figure prominently in the story he tells. Beyond that—he can only intimate by silence that something has happened to him, something which may not be told. Such an one is a transformed personality: he has lost his original self. William James notes "ineffability" as the handiest of marks to classify a state of mind, which as mystical, is negative. The subject of it immediately says that it defies expression; no adequate report of its contents can be communicated in words. It follows from all this that its quality must be directly experienced to be understood. It cannot be imparted; not transferred to others. And thus we are to explain the strange thoughtful silence of returned men by supposing that a touch of the "ineffable" seemed to have entered into the fabric of their lives with their experience at the Front, however brief, or humble, that experience may have been.

In the trenches the instinct of emulation, so closely allied to imitation, found ample expression. In its earliest forms this instinct is closely allied to envy and jealousy. Among the other things that found expression was ardent race hatred; the instinct to revenge; the megalomania that "it is all right for us to fight but never for our enemy to do the same;" with all the instinct of excitement, to adventure, and to unsatisfiable achievement, were not wanting in so far as their expression was concerned. Vengeance is one of the most permanent of all feelings; but the most remarkable thing about its expression on all sides during the war was the extent to which vengeance passed for justice.

The proximity of hostile armies was a powerful spur to invention; attention being of course chiefly turned to the production of the means of offense and defense. Success in war depended upon the mechanical superiority as well as the morale of the armies—indeed, it counted far more upon mechanism than upon any kind of personal prowess. Hence the many new "gases" and "aeroplanes" and long-range "cannon," as well as the manifold ways of concealing one's position in relation to one's enemy.

Collective opinion has a great deal of strength, which is seldom spontaneous, however, for the crowd is really an amorphous organism that is incapable of acting unless it has a leader, who influences it by affirmation, repetition, prestige and contagion. Now Germany was a nation with a civic spirit. We are told of policies of "Schrecklichkeit" and of "Hymn of Hate," and wonder whether these are symptoms of madness or the contrary. The facts as to the psychosis of the composer of this "Hymn" are not forthcoming. But what appears to be the truth is this, rather that the power of song was fully realized by the military powers of Germany, than that Germans hated—actually hated—England. We are in America, all familiar with the political device in which a few venture an assertion and urge it upon the crowd with unobserved compulsion, proclaiming as already existent an agreement in feeling which they are only seeking to inoculate. We believe this to be the meaning of the existence of the "Hymn of Hate."

"Der Tag" was no doubt the symptom of megalomania. It is often said that the Germans were "firmly convinced" that the conflict was due to a conspiracy of the rest of the world. How far this is true a census would tell better than a guess. Fear, to be sure, is the in-
It is a general psychological rule that internal dissension and civil dangers cease as foreign danger begins to threaten. England and Ireland are thus seen united in the hour of danger. The Belgium woman, whose husband did not make her hesitate a moment to defend her "honor," here the Belgian resembles the Frenchman. Invariably when an idea becomes too ethereally abstract (as "honor") the Englishman begin to regard it as humor. In his most exalted moments during the war the Frenchman seemed to the Englishman like an idealistic ghost. An Englishman thinks in quantities; only an American outdoes him in this respect. We see him demand all ships; let him dictate all news, and allow him to control all credit. Here we behold the English world-idea. During the war the English mind developed for the first time, and without insularity, an extension of national consciousness into one of universal magnitudes. A new experience brought the islander to feel a deepened intimacy with the dominions overseas, a feeling reflected in his daily press, in the pulpit, and on the platform, in conversation of philosophers. And even before the war began there was an insular, national consciousness, now there is an imperial consciousness in the Briton.

The experience of rationing has begotten for England a respect for the idea of equality over that formerly exercised by inequality in the same country. Many other transformations in the English habit of thought could be mentioned; space forbids.

It could be shown that Italy entered the war through fear, as did China. Japan's policy is perhaps the most consistent expression of an intelligible purpose of any nation who participated in the war; it may be formulated as the consideration of her own influence in the Far Eastern waters to the exclusion of all others.

Ever since Peter the Great's time Russia had been consciously reaching forth for an outlet upon the warmer waters of the sea. A Russian traces his religion and very largely his civilization to the Christian Empire of Constantinople (Byantium), and this was destroyed by the Turks in 1453.

No thoughtful person underestimates the great moral powers latent in the Russian people. The Slavic world, whether north or south, is one full of deep melancholy beauty, of devoted loyalty, of religious democracy, of sincere idealism. The harshness of its upper classes under the autocratic régime and widespread corruption of its upper classes are unimportant compared with the sterling virtues of the Russian people of Slavic descent.

Even a German soul is full of sunshine. The Russian at its best reveals something sombre, gloomy, oppressive. The aspiration of a Russian aims at democracy, but history reveals that this aim brings high and low to one level, by lowering the better, and thus bringing all to a state of simple humanity. The result is lack of education, complete submission to the church, and a pathetic mixture of ignorance and superstition.

Such is the soul which the Russian exposed to the awful experiences of the Front. No one can wonder that in its various transformations the horrible state of his land as it now exists has
resulted. For is it not a state expressing child-like ignorance of the un-Paradisical innocence of the empirical man?

27. WAR AND ITS RELATION TO WORLD COMMERCE. The war has thrown many aspects of the war and its effect on commerce and industry into the foreground. The war has affected commerce and industry in a number of ways, including: (1) the political and commercial conditions that existed before the war; (2) the political and commercial conditions of the world at the time of the war; (3) the conditions that followed the war; (4) the probable effect of the many changes which it brought about; and (5) the probable effect of the many changes which it has brought about.

The effects of the war upon world commerce in the years to follow will depend upon the effects on the recovery of the areas in which the war was waged. The war has affected commerce and industry in a number of ways, including: (1) the political and commercial conditions that existed before the war; (2) the political and commercial conditions of the world at the time of the war; (3) the conditions that followed the war; (4) the probable effect of the many changes which it brought about; and (5) the probable effect of the many changes which it has brought about.

International commerce of the world at the beginning of the war consisted of annual exchange between nations of about $20,000,000,000 worth of merchandise, but as the value of merchandise was counted twice, once when exported from the country of production and again when imported into the country of consumption, we are accustomed to say that the pre-war commerce was about $40,000,000,000 per annum. About one-third of this, speaking in very round terms, was foodstuffs, another third was manufacturing material and another third was manufactures. Most of the food and manufacturing material entering international trade was produced in the Americas and Australasia and was taken by a new power and paid for in her chief product for exportation, manufactures, to which she added the services of her merchant marine and the earnings of her invested capital in the producing countries. Of the $7,000,000,000 of manufactures entering international trade in 1913 about $6,000,000,000 was supplied by Europe and $1,000,000,000 by the United States, and they took manufacturing materials and foodstuffs in exchange. Much of this manufacturing material and food came from Australasia, but Russia supplied a part of the food, and tropical Asia and Africa a part of the manufacturing material.

Of the manufactures which were exchanged for the food and raw material a very large proportion was produced in those European countries which actively participated in the war, and they were large purchasers of manufacturing material and food. Much of their power of production in manufactures for export was suspended, while in the case of the other great manufacturers, the United States, production and exportation were stimulated. The European manufactures thus lost to a considerable degree their hold upon the world's markets and the United States gained largely in those areas formerly supplied by Europe, our own exportation of manufactures in the year following the close of the war having been over $3,000,000,000, against $1,000,000,000 in the year preceding the war.

Great Britain, France, Belgium, Italy, Germany and Austria-Hungary supplied about $6,000,000,000 worth of manufactures for international trade prior to the war, and while they bought a part of their food from Russia, the bulk of their purchases of this character came from the parts of the world in which there was during the war no suspension of productive power but rather an increase in production, and, therefore, of purchasing power. With the inflation of world currency and increased prices which followed, the nominal value of commerce increased. The belligerents of Europe necessarily increased their imports, buying largely on credit and with money borrowed from their own people, and the valuation of world commerce, measured in the high prices which followed world inflation, was in the closing years of the war over $60,000,000,000, as against $40,000,000,000 in 1913, despite the fact that Germany, Austria-Hungary, Turkey, Bulgaria, Belgium and Russia were cut off from participation in international trade.

The effect of the war upon world commerce in the years to follow will depend chiefly upon the recovery of the areas in which the war was waged. The other parts of the world find themselves with increased power, higher prices for their products and, therefore, higher purchasing power, and while they must pay to labor a higher wage for its services and to ship a higher charge for transportation, their exchanges with each other will be larger, at least when measured in the inflated currency, and their power to supply food and raw material to manufacturing Europe will exceed that of the pre-war period. The proper relation of wages to the high prices which have followed the quadrupling of world currency will be slowly adjusted, the purchasing power of the masses measured in larger figures, and world interchanges, except as to the war-torn sections, will move on at a new level of stated values, for it cannot be expected that prices will materially decrease unless the inflated currency is deflated, and that will not be easy in view of the fact that the countries having this inflated currency must now demand from their people three times as much in taxes as before the war.

The chief subject to be considered in an attempt to look into the future of world commerce, as affected by the war, is the condition present and prospective of the area in which the war was waged. The great belligerents, except that part immediately fronting upon the Atlantic, has been radically changed in political organization, the grouping of peoples and the facilities of production, transportation, finance and, therefore, of commerce. Four great countries with an area of 10,000,000 square miles and a population of 325,000,000 have been transformed into 40 new and comparatively small political divisions, and if we include their "overseas" areas the number of new political units is 50, with an aggregate area of 11,000,000 square miles and 350,000,000 population. In Russian territory alone no less than 20 groups of people have declared themselves as new political organizations, republics in most cases, despite their experience in the conduct of that form of government. From Austro-Hungarian territory a half dozen new political divisions have sprung into existence. Germany, after losing 15 per cent of her European area, 10 per cent of her population, all of her colonies and an important part of her industrial resources, re-enters the industrial and economic world with a new form of government, a much depreciated currency and greatly diminished
transportation facilities, especially on the ocean. From the territory in Asia formerly administered by the Turkish government, a dozen political divisions are being created, many of them to be governed at long distance as "mandates" or colonies, protectorates and dependencies, while in others the administration will be left to the chiefs of the scattered and nomadic populations. The German colonial possessions in Africa, Asia and Oceania are also to pass under new political control and commercial influences.

Thus all of interior Europe with its great manufacturing and agricultural resources has been thrown into the melting pot, and the new political units made therefrom have been grouped chiefly upon ethnic relationship and with forms of government new to the people and to be conducted by comparatively inexperienced minds, leaving to the future the readjustment of their industrial, commercial, financial and transportation facilities. This great area of interior Europe with its 325,000,-

000 people was, prior to the war, an extremely inere and factor in world trade and commerce. Its annual production of wheat averaged 1,250,000,000 bushels or nearly one-third of the entire world crop; it produced practically all of the beet sugar of the world and thus furnished about one-half of the world's sugar supply; its coal and iron production exceeded the requirements of the local population, and its factories distributed their chemicals, textiles and iron and steel manufacturers to the entire world and took in exchange food and manufacturing materials of other countries. Its exports of the four countries which have now been subdivided into 40 new political divisions totaled in 1913 nearly $4,000,000,000 and their combined imports exceeded $4,000,000,000, making a grand aggregate of $8,000,000,000 or one-fifth of the entire international commerce of the world; while their railways were 115,000 miles in length or one-sixth those of the entire world.

It is quite apparent that the effect of the war upon prospective world industries and commerce depends in a large extent upon the industrial, financial and commercial future of the 40 political units into which these four great areas—Russia, Germany, Austria-Hungary and Turkey—have been subdivided.

With this in mind it may be assumed that the 325,000,000 industrious people of this area who have created in the past an international trade of $8,000,000,-

000 are still of the same industrious disposition, it is important to consider the new grouping which has been made, in the matter of ethnic, economic, experience or otherwise as lawmakers, transportation facilities, finances, industrial power and, therefore, commercial prospects. One of the most distinguished American authorities on world political and economic history, Prof. Edwin A. Grosvenor, formerly professor of modern government and international law in Amherst College, and for 20 years professor of history in the Robert College, at Constantinople, discussing the new groupings of people in the area in question, says: "For the first time in human experience, an effort is being made by the victors after a great war to trace the new frontiers in accordance with the racial aspirations and affinities of the peoples involved. Because of the impossibility of defining exactly the limits of a race, many heart burnings are inevitable in the new adjustment of European boundaries. The Old Order has passed away. A new Europe is in the making. Neither a year nor a generation will suffice to make it. . . . Europe, though so old, is for the greater part young and inexperienced in self-government and political duty and opportunity. The Negroes and Orientals in these newly enfranchised people will resemble the uncertain walk of a just-awakened child."

Before entering upon a consideration of the 40 new political divisions created from the four great interior countries, it is not improper to give a moment to the effect of the war upon the population, area and industrial and commercial power of the Allied group.

Great Britain.—Great Britain made no attempt to gain European territory as a result of her participation in the war, but in the distribution of the overseas possessions of the defeated countries, she has added materially to the area of her colonies, protectorates and dependencies. Immediately following the announcement that Turkey had been asked by the Allied Powers, Great Britain on 8 Dec. 1914 declared a British protectorate over Egypt, in the government of which she had for a long time largely participated, and this new British government over Egypt is currently recognized by the French, Russian and Belgian governments, and in at least a limited form by the United States. At the same moment attention was given by Great Britain and France to the German territories in Africa, which aggregated about 930,000 square miles with a population of approximately 11,000,000. Togo, lying on the west coast between the British colony of Gold Coast and the French colony of Dahomey, was jointly taken by the British and French troops in August 1914 and the administration divided between the governments of the British and French colonies and is now governed by a commission appointed by the Allied commanders.

German Southwest Africa was promptly invaded by troops from the adjoining colony of British South Africa and was conquered in July 1915 and placed under the control of the government of the South African Union, a British colony. Kamerun, also on the west coast, between British Nigeria and French Congo, was conquered by British and French troops in co-operation, and in February 1916 a part of its area was placed under the government of British Nigeria and the remainder under that of French Equatorial Africa. German East Africa, the most important of the German possessions in that continent, was invaded by Great Britain in the early part of the war and its conquest completed in 1918, and the Peace Conference at Paris decided that the "mandate" for its government should be held by Great Britain. The control of British East Africa and Egypt by Great Britain gives to that country a continuous stretch of British territory from the Mediterranean at the North to Cape Town at the South. In the Pacific, the German possessions of Kaiser Wilhelm and the Bismarck Archipelago, the German Solomon Islands and Nauru were occupied by Australian troops and the German Samoan Islands by British forces, and all remain under British military occupation. In Asia, Great Britain, by her occupation of Bagdad and the
Valley of the Euphrates in the early part of
1917, obtained control over the Mesopotamia
Valley with an estimated area of 143,000 square
miles and a population of 2,000,000, and by her
occupation of Jerusalem in the latter part of
1917 she obtained control of Palestine with an
area of about 16,000 square miles and a popula-
tion of approximately 500,000.

France.—France gained important addi-
tions to her territory and producing power by
the return to her of the Alsace-Lorraine area
with it a permanent control of the German
coal mines of the adjacent territory of the Saar
Valley. Alsace-Lorraine has an area of 5,600
square miles and a population, by the 1910 cen-
sus, of 1,694,000. The chief cities are Strass-
bourg, the capital, with a population of 179,000;
Mulhausen, in Alsace, 95,000, and Metz, in
Lorraine, 69,000. The chief agricultural prod-
ucts are wheat, rye, oats and wine; the mineral
products in 1913 were 21,000,000 tons of iron
ore and 30,000 tons of coal. The coal mine
manufactures were considered the most im-
portant in Germany and the woolen manufac-
tures also of considerable importance. Ger-
many, by the Peace Treaty, cedes to France the
full ownership of the coal mines of the Saar
Basin, and the Saar River and the Eifel Terri-
ories as far north as Saint Wendel, includ-
ing on the west the valley of the Saar as far as
Saarholzbach and on the east the town of
Monsberg. This coal area is to be governed by
a commission appointed by the League of Na-
tions and at the end of 15 years a plebiscite is
to be taken to determine the wishes of the people
as to union with France or Germany or
continued control by the League of Nations.
France also gains in Africa about 100,000 square
miles of area and about 1,500,000 people.

Italy.—The chief changes in Italian terri-
itory consist of the addition of certain territory,
formerly the southwest part of Austria and in-
cluding the important port of Trieste; also a
fringe of islands and mainland coast on the
eastern frontage of the Adriatic, formerly a
part of Hungary but having a large Italian
population. The details as to the area or popu-
lation gained by Italy are not yet sufficiently
determined by the Peace Treaty. Italy will
be the leading naval power, though apparently
the territory added approximately 18,000 square miles with a popu-
lation of 2,000,000. Late in 1919, the former
Hungarian port of Fiume, claimed by Jugo-
Slavia, was occupied by a military force com-
posed of Italians, but the Italian government
stated that the action was not by its authority.
Later, however, the government announced its
intention to occupy the city and adjacent area,
pending a settlement of permanent control by
procedure of the League of Nations.

Belgium.—The changes in Belgian territory
are extremely small and consist chiefly of the
settlement in her favor of the long-pending
question of the control of the town of Mores-
net, a tiny territory of about one and one-half
square miles, 10 miles north of the German
port of Bremen, and four miles north of the
Prussian frontier. The three townlets of Moresnet lie
close to Aix-la-Chapelle, one being Prussian,
the second Belgian, and the third neutral. The last named, which has a popu-
lation of some 2,800, owes its origin to the
European settlement of 1815. Between 1816
and 1841 it was administered by Prussia and
Belgium jointly. But since 1841 neutral Mores-
net has been independent, being governed by a
council of 10 members with a burgomaster at
its head. The control of this disputed area
now passes absolutely to Belgium.

Greece.—Greece gains a considerable area
of Turkish territory in Anatolia, in Asia
Minor, just across the Aegean from her eastern
border, including Smyrna and the adjacent sec-
tion in which there are many representatives
of her own population. No definite announce-
ment has yet been made as to the boundaries
of the area which will be assigned to her or its
population. Whether the territory at the head
of the Aegean will be attached to Greece is not
yet determined.

Rumania.—Rumania gains largely in area
and population through the absorption of the
eastern section of Hungary, which was occu-
pied by people speaking the Rumanian language,
including the important section of Hungary
known as Transylvania, also the Rumanian terri-
tory of Bessarabia on the Black Sea, also a
considerable area of interior Hungary. No
definite figures can be given as to her increase
in either area or population, though from latest
indications the present area of Rumania is about
double that prior to the war, and absorbed
chiefly from Hungary.

Japan.—Japan took forcible possession in
the early part of the war of the Marshall,
Ladrones and Caroline Islands and the German
colony of Kiau-chau, on the coast of China,
and still retains control thereof. The peace
treaty gives her a “mandate” over the islands
in question and also passes to her all rights re-
garding railways, mines and cables which had
previously been granted by China to Germany. To
this, while protested by the Chinese government, will
if it becomes effective give to Japan extremely
valuable exclusive privileges in the important
Japanese province of Shantung and probably in
other provinces of China.

The losses by the Central Powers may be
outlined as follows:

Germany.—Germany’s losses on the West,
as outlined by the Peace Treaty, consist of the
Alsace-Lorraine territory and the Saar coal
mines, already described. She must also give
full recognition to the Belgian claim of Mores-
net. To Poland on the East, Germany is re-
quired to cede the greater part of Upper Silesia,
Posen and the province of West Prussia on the
left bank of the Vistula, while in regard to
East Prussia, which becomes a German island
surrounded by Polish territory, a plebiscite is to
determine the ultimate frontier. Danzig and
the district adjacent thereto is to be constituted
the “Free State of Danzig” under the guar-
antee of the League of Nations, but to be
included within the Polish customs frontier,
and Poland is to have the use of the city’s
docks and waterways. Germany must also con-
cede to Poland the privilege of railroad com-
munication across German territory to
Czecho-Slovakia, and Poland must in turn grant similar privi-
leges to Germany across the Polish territory.
WAR, EUROPEAN—ITS RELATION TO WORLD COMMERCE (27)

between East Prussia and Germany. On the Northwest the people of North Schleswig and the area of Central Schleswig are to be given the privilege of determining the return of their territory to Denmark or the retention of German control, and the fortifications of Heligoland are to be destroyed. Parts of the Elbe, Danube, Oder and Niemen rivers are to be internationalized, and the Kiel Canal is to be opened to the merchant shipping of all nations at peace with Germany. She is also required to lease to the Republic of Czecho-Slovakia, for a period of 99 years certain areas in the harbors of Hamburg and Stettin as free zones. As a guaranty for the execution of the treaty, the German territory west of the Rhine, together with the bridgeheads, is to be occupied by the Allied and associated troops for 15 years.

Germany's losses of area are in general terms: to France, about 6,000 square miles and 2,000,000 people; to Poland, 30,000 square miles and 6,000,000 people. She loses about 15 per cent of her former area and about 10 per cent of her population, to say nothing of the loss of her colonial mines or of her colonies and dependencies in Africa, Asia and the Pacific with an area of about 1,000,000 square miles and a population of about 12,000,000. The new form of government is a republic with a president to be elected by the whole German people for a term of seven years. Its operations in the first year were characterized by the adoption of socialist laws and regulations, especially in control of basic industries.

Austria-Hungary.—Austria-Hungary's losses of territory and population are much greater than those of Germany. The area of the Austro-Hungarian monarchy at the beginning of the war was 260,000 square miles and the population 51,000,000. The Austrian territory was 116,000 square miles and the population in 1910 28,325,000; the Hungarian territory 126,000 square miles and the population 21,000,000, and in addition to this, Hungary had the administration of Bosnia and Herzegovina with an area of about 19,000 square miles and a population of about 2,000,000. In October 1918 a part of the territory formerly known as Austria established itself as a republic under the title of German Austria, the area which it claimed amounting to about 40,000 square miles or approximately 15 per cent of the former Austro-Hungarian Empire, the population about 9,000,000 or about 19 per cent of the former empire. In the same month, the Austrian provinces of Bohemia, Moravia and Silesia and certain Hungarian areas, designated as Slovakia organized themselves as the Republic of Czecho-Slovakia. The Austrian territory passing into this new republic was about 30,000 square miles and the population about 9,000,000; that of Hungary passing into the Czecho-Slovakian Republic was estimated at approximately 30,000 square miles and the population about 4,000,000. At the same time, the southern part of Hungary established itself as an independent nation with the title of Jugo-Slavia or Yugo-Slavia and including Bosnia-Herzegovina, Croatia, Slavonia, Carniola, Carinthia, Styria, Istria, Gorizia-Gradiska, and certain adjacent islands. Some of these islands and smaller provinces have, however, passed to the control of Italy. A small section at the southeast of Austria was transferred to Italy and this included the former Austrian port of Trieste, leaving Austria without direct access to tidewater or her own territory. The fragment of former Austria which now retains the title of German Austria is about 40,000 square miles in area as against 107,000 in the former Austria and with a population of about 9,000,000 as against 28,000,000 in Austria in 1913.

Hungary established itself as an independent republic (the Hungarian Peoples Republic) in November 1918 with an area much less than that of the Hungarian Kingdom as it existed as a part of Austria-Hungary. A considerable section at the south was incorporated into the new state of Jugo-Slavia, and a large section at the east including Transylvania passed under the control of Rumania. Subsequently (in the latter half of 1919) Rumanian troops occupied a considerable part of the eastern section of the territory which had been designated as the Hungarian Peoples Republic, and still later an attempt was made to transform this republic into a limited monarchy. No definite statement can at this time be given as to the exact area or population of the Hungarian Republic. The estimate available is an area of about 35,000 square miles or about 20 per cent of the area formerly the Kingdom of Hungary, and the population about 8,000,000 or a little over one-third that of the kingdom in 1913. Her principal port of Fiume passed under control of the new state of Jugo-Slavia but its control was late in 1919 taken over by a military organization originating in Italy, and finally occupied by the Italian government pending a final settlement. Hungary, by these incidents, loses her entire frontage on the Adriatic as does also German Austria, though it is expected that both the new republics will be given access to the Adriatic through the internationalization of certain railway lines connecting their trade centres with certain of the Adriatic ports.

Bulgaria.—Bulgaria, by the terms of the treaty submitted by the Peace Conference late in 1919 and accepted by Bulgaria, loses sundry small areas in adjustment of her boundaries with the new state of Jugo-Slavia; also western Thrace which formed her outlet to the Aegean, though she still retains her frontage upon the Black Sea and is promised traffic routes to the Aegean by some plan not yet announced.

Russia.—The changes in Russian territory as relates to political divisions and government are even more striking than those of Germany or Austria-Hungary. While the various groups of Russian political agitators attempted one by one to include all of the former Russian territory in their proposed governments, they were opposed by various groups of people in the different sections of that great area, who desired to establish themselves respectively as new and independent states composed of distinct ethnic or racial stocks. The abdication of the Emperor Nicholas II in March 1917 was followed by a provisional government which continued until 16 May 1917, when it was reorganized with Alexei, Grand Duke of Russia, as Czar of the new Cabinet, but this was in turn reorganized in October 1917, maintaining itself until 7 November 1917, when the Military Revolutionary Committee seized the government authority and handed it over to the All-Russian Congress of
the Councils of Workmen's, Soldiers' and Peasants' Deputies. A Constituent Assembly was created and a form of government established controlled by the Executive Committee of the Councils of Workmen's, Soldiers' and Peasants' Deputies. On 31 Jan. 1918, a decree was issued establishing the permanent character of the Workmen's and Peasants' (Bolshevik) government. On 14 March, 1918, this government took over the control of Petrograd, which thus became the centre of the government. The title of the government thus established is the "Russian Federated Republic"; its flag is red with the legend, "Federal Republic of the Soviets." Its control over Russian territory cannot be definitely stated, however, as to the area in which it exercises jurisdiction and administers government or the number of people under its immediate control or administration. In every part of the area formerly known as Russia groups of people have established themselves by proclamation and organization as independent governments, in nearly all cases republics.

One of the largest and earliest of the groups establishing themselves as independent governments was the republic of Ukraine, occupying the southwestern section of Russia and fronting upon the Black Sea with Odessa as its principal port. It declared its independence in November 1917 under the title of the "Ukraine People's Republic," but its boundaries are still somewhat in dispute, especially with the neighboring republic of Poland, which was formed in part from Russian and in part from German and Austrian territory. The Ukrainian Republic has, so far as can be determined, an area of about 215,000 square miles and a population of approximately 30,000,000. It has a large part of the area known as the "Black Soil District" and its agricultural and mineral possibilities are important. Immediately north of the Ukrainian Republic is a group of people known as the White Russians who established themselves in May 1919 as the Republic of White Russia, with an area estimated at 140,000 square miles and a population of approximately 5,000,000. Immediately west of the Republic of White Russia and extending to the Baltic, another new republic was established in April 1918 under the title of the Republic of Lithuania, with an area of approximately 90,000 square miles and a population estimated at about 10,000,000. Immediately north of Lithuania and also fronting upon the Baltic, the little Republic of Courland with an area of 10,000 square miles and a population of 800,000 was declared an independent government in April 1918. Next north of Courland and fronting upon the Gulf of Riga, a part of the Baltic, the Republic of Livonia was declared in April 1918, with an area of about 17,000 square miles and a population of approximately 1,600,000. The Lettish population occupying the peninsula between the Gulf of Riga and the Baltic established themselves as a republic under the title of Latvia (also sometimes written Latvia). The territory immediately north of Latvia, comprising Livonia, declared itself in April 1918 as the independent Republic of Estonia. It fronts not only upon the Baltic but on the Gulf of Finland, the entrance to the harbor of Petrograd. Its area is stated at about 7,300 square miles and a population of 1,750,000. Still further north, the people of the area long known as Finland declared themselves in December 1917 an independent republic, with a population of about 3,500,000 and an area of 125,000 square miles, extending northward to within a short distance of the Arctic Ocean.

The Arctic frontage of Russia lying immediately east of the northern part of Finland was established as a military district by the Allied Powers on 7 July 1918 with a military government, and has an area of approximately 35,000 square miles and a population estimated at about 100,000. Further east on the Arctic frontage the greater part of the former Russian Province of Archangel was established under the title of the Republic of North Russia with Nicholas Tchaikovsky as its head and its existence as a separate government recognized by certain of the powers, especially Great Britain. Its area is estimated at 275,000 square miles and its population at about 400,000. The populations of both North Russia and the Murman Region are composed largely of Lapps, Finns and Samoyedes. Immediately south of the White Sea and on the eastern border of Finland, the Republic of East Karelia was established in May 1919 and authorized to create a Constituent Assembly to determine whether the area shall form an alliance with Finland or Russia. The area of this republic is about 68,000 square miles and the population approximately 250,000.

In the southeastern section of Russia with its considerable sprinkling of Tatar stock intermingled with Slavic blood, a half dozen small republics sprang into existence; the Tauride Republic, including the Crimea and Karasula, with an area of approximately 23,000 square miles and a population of 1,800,000, declared itself independent of Russia in March 1918; the Kuban Republic just east of the Sea of Azov, with an area of 36,000 square miles and a population of 3,000,000, declared itself independent in November 1919; the Terek Republic at the southeast of Kuban and extending north across to the Caspian Sea, with an area of 28,000 square miles and a population of 1,300,000, declared itself independent in September 1918; the Republic of Georgia, at the extreme eastern end of the Black Sea, with an area of 40,000 square miles and a population of 2,500,000, was declared an independent state in January 1918; the Don Republic lying at the northeast of the Sea of Azov and fronting upon that sea, with an area of 63,000 square miles and a population of 4,000,000, declared itself independent in January 1918. East of the Caspian, the Turkestan area, consisting of about 400,000 square miles and with a population of 6,500,000, was in January 1918 established as an independent government under military control; north of the Caspian, the Tatar-Bashkir Republic was established in October 1918, its area being estimated at 175,000 square miles and its population at 9,000,000; the government is under military control.

Passing across the Urals into Siberia, the independent Republic of Siberia was proclaimed in December 1917, with its capital at Tomsk, and a Siberian Duma of 30 members was opened. Later, however, it was decided for the time being to concentrate all power in the hands of a single individual, Admiral Kolchak. No statement is made as to the actual extent of territory claimed by the Republic of Siberia, though presumably
it would include a large part of the area of Siberia stated at 4,833,000 square miles and a population of 4,833,000. As the extreme north-east of the Siberian area, a separate government designated as the Yakutsk Republic was established in May 1918 with a military government and an area estimated at about 1,000,000 square miles with a population of 4,000,000. The areas governed by native rulers is Palestine fronting upon the Mediterranean which, it is assumed, will be considered British territory by reason in part of her capture of Jerusalem and, further east, the Mesopotamian Valley which was successfully invaded by British troops during the war. Immediately north of Palestine is Syria over which France is expected to be given control. The area of Palestine is small, about 10,000 square miles and a population of 500,000; Mesopotamia, 143,000 square miles and a population of 2,000,000; Syria, 37,000 square miles and a population of 1,000,000. North of Syria lie the important provinces of Armenia with an area of 75,000 square miles and a population of 2,500,000; Anatolia, 145,000 square miles and a population of 5,000,000, of which Greece is to have a part of the Aegean frontage; and the small European area remaining under the Turkish flag, 10,000 square miles and a population of 1,900,000, the future government and governing power in each of these being yet undetermined, though sufficient has developed to justify the statement that the Turkish territory is, like the Syrian territory, to be transformed into comparatively small political divisions independent of each other and thus not likely in the immediate future at least rapidly to develop industrial or commercial power. Nothing has yet been determined as to the future government of Constantinople and the small European Turkish territory by which it is surrounded.

While only a comparatively small proportion of the newly established states have progressed to a point at which it is practicable to state in any detail their physical, industrial, financial or commercial condition and possibilities, it seems proper to state the new facts now available with reference to those for which such material can be presented.

Turkey.—While no definite action has yet been taken by the Peace Congress or the Allies in the readjustment of Turkish territory, the plans outlined include the creation of a half dozen new organizations, some of which have long been in being as representatives of certain of the Allied Powers, while other sections have been lately formed on the central government and established themselves under local leaderships.

The first section of Turkish territory to voluntarily separate itself as a separate government was the Kingdom of Hejaz, with an area of about 9,000,000 square miles, extending along the eastern coast of the Red Sea and including the two Arabian sanctuaries of Mecca and Medina. It declared its independence as the Kingdom of Hejaz in June 1916 and was recognized by the British government as an independent political entity, and later by the Peace Conference which accepted its representative as a member of that body. Its population is estimated at about 300,000. Lying to the east of Hejaz is the great desert area of Arabia, composed in large degree of shifting sands and a nomadic population, though in the vicinity of the oases the population is more permanent in character. In half a dozen of these local groups of people, the native chieftains have established their own rule. The Emirate of Nejd and Hasa, the more powerful of the two Central Arabian principalities, has its capital at Riyadh; the Emirate of Jebel Shammar, lying immediately north of the Nejd, with its capital at Hail, is ruled by an emir; the Imamate of Yemen, with its political centre at Sana; the Principality of Oman, on the west coast, between Hejaz and Yemen, with its capital at Sabivah; the Sultanate of Koweit on the Persian Gulf; and the Sultanate of Oman in the extreme south-east at the entrance of the Persian Gulf, with an area of 82,000 square miles and an estimated population of 500,000. It is assumed that the Sultanate of the Persian Gulf, with an area of 82,000 square miles and an estimated population off 500,000. It is assumed that the several cities of the area will be governed by British governors until the Sultanate of the Persian Gulf is able to assume the control of its own government.

Poland.—While no exact figures are available as to the area or population of Poland, an estimate by Polish authorities puts the total area at 135,000 square miles and a population of 36,000,000. To be a part of Polish Russia is now added those territories ethnographically Polish but which were long ago detached and annexed by other states. This would include a large part of Upper Silesia, East Prussia, Galicia, Poland, and perhaps a part of Lithuania. Coal, iron ore, zinc, lead, potassium salt and rock oil are among the minerals; the agricultural products include wheat, rye, oats, barley, potatoes and sugar beets; and in the industries, those of textiles and iron and steel are the most important. Danzig on the Baltic, formerly in German territory, is to be by order of the Peace Conference constituted the "Free State of Danzig" under the guaranty of the League of Nations but to be included within the Polish-Norwegian Frontier and Poland is to have the use of the city's docks and waterways. Germany must also concede to Poland the privilege of railroad communication across German territory to Danzig, thus assuming Poland as a principal port. Ukraine, the Ukrainian Peoples Republic, proclaimed on 21 Nov. 1917, lies immediately north of the Black Sea with Odessa as its principal port. Its area is estimated at

### Additional Notes

- *Latest available estimate.*
- *Enlarged by absorption of Hungarian territory.*
- *The Marshall group occupied as a wireless station; also known as Pleasant Island.*
- *Limited monarchy proposed 1919.*

About 216,000 square miles and with a population of approximately 30,000,000. A considerable part of Ukrainia belongs to the Black Sea Region of Russia and its agricultural products, wheat and other cereals, sugar beets, potatoes and food animals, are thus important, while the fact that the deposits of iron ore were looked upon as the most important in all of Russia and with rich coal deposits in the Donetz Basin give promise of industrial and commercial activity. The Republic of Ukrainia.

**Czecho-Slovakia—The Czecho-Slovak Republic was declared on 28 Oct. 1918. It comprises two branches of the same nation, the 7,000,000 Czechs of Bohemia, Moravia and Silesia, and the 3,000,000 Slovaks in Upper Hungary who speak a dialect of Czech. It includes Bohemia, Moravia, Silesia and Slovakia with an estimated area of 60,000 square miles and a population estimated at about 13,000,000. About 5,000,000 are Bohemians, 3,000,000 Slovaks, 2,000,000 Moravians, and 2,500,000 Germans. Its principal city and capital, Prague, has a population of about 500,000. The agricultural area is looked upon as one of the most important in interior Europe, supplying large quantities of sugar beets, potatoes and other important crops. The coal mines are considered exceptionally valuable and the manufacturing industries were highly developed prior to...**
the war, the number of factories in operation have been upward of 5,000. Czecho-Slovakia has no ocean frontage, though it is expected that an agreement will be made for its permanent base on the Adriatic with railroad facilities guaranteed through intervening territory and similar privileges are provided at Hamburg and Stettin.

Jugo-Slavia.—Jugo-Slavia, which includes within its borders the Slavic peoples of Croatia, Slovenia and Dalmatia, and certain parts of the former Adriatic frontier of Hungary combined with Serbia and Montenegro, will have an area of approximately 85,000 square miles and a population of about 10,000,000, with frontage upon the Adriatic. Its producing powers agriculturally are little more than sufficient to meet the requirements of the population and manufacturing has not yet been actively developed.

Of the numerous other groups which have been declared independent political units, little can at present be said other than to state the estimated area, population, ethnic stock of the people, date of establishment, form of government, and countries which contributed the area, and which are presented in the table on the preceding page, though it is proper to add that in many instances the figures of area and population are necessarily estimated.

O. P. AUSTIN,
Statistician, National City Bank of New York.

28. EFFECT OF THE WAR ON CURRENCY. The World War made great changes in world currency, and especially in the countries participating in that conflict. The paper currency of 30 principal countries of the world at the beginning of the war aggregated a little over $7,000,000,000; at the end of the war, November 1918, it was about $40,000,000,000; and in December 1919, $48,000,000,000; these figures being again in extremely round terms. Meantime their stock of gold when taken in the aggregate showed an increase from $4,360,000,000 in 1914 to $6,050,000,000 in 1918, and $5,640,000,000 in 1919. Their ratio, as a group, of gold to circulating notes, was in 1914, 71.3 percent; in November 1918 15.8 percent; and in December 1919 11.2 percent. In certain countries, notably that of Hungary, and in the Central Powers and Russia, the ratio of gold to notes fell with a much greater rapidity than that above noted; that of Austria-Hungary from 54.8 percent to about 0.5 percent; Russia from 98 percent in 1914 to approximately 7 percent at the date of the advent of the Bolsheviks; Germany from practically 70 percent in 1914 to 3.5 percent in 1919.

Among the European Allies, the reduction in ratio of gold to notes was not so marked, but less dramatic than that of the Central Powers, the drop in ratio of gold to notes being in the case of France from 62 percent in 1914 to 11.2 percent at the close of the war, and 9.5 percent in 1919; Italy from 75 percent in 1914 to 7.5 percent in 1919; while in our own case the ratio of gold to notes dropped from 99.6 percent in 1914 to 63.2 percent in 1918, and 52.3 percent in 1919. The Central Powers as a group show a ratio of gold to notes in 1914 49.7 percent; in 1918 5.5 percent; and in December 1919 but 1.7 percent. The Allies as a group show a gold ratio in 1914 of 76.6 percent, in 1918 20.8 percent and in 1919 17.1 percent.

The neutrals of course fared better in the matter of their currency than did those participating in the war, though the total of their paper figures did increase from $1,165,000,000 in the eight countries for which figures are available to $2,421,000,000 in 1919, though the increase of gold was still larger proportionately, from $516,000,000 in 1914 to $1,451,000,000 in 1919, bringing the ratio of gold to notes in this group of eight neutrals from 44.3 percent in 1914 to 59.9 percent in 1919 (See accompanying table for details of each of the 30 countries included in the study).

The most astonishing, not to say alarming, feature of this growth of world paper currency and reduction in the ratio of gold reserve thereto, occurs in the development of the year following the war. It was, of course, necessary that the governments while participating in the war should largely increase their quantities of currency, and they did, as is shown from the fact that the paper currency of the 23 countries in question jumped from $6,109,000,000 in July 1914 to $37,284,000,000 at the end of the war, November 1918; though why it should have been necessary to add another $11,600,000,000 in the year following the close of the war and bring the grand total of December 1919 up to $48,352,000,000 is difficult to understand, especially when we realize that none of this increase of $11,600,000,000 in the 13 months following the Armistice included in the $34,000,000,000 of paper issued by the Bolshevik government from its establishment late in 1917 to the end of 1919, and which is described by persons familiar with conditions in Bolshevik Russia as having no gold backing and therefore absolutely valueless.
The table which follows shows the currency conditions as to circulating notes and gold reserve in the 30 principal countries of the world in 1914, 1918 and 1919. These figures include in most cases only the currency issues and gold reserve of the great State Banks, such as the Bank of France, the Bank of Italy, the Imperial Bank of Germany, the Austro-Hungarian Bank, the National Bank of Belgium and the Swiss National Bank; though the figures with reference to Great Britain include not only those of the Bank of England but the Currency Notes Account* which was separately stated by the government from the early part of the war period downward. The figures presented in this table are, therefore, exclusive in most instances of the comparatively small amounts of paper currency represented by other banks of issue, though this statement applies only to those countries having the great banking organization usually termed "State Banks," such as those above cited. The value, in United States dollars,

* The figures of gold and notes are in most cases those of the State Banks of the countries named (Bank of France, Bank of England, Imperial Bank of Germany, Austro-Hungarian Bank, National Bank of Belgium, Swiss National Bank, etc.) and do not include notes of other banks of issue. In the case of the United States the figures supplied by the Treasury Department are exclusive of gold and other certificates which are considered as warehouse certificates for an equivalent amount of metal deposited with the Treasury. British figures include Bank of England and the "Currency Notes Account." Russian figures are exclusive of Bolshevik notes, estimated in 1919 at a face value of about $34,000,000,000 but with practically no gold reserve. All currency figures are in millions of United States dollars, calculated at the normal (pre-war) value of the currency of the respective countries.

† Includes silver.

* Exclusive of Bolshevik notes estimated at a face value of $34,000,000,000, without gold reserve.

WAR, European—Congressional Medal of Honor Awards.—The Congressional Medal of Honor was the most highly prized as it was the most difficult to obtain of all military decorations. See MEDAL OF HONOR, UNITED STATES MILITARY. There were only 78 awards of this medal and of the 78 men on the honor roll 24 lost their lives, most of them in the action for which they were cited. Below is the honor roll of those who merited the highest symbol of appreciation in the gift of the United States. The names are in order of the
dates of the action for which the awards were made from 6 June 1918 to 9 Nov. 1918.

CHARLES P. HOFFMAN, Gunner, Sergeant, 5th Marines, Chateau-Thierry, 6 June 1918.

THOMAS A. FOW, Corporal, Co. B, 113th Infantry, Hamel, 4 July.

GEORGE PICKHEART, First Lieutenant, 10th Field Artillery, Vaux-Andigny, 14–15 July.

LOUIS CUEKEL, Sergeant, 5th Marines, Villers Cotterets, 16 July.

GEORGE DIBOYE, Private, Co. H, 103rd Infantry, Belleau, 18 July.

MARIE KOCUL, Sergeant, 5th Marines, Soissons, 18 July.

LEWIS M. MESTROVITCH, Sergeant, Co. C, 111th Infantry, Fismette, 10 August.

L. WANDLAW MILLS, Captain, 308th Infantry, Revillon, 14 September.

EMORY J. PEKE, Lieutenant-Colonel, Machine Gun Battalion, Veldzande, 15 September.

ULRICH CALL, Corporal, Tank Corps, Varisnes, 26 September.

STANLEY G. GUMPEL, First Sergeant, Co. E, 132nd Infantry, Bois de Forges, 26 September.

PHILIP C. EATE, Sergeant, Co. C, 363rd Infantry, Boves, 26 September.

GEORGE B. MALLON, Captain, 132nd Infantry, Bois de Forges, 26 September.

WILLIE SANDLUND, Private, Co. A, 332nd Infantry, Bois de Forges, 26 September.

ALAN F. HOPKINS, Private, Co. D, 332nd Infantry, Bois de Forges, 26 September.

WILHELM VON WALT, Private, Co. A, 105th Infantry, Steenkerke, 26 September.

CHESTER B. WEST, First Sergeant, Co. D, 333rd Infantry, Bois de Cherove, 26 September.

WILLIAM B. TURNER, First Lieutenant, 105th Infantry, Ronsonay, 27 September.

OSCAR F. MILLER, Major, 361st Infantry, Gisors, 28 September.

PAUL E. SMITH, Lieutenant-Colonel, 308th Infantry, Binarville, 28 September.

FRANK GABBIN, Private, 108th Infantry, Ronsonay, 29 September.

FRANK LUKES, First Lieutenant, Avigation, Murvilliers, 29 September.

WILLIAM S. ROSS, First Lieutenant, 369th Infantry, Schonroll, 29 September.

FRANK J. HART, Private, Co. C, 9th Infantry, Medeas, Parc, 3 October.

JOHN KITCEY, Private, 6th Marines, Blanc Mont Ridge, 3 October.

J. H. FRIETH, Corporal, 6th Marines, Blanc Mont Ridge, 3 October.

HEINZ KUEFFMANN, First Sergeant, Co. K, 308th Infantry, Argonne Forest, 4 October.

FRANK W. ROBERTS, Corporal, Tank Corps, Montreherbain Woods, 4 October.

MICHAEL E. BELL, Sergeant, Co. C, 28th Infantry, Esmont, 4 October.

ARCHIBALD PECK, Private, Co. A, 307th Infantry, Argonne Forest, 6 October.

JOHN B. BARKLEY, Private, Co. K, 4th Infantry, Cuneel, 7 October.

RUDOLPH B. TAYLOR, Sergeant, Co. L, 117th Infantry, Ponchaux, 7 October.

RALPH HILL, Corporal, Co. H, 129th Infantry, Dannevoz, 7 October.

JOHANNES S. ANDERSON, Sergeant, Co. B, 132nd Infantry, Cateau, 8 October.

WILLIAM G. COSTIN, Private, Co. H, 115th Infantry, Bois de Conspoy, 8 October.

JAMES C. DOHERY, First Lieutenant, 118th Infantry, Montreherbain, 8 October.

Oscar E. Young, Sergeant, Co. F, 118th Infantry, Montreherbain, 10 October.

* Made the supreme sacrifice.

WAR, INSTRUMENTALITIES AND METHODS OF

The Hague Convention respecting the laws and customs of war on land (Article 22) declares that the means which a belligerent may adopt for the purpose of overcoming his enemy are not unlimited, and among the instrumentalities and methods which it expressly forbids are the use of poison and poisoned weapons; arms, projectiles and materials calculated to cause unnecessary suffering; the use of projectiles the sole object of which is the diffusion of asphyxiating or deleterious gases; the use of expanding or explosive bullets; the employment of uncivilized races as troops; the compelling of the inhabitants of occupied territory to take part in the military operations against their own country, or to furnish the enemy with information regarding the location or strength of their own forces; the killing of prisoners of war; the assassination of persons belonging to the enemy forces or his civil officials; the resort to treachery or perfidy; the bombardment of undefended towns, villages or habitations; the resort to devastation except in case of military necessity; the destruction of property except when imperatively demanded by the necessities of the war, etc. These pro-
hitions are all expressly incorporated in the war manuals of the United States, Great Britain and France. In addition to these instrumentalities and methods forbidden by The Hague Convention of 1899, the indiscriminate use of which is prohibited by the established customs and usages of civilized warfare. The Declaration of Saint Petersburg of 1868 affirmed the principle that war is a contest between only the armed forces of states and not between their peoples as such, and that consequently the "only legitimate object which states should endeavor to accomplish during war is to weaken the military forces of the enemy; that for this purpose it is sufficient to disable the greatest number of men and that the employment of arms which needlessly aggravate the sufferings of disabled men or render their death inevitable is not permissible." There is a difference of opinion among the authorities as to whether the Declaration of Saint Petersburg that war is merely a contest between the armed forces does not go too far and the later wars have yet to demonstrate that belligerents will not act upon it. In the later wars, the opinion among writers outside Germany that there are limits beyond which considerations of humanity must take precedence over the necessities of war. As Spaight, a high English authority, has aptly put it, the world has long since the two great principles—the first, that the sole end of war is the overcoming of the military forces of the enemy; second, that as regards the means which may be adopted to secure this end certain restrictive laws apply. German militarists and text writers, however, have long maintained a different view as to the nature and objects of war and of the instrumentalities and methods that may be employed in prosecuting it. The German manual ("Kriegsbrauch im Landkriege") asserts that "a war conducted with energy cannot be directed merely against the armed forces of the enemy state and the positions they occupy, but it will and must in like manner seek to destroy the armies and the persons or the sentiments of the latter." The rights of individuals, it adds, and their property can only be taken into consideration in so far as the nature and objects of war permit. This means as a form of means to that it is permissible to direct the war not only against the armed forces of the enemy but against his education, art, science, finance, railroads, industry, everything in fact that goes to make up his Kultur. This view was as gested by von Moltke in a letter to Professor Bluntschi in 1890, where, criticizing Bluntschi's proposed code in general and the Declaration of Saint Petersburg in particular, he said: "I cannot agree with the Declaration of Saint Petersburg that the weakening of the armed forces of the enemy is the only legitimate object which states should endeavor to accomplish during war; no, all auxiliary resources of the hostile government must be destroyed: its finances, railroads, necessities of life, and even its place." This view of the nature and objects of war was that affirmed by Germany's first and greatest military writer, von Clausewitz, who advocated terrorism and violence as a means of overcoming the enemy, who declared that an invader has the right to live on the country, that war must support war and that the resource of requisition and contribution has no limits except those of exhaustion, impoverishment, and the will which prohibits it, but still which are prohibited by the established customs and usages of civilized warfare. And, Views less extreme, although sufficiently so to be condemned by practically all writers outside Germany, have more recently been asserted by Generals von Hartmann, von der Goltz, von Hindenburg, von Bissing, Bernhardi and other German militarists. General von Hindenburg in an interview published in the Vienna Neue Freie Presse in November 1914, said: "One cannot make war in a sentimental fashion. The more pitiless the conduct of the war the more humane it is in reality, for it will run its course all the sooner. The war which of all wars is and must be the most humane is that which leads to peace with as little delay as possible." Speaking on 29 August 1915, at Münster, of the extreme measures which the General Staff has felt it expedient to take against the civil population of Belgium, General von Bissing said: "The innocent must suffer with the guilty. In the repression of infamous human lives cannot be spared and if isolated houses, whole villages and even entire towns are annihilated, that is regrettable but it must not excite ill-timed sentimentality. All this must not in our eyes weigh as much as the life of a single one of our brave soldiers. The rigorous accomplishment of duty is the emanation of a high Kultur, and in that, the population of the enemy country can learn a lesson from our army." Regarding the limitations imposed upon the conduct of belligerents by the laws of humanity, German military writers have long held to the view that war is by its very nature inconsistent with humanity and cannot be prosecuted humanely if success is to be achieved. The General Staff of war, prepared by the General Staff, shows a disposition to belittle the efforts which have been made to humanize the war and more than once it refers to those who have taken the leadership in such movements as misguided sentimentalists and theorists whose humanitarianism has "frequently degenerated into sentiments of pity and flabby emotion" (Sentimentalität und Gefühlsschänderei) which are in "fundamental contradiction with the nature of war and its object." Often the only true humanity, it asserts, "lies in a ruthless application of them" and soldiers would do well to act upon exaggerated humanitarian notions regarding the object and purpose of war. This note of warning had already been sounded years before by von Moltke in the letter to Bluntschi, referred to above, where the great marshal said "the great kindness in war is to bring it to a speedy conclusion." German text writers and militarists frankly admit that there are limits in respect to the methods and instrumentalities which may be employed by a belligerent but the theory of military necessity which they uphold unfortunately reduces the limitations to a nullity in many cases. The Hague Conventions intertemporally, and nearly all text writers expressly, recognize that there are circumstances under which a belligerent may employ instrumentalities set by the established rules of international law but they are all, at least outside Germany, in substantial agreement that the
plea of necessity is no excuse for overriding the limitations of the law unless its observance would result in the early cessation of the belligerent. In short, it must be a case of self-preservation and the injury or danger must be such as will not admit of the delay which the normal course of action would involve. Motions for reconsideration of conscience or strategic interests such as led Germany to send her army through Belgium are not sufficient to justify a belligerent in overriding the law. The German manual, as well as many German text writers, draws a distinction between what they call Kriegsraison and Kriegsraison. The former, which may be translated as "the reason of war," allows a belligerent to employ any means or methods which are necessary to the attainment of the object of the war even though they are forbidden by the customs and usages of war (Kriegsraison). In short, the limitations set to belligerent conduct by the laws of war may be disregarded whenever their observance would hinder or defeat the attainment of the object of war. Such distinction condemned by the Hague Conventions, by the war manuals of the United States, Great Britain and France and by practically all writers outside of Germany.

The German war manual affirms that "every means may be employed to overcome the enemy, without which the object of the war cannot be attained... all means which modern inventions afford, including the most perfect, the most dangerous and those which destroy most quickly the adversary en masse; and since these latter result most promptly in the attainment of the object of the war they must be considered, as indispensable, and, all things considered, they are the most humane." Nevertheless, it admits that "chivalrous and Christian spirit, the progress of civilization and especially the knowledge of one's own interest have led to voluntary relaxations the necessity of which has received the tacit assent of all states and of all armies." Von Moltke from whom the General Staff draws so many of its ideas, laid down the inadmissible principle that "the great benefit in war is that it should be terminated as soon as possible." For this purpose it is permissible to "employ all means except those which are positively condemned" (daen missen alle dem mittleren Waffen massen stehen). In short, the test of the legitimacy of an instrument or measure is not so much its humanity but its effectiveness in enabling a belligerent to bring the war to a speedy and successful termination. This view has recently found advocates in Generals Bernhardi, von Hindenburg, von Bissig and other German militarists and it is apparently the view on which the German government proceeded during the late war. Thus the Imperial Chancellor said in the Reichstag in March 1916: "Every means that is calculated to shorten the war constitutes the most humane policy to follow. When the most ruthless methods are considered best calculated to lead us to victory and a swift victory, then they must be employed." Again in a note of 31 Jan. 1917, handed to the Secretary of State of the United States, the German Ambassador at Washington justifying Germany's repudiation of the pledges given to the American government regarding the sinking of merchant vessels (see Submarine Warfare) and defending the resumption of unrestricted submarine warfare in the belief that the German government is now compelled to continue the fight for existence, forced upon it, with "the full employment of all the weapons which are at its disposal." The employment of new and powerful agencies of destruction or of new methods of attack is, of course, not to be condemned merely because they are new or because they are more effective than those formerly used. The true test of their lawfulness is whether they are humane, whether they can be employed without inflicting superfluous injury upon those against whom they are used, whether in the language of the Declaration of Saint Petersburg the effect is to "uselessly aggravate the sufferings of disabled men." The doctrine of the German militarists that the test is effectiveness, that is, it is permissible to employ any instrument the use of which will contribute to the attainment of the object of the war and especially the shortening of its duration, cannot be accepted by nearly all military codes and is condemned by the Hague Conventions, and by practically all text writers outside Germany. Turning now to the practice during the late war, we find that nearly every instrument, agency or method of destruction forbidden by the Hague Conventions and the customs of war was employed by one or the other of the belligerents, and that Germany has the unenviable distinction of having made use of them all. Each belligerent accused the other during the early months of the war of making use of both dum-dum and explosive bullets and each vigorously denied the charge. Each claims to have captured on the field of battle large quantities especially of dum-dum ammunition, and the French admitted that the Germans may have found such ammunition at Longwy, but asserted that it had been stored there before the war for target practice and that none of it was ever used against the Germans. The German emperor addressed a protest to the President of the United States against the alleged use by the English and French of bullets forbidden by the Hague Convention, and the President of France in a telegram to Mr. Wilson declined to accept the charge. The emperor's protest was designed to deceive the people of the United States. The French government also stigmatized as "the grossest forgeries" what purported to be facsimiles of labels found on French ammunition boxes showing the presence of dum-dum bullets. Count von Bernstorff, German Ambassador at Washington, filed a complaint with the Department of State, charging that bulwells forbidden by the Hague Convention were being manufactured in the United States for shipment to England for use by the British forces. The department made an investigation of the charge and informed Count von Bernstorff that no evidence could be found in support of his charge. Nevertheless, it is said that some inconvenience could be furnished to any firm or individual in the United States was engaged in the manufacture of such ammunition for shipment to England or France, it would be glad to have the proof. None was ever furnished. While prac-
tically every belligerent accused the other of using forbidden bullets; the evidence at hand does not indicate that any general use was made by any belligerent of the particular type of bullet prohibited by The Hague Convention, although there may have been occasional use of it with or without the authority of the government whose troops were guilty of it.

A substance which, however, was used by all belligerents on an extensive scale and the lawfulness of which is now a matter of controversy was asphyxiating and even poisonous gases. This new agency of attack appears to have been first employed by the Germans on 22 April 1915, at the second battle of Ypres. The Germans charged that it had already been used by the British troops but there is no evidence in support of the charge. Several methods were employed in generating the gases thus used, the most common of which was to ignite the substance in the first line trenches at Eastern front so that the gas would blow the fumes toward the enemy. The opinions of chemists regarding the composition of the gases first used differed but there was a general agreement that one of the ingredients was chlorine. During the early battles what was described in the press dispatches as "poisonous" gases was used by the Germans against the Russians on the Eastern front, the gases being generated, as on the Western front, by means of steel cylinders placed in the trenches. The British, French and Russian troops naturally considered that retaliation in kind was legitimate and accordingly they very early organized "gas detachments" and before the end of the year 1915 apparently all belligerents were resorting to this new mode of attack. Whether such mode of warfare is a violation of The Hague Convention would seem to depend mainly on the character of the gases employed and the effect which they produced on the man against whom they were launched. According to the reports of British and French military commanders, medical experts and newspaper correspondents who saw the victims of these attacks the effect was to produce agonizing and prolonged suffering; that the result was not merely to disable the victim by rendering it but to inflict permanent injury upon those who did not succumb on the field or cause them to die a painful and lingering death. Alexander, Powell, an American newspaper correspondent who saw many of the victims on the Western front, stated that the inhalation of the gases produced painful and agonizing strangulation accompanied by blackened and distorted features. Stanley Washburn, a London newspaper correspondent who saw hundreds of the victims in the hospitals on the Eastern front, stated that the gas caused blood congestion and the formation of clots not only in the lungs but in the blood vessels and arteries and that those who lingered on and finally succumbed suffered a torture which the days of the Inquisition could hardly parallel.

The Germans, however, at first denied that such effects were produced by the use of gas and asserted that the suffocation of the enemy in this method was no more cruel or inhuman than the bombardment of trench lines in which the Germans had done at Neuport. The evidence, however, was so strong to the contrary that the Germans later preferred to rest their defense on the ground of reprisal against the enemy for having first resorted to this method of attack. As stated above, however, no evidence has been produced in support of their charge that the English were the first to make use of this agency of attack. The Germans might have argued that what The Hague Convention prohibited was projectiles and not generating tanks or cylinders; and that it prohibited only poisoned weapons and not the use of noxious or poisonous fumes generated by apparatus in the trenches and which reach the enemy by being blown against him by means of the wind. But to this argument it might be replied that The Hague Convention forbids the use of poison in any form and it also forbids not only the employment of arms and projectiles but also of material calculated to cause unnecessary suffering. At the time, the Conference did not foresee these agencies than bombs or projectiles for the diffusion of asphyxiating or deleterious gases and consequently the language employed in the Convention was directed only against the instruments then in use. It is hardly probable that had the Conference been forese of other instruments than bombs or projectiles for diffusing such gases it would have failed to formulate its prohibition in such language as to embrace the methods of attack devised by the Germans and subsequently adopted by the other belligerents as a measure of reprisal and defense.

Not only did the Germans first make use of asphyxiating and poisonous gases in the manner described above, but at the same time, according to the report of Sir John French, on the battle of Ypres, they employed explosive shells charged with deadly asphyxiating gases. Later shells charged even with poisonous gases were employed on an extensive scale by the Germans. Whatever may be the opinion regarding the legitimacy of the method of attack by means of gas generated from tanks or cylinders and wafted against the enemy by the wind, there can be no difference of opinion in regard to the use of explosives to emit such gases. The Hague Convention expressly forbids the use of such weapons.

Still another instrumentality invented by the Germans and first used by them in their operations against Verdun in March 1916, and against which there was more or less protest, was the "liquid fire projector" or "flame thrower" (Flammenwerfer)—a small tank filled with a highly flammable composition liquid under high pressure and strapped to the back of the soldier using it. Connected by a swivel joint with the bottom of the tank was a hose pipe with a valve and a nozzle to which was attached an igniting apparatus. By opening the valve and igniting the composition a stream of fire with intense heat could be projected a distance of 20 or 30 yards. The effect against those upon whom it was directed was deadly, the victims sometimes being burnt to a crisp. The French government denounced it as an "abominable method" of attack, in consequence of which there was only a protest given by the German government to the other powers and in "contempt of all the sentiments of humanity." No government, it added, could
remain defenseless against such refinements of barbarity without endangering the safety of its own troops and accordingly it was announced that the French government would adopt retaliatory measures. The employment of such an instrument is not expressly forbidden by The Hague Convention unless it belongs to the category of "material calculated to produce suffering which may be described as incompatible with life itself." This doctrine is not to be doubted. Owing to its very limited radius of action and the visibility of the flame it is always possible for the enemy to avoid the effect, which is not the case where the instruments employed are explosive projectiles or shells charged with gas.

A serious charge made by General Botha against Lieutenant-Colonel Frank, Commander of the German forces in Southwest Africa, was that he had given orders to poison the wells of Swakopmund in January 1915, before evacuating the town. This was done by placing bags of arsenical cattle dip in the wells. General Botha protested[ed] on the ground that the use of poison was forbidden by The Hague Convention and that the practice was persisted in he would hold the officers concerned responsible and would be compelled to resort to such measures as repuls as might seem advisable. Colonel Frank, admitted that cattle dip had been put into the wells by his orders but asserted that they had been care-fully marked by warning notices, so that it was not a case of poisoning, since poisoning implies the secret adding of matter injurious to health to human beings. It was, in short, nothing more than the "effecting a change in the natural condition of the water in order to deprive the enemy of the use of this means of existence." It is admitted by all the authorities that the cutting off of the water supply upon which the armed forces of the enemy are dependent is entirely legitimate and the diversion of streams which supply a besieged place is not an unusual method of compelling the place to surrender. It is also admitted by some authorities that it is legitimate to pollute the water supply of the enemy as by throwing the carcasses of dead animals into it. This was done by General Johnston during the Civil War and by General Cronje during the Boer War. Such a measure would seem to differ little in principle from introducing poisonous substances in wells provided they are carefully marked as Colonel Franke claims to have been the case with the wells at Swakopmund. It should be remarked, however, that the effect if not the purpose of the German measure was not to deprive the armed forces of the enemy of his water supply but to cut off the supply of the civil population which was left behind after the Germans had evacuated the town. It is very doubtful whether belligerent has a lawful right to punish in this way the peaceable civil population of the territory evacuated by him. The American "Rules of Land Warfare" (Art. 177) go to the length of providing for the punishment of The Hague Convention in respect to the use of poison to include "the deliberate contamination of sources of water by throwing into the same dead animals and all poisonous substances of any kind."

A somewhat similar case was the action of the Germans in poisoning certain wells in the Somme region of France, during their retreat in the spring of 1917 and with having filled others with diphosphoric and creosote soda. Charges were also made against German aviators for having dropped poison candy in certain towns of France over which they flew and the mayor of Vadelaincourt felt obliged to issue a proclamation urging the inhabitants against eating candy thus dropped.

Falling within the category of forbidden instrumentailities is the employment of savage troops. In July 1915 the German Foreign Office issued a white book in which it protested against the employment in Europe, contrary to international law, by England and France of large numbers of colored troops from Africa and Asia: Gurkhas, Sikhs, Pathans, Senegalese, Moroccans, Bemba, etc. These people having, it was said, grown up in countries where war was still conducted in its most savage forms, had brought to Europe the custom of their countries and had in fact committed atrocities which set at defiance not only the rules of warfare but of civilization and humanity. Among the evidence submitted in proof of the charge were depictions of witnesses, facsimile reproductions of extracts from diaries of French and Belgian soldiers and photographs of mutilated bodies, amputated ears, and the like. In some cases, it was alleged, war trophies consisting of the severed heads, ears and fingers of German soldiers were found in the pockets of captives. It was, in short, nothing more than the "effecting a change in the natural condition of the water in order to deprive the enemy of the use of this means of existence." It is admitted by all the authorities that the cutting off of the water supply upon which the armed forces of the enemy are dependent is entirely legitimate and the diversion of streams which supply a besieged place is not an unusual method of compelling the place to surrender. It is also admitted by some authorities that it is legitimate to pollute the water supply of the enemy as by throwing the carcasses of dead animals into it. This was done by General Johnston during the Civil War and by General Cronje during the Boer War. Such a measure would seem to differ little in principle from introducing poisonous substances in wells provided they are carefully marked as Colonel Frank claims to have been the case with the wells at Swakopmund. A somewhat similar case was the action of
and soldiery body of men, clean, well-man-
nered, and like all good troops, most punctual about saluting."
Again he says: "They are fierce and terrible in their charge but are merciful to their prisoners, there is none of that slaying of prisoners that has eternally be-
smirched the German escutcheon."
Turning now from instrumentalities and weapons to methods and practices forbidden either by the Hague Conventions or the cus-
tomary rules of warfare we find many ex-
amples during the present war of non-con-
formity to the law and custom. One of the most common and reprehensible of such prac-
tices was the conduct of German military com-
manders in using their civilian captives as
screens or shields to protect their own troops
against attack by the forces of the enemy or
by the civil population. In many towns and
villages occupied by the Germans large num-
bers of the inhabitants, men, women and chil-
dren, were seized and placed in front of the
German firing lines and sometimes were com-
pelled to march long distances at the head of
columns of German troops. The evidence in
proof of this charge is so abundant in quantity and
so reliable in character as to leave no

doubt whatever in the mind of the investigator
that this barbarous practice was resorted to on
numerous occasions particularly in Belgium
and France and to a less extent on the Rus-
sian and Italian fronts and in Serbia. In
some cases the Germans approached their ob-
jects of attack and even attacked the forces of
the enemy from behind columns of civilians or
military prisoners. Such a cruel and barbarous
expedient is not only contrary to the customs
and usages of civilized warfare but is ex-
pressly forbidden by the Hague Convention
itself, which declares that the inhabitants of
occupied territory may not be compelled to
take part in the military operations against the
troops of their own country.

Another practice frequently resorted to by
German commanders was the taking of hostages
from among the inhabitants of occupied ter-
ritory and in some instances even the putting of
women and children to this use. They were
taken for a variety of purposes, the most com-
mon of which was to insure the good behavior of
the civil population. Generally their seizure
was accomplished by a threat to shoot all or a
certain number of them in case acts of hos-
tility were committed and in some cases the
threats were actually carried out. The per-
sons taken as hostages were usually the leading
"citizens of the community: the mayor, mem-
ers of the city council, senators or deputies, some-
ter or the schoolmaster and frequently the
parish priest. Sometimes they were shut up in
buildings as prisoners, sometimes they were led
through the streets and compelled to warn
their fellow citizens of the consequences which
would result from hostile acts and considerable
numbers were deported to Germany where they
were confined as prisoners or held to forced
labour.

The practice of taking hostages is an old
one and in early times was resorted to as a
measure of insuring the execution of treaties,
armistices and other agreements. During the
Franco-German War of 1870-71 it was resorted
to on a large scale by the Germans for the
purpose of securing their troops against at-
tack by those whom the Germans considered
to be "francis-fires," for insuring the obedience
of the inhabitants and to compel the payment
of community fines and the raising of contri-
butions. It was also during this war that
hostages for the first time were placed on rail-
way trains for the purpose of protecting them
against derailing either by the troops of the
enemy or the civil population. This expedient
was also resorted to for similar pur-
poses by the British during the Boer War. Mr.
Bryce in the House of Commons criticized the
action of Lord Roberts and Earl Kitchener as
being "contrary to the Hague Convention and
the general usages of civilized warfare," but it
was defended by Mr. Broderick, Secretary of
State for War, as a legitimate war measure.

Writers on international law have generally
condemned the practice as being analogous to
the placing of innocents and children in the
line of battle in order to induce the enemy's
troops to withhold their fire. The German war
manual, as might be expected, defends the con-
duct of German commandants in resorting to this
practice in 1870-71, because it "although it
frankly admits that "every writer
outside Germany has stigmatized it as con-
trary to the law of nations, and that it was
a harsh and cruel measure."

Regarding the legitimacy of the taking of
hostages for the general purpose of insuring the
good behavior of the civil population there
is a difference of opinion among the authorities
on international law. The Hague Conventions
do not deal with the matter further than to
declare that "the lives of private individuals
must be respected" and that "belligerents are
forbidden to compel the nationals of the ad-
verse party to take part in the operations of
war directed against the enemy." Whatever
may be one's opinion regarding the lawfulness
of the practice there is no difference of opinion
among the authorities as to the treatment to
which hostages are entitled. All are agreed
that hostages are both "private persons" and
prisoners, not combatants. The Hague Conven-
tion, as stated above, declares that "the lives of
private persons must be respected, and as
to prisoners it declares that they shall be "hu-
manely treated." They cannot, therefore, be
put to death except for crime. Nevertheless,
as stated above, the Germans in a number of
instances put to death hostages on account of
acts of hostility alleged to have been com-
mitted by the civil population. The most fla-
grant instance of the kind was the shooting of
more than 90 hostages at Les Rivages, a suburb
of Dinant, for the act of certain civilians in
firing upon a detachment of German troops
who were engaged in constructing a pontoon
bridge. The German white book, 'The Belgian
Peoples' War,' admits that hostages were shot
there and elsewhere but undertakes to justify
this extreme measure on the ground that the
taking of hostages would often be without
effect if the belligerent taking them were not
allowed to inflict the death penalty for viola-
tion of the conditions as provided in the
armistice. In early times the right to put hostages to
dead was asserted, but no modern writer
outside Germany can be found to defend this cruel
practice, and it does not appear that in fact it
has been resorted to in any war of modern times, until the ancient practice was revived by the Germans during the late war.

Another practice forbidden by the laws of war is the devastation of the enemy's country except when absolutely required as a measure of military necessity. This long-established rule of civilized warfare, like so many others, was flagrantly violated by the Germans during the late war. The most notable instance of the kind was the frightful devastation of a region on the Somme front in France in March 1917 before the Germans retreated from it. The territory evacuated was, according to German accounts themselves, "converted into a veritable waste and left an empire of death." Not only were the roads, bridges, culverts and other objects of military value destroyed, but hundreds of private houses were burned, fences destroyed, shade trees cut down, orchards leveled, vineyards uprooted, dwellings pillaged and their contents destroyed or carried away, wells polluted and poisoned, banks robbed, churches desecrated and despoiled of their relics, and even the tombs of the dead broken open. "Never before in the history of the world," said the American Ambassador who visited the devastated region and made a report to the Department of State, "had there been such a thorough destruction wrought by either a vanquished or a victorious army." Mr. Fendfield, American Ambassador to Vienna, made a similar report.

The German military authorities attempted to justify the act as a measure of military necessity; the territory in question was to be a military zone and it was, therefore, necessary to destroy trees, houses, vineyards, etc., to prevent the enemy from using them for purposes of concealment. As stated above, all authorities on war law are agreed that a belligerent may destroy objects likely to be of military value to the enemy into whose hands they may fall and he may level houses and trees for the purpose of bombardment to prevent the enemy from concealing himself behind them. He may even destroy mills, granaries and growing crops for the purpose of depriving the enemy of the means of subsistence which they afford. It was on this theory that Sheridan's devastation of the Shenandoah Valley during the Civil War has been defended by some writers on international law. But it is clear that the German devastation of the Somme region went much further than this, including as it did the cutting down of orchards and vineyards which lay not within a probable zone of attack but in a region from which the Germans were retreating. As a measure of permissible devastation, say the American Rules of Land Warfare, "is found in the strict necessities of war. As an end in itself, as a separate measure of war, devastation is not sanctioned by the laws of war. There must be some reasonably close connection between the destruction and the overcoming of the enemy's army." (Art. 334). The British and French manuals lay down essentially the same rule and this is the view of the great majority of the text writers on international law.

Numerous charges and counter-charges have been made by each belligerent against the other of misusing the flag, and the Germans have been the most frequent offenders. The abuse consisted in hoisting the flag as the token of a desire to surrender and of firing upon the enemy when he advanced to receive them as prisoners of war or to confer with the commander. In some cases the white flag was raised by the enemy for the purpose of enabling him to bring up his reserves. The Germans were many times charged with this offense. The employment of the white flag and the flag of truce for such purposes has long been forbidden by custom and it is expressly condemned by The Hague Convention respecting the laws and customs of war on land. (Arts. 23) and 32-34). The use of either flag for the purposes mentioned above is not regarded as a legitimate ruse of war but an act of gross perfidy and treachery. A ruse of war to be legitimate must be one which does not involve perfidy or breach of faith, such as the giving of false or bogus dispatches to fall into the hands of the enemy, deceiving the enemy by means of false signals, sham works, dummy artillery and the like.

In several instances charges and counter-charges were made by belligerents on one side against the enemy for attacking in his adversary's uniform. International law does not forbid the use of the enemy's uniform or his military insignia as a ruse of war, but The Hague Convention prohibits their improper use without indicating what is and what is not a proper use. Many writers on international law hold that it is legitimate to wear the enemy's uniform for the purpose of approach, but that before attacking he must put on his own uniform and reveal his true identity. Other authorities, however, take the position that it is not allowable for any purpose, not even for the purpose of approach, on the theory that the distinction of uniforms is one of the insignia prior to beginning the attack and after beginning it is arbitrary. Most military manuals now condemn the use of the enemy's uniform for purposes of deceit, but allow it in case of necessity, as, for example, on account of lack of a sufficient supply of clothing the soldiers are dependent upon uniforms captured from the enemy. In that case if the uniforms are altered or distinctly marked so as to disclose the true character of the wearers there is no treachery and the practice is unobjectionable.

A somewhat similar question was many times raised during the late war by the action of merchant vessels or warships in flying the enemy's flag as the emblem of truce and the flag of truce. The action of the master of the ill-fated Lusitania and other British merchants in hoisting the American flag in order to deceive German submarines evoked a protest from the American government. The German cruiser Emden flew the Japanese flag on the high seas for many weeks, and even entered neutral ports and obtained supplies under false colors. The use by a warship of the enemy's
flag for the purpose of deception has generally been regarded as a legitimate ruse, subject to the condition that before beginning the attack the ship must display its true colors. That is to say, a warship may sail and chase under false colors but it cannot attack until its own flag has been raised. The prize regulations of many countries lay down this rule, but as in the case of the use of the enemy’s uniform, the distinction between approaching and attacking ships is not less arbitrary, and writers are not lacking who condemn the use of the enemy’s flag for any and all purposes. The Institute of International Law in 1913 adopted a rule forbidding the use of false flags, uniforms or insignia of whatever character.

As regards the use of neutral flags by warships, opinion is still more divided, although the practice has often been resorted to, e.g., by the commanders of the Alabama and the Florida during the Civil War. It has also been stated that the American warship Charleston was flying the Japanese flag at the time it captured Guam during the Spanish-American War. As to the use of neutral flags by merchant vessels of neutrality for the purpose of deceiving the enemy and escaping attack there appears to have been no instance prior to the present war of such use, doubtless because merchant vessels have not heretofore been regarded as liable to attack and destruction and hence the necessity of resorting to ruses of this kind rarely existed. In the course of the controversy between the American and British governments on account of the Lusitania in hoisting the American flag to escape destruction by a German submarine, the British Foreign Office contended that the use of neutral flags as a ruse of war was a well-established practice and it pointed out that British law allowed British merchants to use neutral flags for the purpose of escaping capture. The American government contended that there was a distinction between the occasional use of a neutral or enemy flag under the stress of immediate pursuit or with a view to deceiving an approaching enemy, on the one hand, and the general authorization of a belligerent of its merchant vessels to fly the flag of a neutral power within certain positions of the high seas which are presumed to be frequented by hostile warships. In short, it did not deny the right of a British merchant vessel to use the American flag in particular instances to escape destruction but it did contest the right of the British government to authorize its merchant vessels generally to fly the American flag since such general use would expose American vessels and their passengers to danger.

Such are some of the methods and practices of war which are either forbidden by international law or concerning the legitimacy of which there is doubt or difference of opinion among the authorities. The list is by no means exhaustive. Many others were resorted to during the late war, especially by German military and naval commanders, but the limits of this article do not permit a consideration of them.

WAR DANCE, a dance formerly common among the American Indians, engaged in by the warriors of a tribe before a warlike expedition. The men put on their head-dress and war paint, flourished their weapons and circled about to the noise of crude drums.

WAR DEMOCRATS. Members of the Democratic party who during the Civil War of 1861-65 supported President Lincoln and the Union cause. The chief figure of the group was Stephen A. Douglas, who pledged his support to Lincoln in person on 14 April 1861. Douglas died 3 June 1861 and the War Democrats were bereft of a national leader. In the 37th Congress the Democrats nominated no candidate for Speaker and joined the Republicans in voting war supplies of men and treasure. In the elections of 1861 it was evident that there was a lack of harmony in the party, some like Dickinson, in New York, and Tod, in Ohio, heading a coalition movement, others nominating their own candidates and while approving the war in their platforms, severely criticized several of Lincoln’s policies, especially the suspension of habeas corpus. In 1862 the effect of the Emancipation proclamation was to estrange the War Democrats from the Republicans. In 1864 Andrew Johnson was nominated for vice-president by the Republicans, and at Chicago the regular Convention nominated McClellan and Pendleton, thus the War Democrats were divided in two factions. The election of Lincoln saw the party without influence and its numbers reduced to impotence. Consult Rhodes, James F., ‘History of the United States’ (New York 1905); and Stanwood, E., ‘History of the Presidency’ (1898).

WAR-EAGLE, any eagle connected with war or the idea or war in symbolism or otherwise, as the imperial eagle (Aquila mogolnix) adopted as a standard first by a favorite legion and later by Roman troops generally; whence the symbol spread to the national insignia of many European countries. The war-eagle of the North American Indians, whose feathers ornamented their war-bonnets and other accoutrements, was the golden eagle (A. chrysaetos). See Eagle.

WAR GAME. See Kriegspiel.

WAR GARDENS. Among the problems which faced the world at the outbreak of the World War there was none more vital than that of food supply. Substitutes were found for many of the articles needed to carry on the war. Inventive chemists discovered alloys or compositions which could be made to serve in
place of metals which were indispensable. In some countries they began to make clothing from materials which had never before been used for that purpose. But for food there could be no substitutes and it became necessary not only to keep up the usual supplies but if possible to increase the output. On this account efforts were made to discover hitherto undeveloped sources of food production. While experts had already established a need to speed up and add to the nation's food resources, there was a limit to what he could do, due particularly to his increasing difficulties as the war progressed in getting help. Here then was the opportunity, in fact it amounted practically to a necessity, for the development of a new branch of agriculture. The result was the city farmer. Starting in 1917 when the entry of the United States into the war made the food situation acute, the war gardeners of the United States had increased by the following year into a grand total of 5,285,000, which was an increase of 1,785,000, or 51 per cent over the number who went into the home food production work in the first year of the National War Garden Commission's nation-wide campaign. Before 1918, too, the message of Food F.O.B., The Kitchen Door had spread beyond the bounds of the United States, and other countries were coming here for information as to how much universal interest had been aroused in home gardening and what methods of instruction and assistance were given to the workers. The National War Garden Commission was organized early in the spring of 1917 for the purpose of stimulating and encouraging the cultivation of all that land which was lying idle in the form of backyards and vacant lots by the millions in cities, towns and villages all over the country. Those who started the movement realized that here was a great untapped source of food wealth; and that if all this slacker land, or even a large percentage of it, could be put to work there would be opened up an unlimited addition to the fighting resources of the United States and its Allies. The results were remarkable and have far outstripped the early anticipations of the founders of the scheme. Like the forces of Roderick Dhu which rose unseen from the heather all over the mountain side at his whistle shrill, so the vast army of war gardeners all over the United States from coast to coast rose at the call to them to "Sow the Seeds of Victory." They formed a mighty force and added about $350,000,000 to the food wealth of the nation in 1917. In the following year they had increased vastly in numbers and the product they raised was valued at more than $500,000,000. Co-operation was the means which made the war garden campaign a success. Patriotic and unselfish assistance was given to the Commissioner in spreading widestac its call to the back yard and vacant lot farmer. Organizations of all kinds, committees and women's clubs; State, city and county officials; industrial and manufacturing concerns, big and small; banks and business houses; chambers of commerce and other trade bodies; railroads and mining companies; school and college superintendents and instructors; city park departments, bureaus of municipal researches, associations, even tenement-house inspection services in some cases: these and many others operated loyally in getting the message home to the people, and through their local committees organized and started the good work. The war gardens of the United States proved their worth in many ways. They added a vast total to the food wealth of the nation. But they accomplished much more. They resulted in the saving of transportation facilities, and by making the consumer also a producer released thousands in the establishment of more essential war work. At the same time this also freed many workers for other service.

Another important benefit has been the lesson of thrift which the war garden has inculcated in the minds of millions of American people. This has had its effect and made easier the work of the government in urging the purchase of Liberty Bonds and thrift stamps. Not only was the lesson there, but the war gardener had been able to save a considerable amount of money which he would have spent at the market. When the call came, therefore, to buy government certificates the home food producer found that he was able to pay a larger monthly installment than otherwise would have been possible if he had been growing $10 to $20 worth of vegetables in his little back yard or vacant lot plot every month. The war garden has come to stay — that is the testimony which has come from many sources; and it is one of the ways in which the work proves its value.

Employers of labor have found the war garden one of the best means of helping to keep their men contented and of stabilizing labor. Through their mutual interest in similar departments they have furnished tracts of land for their workers, in many cases also preparing it for them and providing the fertilizer and seed or selling it to the men at cost and on easy instalments. This has worked to the benefit of both employer and employee. The satisfied worker is a better worker. He is not so likely to leave if he happens to hear of what he believes a better opportunity elsewhere. He realizes that his firm and his Allies are interested in his welfare and he appreciates this human touch. While the workers at hundreds of plants have thus been helping themselves and adding to their incomes, they also have been assisting their country, for frequently industrial centres where every saving of freight space is doubly valuable. The wives and children have gone out into the gardens and helped to care for them. In addition the women have been encouraged to conserve as much of the garden product as possible; and this move the manufacturers have stimulated by fairs and contests at which prizes were given for the best display of vegetables and for the finest canned goods. The National War Garden Commission in 1917 took an added interest in 1918 added national recognition to those contests, as well as to many held at county fairs and other war garden exhibits, by its National Capitol Prize Certificate which went to blue ribbon winners.

Plans for the big new cities which have gone up almost as if by magic around new shipyards and munition plants include as one of their features little gardens for the workers. Every Garden Committee has taken up the slogans which the Commission sounded throughout the country, has added an increased significance when

applied to conditions like these. While the guns and the ammunition are in the field, and the shells are being turned out in the nearby factories and yards, the men are growing "ammunition" in their home plots.

CHARLES LATHEP PACK,
President of the National War Garden Commission.

WAR GOD. Most ancient religions had their war gods, and in America, before the Spanish conquistador, the Mexican war god was specially worshipped, with human sacrificial rites. Ares and Mars were the war gods of Greece and Rome respectively. The Jews evidently regarded Jehovah as presiding over their battles, and David is represented in 1 Samuel xvii, 45, as telling the Philistine that he comes "in the name of the Lord of hosts, the God of the armies of Israel." The same conception exists in some degree among Christian nations, and in the Great World War the kaiser and other prominent Prussians were fond of evoking the approval of their deity.

WAR INDEMNITY, the sum of money paid by the defeated country in an international war to the victorious government. The largest amount demanded in this way previous to 1919 was $1,000,000,000, which France was compelled to pay Germany after the war of 1870-71. In the war of 1866 Prussia took from Austria and her allies a war indemnity of $41,750,000, besides $3,750,000 requisitioned during the campaign. The war between Japan and China in 1904-05 amounted to $150,000,000. The Spanish-American War lasted four months, and cost the United States $150,000,000. The Spaniards were defeated in every battle on sea and land, and finally sued for peace. A treaty was signed by President McKinley and by the queen regent of Spain in 1899 by the terms of which the United States relinquished all claims for indemnity of any kind, and agreed to send back to Spain, at its own cost, all Spanish soldiers taken prisoners, with their arms. The United States further agreed to pay to Spain the sum of $20,000,000. On her part, Spain was to relinquish all claims of sovereignty over Cuba; to cede to the United States the island of Porto Rico and other islands then under Spanish sovereignty in the West Indies; the islands being in the archipelago known as the Philippine Islands. In this case it would appear that the victors paid for their success. At the close of the trouble between China and the powers, growing out of the Boxer uprising in 1900, it was agreed that China pay to the powers 450,000,000 taels as an indemnity. These settlements are petty compared with that exacted from Germany under Section VIII of the Treaty of Versailles signed 28 June 1919, according to which Germany undertakes to make compensation for all damage caused to civilians, the total obligation to be determined by an Inter-Allied Reparation Commission. As an immediate step toward restoration, Germany shall pay within two years 20,000,000,000 marks in either gold, goods, ships or other specific forms of payment. The Commission may require Germany to give from time to time by way of guarantee issues of bonds or other obligations to cover such claims as are not otherwise satisfied. In this connection and on account of the total amount of claims, bond issues are presently required of Germany in acknowledgment of its debt as follows: 20,000,000,000 marks gold, payable not later than 1 May 1921, without interest; 40,000,000,000 marks gold, bearing 2½ per cent interest between 1921 and 1926, and thereafter 5 per cent with a 1 per cent sinking fund, payment beginning in 1926, and an undertaking to deliver 40,000,000,000 marks gold, bearing interest at 5 per cent under terms to be fixed by the Commission.

Germany was also obliged to undertake to replace ton for ton, and class for class, all merchant ships or fishing boats lost or damaged owing to the war, and to cede to the Allies all German merchant ships of 1,000 tons gross and upwards, one-half of her ships between 1,500 and 1,000 tons gross, and one-quarter of her steam trawlers and other fishing boats. As an additional part of reparation, the German government further agrees to build merchant ships for the account of the Allies to the amount of not exceeding 200,000 tons gross annually during the next five years.

WAR INDUSTRIES BOARD. One of a number of boards organized for the purpose of enabling the United States to meet the tremendous demands for men and materials springing from her entrance into the World War as a combatant. While it functioned, it controlled and regulated industry in all of its direct and indirect relations to the war and to the nation. Especially it was charged with the duty of procuring an adequate flow of materials for the two great war-making agencies of the country, the War and Navy departments—and for the two agencies immediately affiliated with those departments, namely, the Emergency Fleet Corporation and the Railroad Administration. Originally the War Industries Board was organized as a branch of the Council of National Defense, which was created by Act of Congress of 29 Aug. 1916, "to increase and develop domestic production and to concentrate, mobilize and co-ordinate the country's resources, both in men and supplies, in time of need." President Wilson, however, in effect, reorganized the board 4 March 1918, and on 28 May, following, made it a separate administrative agency. As it was finally made up the board consisted of the following members: Bernard M. Baruch, chairman; Alexander Legge, vice-chairman; Robert S. Brookings, chairman of the Price-Fixing Committee; Rear Admiral F. F. Fletcher, representing the Navy Department; Hugh Frayne, head of the Labor Division; Major-General George W. Goethals, representing the War Department; Judge Edwin B. Parker, Priorities Commissioner; George N. Peek, Commissioner of Finished Products; J. Leonard Reploge,
Steel Administrator; L. L. Summers, Technical Adviser; Albert C. Ritchie, General Counsel, and H. P. Ingels, Secretary. Herbert Bayard Swope, C. Dillon and Harold T. Clark were named as assistants to the chairman. In a letter asking Mr. Barruch to accept the chairmanship of the board, the President declared its functions should be:

(1) The creation of new facilities and the disclosing — if necessary, the opening up — of additional sources of supply.
(2) The conversion of existing facilities, where necessary, to new uses.
(3) The studious conservation of resources and facilities by scientific, commercial and industrial economies.
(4) Advice to the several purchasing agencies of the government with regard to the prices to be paid.
(5) The determination, wherever necessary, of priorities of production and of delivery and of the proportions of any given article to be made immediately accessible to the several purchasing agencies when the supply of that article is insufficient, either temporarily or permanently.
(6) The making of purchases for the Allies.

The President further stated that the ultimate decision of all questions, save those relating to the determination of prices, should rest with the chairman, the other members simply acting in a co-operative and advisory capacity.

Keeping in mind the President's outline of what its functions should be, the board organized for work by creating the following divisions:

Requirements Division.
Priorities Division.
Price-Fixing Division.
Controlled Industries Division.
Purchasing for the Allies Division.
Labor Division.
Conservation Division.

The duties of these divisions were apportioned as follows:

Requirements Division.—The principal task of this division was that of distributing materials and supplies by industries that were essential to the war before the less essential industries were taken care of. Such distribution was necessary because the demands made by the war upon the industries of the country were so great and so varied that in most cases the production of materials and supplies for direct and indirect war needs fell far short of meeting those demands and the demands of the civilian population as well. In many cases, the production was not sufficient even for war purposes. The first thing this division did was to make a survey of the industries of the country as a result of which numerous plants engaged in the production of non-essentials were converted into plants supplying the needs of the war. For instance, plants for making gas-holders were converted into munitions plants; carpet plants were converted into blanket and duck plants; automobile factories were converted into plants for the manufacture of air planes, refrigerator plants were converted into plants for making filing cases for the navy; furniture plants were changed into plants for making ammunition boxes; horseshoe plants were changed into plants for making trench picks; toy plants were changed into plants for the manufacture of packing-boxes; factories turning out women's waists were converted into plants for making signal flags; electric-vacuum plants were changed into plants for making Liberty motors; rubber and canvas factories were changed into gas-mask plants; stove plants, stove hand grenade and trench-bomb factories, corset factories were put to work making supplies for the Medical Corps and gear plants were changed to plants for making gun-sights. The list of conversions might be continued almost indefinitely, but those referred to indicate how varied and extensive that list grew to be.

Priorities Division.—The functions of this division were to determine, whenever necessary, priorities of production and delivery and the proportions of any given article which were to be made accessible to the various and varying demands for it. The division formulated general plans for the co-ordination of the military program, as presented by the military authorities, and the industrial program, in so far as such programs called for priorities. It determined policies and designated agencies to carry such policies out. It defined those activities which are accorded preferential treatment because of their war or civilian importance and certified its classifications to the Fuel Administration, the Railroad Administration, the United States Employment Service and the Industrial Advisers of the District Draft Boards for their respective uses and guidance in distributing fuel, furnishing transportation and labor and passing upon cases of industrial and occupational deferment. All government and other agencies were governed by its decisions and rulings in all matters pertaining to priorities.

Price-fixing Division.—Statutory authority to fix prices was extended to the government with reference only to food, wheat and fuel — coal and coke. However, it had authority to commandeer, and this power, coupled with its power to determine priorities, enabled it in many cases to fix prices by agreement with producers. The prices fixed by it were of two kinds — prices which the government only paid and prices which the government only controlled. In both cases there was a limiting price for the Allies and the public. Prices for the government alone were fixed whenever such price-fixing was necessary to prevent it from being charged more than a reasonable and fair price for its needs and when the government purchases were not such as to disturb market conditions. When the needs of the government absorbed so large a portion of a product as to change normal economic conditions, then prices for the public also were fixed. Among the commodities, the prices of which were fixed, were aluminum, cement, copper, cotton fabrics, cotton linters, hides and leather, hemp, lumber, platinum, rags, sand, gravel, crushed stone, steel, wool and zinc. In each case, maximum prices only were fixed.

Controlled Industries Division.—Government control of an industry, in so far as distribution is concerned, results when its entire output is allocated. That control becomes absolute when, in addition, it is the industry's output, the government also fixes the price therefor. The principal commodities for which prices were fixed by the War Industries Board already have been named. In some cases the entire supply of the commodities was
allocated also. With respect to certain other commodities the output was allocated though the prices were not fixed. The principal commodities with respect to which the entire output was allocated were chlorine, copper, cotton, duck goods, cotton linens, felt, hides and skins, optical glasses, nitrate of soda, platinum, steel and pig iron, sulphur, toluol (the essential ingredient of T.N.T.), turbines, wood chemicals and wool.

Purchasing for the Allies Division.—Under the agreement between the United States and the Allies all purchases of supplies made by the latter had to be submitted to and approved by the Allied Purchasing Commission of the War Industries Commission. It was the duty of that commission to secure the best prices and the best terms of delivery possible and submit them to the Allied governments. In practice the purchase of food and feed was made by the Food Administrator. The Allies governments had to agree among themselves as to their several requirements and priorities of delivery. In cases where prices had been fixed by the Price-fixing Commission, such prices applied to purchases made by the Allies. In other cases, the prices were approved by the Allied Purchasing Commission. However, the purchases actually were made by representatives of the Allied governments within limitations imposed by the Allied Purchasing Commission.

Labor Division.—The activities of this division were devoted to:

1. Securing co-operation of the government and organizations in reclaiming man power and waste materials.
2. Utilization of prison labor—war, civil and disciplinary.
3. Re-education by vocational training of cripple soldiers, sailors and persons injured in industry so as to make them self-sustaining.
4. National waste reclamation system.
5. Standardization of industries and occupations in penal institutions for producing materials.
7. Development of war prisoners’ division in the army.
8. Induction into industry and agriculture of discharged or paroled prisoners.
10. Development of camp gardens.
11. Aiding in work of securing legislation to make this work permanent.

Conservation Division.—This division took over the work of the Commercial Economy Board of the Council of National Defense. Its functions were the studious conservation of resources and facilities by means of scientific, commercial and industrial economies. It determined in the case of each industry what labor, materials, equipment and capital could be diverted to war purposes while the facilities might be put to more essential uses. In other words, its primary object was to eliminate waste and unnecessary uses of all kinds and to put the labor, materials or capital thus saved into business essential to war needs. The results of its efforts to conserve the wool supply of the country afford an excellent example of what it accomplished. Soon after taking up its duties it ascertained that substantial economies could be effected by reducing the number of designs of wool fabrics the manufacturers were putting out, and also by reducing the number of models of garments, eliminating the use of cloth for needless adornments and by reducing the size of samples. It was learned, for instance, that a fabric manufacturer would get out, say, 1,000 designs for a season, of which perhaps not more than 200 would be sold in commercial quantities. The labor and material used in making the other 800 designs were wasted. The fabric manufacturers, therefore, were requested to reduce the number of their designs, and thereby large savings were effected. Wholesale tailors were persuaded to reduce the size of the samples sent out by them, and as a result, 450,000 yards of cloth were saved in this way in the spring season of 1918 alone. The matter was taken up with other branches of the industry and a total saving of between 3,000,000 and 4,000,000 yards of cloth was the result. Even larger savings were effected by persuading clothing manufacturers to eliminate useless adornments such as belts, plaits, cuffs on sleeves and the like. Extensive savings in leather were brought about by getting shoe manufacturers to eliminate styles involving excessive and wasteful uses of material. Manufacturers of pneumatic tires for automobiles were induced to reduce the number of types and sizes they were putting out from 287 to 33 with a promise of a further reduction to nine types and sizes in two years. Similar economies were effected with reference to agricultural implements, paints and varnishes, stoves and furnaces, davenports and metal beds, tinware and sample trunks, buggies and spring wagons. Considerable labor was saved by persuading department stores to reduce their delivery services, this labor being released for more essential occupations. Taking all of these things into consideration the probabilities are that none of the various boards created for the purpose of helping the United States and the Allies to win the war rendered more efficient service.

Albert C. Ritchie,
Attorney-General of Maryland, 1915-19; General Counsel, War Industries Board, 1918-19; and Governor of Maryland, 1920—

WAR LABOR BOARDS. As the United States speeded up its industries for the successful prosecution of the war it appeared early that much depended on the attitude and efficiency of labor. The United States Labor Department was called upon to adjust problems of employment, wages and hours, mediation and the maintenance of a labor morale. A program of labor administration was formulated at a conference between the Department of Labor and the Council of National Defense in January 1918 and in approving the program President Wilson also appointed Secretary of Labor Wilson, Labor Administrator. The program called specifically for the following: (1) an agency to establish Federal Labor Exchanges which would advise as to the methods of training workers and secure a staple labor supply; (2) an agency to deal with questions arising in regard to working conditions; (3) an agency to secure proper working conditions; (4) an agency to secure adequate housing and living conditions; (5) an agency to collect and digest labor information; and (6) an agency to keep the public well informed. An advisory
commission was appointed by Secretary Wilson and on 28 Jan. 1918 this commission reported in favor of extending the program above outlined to include agencies for women in industry, training and dilution, etc., and also recommended the formation of a War Policies Board. From these suggestions there developed the War Labor Policies Board and the National War Labor Board, also known as the War Labor Conference Board and the Taft-Walsh Board. Directors were then appointed to administer the several agencies. On 13 May 1918 Mr. F. P. Frankfurter was made chairman of the War Labor Policies Board; with him served representatives of the Labor, War, Navy and Agriculture departments, the War Industries Board, the Fuel Administration, Shipping Board, Emergency Fleet Corporation, Food Administration, Railroad Administration and the Committee on Public Information. Its chief function was to co-ordinate the industrial services of the departments and boards represented. It aimed to standardize employment conditions and thus to stabilize industry.

The National War Labor Board, formed 29 March 1918 was empowered to settle labor disputes by mediation and conciliation in all industries classed as essential to the successful prosecution of the war; to establish means to bring about such conciliation, and in the case of failure of local mediation to bring the parties in question for a hearing before the Board itself. In case the decision of the Board was not unanimous the case was carried before an umpire appointed by the President of the United States. The Board consisted of Messrs. W. H. Taft and F. Walsh as representatives of the public, Messrs. L. A. Osborne, W. H. Vandervoort, L. F. Loree, C. E. Michael and B. L. Worden as representatives of the employers, and Messrs. F. S. Hays, W. H. Johnston, V. A. Olander, T. A. Rickert and W. L. Hutcheson as representatives of the employees. The basis of the relations between employers and employees in war industries which the Board recognized, included the right of workers to organize trade unions, collective bargaining, maintenance of satisfactory health and safety measures, equal pay for women, the eight-hour day as basic in certain industries, mobilization of labor by every available means, the fixing of wages, hours, etc., in accord with local standards, the recognition of the principle of a living wage. Among the important decisions of the Board were those in the cases of the telegraph companies, the Bethlehem Steel workers, the street railways, the Smith and Wesson munition workers and the Bridgeport strike.

WAR OFFICE, in Great Britain, the department of government which controls all matters connected with the army. The head of the department has long been the Secretary of State for War, with a seat in the cabinet, and a salary of £25,000 a year attached to his office. During the World War a War Cabinet was formed, with D. Lloyd George (q.v.) as Prime Minister and First Lord, but having been Minister of Munitions from May to July 1916 and Secretary of State for War until December 1916, when he was made Prime Minister. Earl Curzon at the same time was made Lord President of the Council, A. B. Derazze, and Viscount Milner and Arthur Henderson ministers without portfolio.

WAR OF THE PACIFIC, a name given to the war between Chile and Bolivia and Peru in 1879-83. See Bolivia; Chile; Peru.

WAR PAINT, among the American Indians, paint put on the face and other parts of the body on going to war, with the object of making their appearance more terrible to their enemies.

WAR PATH, among the American Indians, the route or path taken on going to war; a warlike expedition or excursion. On the war path means on a hostile or warlike expedition; hence, colloquially, about to make an attack on an adversary or measure.

WAR AND PEACE ("Voina i Mir"). In the early sixties Count Tolstoy was engaged in gathering material for a novel that should introduce some of the surviving participants in the famous "Dekabrist," or December Conspiracy of 1825, and portray their relationship to the changed conditions in Russia after the accession of the liberal Emperor Alexander II, who permitted these surviving exiles to return from Siberia to their former homes. He wrote several chapters and parts of chapters, but was irresistibly drawn back to the principal causes of the Conspiracy in the fateful period of Napoleon and of mystical-minded Alexander I. He laid aside his project of producing a contemporary romance and energetically went to work on a historical novel which should depict the epoch ending with Napoleon's invasion of Russia, the burning of Moscow by Count Rostopchin and the disastrous retreat of the French. He had three chief objects in view. One was to give living pictures of the great events not only in Russia but also in Europe that brought about the downfall of Napoleon. The second was to evolve a theory of Chance or Fate as overruling the apparently free actions of even the greatest of men. The third was to expound the absurdity of life. His dramatis personae comprise emperors, famous statesmen and generals, gentlemen and ladies of the court, and a host of landed properites, princes and other titled personages, soldiers, peasants, each carefully individualized and, however insignificant, yet introduced so as to become an integral part of the whole. The conversations also, even when trivial, are so managed as to help create the general effect of reality. The flow of the narrative is occasionally interrupted by philosophical disquisitions in themselves forming a complete treatise which has been translated and published in both French and English. Its English title is 'Napoleon and the Russian Campaign.' The author's principal argument tries to prove that great leaders like Napoleon and the Emperor Alexander I, were not, as they themselves believed and as historians have taken for granted, the principal factors in the great movements of mankind, but were merely like the kings, knights and bishops on a gigantic chessboard directed by a higher power which Tolstoy calls Chance or Fate. He argues that even their mistakes and blunders were vital links in the woven chain of circumstances leading to their successes, and actions which viewed from the
standpoint of ordinary common sense would seem to have been to the last degree fatuous were turned to their advantage; while, on the other hand, lofty intentions and admirable qualities were made the instruments of misfortune. He shows how mighty preparations were brought to naught and petty circumstances led to immense consequences. There is, therefore, deep meaning attached to slight episodes and to snatches of idle dialogue: they are like the chips floating on a broad current, making evident to the eye in which direction the river flows. The epilogue also has been published by itself under the title of 'Power and Liberty,' in which Tolstoy scouts the theory of Free Will. Three characters, Prince Andrei Bolkonsky, Count Nikolai Rostof and Pierre Bezukhov in a very distinctive way illustrate the author's own mental and religious development. They are members of families from which—the names being only slightly changed—Count Tolstoy himself was descended, and they follow rather closely the records and traditions that had come down to him, modified by an infusion of his personal experiences in a somewhat similar environment abroad, in Moscow and Petrograd, in the army and in the activities of country life. The character and theories of the philosophic muskik, Platian Karatyayev, may be seen exemplified in the religious ideals which Count Tolstoy later developed as the guide of his life and which came to be the culmination of his teachings, in accordance with which he renounced his wealth, his title, his home, his family, everything usually held dear by men of his station. These three characters are swept into the great maelstrom of the Napoleonic Wars; their individual actions are contrasted with the historic figures that appear and reappear—Napoleon, Alexander, General Kutuzof, Prince Adam Crartoryski, Speransky, General Bennigsen, the Countess Potocka and many other famous men and women of that day. There is a kaleidoscopic succession of descriptions of scenes in palaces and in peasants' izbas, in camps and in battles. There are horse-races and balls, quarrels and duels, flirtations andamusements, proposals of marriage and realizations of births and of deaths, drinking bouts and gambling, country idyls and workingmen's riots, councils and conferences, the orgies during the conflagration of Moscow, the horrors of the French invasion, hunting and harvest scenes—all depicted with perfect realism, so that the whole seems like a transcript from life, while the element of fiction is fused into a vast transcript of history.

As a novel 'War and Peace' has serious faults, but its greater merits place it in the front rank not only of Russian but also of world literature. It is of remarkable length. The original covers more than 2,000 pages, aggregating not far from 650,000 words. It appeared between 1864 and 1869 in the Russian Messenger (Russky Vesti). It was enthusiastically received, and when published in six volumes went through many editions. In the later and less expensive popular editions the dialogue, which, in order to represent the fashion of the last century, was given with a considerable amount of compromise, is all left out. The sixth edition is dated 1886, and in this year the first English edition made by Clara Bell from the French version was reprinted in New York. In 1898 the first translation from the original Russian, by Nathan Haskell Dole, appeared in six volumes. It is also comprised in the later versions of Tolstoy's complete works made by Leo Wiener and by Constance Garnett.

WAR PENSI0NS. During the fiscal year 1918-19 the United States Government paid to 624,427 persons pensions totaling 222,129,292.70. This was the largest sum ever disbursed by the government since the pension system was adopted notwithstanding the fact that the number of names on the pension roll was the smallest since 1890. Payments on account of pensions during the preceding fiscal year amounted to $179,835,328.75. There were at that time 646,895 names on the pension rolls. The greatest number of names ever on the United States pension rolls was 999,446 in the year 1902. Payments to them totaled $137,502,267.99. According to the 1919 report of the Pension Commissioner the total pensions paid on account of the Civil War up to that year amounted to $5,299,859,509.39 and the total on account of all wars was $5,617,520,402.30, including $65,211,665.71 paid on account of the Spanish-American War. The net reduction in the pension roll during 1919 was 22,468 names, 32,149 names having been removed from the roll while 9,681 names were added to it. Of the pensioners on the rolls in 1919, 3,747 were scattered through 63 foreign countries, one being on the Island of Saint Helena, famous in history as the place of Napoleon Bonaparte's last exile and death. These pensioners in foreign countries received a total of $1,188,188.45. Ohio led the States with the greatest number of persons on the Federal pension rolls in 1919, there having been 60,002 residents of that State who drew pensions totaling $21,582,330.04 in that year. Pennsylvania was second with 59,072 who received $20,630,813.44; New York came third on the list with 53,736 pensioners who drew $19,631,090.72; Illinois was fourth with 43,976 pensioners who received $15,956,335.52 and Indiana was fifth with 37,647 pensioners who drew $13,703,084.94. See Pensions.

WAR POWER. The United States Constitution, dates back to Federal Convention of 1787; and it provides for the national defense through Congress which alone has the right to declare war and of making rules relative to the conduct of the war and of captures on land and sea. Congress is also empowered to raise and maintain armies and the navy and to make rules for the government of both and to provide for their organization, training and discipline. This power is exercised through the President of the United States, as the commander-in-chief of the militia and the land and naval forces in the service of the nation. It is the duty of Congress to provide the necessary military forces in case of need; and it is the business of the President as the chief executive officer of the nation, the army and the navy, to see that these are made use of in accordance with the will of the nation as expressed through Congress, which must decide all questions relative to the strength and composition of the land and naval forces and

WAR RELIEF—WAR RISK INSURANCE

prescribe the Articles of War and the Rules for the Government of the Navy. The declaration of war by Congress does not, however, become law until it has received the sanction of the President of the nation. The President is also empowered to use the national forces on land and sea to repel aggression and in case of invasion and to suppress insurrection until Congress is able to declare its will in the matter. In fact the powers of the President in case of war, invasion or insurrection are plenary over the forces placed at his disposition by Congress, or by the Constitution. This applies even to the property of the enemy which he may take for the use of the army, the navy and the needs of the nation in time of war. In the case of newly-acquired territory the President also exercises very extensive powers until it has been assimilated legally by act of Congress. Consult Black, H. C., "Constitutional Law" (1895); Cloyd, C. M., "Military Forces of the Crown" (1899); A. P. Waters, "United States As a World Power" (1908); Moore, J. B., "American Diplomacy" (1905); Pomeroy, J. N., "Constitutional Law" (1907).

WAR COSTS. See WA R COSTS.

WAR RISK INSURANCE. The Bureau of War Risk Insurance (U. S. A.) traces its origin back to 1914 in the days when the world was stunned by the European cataclysm, and found its prototype in the action taken by the British government in assuming the war time risk on vessels flying the British flag. The British government had all it could do to provide for its own commerce. That left neutrals to look after themselves. It was necessary for America to cover the risks on American vessels and cargoes. William G. McAdoo, then Secretary of the Treasury, asked of Congress the authority to establish a Bureau of War Risk Insurance as an adjunct to the Treasury Department. Congress passed a bill at once to provide government insurance for American hulls and cargoes. William C. De Lanoy, a prominent insurance broker of New York, was appointed to establish and direct the new government bureau.

Mr. De Lanoy continued in office as Director of the Bureau of War Risk Insurance until October 1918 and was succeeded by Col. Henry D. Lindsay, who took office in December 1918, resigning in the spring of 1919 to be in turn succeeded by Col. R. G. Cholmeley-Jones, the present Director of the Bureau.

Mr. De Lanoy began business on 2 Sept. 1914 with an office force of four persons, yet on the first day of his incumbency Mr. De Lanoy wrote several hundred thousand dollars worth of insurance on American ships and cargoes. This marine insurance remained the only form of war risk insurance until June 1917 when Congress amended the original war risk bill to establish a Seamen's Division to insure the lives of officers and crews of American merchant vessels in sums ranging from $1,500 to $3,000 according to their scale of pay. On 12 June 1917 President Wilson approved the amendment to the Act of 1914 under which the War Risk Insurance Bureau was authorized to insure the masters and crews of American merchant vessels against loss of life or disability on account of risks of war apart from any being dis-
after the date of passage of the act, and provided that all men enlisting thereafter must make application for it within 120 days after their enlistment. For men already in the service, there was no time back date to the time they entered the service.

Another feature of this act was the provision whereby a soldier or sailor might make allotment of his pay to any one dependent upon him, and the government would supplement this with an allowance.

Organization.—Immediately upon the passage of the act voluntary applications for insurance began to pour in. The first came from Lieut. Coke Plannagan of the army, for the maximum $10,000. By cablegram on 12 Nov. 1917, General Pershing applied for the maximum insurance for himself, at the same time thanking the government in the name of the army in France for giving to the soldiers a privilege which no other country had ever extended to its fighting men.

The Military and Naval Division of insurance was thus added to the Marine and Seamen Division. The two divisions were still presided over by the original committee, Mr. DeLanoy. To the general direction of the work Hon. Thomas B. Love of Texas was called as Assistant Secretary of the Treasury in charge of the War Risk Insurance and Internal Revenue. At this time the late Maj. Willard D. Straight of New York was summoned to Washington to command the War Risk Section for duty overseas. If the insurance plan was to be the broad, beneficent plan intended, every man in the service should be insured. To get the 1,500,000 men already in the army and the navy and sign up the thousands and tens of thousands being added daily and weekly to the war force was a Herculean task even if a big organization had been devised for this work. But there was no organization. The War Risk Bureau had two rooms in the basement of the Treasury building. It had to get thousands of clerks to handle the colossal volume of papers. It had to spread its canvass in America and camps in Europe, in navy stations in America, in England and in France, and elsewhere. It had to jump in a few weeks from a bureau with 20 clerks to one with thousands of clerks. The housing of the office was a problem. Seemingly every available foot of office space had already been taken over by one or another branches of the government. Various old departments and not a few new ones were having structures built for them hastily and meanly while were "camping out" wherever they could find space. There was a great scarcity of labor, particularly skilled labor. There was still a greater scarcity of office workers, particularly trained office workers.

The life insurance division which was known in the beginning merely as the "Underwriters Section" was under the immediate direction of Mr. Fred O'Neil, who accomplished the pioneer work and was later succeeded by Mr. John M. Cangiato, a member of the Actuarial Society of America, which contributed distinguished service in systematizing the records of War Risk.

Within five days of the passage of the act in October, the bureau sent insurance applications to every military and naval station. At the same time the adjutant general telegraphed every department commander, explaining the opportunities and privileges the new law extended to the men—how for an average cost of $8 per $1,000 per year for policies up to $10,000, any and every officer and man in army and navy could insure his life, make provision for wife, mother or dependent in case of his death or disability.

A few days later representatives of the rank and file of every military unit in the United States met in Washington, summoned by telegraph by the government to receive first hand information concerning the construction and operation of the Insurance Act. The Secretary of War, Newton D. Baker, and the Secretary of the Navy, Josephus Daniels, took an active part in forming this organization to co-ordinate in the field.

In the beginning the Allotment and Allowance Division was under the direction of Mr. F. C. Brown; later the leadership passed to Mr. Dudley Cates; and the activity of these officials is reflected by the fact that before the armistice was signed there were on file in the bureau in Washington the applications for allotment and allowance of more than 4,000,000 men.

The whirlwind campaign by the United States that went forward immediately on the passage of the act could not exceed the concerted, whole-hearted effort to reach the men so much nearer the risk of supreme sacrifice in France. At the time the act was passed there were a quarter million soldiers already in England and France and hundreds of thousands on the point of embarking for duty overseas. Col. S. Herbert Wolfe, of the Quartermaster's Corps, who was in Paris on special detail, was ordered by cable to form an organization, and at the same time a special section of the Adjutant General's Department was organized by Maj. Willard Straight in America for service overseas. After three weeks of intensive training to familiarize themselves with the law and its interpretation a War Risk company of 35 officers and 65 men left Washington for New York whence they sailed overseas on Christmas Day, 1917. This comprising their first campaign for War Risk Insurance in France.

From 5 o'clock in the morning until 9 o'clock at night field squads were at it. Speeches were made in the Y. M. C. A. huts and at mess and everywhere that men could be gotten together. After the making speeches was personal work. Every man was approached directly. If the proposition was not quite clear to him it was explained in detail; if his attitude remained indifferent all the ingenuity of the insurance squad was bent toward his conversion. They wrote insurance all the way from the farthest western training camp to the most easterly port of debarkation and the receiving ports in France. They wrote insurance as near the front-line trenches as any non-combatant was permitted to go, and when they could proceed no farther they sent blank insurance applications into the front trenches on the very eve of battle.

In the Insurance Division of the Bureau of War Risk, locked up in a steel cabinet, is now treasured the original paper, griny with the soil of the trenches, but bearing the names of boys who "signed up" on it for insurance of large amounts the night before they were sent out at daybreak into No Man's Land, some never to return. Across the names of these is written
simply the word "Dead." But these applications collected by insurance officers who had gone into the trench during a stiff German offensive, have been treated as the last will and testament of those odders and the beneficiaries mentioned are receiving government insurance upon as valid a contract as if it had been formally made and taken in triplicate as was the custom.

These insurance officers wrote insurance in hospitals; went into "flu" wards and among the desperately wounded and wrote insurance for dying men; policies, the validity of which was established by a ruling of the Secretary of the Treasury and on which payments are being made.

When the campaign ended by statutory limitations on 12 February, more than $900,000,000 worth of insurance had been written for the quarter million men then in foreign service.

Capt. G. H. Rennick who was also a member of this unit, on his return to the United States was assigned as assistant director of War Risk in charge of personnel, and Capt. John W. Barton who later was appointed assistant director in charge of Compensation and Claims, was a leader in the work of insuring the men in hospitals and camps abroad. The writer of this article, the present director of the Bureau of War Risk Insurance, was privileged to have a part in this insurance campaign among overseas troops.

All in all, the Bureau of War Risk Insurance, in America and abroad, has written $40,000,000,000 of insurance on the lives of 4,539,045 men and women in the military service.

After the signing of the armistice Secretary Love resigned on account of ill health, and was succeeded as Assistant Secretary of the Treasury in charge of War Risk, by the Hon. Jouett Shouse, of Kansas.

In the early spring of 1919 the bureau moved into its new home, a building started as a hotel but taken over by the government in the center of construction and finished so that the Bureau of War Risk was assured a wing at least be housed under one roof. It is 11 stories above ground, has three sub-basements and a total floor space of 608,000 square feet. It has 12 high-speed elevators, its own telephone exchange and every comfort and convenience for its 16,000 employees, over 90 per cent of whom are women. In this new home the bureau will continue its service to service men.

Allotments and Allowances.—Under the law every enlisted man with a wife or with a child under 18, or with a divorced wife in receipt of alimony was required to set aside a portion of his pay as an allotment for these dependents, who were known as class A. For parents, brothers, sisters and grandchildren, known as class B dependents, the enlisted man might make voluntary allotments. In the original law the compulsory allotment for class A dependents was at least $15 per month from a man's pay and as much more up to 50 per cent of his monthly pay to equal the allowance in the government schedule. Women in the service were placed on the same basis as men. Allotments in class B were subject to the same rule. Government allotments were given only on request and after payment of the compulsory allotment. The schedule of government allotments was at first as follows: Wife alone, $15; wife and one child, $25; wife and two children, $32.50 and $5 additional for each additional child up to $50, the maximum; for one child alone, $5; for two children, $12.50; for three, $20; for four, $30; and $5 for each additional one. About 20 per cent of all payments in pay of enlisted men involved a corresponding change in allowances and allotments, which in turn necessitated a vast amount of clerical work. To obviate this an amendment was introduced in the law providing for a flat compulsory allotment to dependents of class A of $15 per month and a flat allotment to dependents of class B of $5 per month.

Compensations and Insurance Claims.—The compensation and claims division was in the nature of an employer's liability company. This division, as the name indicates, paid compensations and indemnities in cases of disability or death due to injuries sustained or diseases contracted while in actual service. These two branches, however, were almost insignificant compared with the insurance division. The insurance provisions of the Act of 6 Oct. 1917 enabled any person, male or female, in active service or honorably discharged to take out insurance in multiples of $500 for any sum from $1,000 to $10,000. Premium rates on an annual term basis were moderate and a list of beneficiaries was specified. There were made certain modifications of the act in 1918, when Congress extended the time for applying for the insurance, changed the rates of allowance to dependents, allowed changes in beneficiaries when attested in writing, limited contracts to $3 in preparing and executing papers for claimants and provided fine and imprisonment for soliciting or receiving any other fees. Other amendments were requested by the Treasury Department in 1919 especially in the schedule of compensation payable to disabled ex-service men. Under the law as it stood a man totally disabled was paid $30 a month if single. The Treasury Department requested that this be increased $20; it asked also that the allowance of $45 for a man with a wife be increased to $90; and $55 paid a man with wife and one child be increased to $95. The man with a wife and two or more children received $65; it was recommended that this be increased to $100. The amendment incorporating these changes was known while pending before Congress as the Sweet Bill and became a law on 24 Dec. 1919.

The stupendous scope of the Bureau of War Risk Insurance is shown by the following facts and figures, which demonstrate that within its organization are four of the largest businesses of their kind in the world.

1. Marine and Sailors' Insurance Division: Total business to 1 Dec. 1919 $2,389,962,663.54
With premiums collected 1,716,185,454.45
33,346 policies issued and paid claims. 28,751,628.72
Surplus over expenses and refunds 17,129,994.46

2. Allotments and Allowance Division:
Payments of allotments to dependents of men in the service $285,538,383.77
Payments of allowances 255,922,779.12
Total up to 1 Dec. 1919 $539,461,162.89

3. Compensation and Claims Division: 37,053 claims approved for Compensation on account of deaths in the service and now making payments thereon each month $976,950.27
furthermore, the business of the American life insurance companies, which it had taken many of them over 50 years to establish, was obtained by agency forces operating in all the cities and large towns of the United States within a few weeks. On the other hand, the Insurance of the War Risk Bureau had no qualified agents and had to rely in many instances upon the services of those without insurance experiences.

During the war the bureau depended upon the army, the navy and the marine corps for all contact with service men; contact manifestly upon a wholesale basis. Men entering a service had their insurance written up for them and the applications for family allowance were made out by the officers in charge of the work, and all papers were forwarded to the bureau by the officers. The bureau had no direct contact with men in the service, its province being merely to carry out the instructions contained in the service men’s papers sent in by camp officers. The bureau, however, had direct contact with the families of service men, to which insurance or allotment and allowance were paid; the bureau in this work becoming in effect a gigantic banking concern through which service men’s checks went to the United States Treasury and payable to their dependents.

With demobilization and the return to civil life organized processes ceased and there existed no means by which the bureau could appeal directly to service men and urge upon them the very great value of their War Risk Insurance and the importance of retaining it and ultimately converting it into permanent United States Government Insurance. A large percentage of the men when released from the service failed to make premium payments and their insurance thus lapsed. It was found that many elements entered into the failure to keep up this insurance. Many men, just out of military service, and not yet placed industrially, were unable to pay their War Risk Insurance premiums, small as those premiums were. This constituted a large class, but not so large, it was believed, as the class made up of those who were apathetic on the subject of life insurance and those not fully alive to the value of life insurance and the tremendous asset which they have in a government insurance contract.

To meet this situation the Bureau of War Risk Insurance, under whose general supervision is the Bureau of War Risk Insurance, issued a very generous reinstatement ruling. The reinstatement provision allows a service man 18 months after discharge from the service within which to reinstate his policy. He is required to pay only two months’ premiums, one for the month of grace, during which he had full insurance protection, and the other for the month in which reinstatement is made.

As originally announced this ruling stipulated that the application for reinstatement be accompanied by a declaration on the part of the applicant that his health is as good as at the date of discharge. This ruling has since been liberalized by an amendment providing that men out of the service shall be permitted to reinstate merely by paying two months’ premiums, without a formal application for reinstatement or a statement as to health at any time within three calendar months following the month of their discharge from the service.
Later a special blanket ruling was made which permitted any former service man to reinstate his lapsed or canceled insurance before 31 Dec. 1925, with the premium paid for the aggregate period of his health as at the date of discharge, or at the expiration of the grace period of his insurance, whichever was the later date, and he so stated in his application.

Another decision is of interest to former service men who paid back premiums on their insurance reinstatement. Those who paid back premiums in excess of two may have the excess applied toward the payment of future premiums.

The Sweet bill, passed by the 66th Congress, provides for a change in the manner of paying converted policies, and the Wason bill, answering the wishes voiced by the American Legion, proposes similar changes in the payment of War Risk term policies issued to men while in active service. The Wason bill contains provisions not included in the Sweet bill, which latter bill had passed the House before the American Legion meeting. The Wason bill codifies the additional recommendations of the Legion and embodies additional amendments to the act not touched by the Sweet bill.

There had been an insistent demand for a change from the present method of paying policies in monthly installments covering a period of 20 years. And to be sure it is not a perfect system for small policies. A thousand dollar policy paid in that manner means a monthly payment of $5.75 continuing over 20 years. On the other hand the policy for the misinvestment of a lump sum payment by inexperienced beneficiaries always exists.

To arrive at a conclusion as to the best method of policy payment, the bureau communicated with numerous philanthropic and charity organizations asking, "Of those adults who come to you for aid, whether or not they or any member of their family had insurance, how many of them get on their feet financially in the first, the second, the third, etc., the fourth year?" The records furnished by these organizations proved that 85 per cent of all the adults who need financial aid because of stress get on their feet within the first year; more than 85 per cent of the second year; and all but the disabled the third year. By these records, we were able to determine that three years is approximately the period of stress. So, upon recommendation of the bureau, the Sweet bill provides that the policyholder shall have the right to say whether the policy shall be paid in a lump sum or in 36 or more monthly payments.

The Wason bill has a like provision for the present term insurance, and provides also that if the policyholder has not designated how the policy shall be paid, the beneficiary shall have the right to elect to take the proceeds in not less than 36 monthly installments. If the insured specifies that the policy shall be paid in 36 monthly installments, or any other number; but by making it impossible for the beneficiary to reduce the number of payments he is protected against unnecessary loss or danger of loss.

The Wason bill further provides that the full face of the policy shall be paid to beneficiaries irrespective of what sums may have been paid on the policy to the insured in his lifetime on account of the insured's permanent disability; and it exempts from premium payments those receiving hospital care from the bureau, those receiving training under the Vocational Rehabilitation Act and those who are temporarily totally disabled.

The Sweet bill increases the class of beneficiaries to include uncles, aunts, nephews, nieces, brothers-in-law, sisters-in-law and persons who may have stood in loco parentis to the insured for a period of one year preceding the issuance of the policy.

The Wason bill goes even further; it absolutely abolishes any limitation as to beneficiary and makes a United States Government Insurance policy negotiable in exactly the same way that commercial policies are negotiable.

The class of persons privileged to carry government insurance is comparatively small, and once that privilege is finally lost it is lost for all time. At any rate it is suggested that the loss of the endorsement of the American Legion and the possibility of the revocation of the endorsement of the American Legion and the possibility of the revocation of the government contract to lapse and take out some other insurance contract, that man has suffered a gross injustice.

Under the Sweet bill single men would receive $80 a month, instead of $30 as provided by the original act; those with a wife, $90 instead of $45; those with a wife and one child, $95 instead of $5; those with a wife and two or more children $100 instead of $80; those without a wife, but having one child, $90 instead of $40, with $5 additional allowed for each of two additional children. Partial disability is to be rated by a percentage of the foregoing, and it shall equal "the degree of reduction in earning capacity."

The compensation provisions of the Wason bill are even more generous. For a disabled man without wife or child $80 a month is allowed; if he has a wife and no child, $95; a wife and one child, $100; a wife and two children, $112.50; and $5 additional for each child above two; if there is no wife, but one child, $85; no wife, but two children, $92.50; no wife, but three children, $100; no wife, but four children, $110; and $5 additional for each additional child.

Closely related to the Compensation Division, though distinct in its own province, and certainly very near to the hearts of all who are interested in service men, is the Medical Division. Properly speaking, though the Bureau of War Risk Insurance is charged with the physical aid and relief of all men discharged by the army, navy and marine corps as physically unfit, the bureau has no hospitals. There are, however, numerous hospitals owned by the Treasury Department and operated by the United States Public Health Service. In these hospitals as well as in various private hospitals disabled service men are receiving treatment. Just before the present Congress adjourned its special session in 1919 an appropriation of $9,000,000 was made for the purchase or building and equipment of hospitals to be owned by the Treasury, and operated by the United States Public Health Service for War Department patients. The program outlined at that time seemed ample for all possible needs. As time has gone on, however, it has been made evident...
WAR OF THE ROSES — WAR WOUNDS

that vastly greater preparation for the treatment of men discharged because of disability will have to be made. It is not unlikely that Congress will be asked to make a considerably larger appropriation for this purpose.

Probably it will be necessary in time to add to the hospital facilities now available, on ac-

which must be deducted the profit of $17,124.903.84 made in the marine insurance division, which reduces the net cost of administration up to 30 June 1919 to less than $2,000,000.

The following table gives the monthly premium rates on each $1,000 of war risk insurance.

</table>

count of the fact that several thousand disabled men will shortly be discharged from army hospitals and turned over to the Bureau of War Risk Insurance as compensation and hospital cases. Months of treatment to effect a cure will be required in a large number of those cases in which cure may be possible. Unfortunately there is a distressingly large number of these cases for which institutional care must be considered permanently necessary. Besides, there are those men who were discharged from the service as physically unfit before being assigned to permanent units.

Early in the summer of 1918, with the idea of standardizing the physical fitness of the army, there was a general weeding out process in the training camps all over the country. As a result of this, more than 170,000 men who had not completed their work in the training camps were sent back to civil life. Of this number more than 25,000 were tubercular cases. Some of these cases had developed from pneumonia and "fit," but so many of them had developed without any exact cause to which the malady might be assigned, that the assumption among army medical men was that a large number of them had been latent or incipient at the time the men were accepted by their local boards. There were approximately 3,500 cases of discharge because of epilepsy, and the list of causes for discharge on account of physical disability runs the whole gamut of human ills. In time, all of these cases will be submitted to the Bureau of War Risk Insurance for hospital treatment to which every man discharged because of physical disability is entitled:

The cost of administering the bureau to 30 June 1919 was approximately $19,000,000, from

The Bureau of War Risk Insurance was established and is conducted for the benefit of our soldiers, sailors and marines. It exists for and because of them, and its sole concern is to serve them promptly, efficiently and with understanding of the needs of each particular case,

R. G. CHOLMELEY-JONES,
Director, War Risk Insurance Bureau, Washington, D. C.

WAR WOUNDS. The wounds described will be those peculiar to the war of 1914-18. Indeed, they have special characteristics, according to the objects producing them, and cannot be compared with the wounds of preceding wars. In the wars of the last century, 80 per cent were produced by bullets. In the war of 1914-18 80 per cent were caused by pieces of shell, grenades, bombs and torpedoes. We are also confronted with injuries resulting from new chemical compounds, like gas and burns from liquid flame. Wounds by knife, bayonet, sword or lance are rare, while the two most common types of injury-inflicting agents are the bullet and pieces of shell. But besides these, we find other foreign bodies in the wounds. For instance, the projectile may carry a fragment of wood which was in the vicinity of the soldier into the body, or a shell may explode in a group of men, the bones of one man entering the body of another. These projectiles often carry with them pieces of

VOL. 28-44
WAR WOUNDS

clothing covered with mud and containing many bacteria. The presence of such foreign bodies is characteristic of shell wounds.

It sometimes happens that a bullet takes along with it a button or a metallic piece of a suspender, but this is exceptional. It may happen, also, when the form of the bullet has become changed, by ricochetting, that it will carry with it bits of clothing. But with this, it strikes directly, it perforates the clothing, piercing its way between the fibres of the tissue, and in this way does not carry along any of the clothing. On the contrary, a piece of shell, always irregular and jagged, cuts the cloth into pieces, which it carries to the bottom of the wound. This cloth is the conveyor of the bacteria into the wound. It can thus readily be seen why a bullet wound is generally uninfected, while that produced by shell is usually infected.

Aside from the element of foreign bodies carried into the wound, there is a big difference between the injury produced by a bullet and that resulting from a piece of shell. The bullet causes only slight damage to the soft tissues, because it advances insinuatingly, pushing the fibres aside without tearing them. The piece of shell tunnels its way through the body, its ragged edges cutting and tearing, producing in this way a kind of pulp out of the contused muscles and cellular tissues torn and detached from the walls of the track. This pulp provides a very good culture medium for the bacteria. The shell fragments are thus not only sources of infection, but are also the purveyors of food for the bacteria which they carry into the wound along with clothing and other foreign bodies.

Upon the bony structure of the body, the bullet inflicts generally more serious injury than does the piece of shell. This is due to the greater velocity of the bullet, which produces considerable pressure in the bone into which it is penetrating, this pressure causing bursting of the bone. The lesser speed with which a piece of shell enters usually prevents bursting of the bone, but it increases the seriousness of the compound fracture by carrying more bacteria.

In the present-day warfare every kind of injury can be seen, from a tiny scratch to complete tissue disintegration, but the variety of wounds is less characteristic than their number. The plentiful supply of artillery, with its greater precision, multiplies the injuries. The wounded are numerous and each usually has several wounds: generally not less than two or three, often 10 or 15, sometimes as many as 40 to 70, and even 90. The number of the wounded emphasizes the fact that the injured can no longer be considered by the general staff as a negligible waste, of which little care need be taken, but that it is important to treat them quickly in order to preserve them for a continuance of the struggle.

The characteristic of the clinical evolution of shell wounds is the element of infection. Every disease-producing bacterium may be the agent of this infection. The most dangerous are the tetanus bacillus, gas or Welch bacillus, and the streptococcus. Tetanus was very frequent at the beginning of the late war because of the lack of antitoxin. Later every wounded man was injected with antitoxin and no more tetanus was observed. Gas gangrene is a very serious complication, which manifests itself by the necrosis of the walls of a wound, spreading quickly into the rest of the limb; by the production of gas which distends the tissues and by general poisoning of the injured. Treatment for it is wide opening of the wound, to expose the bacteria to the oxygen of the air, which prevents the further injection of an antitoxic prepared by Bull and Pritchett of the Rockefeller Institute, or by Weinberg in France. Streptococcus is the bacterium of erysipelas. It is one of the most resistant bacteria, and causes serious local and general infection. We have not as yet any specific treatment against it.

But whatever may be the infection, it is possible to subdue it by accurate surgical and antisepic treatment. This should be done as early as possible, preferably before the first eight hours after the injury. An X-ray picture indicates the bone lesion and also the location of foreign bodies. The operation which follows consists of wide opening of the wound; of the complete excision of the walls of the wound; of the foreign bodies, and of the resection of bone splinters. This mechanical cleansing permits the removal at the same time of any necrotic tissue and bacteria. After this operation it is in many cases possible to close the wound immediately. But if there remains a doubt as to the presence of dangerous bacteria within the injured part, it is preferable to keep the wound open, to make bacteriological examinations and to close it only after knowledge has been obtained of the result of these bacteriological examinations. If a wound is infected, it is best to keep it open and to sterilize it by an antisепic method, which permits secondary closure after several days.

The old antisепic methods have proved themselves inefficient. Carrel and Dakin thought that the main reason for the failure of these methods was their inadequate application. Indeed, contact of an antisепic substance with a wound only once a day produces sterilization for only a few minutes, because the secretions quickly contaminate the antisепic, thereby destroying its efficacy. The Carrel-Dakin method consists of the application, renewed every two hours, of a strong antisепic, non-toxic and non-irritating, but having the property of dissolving necrotic tissue. This substance must reach every part of the wound, for which purpose tubes especially prepared are placed in all the interstices of the injury, as carriers of the antisепic fluid.

Experience has shown that with the use of hypochlorite of sodium, as Dakin has described, it is possible quickly to sterilize every kind of wound, and Dehelly and Dumas have shown the feasibility and necessity of closing these wounds after sterilization, instead of allowing them to cicatrize spontaneously.

Dakin and Dunham, endeavoring to simplify the technique, prepared another antisепic, dichloramine-T, dissolved in a chlorinated paraffin oil. This preparation permits the slow decomposition of the antisепic in contact with the secretions of the wound, thus diminishing the necessity for renewal of the antisепic on
WAR ZONES

the surface of the wound. Good results have been reported from the application of this compound.

To resume. Considerable progress was made from the beginning of the war until its close in the treatment of the wounded. This was due, first, to the early treatment of the injured; second, to the conquest of the infection by the Carrel-Dakin method; third, to the perfected surgical cleansing of the wounds; fourth, to the secondary closure provided necessary by Dehelly and Dumas, and, fifth, to the work of Gaudier, showing the possibility of cleansing a wound thoroughly by surgical means and closing it immediately after the first operation. The result of this progress was that 80 per cent of the wounded were returned without disability and after short period of treatment to the active military forces.

WAR ZONES. Among the many circumstances which distinguished the late war from all others of the past was the practice of belligerents in treating certain areas of the ocean as "war zones" and asserting belligerent rights within such waters which are inconsistent with the long-recognized principle of the freedom of the seas. At the very outbreak of the war, between Great Britain and Germany the German Admiralty was guilty of planting submarine mines in open waters of the North Sea in consequence of which a goodly number of merchant and fishing vessels were destroyed. The British Admiralty at first refrained from this procedure, but on 2 Oct., 1914, in consequence of the policy of the German admiralty, it announced that it had as a counter measure authorized "a mine laying policy in certain areas," and that a "system of mine fields had been established and is being developed on a considerable scale." Notice was, therefore, given that within certain areas of the North Sea it would be dangerous for ships to navigate. In the following months the British Admiralty announced that in consequence of Germany's having scattered mines indiscriminately on the trade routes from America to Liverpool, the whole of the North Sea must be considered as a "military area" within which shipping of all kinds would be exposed to the gravest danger from mines which it had been necessary to lay as a counter measure. Lanes of safety, however, were provided and directions were issued to enable neutral vessels to navigate the North Sea without exposure to destruction. The British mine field was extended or contracted by successive notices issued by the Admiralty from time to time throughout the succeeding years of the war.

By a memorandum of 4 Feb., 1915 the German government charging Great Britain with various violations of international law and declaring that it had in vain called the attention of neutral governments to these violations, proclaimed that the waters around Great Britain, including the whole of the English Channel, were a "war zone" within which after 18 February all enemy merchant vessels would be destroyed. Even if it were not always possible to save the crews and passengers, it was asserted that in consequence of the misuse of neutral flags by British masters, neutral vessels navigating such waters would be exposed to the danger of destruction. The principal difference between the so-called "danger area" proclaimed by Great Britain and the German "war zone" was that nothing was said in the British proclamation regarding the possible sinking of neutral vessels; on the contrary, it left certain routes open and undertook to guarantee neutral vessels against destruction from English mines by furnishing their masters with sailing directions which it followed would insure their safety. In fact, it does not appear that any neutral vessel was ever destroyed or injured by a British mine while navigating the dangerous area. Aside, therefore, from the delays and inconveniences to which neutrals were subjected in the exercise of the right to navigate the high seas, the British measure was unobjectionable. The German proclamation involved a much more serious encroachment upon neutral rights since it not only exposed neutral vessels navigating the war zone to destruction, but it similarly exposed neutral persons innocently traveling on belligerent merchant vessels within the zone, since it was the avowed intention of the German government to sink such vessels, even when it was possible to provide for the safety of their crews and passengers. It is one thing for a belligerent to plant mines in the open seas for the sole purpose of preventing the approach to its coasts of enemy war ships, when precautions are taken to protect neutral vessels against destruction therein; it is a very different thing for a belligerent to proclaim a portion of the sea to be a war zone and announce that all enemy merchant vessels encountered within such zone shall be destroyed, even when provision cannot be made for the safety of crews and passengers and without taking steps to prevent the destruction of neutral vessels therein by providing them with sailing directions enabling them to make their way safely enough through the forbidden zone. In January, 1917, the German government went still further, and after abrogating its previous pledges to the United States in regard to the sinking of merchant vessels (see SUBMARINE WARFARE), proclaimed a "war zone" embracing the whole North Sea, including the waters around the British Isles, extending north to the Faroe Islands, westward from France and England about 500 miles and southward to within a few miles of the coast of Spain. A large portion of the Mediterranean Sea was also included within the area. This vast expanse of ocean embracing more than a million square miles was declared to be a "barred" or "blockaded" zone within which after 1 February all sea traffic would be prohibited by means of mines and submarine torpedoes. As a special concession to the United States a narrow lane extending westward from Falmouth through the zone was to be left open for the passage of one American steamer per week, provided it arrived at Falmouth on Sunday and departed on Wednesday, and provided it had vertical stripes three metres broad painted on its sides and carried a large flag of checkered red and white at the mast end and the American flag at the stern. Within this zone all other merchant vessels, belligerent and neutral alike, were to be sunk
without warning and without provision for the safety of the crews and passengers. This extraordinary measure was avowedly adopted as an act of reprisal against Great Britain for various acts, the chief of which was the alleged attempt of the British government to starve the German nation by means of an unlawful blockade. It was also justified on the ground that the Entente powers had bluntly refused to consider Germany's peace offer. Finally, it was added that the measure would result in a speedy termination of the war and the restoration of peace which the United States had so much at heart. The assertion of the right to close a vast area of the open seas to neutral navigation and the threat to destroy neutral vessels which dared to traverse it was so manifestly contrary to the long-established doctrine of the freedom of the seas for which the German government pretended to be fighting that it would be a waste of time to argue the question. It was, as the President of the United States aptly declared, a declaration of war against the world and against humanity itself. Various neutral governments vigorously protested and the action of the German government in proceeding to put the decree into effect was one of the chief causes which led the United States to declare war against Germany in April 1917.

Aside from the action of the Japanese government in proclaiming in January 1904 certain "strategic areas" in and adjacent to its own territorial waters there is nothing analogous in the slightest degree to the war zone decree of either Great Britain or Germany in any previous war. It has long been a recognized rule of the law of nations that a belligerent has no right to close any portion of the high seas to neutral navigation or to interfere with neutral vessels traversing them further than such as is incidental to the right of search, visit or blockade, or in pursuance of the right of a belligerent to intercept the carriage of contraband to the enemy.

A belligerent may, of course, engage the enemy in battle and prey upon his commerce anywhere on the high seas. He may even warn neutrals that within a certain area of the sea which is likely to become an immediate theatre of naval operations their vessels will be exposed to destruction in the same way that a non-combatant individual who in land warfare strays into the military lines will be exposed to danger, and if they disregard the warning and are unavoidably destroyed or injured in consequence of their presence in such theatre of operations it is doubtful whether the belligerent from whom they suffer can justly be held responsible. But it is a very different thing for a belligerent to proclaim an immense area of the ocean which by reason of the extent of such area cannot be made a theatre of operations as it is prohibited to be the barred or closed zone and to destroy neutral vessels engaged in peacefully navigating such waters.

The action of the British government in proclaiming the North Sea to be a military area in which mines were planted on an extensive scale was itself an infringement upon the principle of freedom of the seas, but for the reasons mentioned above it was far less objectionable than the German war zone decree of January 1917. It is difficult to see how the German measure can be defended on grounds of international law.

JAMES W. GARNER,
Professor of Political Science, University of Illinois.

WAR OF 1812, General Society of, a patriotic society founded in 1894, its membership being open to the male descendants over 21 years of age of any one who fought in the army or navy in the War of 1812. In case of there being no lineal male descendant one representative of a collateral line may be admitted to membership. The society was organized by members of the Defense of Baltimore in 1814, and by the Pennsylvania Association of the Defenders of the Country in the War of 1812, and has State branches in Massachusetts, Connecticut, the District of Columbia, New York, New Jersey and Delaware. Its president in 1918 was John Cadwalader. Its headquarters are at Boston, and its membership in 1918 was 575.

WAR OF 1812, Military Society of, a patriotic society founded in New York, 3 Jan. 1836. It admitted to membership officers of the regular army, navy and volunteer services who had served in the War of 1812. It was consolidated 8 Jan. 1848 with the Veteran Corps of Artillery, a society of the Revolutionary War which was organized in New York 25 Nov. 1790. At that time it adopted the name as well as the rules of the Veteran Corps of Artillery concerning membership, extending it to male descendants of the officers of both the Revolutionary War and the War of 1812. Its last survivor of the Revolution was Daniel Spencer, d. 4 March 1854; its last survivor of the War of 1812 was Hiram Cronk, d. 13 May 1905.

WARBEC, war'bék, Perkin, pretender to the throne of England in the reign of Henry VII: b. Tournay, about 1475; d. London, 28 Nov. 1499. He was the son of a Jew of Tournay, and appears in history in 1490, when he was attached to the court of Margaret, dowager Duchess of Burgundy. At the court he was taught to represent Richard, Duke of York, younger brother of Edward V, one or the princes generally supposed to have been murdered by their uncle, Richard of Gloucester, in the tower. In 1492, when there was prospect of a war between France and England, Warbeck landed at Cork, and was joined by numerous partisans. At the invitation of Charles VIII he went to the court of France, where he was acknowledged as Duke of York, received a pension and was attended by a bodyguard. At the Peace of Estaples he was dismissed from France and went to Flanders,
WARBLERS, a popular name applied in different countries to a variety of small insectivorous birds belonging to quite distinct families, but resembling one another in habits and appearance. The American warblers, to which the book name "wood-warblers" is often given, belong to the extensive family Minio-tilidae and include a varied assemblage of generic types somewhat closely related to the tanagers (Tanageridae). They are small birds, with one or two exceptions about five inches in length. Their colors are bright and varied, yellow often predominating, with patches of red, blue, brown, black or white in conspicuous places; but the females are often plain and often closely resemble one another in the different species. The bill varies, but is generally rather slender, pointed, slightly curved and without a hooked tip, a tooth or a deep notch; the feet are rather small with scutellate tarsi and present no positive characters; the primary wing-quills are nine in number, the outer primary is not elongated and the tail-quills are 12 in number. Owing to the great diversity of the genera it is practically impossible to give any brief definition covering all. Various groupings of the genera into subfamilies have been proposed, but with the exception of the well-marked Icteira, which are decidedly aberrant, they all intergrade more or less easily. A division such as follows is convenient and fairly natural. The typical warblers (Sylvicolinae) have the wings nearly always longer than the tail, the bill slender and conical, with the commissure slightly curved and the rictal bristles numerous and very long. The chats (Icterinae) have the wings shorter than the tail, the bill high, compressed and stout, with strongly curved commissure and no rictal bristles. They are much larger and less of any of the other subfamilies. There are, in round numbers, about 130 species of known warblers, strictly confined to America; the flycatching warblers being found in greatest variety and abundance in northern South America, Central America and the West Indies, while the Sylvicolinae are pre-eminently characteristic of North America.

Warblers are all insectivorous and migratory, chiefly inhabitants of the woods and thickets and because of their varied habits and great abundance among the most interesting of our birds. They have the habit of busking in the crevices or high up in tall trees, nests exhibiting a great diversity in material and architecture. The name warbler probably alludes to their constancy rather than to their ability as musical performers, though the most interesting, are, with a few exceptions, not highly melodious. The varied role played by warblers in nature has been well expressed by Dr. Coues in the following poetic passage: "The warblers have we always with us, all in their own good time; they come out of the South, pass on, return and are away again; their appearance and withdrawal are less than a mystery; many stay with us all summer long, and some brave the winters in our midst. Some of these slight creatures, guided by an erring instinct, travel true to the meridian in the hours of darkness, slipping past 'like a thief in the night,' stopping at daybreak from their lofty flights to rest and recruit for the next stage of the journey. Others pass more leisurely from tree to tree, in a ceaseless tide of migration, gleaning as they go; the harder males, in full song and plumage, lead the way for the weaker females and yearlings. With tireless industry do the warblers befriend the human race; their unconscious zeal plays due part in the nice adjustment of Nature's forces, helping to bring about that balance of vegetable and insect life without which agriculture would be in vain. They visit the orchard when the apple and pear, the peach, plum and cherry are in bloom, seeming to revel carelessly amid the sweet-scented and deliciously tinted blossoms, but never interfering with the fruit work. They peer into the crevices of the bark, scrutinize each leaf, and explore the very heart of the buds, to detect, drag forth and destroy those tiny creatures, singly insignificant, collectively a scourge, which prey upon the hopes of the fruit-grower, and which, if undisturbed, would bring his care to naught. Some warblers flit incessantly in the terminal foliage of the tallest trees; others hug close to the scored trunks and gnarled boughs of the forest kings; some peep from the thicket, the coppice, the impene-trable mantle of shrubbery that decks tiny water courses, playing hide-and-seek with all comers; others, more humble still, descend to the ground, where they glide with pretty mincing steps and affected turning of the head this way and that, their delicate flesh-tinted feet just stirring the layer of withered leaves with which a past season carpeted the ground. We seek warblers everywhere in their season; we shall find them a continual surprise."

Of the Sylvicolinae, which contain 46 species are North American, the principal genera being Dendroica, the largest by far, Helminthopha and Geothlypis. The diagnostic colors of many are sufficiently indicated by their vernacular names, which, however, are generally descriptive of the full-plumaged males only. The black and white creeping warbler (Minioilla varia) has the sexes similarly colored and is a common migratory woodland species throughout eastern North America, breeding from Virginia northward and wintering from the Gulf Coast into South America. In feeding habits it resembles the brown creeper rather than the other warblers, climbing the tree trunks and larger branches by clinging to the bark, searching the crevices for insects and their eggs, but not using the tail as a prop. The song is a feeble unmusical trill, but the call notes are varied. A simple nest on the ground of bark, moss, grass, etc., contains four or five eggs, white with brown specks, and the synonymy includes only P. ciriola, the prothonotary warbler, a beautiful species whose prevailing color in both sexes is golden with
WARBLERS

olivaceous and bluish above and the tail-quills largely white; the bill is unusually long, acute and black. It breeds in most of the United States east of Nebraska, but is rare in the East unless it is in extensive swampsy woods and thickets and nests in holes of trees. An interesting species of striking aspect is the worm-eating warbler \((Helminthus vermicularis)\), with a stout acute bill without bristles, a very short tail and strong feet. In both sexes the upper parts are olivaceous and the head conspicuously marked with four longitudinal black stripes. A common bird of the eastern United States west to Nebraska and north to southern New England, breeding over this range and wintering in the Antilles and northern South America. It is a bird of the woodland undergrowth and nests on the ground, the four or five eggs being brilliant white with fine dots of reddish brown. The popular name is a misnomer as it does not feed on worms but chiefly on caterpillars and spiders. The best known of the \(Helminthus\) is the blue-winged yellow warbler \((H. pinus)\) having about the limits of range of the last and much resembling it in habits though they are much larger in size and arboreal habits than the shrubby of parks and well-kept grounds. The Nashville warbler \((H. ruficapilla)\) is a plain species; the males in breeding-dress olive above, yellow below, the latter remaining even in the duller autumn colors. Except in the extreme Northern States this species is a migrant only, but very common in the United States, breeds in the British provinces and winters in Mexico and Central America. This genus also includes the golden-winged, Tennessee and orange-crowned warblers of the eastern United States and several western species, besides some rarities which are supposed to be hybrids. No warbler is better known than the little gaily-dressed parula or blue-yelow-backed warbler \((Compsithrypus americana)\), which breeds in the United States and lower Canada west to the great plains and winters in the West Indies and Central America. They are very common in open woods during the migrations and distributed more locally in summer in districts and river valleys. During the breeding period, probably attracted by the abundance of the long-stemmed \(Usnea\) or Spanish moss, of which their beautiful, usually globular hanging nests, are in chief part constructed. Like the \(Dendroica\) they are true tree-warblers, incessantly flitting about the outermost twigs, turning and hanging in every conceivable attitude and often taking short flights in pursuit of flying insects.

\(Dendroica\) comprises 24 species of the warblers found within our limits. Most of them glean for their food in the terminal twigs of trees much as does the parula and like it their songs are simple feeble trills. They come in troops when the forest trees are bursting into leaf in May and most of them pass to the British provinces or at least to the northern woods and high mountain ridges to breed, but a few, like the yellow warbler, remain through the summer. With few exceptions they never nest on the ground. Their plumage is handsomely and variously colored, but nearly always have much white on the tail quills, the female, young and male autumn plumage is generally very different. One of the most known but hardly a good representative example is the yellow or summer warbler \((D. aestivalis)\), one of the few species which has an extensive range reaching southern Canada and the United States. It is abundant almost everywhere in North America and its warm glowing yellow color and the absence of white from the tail are diagnostic. It is less of a woodland bird than many of the others and frequents orchards, meadows, parks and old cultivated fields. It makes a neat nest, compactly felted of soft vegetable fibres, bits of wool, paper, etc., securely wedged in the upright fork of a bush or low tree. More than one brood of four or five young is sometimes raised and these birds often outwit the cowbird which drops an egg in their nests by covering the intruder with a false floor and hatching their own brood above it. The spring song of the yellow warbler is very sprightly. Other species which breed over considerable areas in the United States are the English leaf warbler \((D. carulea)\), chestnut-sided warbler \((D. pensylvanica)\), yellow-throated warbler \((D. dominica)\), pine warbler \((D. vigorsii)\), and prairie warbler \((D. discolor)\) in the East and the hermit \((D. laminirostris)\), Townsend's warbler \((D. townsendi)\), hermit warbler \((D. accidentalis)\) and golden-cheeked warbler \((D. chrysoparia)\) in the West. Well-known migrant species, which breed in Canada and more or less in our northern border States and along the high mountain ridge southward even to North Carolina and Georgia, are the Cape May warbler \((D. tigrina)\), black-throated blue warbler \((D. caeruleus)\), yellow-rumped or myrtle warbler \((D. coronata)\), which lingers into the winter even in the latitude of Philadelphia, magnolia warbler \((D. maculosa)\), bay-breasted warbler \((D. castanea)\), the beautiful black and orange Blackburn's warbler \((D. blackburniae)\), black-throated green warbler \((D. virens)\) and the Eastern palm warbler \((D. palmarum hypochrysea)\).

Very distinct in appearance from all of the above are the members of the genus \(Seiurus\), of ground-loving habits and thrush-like plumage, brownish above and streaked or spotted below. We have only one species, the crowned thrush or oven-bird \((S. aurocapillus)\) slightly exceeds six inches in length, and both sexes are of a rather bright olive color above, with a golden crown-streak bounded by black. It inhabits the greater part of North America and breeds from Virginia and Kansas northward, building its over-arched nest of leaves and grasses on the ground and laying therein four to six white eggs thickly speckled with brown and lilac. The oven-bird is very common in the summer in the New England and Middle States, inhabiting low damp woods and living mostly on or near the ground, searching for its chiefly insect food among the fallen leaves. Besides its ordinary loud clear whistled song, it has an exquisitely sweet nuptial song seldom heard. The common water-thrush or water-wagtail \((S. noveboracensis)\) is slightly smaller and of a nearly uniform rich olive-brown above, pale yellow, streaked with brown below. Its breeding range is northerly in the eastern United States to Illinois and to the Arctic, and it winters in middle America. The water-thrush inhabits woodlands in the vicinity
WARBLERS

of streams and swamps and resembles the wagtail in its habit of wading and raising the tail to balance the body on its insecure footing. The nest of leaves, grasses and fine roots is built on the ground in the shelter of a log and the crystalline white eggs are profusely speckled with brown number four to six. A related species, similar in habits, is the Baltimore oriole (Icterus galbula), which nests from Georgia to Labrador. The male is a handsome bird, olive above, chiefly clear yellow below, the face with a broad rich black mask which the female lacks. It lives in thickets and shrubbery, especially where the ground is wet and wet. The nest is skilfully concealed in tufts of herbage on the ground and is constructed of leaves, twigs, grass, rootlets, etc. The four to six eggs are white and rather sparingly spotted above and below. The song is a loud, clear, lively whistle sung with great energy. A related species is the Kentucky warbler (G. formosa), which differs in having in place of the black mask a black crown and a black bar running obliquely downward and backward from the eye and between them a yellow superciliary stripe. It is more southern than the yellowthroat but breeds throughout the eastern United States. Much less common than the yellowthroat its habits are essentially similar, but it is a bird more of the woodland borders and underbrush than of the swampy thickets. Other species are the mourning warbler (G. philadelphia), the Connecticut warbler (G. agilis) and several southern and western species closely similar to the Maryland yellowthroat.

Coming now to the Setophaga, we find five genera and 10 species described as North American, six of which are Mexican and south of Mexico. All cross the borders of the United States. The remaining four are generally common eastern birds. Typical of the subfamily is the redstart (Setophaga ruticilla), not at all related to the redstart of Europe. The male is a bird of garden and woodlands with a russet breast, a brilliant yellow throat, a white eye-stripe, black tail and a white patch on the wing. The females and immatures are a duller brown with a yellow rump. The song is a series of short, musical warbles, the notes of which are slightly prolonged.

The migration and stops of the American redstarts are much the same as those of the eastern warblers. They breed in the United States from northern California to New York and from New England to Ohio, and winter in the southern states from southern Florida to Georgia and Alabama.

Of the Icterina our fauna contains but a single genus and species, the yellow-breasted chat (Icteria virens), isolated in structure and standing quite apart from the other warblers; and in manners equally unique. The length is about seven and one-half inches, the color clear olive-green above; the throat, breast and sides bright rich yellow; and the belly, supra-axillary and axillary stripes and a spot below the eye, white; the cheeks and lore black and the bill blue-black. The form is stout and the wings much shorter than the tail. In two subspecies the yellow-breasted chat inhabits the whole United States except the northern tier. It is locally abundant, living in tangled thickets on warm hillsides and sheltered valleys, and building a loose but pretty nest of leaves, plant stems, strips of bark and grass in the thickest patches of briers, often in association with many of its fellows. The eggs, which are about an inch long by four-fifths of an inch in diameter, are usually three or four in number, variously spotted and blotched with brown and lilac. The chats are among the most remarkable of our songsters, but have no definite song, producing a constant succession of extraordinary sounds with much force and expression. Some are clear whistles endlessly modulated and combined, some are hoarse and guttural, some are sharp, coughing sounds, some cat-like mews, some are original, others imitated, but all are uttered with a vehemence and abandon that is quite inimitable. Few birds surpass the chat in imitative or ventrilogistic powers and few combine their nuptial song, which is heard both by night and day, with such a series of grotesque aural antics.

The warblers of Europe belong to the family Sylviae, related to the thrushes and by many ornithologists combined with these and other birds in the family Turdidae used in a wide sense. The Sylviae have the bill of moderate length and slender form, broad at the base and tapering toward the extremity. The tip of the upper mandible is curved downwards, and is slightly notched. The wings are elongated with 10 primaries and the tail has often only 9 quills, the tarsi long and slender. The family includes a variety of sub-families and a large number of genera, presenting quite as varied array of structures and habits as do the Mniotilidae and quite as difficult to classify. All are small insectivorous and mostly plain-colored birds. They are especially characteristic of Eurasia, though some breed in Australia, New Zealand and the Polynesian Islands.
Regulus and Phyllophilus inhabit North America. To this group belongs the genus Sylvia, represented by such forms as the white-throat (Sylvia maritima), garden warbler (S. hortulana), and thrush (S. rubetra), and other equally notable species elsewhere described.

Besides an Asiatic species (Phyllophilus borealis) which extends its breeding range into Alaska the only North American representatives of this very extensive family are four species of Regulus, diminutive little birds known as kinglets (q.v.). The dainty little gnatchatchers (q.v.), of which three species are North American, and which with their allies form the family Poliophlycidae are called warblers in Australia.

Consult Baird, Brewer and Ridgway, ‘North American Birds’ (1874); Coles, ‘Key to North American Birds’ (Boston 1903); Ridgway, ‘Birds of North and Middle America’ (Washington 1902); Wilson, ‘American Ornithology’ (Philadelphia 1814); Jones, ‘Songs of the Warblers’ (Oberlin 1900); Dresser, ‘Birds of Europe’ (London 1861); Chapman, ‘Warblers of North America’ (New York 1907).

WARBURG, Paul Moritz, American banker: b. Hamburg, Germany, 10 Aug. 1868. He was educated at the Realschule, Hamburg, later studied in France and England and traveled widely. He entered his father’s banking business at Hamburg in 1894; and for several years after 1902 he was a member of the banking firm of Kuhn, Loeb and Company, New York, as well as very closely related to banks, trust companies, railroads and other organizations. He was a member of the central banking system in the United States, and in 1914 he was appointed by President Wilson a member of the newly-formed Federal Reserve Board, whereupon he resigned his directorships and similar connections. Upon the expiration of his term in 1918 he insisted upon retiring, owing to criticism directed at his own banking business. His activity on various committees in connection with the European War. Author of ‘Essays on Banking Reform in the United States’ (1914).

WARBURTON, Alexander Bannerman, Canadian statesman: b. Charlottetown, Prince Edward Island, 5 April 1852. He was graduated at King’s College, Windsor, Nova Scotia, in 1874, and later studied at the University of Edinburgh. He was called to the bar in 1879 and engaged in practice at Charlottetown. He was elected to the legislature of Nova Scotia in 1891; served as premier in 1897-98; and in 1898-1904 was judge of Queen’s County Court. He was elected to the Dominion Parliament in 1908. He is a governor of King’s College, Windsor, and is known as a writer on political subjects, and on the history of Prince Edward Island, forestry, education and other subjects.

WARBURTON, Bartholomew Elliott George (ELIOT WARBURTON), Irish author: b. near Tullamore, King’s County, 1810; d. at sea, 4 Jan. 1852. He was educated at Trinity College, Cambridge, and was called to the bar of Ireland in 1837. Later, however, he abandoned law for travel and literary pursuits. He achieved a great success with his first book, ‘The Crescent and the Cross’ (1844; dated 1845), a narrative of his travels in 1843 through Turkey, Syria, Palestine and Egypt. It passed rapidly through many editions, winning him the esteem of Bishop Keble and the approbation of most of the scholars of his time. ‘The Christian’s Hope’ (1849) was another popular book, and his last work, ‘The Morning Star’ (1850), though less successful, was equally well received. ‘The Wonders of the East’ (1851) was a popular picture of life in the East.

WARBURTON, William, English prelate: b. Newark-upon-Trent, Nottinghamshire, 24 Dec. 1698; d. Gloucester, 7 Jan. 1779. He studied law and practised in Newark, but soon gave up his profession and in 1723 took orders in the English Church, becoming rector of Brant Broughton, Lincolnshire, in 1728. In 1726 he formed an acquaintance with Theobald, to whose edition of Shakespeare he contributed. In 1727 he began to distinguish himself as an original writer by his inquiry into the ‘Causes of Prodigies and Miracles,’ and in 1730 appeared his ‘Concerns between Church and State, or the Necessity and Equity of an Established Religion and Test Law.’ The first volume of his chief work was published in 1737, entitled ‘The Divine Legation of Moses demonstrated upon the Principles of a Religious Deist from the Omission of the Laws of Moses, as it was never given by him or his Prophets’ (1740). This work was followed by a great number of treatises, the most of which were written in defense of his opinions. Having published in the journal called the ‘Works of the Learned,’ in 1739 and 1740, a defense of the ‘Essay on Man’ against the remarks of De Crousaz of Geneva, Pope acknowledged his debt to Warburton and an intimacy was established. On his death in 1744 Pope bequeathed to Warburton half his library and the copyright of such of his works already printed as were not otherwise disposed of. In 1744 Warburton appeared as the executor of Shakespeare and proved himself to be but a poor commentator. In 1750 appeared ‘Julian, or a Discourse concerning the Earthquake and Fiery Eruption which defeated that Emperor’s Attempt to rebuild the Temple, elicited by Mid- dleton’s Inquiry concerning the Miraculous Powers of the Christian Church.’ In 1757 he became dean of Bristol, and two years after bishop of Gloucester. In 1768 he established a lecture at Lincoln’s Inn on the evidence in favor of Christianity from the prophecies of the Old and New Testaments. His collected works were published by Hurst in 1788. Consult the biography of Watson (1863); and Mark Pattison, ‘Essays’ (1889).

WARD, wärd, Sir Adolphus William, English historian: b. Hampstead, 2 Dec. 1837. He was graduated at Trinity College, Cambridge, and became a Fellow of his college. In 1866 he was appointed professor of
history and English literature in Owens College, Manchester, an institution of which he was principal from 1888 until his resignation in 1897. He took a leading part in the movement for the foundation of Victoria University, and in 1900 became master of Peterhouse. He was knighted in 1913, after serving two years as president of the English Academy. He published a translation of Curtius 'History of Greece' (1866-73), and in 1873 his valuable 'History of English Dramatic Literature to the Death of Queen Anne' appeared (new ed., 1899). Among his other works are 'The House of Austria in the Thirty Years' War' (1869); 'Chaucer' (1880) and 'Dickens' (1882) in 'English Men of Letters' series; 'The Counter-Reformation' (1888); 'Sir Henry Wotton' (1897); 'Great Britain and Hanover' (1899); 'The Electress Sophia and the Hanoverian Succession' (1903); 2d ed., 1909); 'Lillo's London Merchant and Fatal Curiosity' (1906); 'Germany' (Vol. I, 1916; Vol. II, 1917) and numerous contributions to 'Cambridge Britannica,' 'Dictionary of National Biography,' 'Cambridge Modern History' and 'Cambridge History of English Literature.'

WARD, Artemas, American general: b. Shrewsbury, Mass., 1727; d. there, 28 Oct. 1800. He entered the military service early in life, and early entered public life as a representative to the General Court; became a member of the executive council and a justice of the Court of Common Pleas of Worcester County. In the French and Indian War he served as lieutenant-colonel under Abercrombie and at the opening of the Revolutionary War was in command of the besieging forces at Boston till the arrival of Washington, after which he was stationed with the right wing on Roxbury Heights. He resigned his commission of major-general, in April 1776, but at the request of Washington continued to serve till the end of May. He was president of the Massachusetts executive council in 1777, a member of the legislature for 16 years and in Congress 1780-81 and 1791-95.

WARD, Artemus. See Browne, CHARLES FARRAR.

WARD, Bernard (Nicolaes), English Roman Catholic bishop: b. Old Hall, Hertfordshire, 4 Feb. 1857. He was educated at Saint Edmund's College, Old Hall, and at Oscott College, Birmingham, and was ordained priest in 1882. He served as a master at both Saint Edmund's and Oscott colleges, and in 1893-1916 was president of Oscott. He was rector of Holy Trinity, Brook Green, in 1916-17. He was appointed domestic prelate to the Pope in 1895; Roman Catholic canon of Westminster in 1903; and since 1917 he has been bishop of Brentwood. Author of 'History of Saint Edmund's College' (1893); 'Life of Saint Edmund of Canterbury' (1901); 'Catholic London a Century Ago' (1905); 'The New Catholic Emancipation' (3 vols., 1911-12); 'The Sequel to Catholic Emancipation' (2 vols., 1915), etc.

WARD, Edgar Melville: b. Urbana, Ohio, 24 Feb. 1839; d. 1915. He was graduated at Miami University; proceeded to study art at the National Academy in New York, and subsequently spent six years in France (1872-78). He was a favorite genre painter and among his pictures are 'The Sabot Maker'; 'Brittany Washwoman'; 'The Quilting Party'; and 'The Coppersmith,' the latter being in the Metropolitan Museum, New York. He was made a National Academician in 1883 and subsequently was elected professor in the National Academy.

WARD, Edward Matthew, English painter: b. Pimlico, London, 14 July 1816; d. Slough, 15 Jan. 1879. His first studies were pursued in the studio of John Cawse, London, and in 1834 he entered the Royal Academy schools. During the three years 1834-39 he was in Paris, Venice and Rome, and studied fresco-painting with Cornelius at Munich. His first noteworthy picture was 'Cimabue and Giotto,' exhibited at the Royal Academy (1839). From that time he was a regular contributor to the Academy's annual exhibition, and in 1855 was elected academician. In 1853 he was commissioned to paint eight pictures for the corridor of the House of Commons. He died from the effects of a self-inflicted wound. His numerous oil paintings were historical and genre, and among the best of them are 'Dr. Johnson reading the Manuscript of the Vicar of Wakefield,' 'The Scene from the Early Life of Goldsmith,' (1844); 'A Scene in Lord Chesterfield's Ante-room in 1748,' (1845), now in the Tate Gallery; 'Charles II and Nell Gwyn' (1848), in the South Kensington Museum; 'The Royal Family in France in the Temple,' (1851); 'Charlotte Corday going to Execution' (1852); the 'Antechamber at Whitehall during the Dying Moments of Charles II' (1861); 'Hogarth's Studio, 1730' (1863); 'Luther's First Study of the Bible' (1869), now owned by the British and Foreign Bible Society; 'The Eve of Saint Bartholomew' (1873); 'Marie Antoinette in the Conciergerie' (1874), etc. Many of these are well known in engravings. Consult Daforne, 'Life and Works of E. W. Ward' (1879).

WARD, Elizabeth Stuart Phelps, American novelist and poet, daughter of Austin Phelps (q.v.): b. Andover, Mass., 31 Aug. 1844; d. Newton, Mass., 28 Jan. 1910. In 1888 she was married to H. D. Ward (q.v.), with whom she sometimes collaborated. Her first work to attract attention was 'The Gates Between' (1868), which had a very wide reading and was instrumental in substituting reasonable healthy views concerning a future existence in place of the vague and conventional ideas on the subject then prevalent in religious circles. Among her later works were 'Men, Women and Ghosts' (1869); 'The Silent Partner' (1870); 'Hedged in' (1870); 'The Story of Avis' (1877); 'Beyond the Gates' (1885); 'Dr. Zay' (1884); 'The Gates Between' (1897); 'Poetic Studies,' verse (1875); 'Songs of the Silent World' (1884); 'The Struggle for Immortality' (1889), a volume of essays; 'A Singular Life' (1895); 'The Story of Jesus Christ' (1897).

WARD, Frederick Townsend, American military leader in China: b. Salem, Mass., 29 Nov. 1831; d. Ningpo, China, 21 Sept. 1892. He served in the French army in the Crimean War and later was for a time a ship broker in New York. The Taeping Rebellion in China enlisted his interest in 1860 and he went to Shanghai. There he gathered a band of adventurous spirits of various nationalities and approached the local Chinese authorities with an offer to capture the city of Sungkian in
WARD

return for a large sum of money. The city was held by about 10,000 rebels, but Ward made good his offer to take it and not only received his monetary reward but was made a mandarin of the fourth class. He cleared the country about Shanghai of rebels, receiving a monetary reward for each victory and later organized and drilled three regiments of native troops. With this force he met and defeated a superior force of rebels, saving Shanghai from capture and later clearing a 20-mile belt around the city. From this time he was taken into the confidence and esteem of the French and English officers on duty there and who had hitherto considered him merely an adventurer. He was made a mandarin of the highest rank, married a Chinese woman and was appointed admiral-general by the emperor. He was killed in a skirmish at Ningo at a time when he was making arrangements to return to the United States to take part in the Civil War. A remarkably trained and disciplined military force afterward became the nucleus of Gordon's famous "Ever Victorious Army" and he was generally regarded as a military genius. He was buried by the Chinese with a funeral in the Confucian Cemetery at Ningo, where a great mausoleum was erected to him; and monuments also were erected at the scenes of his important victories.

WARD, Henry Augustus, American naturalist: b. Rochester, N. Y., 9 March 1834; d. Buffalo, N. Y., 4 July 1906. He was educated at Williams College and at the Lawrence Scientific School at Harvard, where he was assistant to Professor Agassiz. He studied in Paris and traveled through Europe and the Orient in 1855-59; occupied the chair of natural sciences at Rochester University in 1860-65; and in 1866-69 was manager of gold mines in Montana and South Carolina. He traveled in various countries between 1870 and 1900 collecting cabinets of mineralogy and geology, which he distributed among the colleges and universities of the United States. He founded at Rochester Ward's Natural Science Establishment, was naturalist to the United States expedition to South America in 1871 and published "Notes of the Megatherium Cuvieri" and "Description of the Most Celebrated Fossil Animals in the Museums of Europe."

WARD, Herbert Dickinson, American author, son of W. H. Ward (q.v.): b. Waltham, Mass., 30 June 1861. He was graduated from Amherst and in 1888 was married to Elizabeth Stuart Phillips (q.v.) with whom he wrote "The Master of the Magicians" (1890); and "Come Forth" (1890). Among works of which he is so proud are: "The New Senior Andover"; "The Burglar Who Moved Paradise" (1887); "The White Crown and Other Stories" (1894); "The Light of the World" (1901); "A Dart to the Pole"; "Love Letters of an American Girl."

WARD, Mrs. Humphry. See Ward, Mary Augusta.

WARD, James, English artist: b. London, 23 Oct. 1769; d. Cheshunt, Hertfordshire, 23 Nov. 1859. He studied the engraver's art in his boyhood and also early turned his attention to painting, in which he was a pupil of Morland, who married his sister. He was elected R.A. in 1811. His first painting was exhibited in 1790, and from that time to his death he produced numerous pictures of different types, though his best work was done in the painting of animals. His most important works are: "Bull-baiting" (1797); "The Beef, the Cow, and Calf in a Meadow" (1820-22), his masterpiece, now in the National Gallery, painted in rivalry with Paul Potter's celebrated picture; "Allegory of Waterloo" (1817), a sketch for the British Institution which he afterward painted larger and with less success: "Gordale Scar, Yorkshire," in the National Gallery (this great picture with its noble group of cattle which was painted by Lord Ribberdale to the British Museum with a view to its being hung up and consigned to a cellari until 1838, though it eventually reached its destination in 1878); "Harlech Castle," also in the National Gallery; "Regent's Park in 1807"; "A Cattle Piece," also in the National Gallery; "Bulls Fighting in a Landscape," a work of great merit, now in the South Kensington Museum; "Donkey and Pigs," also in the museum at South Kensington; "Pigs," and "A Chinese Cow," in the same collection; "Old Man," in the Manchester Gallery, and "De Tabley Park," in the Oldham Gallery. Among his engravings the most noteworthy are after Rembrandt, Hopper, Rubens, Northcote, Morland and Reynolds. As an engraver he was successful than as a painter and a complete set of impressions of all his plates, in their different states, 300 in all, was presented by him to the British Museum before his death.

WARD, James, English psychologist and metaphysician: b. Hull, 27 Jan. 1843. He was educated at the Liverpool Institute, the universities of Berlin and Giessen and at Trinity College, Cambridge. He was ordained in the Congregationalist ministry and was for a year in charge of Emmanuel Church, Cambridge, but later engaged in psychological research. He became a Fellow of Trinity and lecturer there in 1881 and in 1887 he was called to the chair of mental philosophy at Cambridge University. He was Gifford lecturer in psychology at Aberdeen University in 1895-97 and lecturer at Saint Andrew's. He has accomplished notable work in both psychology and metaphysics; has received honorary degrees from the universities of Cambridge, Edinburgh and Oxford; and in 1913 was elected to the French Institute. He has contributed extensively to the "Journal of Physiology, Mind, and British Journal of Psychology." He is author of "Naturalism and Agnosticism" (1889); "4th ed., 1915; "Heredity and Memory" (1913) "Psychological Principles" (1918), etc.

WARD, John Henry Hobart, American soldier: b. New York, 17 June 1823; d. Monroe, N. Y., 25 July 1903. He entered the United States army in 1841, was appointed sergeant-major in 1845, served through the Mexican War, and was afterward successively assistant commissary-general and commissary-general of New York. He organized a regiment of volunteers at the outbreak of the Civil War, was appointed colonel and was engaged at the first battle of Bull Run. He later participated in the Peninsular campaign, in the second battle of Bull Run, and on 4 Oct. 1862 was promoted brigadier-general of volunteers. He was subse-
ently engaged with the Army of the Potomac and was in command of a brigade at Fredericksburg, Chancellorville, Gettysburg, the Wilderness, Spottsylvania and other important battles. He was honorably mustered out of service 21 July 1864 and from 1870 until his death was clerk of the Superior Court of New York City.

WARD, John Quincy Adams, American sculptor: b. Urbana, Ohio, 29 June 1830; d. 1 May 1910. In 1850 he entered the studio of Henry K. Browne, where he studied six years. In 1856 he opened a studio in New York, where as the fruits of his residence in the Indian country, he modeled his 'Indian Hunter.' This was followed by 'The Good Samaritan,' 'Commodore M. C. Perry,' with reliefs and 'The Freedman.' Among his best-known work in later years he produced the 'Citizen Soldier,' and statues of 'Shakespeare,' 'General Reynolds,' 'General Washington,' 'General Israel Putnam,' 'General Thomas,' 'General Daniel Morgan and Lafayette.' He subsequently modeled the colossal statue of Washington for the New York sub-treasury-building, a colossal statue of 'President Garfield' and 'The Pilgrim.' The crowning group of 'Victory in the arch for the Dewey reception in New York in 1890 was also his work. For three years he was vice-president and for one term president of the National Academy of Design, and was trustee of the Metropolitan Museum of Art.

WARD, Lester Frank, American geologist: b. Joliet, Ill., 18 June 1841; d. 1913. Graduated from the Columbian University in 1869, he was assistant geologist in the United States Geological Survey in 1861-88, and geologist in 1888. He made special investigations in the field of palaeobotany. Among his publications are 'Guide to the Flora of Washington and Vicinity' (1881); 'Sketch of Palæobotany' (1885); 'Types of the Laramie Flora' (1887); 'Geographical Distribution of Fossil Plants' (1888); 'Outlines of Sociology' (1898); 'Pure Socioceny' (1900), and 'Psychic Factors of Civilisation' (2d ed., 1906).

WARD, Lydia Avery Conoley, American writer: b. Lynchburg, Va., 31 Jan. 1845. She was married in 1867 to J. E. Cooley (d. 1882) and in 1897 to H. A. Ward, and was president of the Chicago Woman's Club 1895-96. She has published 'Under the Pines and Other Verses' (1895); 'Our Flag,' a cantata, with music by G. F. Root (1896); 'Singing Verses for Children' (1897); 'Love Songs' (1898).

WARD, Mary Augusta Arnold, English novelist: b. Hobart, Tasmania, 11 June 1851; d. London, 24 March 1920. She was a daughter of Thomas Arnold (q.v.), son of Arnold of Rugby, and in 1872 was married to Thomas Humphry Ward. Her father, having become a Roman Catholic, gave up his educational post in Tasmania and returned to England in 1856 and there his daughter was educated. The family had settled at Birmingham, and after 1885 resided at Oxford, where she also lived with her husband until they removed to London in 1880. Her long residence in Oxford and consequent familiarity with the intellectual atmosphere of the university no doubt gave her that inclination toward ethical discussion which so markedly influenced the character of her writing. In 1890 she was one of the principal founders of University Hall, a settlement among the poor in the Saint Pancras district of London, and since 1897 occupying a spacious building near Tavistock square, erected for that purpose by Passmore Edwards. In the work of this settlement Mrs. Ward put a vast amount of personal endeavor and thought, and its influence has been commensurate with the pains that have been taken in its behalf. Mrs. Ward's first important literary work was a translation of 'Amiel's Journal' (1885), but prior to this she had published 'Milly and Olly,' a child's story. These were followed by 'Miss Breherton,' a story (1886), and 'Robert Elsmere' (1888), which brought her almost immediately a wide-wide fame, being translated into several languages, and having an immense sale. Later works of hers are 'The History of David Grieve' (1892); 'Marcella' (1894); 'Sir George Tressady' (1895); 'Abebeck of Bannister' (1895); 'Eleanor' (1900); 'Lady Rose's Daughter' (1902); 'The Marriage of William Ashe' (1905); 'Fenwick's Career' (1906); 'Unitarianism and the Future' (1894). All of Mrs. Ward's novels display a great intellectual power and intensity of moral purpose, and her influence upon the social and ethical thought of England and the United States has not been inconsiderable. Her novels are of varying degrees of excellence, 'Hebeck of Bannistale' being perhaps the most powerfully composed since 'Robert Elsmere.' She was a founder of the Women's National Anti-Suffrage League in 1908, and took the platform in defense of their views on several occasions.

WARD, Nathaniel, English Puritan divine: b. Haverhill, Suffolk, 1578; d. Shenfield, Essex, 1652. He was educated at Emmanuel College, Cambridge, traveled widely on the Continent, took orders in 1618 and from 1620 to 1624 appears to have been chaplain to the colony of British merchants at Elbing, Prussia. On his return to England, he emigrated to New England, was pastor at Salem, Ipswich and Stratford, and subsequently rector of Standon Massey, Essex. On account of his Puritan views he was frequently cited before Laud, who finally (1633) deprived him of the living. He emigrated again to New England, settled at Agawam, and became minister to a settlement at Agawam, later called Ipswich. This post, because of ill-health, he resigned in 1636. In 1637 he was appointed, with the Rev. John Cotton (q.v.), to frame the first code of laws for the colony,— the 'Body of Liberties,' passed by the General Court in 1641. This compilation is in many respects a remarkable one, and displays wide knowledge of law. Ward was influential in the colonial government; in 1645 he became a member of the committee for the revision of the Massachusetts laws. But he is chiefly known as the author of the "most eccentric and amusing" work written in colonial America. This book, 'The Simple Cobbler of Agawam,' was printed at London in 1647, and passed through four editions in that year. It appeared under the pseudonym of Theodore de la Guard — Theodore being the Greek equivalent of the Hebrew Nathaniel, de la Guard the French for Ward — who turns from his humble last to satirize England old.
and new. Amid some curious syntax, there is in it an abundance of eloquence and wit, making it still very readable. There is, too, much of the intolerance of the place and time. Ward went back to England in 1646. His 'Cobliner' had gained some notice, and he preached before the Commons in 1647 and received the living of Shenfeld, Essex, in 1648. Among his further publications were 'A Religious Retreat, Founded in a Religious Army' (1647); 'To the High and Honorable Parliament, Humble Petitions, Sdasional Suggestions and Dutiful Expostulations' (1650); and probably, 'Mercurius Anitmechanicus' (1648), denouncing the execution of Charles. Consult Dean, 'Memoir of Nathaniel Ward' (1868); Tyler, 'A History of American Literature' (1878); the 'Collection of the Massachusetts Historical Society,' 3d ser., I, VII; 4th ser., VII.

WARD, Nathaniel Bagshaw, English botanist: b. London, 1791; d. Saint Leonards, Sussex, 4 June 1868. He was apprenticed to his father, a medical man, studied at the London Hospital and attended the lectures of Dr. Wheeler at the Society of Apothecaries. He succeeded to his father's practice but his interest was in collecting and cultivating plants. In 1836 he observed a seedling which had sprouted and was growing in a bottle, which suggested to him the possibility of growing plants under adverse atmospheric conditions, and resulted in his construction of the Wardian Case. The high value of the case was demonstrated by the successful conveyance of 20,000 tea plants from Shanghai to the Himalayas; and later cinchona plants were introduced into India through the same means. He collected a herbarium of 25,000 specimens; was one of the founders of the Microscopical (now the Royal Microscopical) Society, and was elected to the Royal Society in 1852. Author of 'On the Growth of Plants in Closely Glazed Cases' (1842).

WARD, Susan Hayes, American author, sister of W. H. Ward (q.v.): b. Abington, Mass., 26 Nov. 1838. She was educated at Wheaton Seminary, Mass., under Lucy Larcom (q.v.), studied in New York, Boston, Dresden, and Paris, and later studied at the Woman's Medical College in Boston. She afterward engaged in lecturing on art; was art-critic on the New York Independent in 1883-93, and office editor in 1892-98. Her writings include 'Christ at the Door' (1872); 'Sahbra Hackett'; 'History of the Broadway Tabernacle' (1901); 'George Hepworth,' a biography (1903), etc.

WARD, Thomas Humphry, English author and journalist: b. Hull, 9 Nov. 1845. He was educated at Oxford, and was married to Mary Augusta Arnold, since widely known as Mrs. Humphry Ward, in 1872. He edited 'Ward's English Poets' (1881-82); 'English Art in the Public Galleries of London' (1888); 'The Reign of Queen Victoria' (1887); 'Men of the Reign' (1885); 'Men of the Time,' 12th ed.

WARD, Wilfrid Philip, English author, son of W. G. Ward (q.v.): b. Ware, Hertfordshire, 2 Jan. 1856; d. 9 April 1916. He was educated at Ushaw College, Durham, and the Gregorian University at Rome, and was lecturer at the former in 1890. He has been a member of the Council of the Catholic Union of Great Britain since 1886, and has published 'The Wish to Believe' (1884); 'The Clothes of Religion' (1886); 'William George Ward and the Oxford Movement' (1889); 'William Ward and the Catholic Revival' (1893); 'Witnesses to the Unseen' (1894); 'Life and Times of Cardinal Wiseman' (1897); 'Life of Cardinal Newman' (1908); 'Man and Matters' (1914).

WARD, William, English Baptist missionary: b. Derby, 20 Oct. 1769; d. Serampore, India, 7 March 1823. He was a printer who was licensed as a preacher and going to India in 1799 settled at Serampore. Besides printing various religious works in the Bengali language, he wrote 'An account of the Writings, Religion and Manners of the Hindoos including Translation from their Principal Works' (1811, 5th ed., 1863), which was long the principal authority upon Indian affairs.

WARD, William George, English Tractarian leader and Roman Catholic theologian: b. London, 21 March 1812; d. Hampstead, London, 6 July 1882. Educated at Winchester College, he entered Christ Church, Oxford, in 1830, obtained a scholarship at Lincoln College in 1833, was graduated in 1834 and about the same time secured election to a Fellowship at Balliol. He then took orders, and was a lecturer in mathematics and logic. He soon became a powerful influence in Oxford life, especially on its religious side, among those more or less affected by him being Archbishop Tait, Benjamin Jowett, Dean Stanley and the poet Clough. He in turn was profoundly influenced by John Henry Newman, whose famous 'Tract 90' he defended in two pamphlets. The publication, in 1843, of William Palmer's 'Narrative of Events connected with the Publication of Tracts for the Times' produced from Ward in reply his famous work 'The Ideal of a Christian Church considered in comparison with existing Practice' (1844), and the formal condemnation of this book by the university authorities precipitated Ward's reception into the Roman Catholic Church (1845), where he was soon followed by Newman and other Tractarians. In 1851 he became lecturer in Serampore, Edmund's College Ware, and in 1854 the Pope gave him the diploma of Ph.D. He resigned his lectureship in 1858, and in the Dublin Review, which he edited 1863-78, contended vigorously on behalf of ultramontane principles. He was founder and leading member of the Metaphysical Society (1869), which included such opposites as Huxley and Martineau. In addition to the works already mentioned Ward wrote 'On Nature and Grace' (1867); 'Essays on the Philosophy of Theism' (1884), a work of great ability; and many smaller works. Consult 'William George Ward and the Oxford Movement' (1889), and 'W. G. Ward and the Catholic Revival' (1893), both by his son Wilfrid. See OXFORD MOVEMENT.

WARD, William Hayes, American Congregational clergyman and Orientalist: b. Abington, Mass., 25 June 1835; d. 28 Aug. 1916. He was graduated from Amherst in 1856, from the Theological Seminary there in 1859 and was ordained to the ministry in the last-named year. He engaged in pastoral work and in teaching and in 1860-68 he was pastor of the Congre-
gational Church and professor of Latin at Ripon College. He joined the editorial staff of the New York Independent in 1868 and was chief editor from 1896 until a few years before his death. He was in charge of the Wolfe exploring expedition to Babylonia in 1884, concerning which he published a 'Report' (1885); and has also written 'World's Christmas Hymn' with his sister, S. H. Ward (1883); 'Biography of Shakespeare' (1913).

WARDE, wär’d, Frederick, American actor: b. Wardington, Oxfordshire, England, 23 Feb. 1851. He made his first stage appearance in 1867, acted in English cities until 1874, then came to the United States and for three years was leading man at Booth's Theatre, New York. He afterward supported Edwin Booth and John McCullough and since 1881 has starred as a tragedian, also lecturing often on Shakespearean and other subjects. He published 'The Fools of Shakespeare' (1913).

WARDEN, David Baillie, American scholar: b. Ireland, 1788; d. Paris, France, 8 Oct. 1845. He came to the United States when young, received a classical education, was graduated from the New York Medical College and in 1808 he was appointed Secretary of the United States legation at Paris. He subsequently became consul and continued in that office until his death. His 'Statistical, Political and Historical Account of the United States of North America' (3 vols., 1819) was later published in both French and German and his other writings include 'Inquiry Concerning the Intellectual and Moral Faculties and Literature of the Negroes' (1810); 'Recherches sur les antiquités de l'Amerique septentrionale' (1827); 'L'Art de vérifier les dates, chronologie historique de l'Amerique' (10 vols., 1826-44); 'Bibliotheca Americana' (1831), etc.

WARDEN, Florence. See JAMES, Florence.

WARDEN, the title in the United States of certain public officers, such as game-wardens, who enforce the game laws, port-wardens, who are harbor officers, and the wardens of prisons.

In the Protestant Episcopal Church the church-wardens are parochial officers, chosen annually at the Easter vestries, one by the vestrymen and one by the clergy of the parishes. Their duties are to protect the church-building and its appurtenances, to superintend the ceremonies of divine worship and generally to act as the legal representatives of the parish.

In England the heads of All Souls, Keble, Merton, Merton, Wadham and New colleges at Oxford are known as wardens. The Lord Warden of the Cinque Ports is an official with merely nominal duties now, though he was formerly of much importance. Lord Wardens of the Cinque Ports were formerly appointed to keep the disturbed border counties of England in a state of defense against the Scotch.

WARDHA, wär'dhə, or WURDA, India, (1) the chief town of the district of the same name, Central Provinces, on the left bank of the W. R. River, 40 miles N. of Nagpur and 471 east of Bombay. It was founded in 1866; as a junction station on the railway it has become a centre of the cotton trade. Pop. about 10,000. (2) The district, which was formed out of Nagpur in 1862, has an area of 2,401 square miles and about 300,000 population. The staple crops are millet, cotton, wheat and rice. Here is produced the well-known Hinganghat cotton, which is exported to the amount of 25,000 bales a year. The breed of cattle is good, especially the trotting breed. A railway crosses the centre of the district. (3) The Wardha River rises in the Satpura hills and flows southeast for 254 miles to join the Waingunga; the united stream, under the name of the Pranhita, ultimately falls into the Godavery at Sironcha.

WARDLAW, Elizabeth, Lady, Scottish poet: b. 1677; d. 1727. She was the daughter of Sir Charles Halkett of Pittfranne and in 1696 married Sir Henry Wardlaw of Pittreavie, near Dunfermline. Her ballad, 'Hardyknute, a Fragment,' was first published in 1719 as an antique and after enlargement from 216 to 336 lines, had been several times reprinted, when Percy in the second edition of his 'Reliques' revealed its authorship. To Lady Wardlaw has also been ascribed 'Sir Patrick Spens,' 'The Douglas Tragedy' and many more traditional Scotch ballads. This is highly improbable. 'Hardyknute,' says Sir Walter Scott, "was the first poem I ever learnt, the last I shall ever forget.'

WARDLAW, Ralph, Scottish Congregational clergyman: b. Dalkeith, 22 Dec. 1779; d. near Glasgow, 17 Dec. 1853. He at first studied divinity with the view of becoming a minister of the Associate Secession Church, but having been led to change his views on the subject of ecclesiastical polity, he was settled in charge of a congregation in Glasgow, where he continued to officiate to the close of his life. In 1811 he was appointed professor of systematic theology in the Congregational seminary in Glasgow. Both as a lecturer and as a preacher his abilities were of the first order. Of his numerous publications may be cited 'Discourses on the Socinian Controversy' (1814); 'Essays on Assurance of Faith and Extent of the Atonement and Universal Pardon' (1830); 'Christian Ethics' (1832); 'National Church Establishments Examined' (1839); 'Lectures on Female Prostitution' (1842); 'Congregational Independency' (1847).

WARD'S ISLAND, an island in the East River, lying northeast of the borough of Manhattan, New York City, and forming the western boundary of Hell Gate. It is roughly rectangular in shape and includes about 200 acres. It is the property of the city of New York and contains a State insane asylum, a home for invalid soldiers, a home for children and the State Emigrant Hospital.

WARE, wär, Henry, American Unitarian divine: b. Sherburne, Mass., 4 April 1704; d. Cambridge, Mass., 12 July 1845. He was graduated at Harvard in 1785; for two years studied theology, and in 1787 became pastor of the First Church at Hingham, Mass., where he remained until 1805 and then accepted the Hollis professorship of divinity at Harvard. At this time Unitarian views were beginning to cause dissension in the New England churches, and the appointment of Ware, a leader of Unitarian thought, to this position in the college brought on a memorable controversy, in which he took a prominent part, particularly in his 'Letters Addressed to Trinitarians and Calvinists' (1820), in answer to the 'Letters to
Unitarians by Leonard Woods, a professor at the Andover Theological Seminary. Ware also published ‘An Answer to Dr. Woods’ Reply’ (1822); ‘A Postscript to an Answer,’ etc. (1823); ‘Proofs, Evidences, and Truth of Religion’ (1842), and other writings. He resigned his professorship in 1840, but was at the head of the Harvard Divinity School from its establishment in 1826 until his death.

WARE, Henry, Jr., American Unitarian divine and author, son of Henry Ware (q.v.): b. at Hingham, Mass., 21 April 1794; d. at Cambridge, Mass., 22 Sept. 1843. He was graduated at Harvard in 1812; was instructor at Phillips Exeter Academy, 1812–14; studied theology at Harvard under his father and in 1817 became minister of the Second Church, Boston. From 1830 to 1842 he was professor of pulpit eloquence and pastoral care in the Harvard Divinity School, and in 1819–22 was one of the editors of the Christian Disciple, afterward the Christian Examiner, an organ of Unitarian thought. He took an active part in the organization of the Unitarian movement. Among his writings are ‘Hints on Extemporaneous Preaching’ (1824); ‘On the Formation of the Christian Character’ (1831); ‘Life of the Saviour’ (1832); ‘Scenes and Characters Illustrating Christian Truth’ (1837); various memoirs, and compositions in verse.

WARE, William, American Unitarian clergyman and author: b. Hingham, Mass., 3 Aug. 1797; d. Cambridge, Mass., 19 Feb. 1852. He was graduated at Harvard in 1816, studied theology under his father, Henry Ware (q.v.) at Cambridge, Mass., was pastorates at Northboro, Mass., Brooklyn, Conn., and Burlington, Vt., and from 1821 to 1836 was minister of the First Unitarian Church, New York. He afterward preached for short periods at several other places, all near Boston, was proprietor and editor of the Christian Examiner (1839–44), and published ‘Letters from Palmyra’ (1837), first published in the Knickerbocker Magazine, subsequently republished as ‘Zoeiba, or the Fall of Palmyra’ (new ed., 1868); ‘Prolus, or Rome in the 3rd Century’ (1838), republished as ‘Is Tauroilan?’ (new ed., 1868); ‘Julian, or Scenes in Judea’ (1841); ‘Sketches of European Capitals’ (1851); ‘Lectures on the Works and Genius of Washington Allston’ (1852), and a ‘Life of Nathaniel Bacon,’ in Sparks’ series. He edited ‘American Unitarian Biography’ (1850).

WARE, William Robert, American architect, son of Henry Ware, Jr. (q.v.): b. Cambridge, Mass., 27 May 1832; d. Milton, Mass., 9 June 1915. He was graduated at Harvard (1852) and at the Lawrence Scientific School (1855). He received an architectural degree at Boston (1860–81). In 1865 he was appointed professor of architecture in the Massachusetts Institute of Technology and filled the same chair in Columbia University from 1881–1903, when he retired with title of professor emeritus. Among his writings are ‘Modern Perspective,’ ‘The American Vignola,’ ‘Shades and Shadows.’

WARE,Mass., town in Hampshire County, on the Ware River and on the Boston and Maine and the Boston and Albany railroads, nearly in the center of the State, about 25 miles northeast of Springfield and about the same distance west of Worcester. It was settled in 1673 by Jabez Olmstead, and on 25 Nov. 1761 was incorporated as a precinct and in 1775 was made a town. The town has a general elevating, and a number of paper and printing establishments. The waterworks are owned and operated by the town. The chief manufacturing establishments are cotton, woolen and hosiery factories, shoe factories, paper manufactures and machine shops. There are more than 100 factories in the town with nearly 3,000 employees. The surrounding farms and the nearby manufacturing villages contribute to Ware’s industrial prosperity. There are seven churches, a public high school, established in 1850, and parish graded schools and a public library which contains about 15,000 volumes. There is one national and one savings bank, the latter unusually prosperous for a town of the size. The government is administered by means of town meetings, at which, by popular vote, the town officers are elected. Nearly all the population are of foreign birth, chiefly French Canadians and Poles. Pop. 9,346. Consult Gay, ‘Gazetteer of Hampshire County.’

WAREHAM, wär’əm, Mass., town in Plymouth County, on Buzzard’s Bay, and on the New York, New Haven and Hartford Railroad, about 50 miles southeast of Boston and 15 miles northeast of New Bedford. It has steamer connections with many of the coast cities and towns. The town contains the villages of Wareham, East Wareham, West Wareham, South Wareham and Onset. The chief industries are iron manufacturing and the cultivation of cranberries. The town has five churches, one high school, elementary schools, public and private, and a public library. There are two banks and two newspapers. Pop. 5,176.

WAREHOUSE ACT, an act of Congress which became a law 11 Aug. 1916, its purpose being to establish a form of warehouse receipt for cotton, grain, wool, tobacco and flaxseed, which will make these receipts easily and widely negotiable as delivery orders or as collateral for loans, and, therefore, of definite assistance in financing crops. This purpose the act aims to attain by the establishment of warehouses under conditions which will insure the integrity of their receipts and make these receipts reliable evidence of the condition, quality, quantity and ownership of the products named which may be stored with them. The general authority of supervision and investigation and classification of warehouses and their methods is vested in the Secretary of Agriculture. Licenses may then be granted to warehousemen who fulfill the proper conditions mentioned in the license and who supply sufficient bond and sureties for their responsibility. Licenses may also be granted to persons not warehousemen to accept custody of and store agricultural products in warehouses owned by the State, provided they fulfill certain specified conditions. A nominal fee is charged for such license and for its renewal. Consult ‘United States Compiled Statutes’ (chap. E, sec. 87474, 1916).

WAREHOUSEMAN, in law, one who receives goods of any kind for the mere purpose of storage. He is a bailee, and, his contract with the owner being one for their mutual
WAREHOUSING SYSTEM — WARFIELD

benefit, is held only to ordinary care and diligence, and if loss or injury happen to the goods, he is not responsible without the absence of this care or diligence on his part, unless he expressly assumes to be responsible for them. Goods must remain in store in their original packages, unless when permission is given before or after storing to sort or repack them. Any infringement of this regulation of the regulations for storing or removing goods subjects to heavy penalties, commonly to the forfeiture of the goods. Goods under bond may on application be removed at the expense of the owner as often as required from one warehouse to another, or by coast or inland carriage, from one port to another, being stored on the same terms in the new port or warehouse as in the old. The warehouse-keeper is bound to store the goods so that easy access can be had to each package. The keeper of the warehouse is liable for the duty of any goods taken out of the warehouse without proper authority; but if goods are improperly removed by a customs-officer no duty is exigible. Goods which have been in warehouse for five years must be re-warehouse or they are liable to be sold.

WARFARE, Submarine. See Submarine Warfare.

WARFIELD, Benjamin Breckinridge, American educator; b. Lexington, Ky., 5 Nov. 1851. He was graduated from Princeton in 1871, from the Princeton Theological Seminary in 1876 and studied at the University of Leipzig in 1877. The next year he became instructor in New Testament literature and exegesis at the Western Theological Seminary, Allegheny, Pa. He was appointed professor of those branches in 1879, and in 1887 he resigned to accept the chair of didactic and polemical theology at Princeton, which he still occupies. He has twice for short periods served as president of Princeton Theological Seminary (1902-03 and 1913-14). He was for a time coeditor of the Presbyterian Review (1890-1902), and he has written 'The Divine Origin of the Bible' (1882); 'Introduction to the Textual Criticism of the New Testament' (1886 and 11 subsequent editions); 'Augustine's Anti-Pelagian Treatises' (1887); 'The Right of Systematic Theology' (1897); 'Two Studies in the History of Doctrine' (1897); 'The Significance of the Westminster Standards as a Creed' (1897); 'Acts and Pastoral Epistles' (1902); 'The Power of God Unto Salvation' (1903); 'The Lady Story' (1907); 'The Saviour of the World' (1913); 'The Plan of Salvation' (1915). He has contributed frequently to the Quarterly Review, and has written many articles for the leading encyclopedias and dictionaries of the Bible.

WARFIELD, David, American actor; b. San Francisco, Cal., 1866. He first appeared on the stage in 1888 in 'The Ticket-of-Leave Man,' and from 1890 he was seen in New York at the Casino and at the Academy of Music. In 1901 he came under the management of David Belasco and was given a new term at the Union Hall. He came under the management of David Belasco in 1901 and from that time starred in a series of phenomenal successes. 'The Auctioneer,' in which he starred, was staged in 1901 and had a run of 1,000 performances. This was followed in 1904 by 'The Music Master,' which ran for more than 1,000 performances and was repeatedly successfully re-
vived. He played in 'The Grand Army Man' in 1907; in 'The Return of Peter Grimm' in 1911, and in 'Van der Decken,' written for him. His role in 'The Music Master' was again revived in 1917-18 and 'The Auctioneer' in 1918-19. Under Belasco's management he has appeared only in rôles portraying a lovable old gentleman, and his mastery of the art of making the rôle by turns pathetic, amusing and always appealing has placed him in the foremost ranks of American actors.

WARFIELD, Ethelbert Dudley, American college president, brother of B. B. Warfield (q.v.): b. Lexington, Ky., 16 March 1861. He was graduated from Princeton in 1882 and from the Columbia Law School in 1885. In 1886-88 he was engaged in law practice at Lexington, but in 1888 accepted the chair of history and the presidency of Miami University, Oxford, Ohio, resigning in 1891 to accept a like position at Lafayette College, Easton, Pa. He was ordained to the Presbyterian ministry in 1899 and has published 'The Kentucky Resolutions of 1798' (1887); 'At the Evening Hour' (1898); 'Memoir of Joseph Cabell Breckenridge, U. S. N.' (1898), etc.

WARHAM, wär'am, William, English prelate, archbishop of Canterbury: b. Hampshire, about 1450; d. 22 Aug. 1532. He was educated at New College, Oxford, of which he became a Fellow in 1475. He acted for a time as advocate in the Court of Arches and moderator of the Civil Law School at Oxford, and in 1492 was ordained subdeacon. He was granted the living of Barley, Herts, in 1495, and that of Cottenham, near Cambridge, in 1500, and held both till 1502 when he was consecrated bishop of London. He was formally installed as archbishop of Canterbury in 1504 and about the same time he was appointed lord-chancellor after 17 months' service as keeper of the great seal. From 1506 until his death he was chancellor of Oxford University. He performed the ceremony of coronation in 1509, after the accession of Henry VIII, and in 1515 was succeeded by Wolsey in the lord-chancellorship. When Wolsey had been raised to the dignity of papal legate there was much friction between him and Warham in their official capacities. Warham's action in regard to the divorce question was weak and subservient, but shortly before his death he made a protest against the acts of the Parliament undermining the papal authority. In his earlier years he was much employed on foreign embassies. Consult Campbell, 'Lives of the Lord-Chancellors' (1845-46); Hook, 'Lives of the Archbishops of Canterbury,' new series, Vol. I (1868).

WARING, wär'ing, George Edwin, American sanitary engineer: b. Poundridge, N. Y., 4 July 1833; d. New York, 29 Oct. 1898. He was a pupil in agriculture of James J. Mapes, in 1853-55 lectured in Vermont and Maine on improved farming methods and in 1855 was made by Horace Greeley manager of the latter's well-known experimental farm at Chappaqua, N. Y. In 1857-61 he was agricultural and drainage engineer of Central Park, New York, whose drainage system he planned. Having been elected a member of the Federation of the 39th New York Volunteers (Garibaldini Hussars), he fought at the first Bull Run, was transferred to the Department of the South-west, recruited a battalion of cavalry (Frémont Hussars) at St. Louis, and when these were consolidated with the 17th to form the Fourth Missouri Cavalry, he was made colonel of that regiment. He served as such until mustered out of the service in 1865. In 1867-77 he was manager of the Ogden Farm, Newport, R. I., writing during that time the 'Ogden Farm Papers' for the American Agriculturist. At the time of the yellow-fever epidemic in Memphis, Tenn., in 1878, he was appointed to alter the drainage system there; and subsequently he devoted himself to sanitary engineering. In 1882 he was appointed a member of the National Board of Health, with which he remained connected for several years; and in 1894 he became assistant engineer of New Orleans. From 1895 to 1898 he was street-cleaning commissioner of New York; during his administration he thoroughly reorganized his department and brought it to a high state of efficiency. In 1898 he was selected to be head of a commission for the improvement of sanitary conditions in Havana, Cuba, with the purpose of eradicating yellow fever. He prepared a detailed report of great value, but died of the fever not long after his return to the United States. He was a member of the Institution of Civil Engineers, Great Britain; Fellow of the Sanitary Institute of Great Britain; honorary member of the Royal Institute of Engineers, Holland, and corresponding member of the American Institute of Architects. Among his published works are 'The Elements of Agriculture' (1854); 'Whip and Spur' (1875); 'A Farmer's Vacation' (1876); 'Village Improvements and Farm Villages' (1877); 'Sewerage and Land Drainage' (1889) and 'Modern Methods of Sewage Disposal' (1894).

WARK, David, Canadian legislator: b. near Londonderry, Ireland, 19 Feb. 1804; d. Fredericton, New Brunswick, 19 Oct. 1875. In 1825 he emigrated to New Brunswick, there took up shipbuilding, bookkeeping and teaching until 1836, turned to mercantile life at Richibucto, later adding to his interests milling and the lumber-trade. He had been, as magistrate and judge of the Court of Common Pleas, in 1842 was elected from the county (Kent) to the provincial legislature and in 1846 re-elected. From 1851 to 1867 he was a representative of the county in the legislative council, being in 1858-62 in the executive council, and for a time holding the post of receiver-general. In 1867 he was one of the original senators appointed to the Senate of Canada under the British North America Act. Throughout his political career he was identified with the Liberal party. In the development of agriculture, the extension of trade and the promotion of education, he was prominently concerned. He undertook in 1847 the furtherance of legislation favoring reciprocal trade between the provinces, and such legislation eventually proved of influence in connection with the reciprocity treaty of 1854 between Canada and the United States. The perfected system of the New Brunswick savings bank was largely due to his in 1861, as mayor of the city of Saint John, member of the 39th New York Volunteers (Garibaldini Hussars), he fought at the first Bull Run, was transferred to the Department of the South-west, recruited a battalion of cavalry (Frémont Hussars) at St. Louis, and when these were consolidated with the 17th to form the Fourth Missouri Cavalry, he was made colonel of that regiment. He served as such until mustered out of the service in 1865. In 1867-77 he was manager of the Ogden Farm, Newport, R. I., writing during that time the 'Ogden Farm Papers' for the American Agriculturist. At the time of the yellow-fever epidemic in Memphis, Tenn., in 1878, he was appointed to alter the drainage system there; and subsequently he devoted himself to sanitary engineering. In 1882 he was appointed a member of the National Board of Health, with which he remained connected for several years; and in 1894 he became assistant engineer of New Orleans. From 1895 to 1898 he was street-cleaning commissioner of New York; during his administration he thoroughly reorganized his department and brought it to a high state of efficiency. In 1898 he was selected to be head of a commission for the improvement of sanitary conditions in Havana, Cuba, with the purpose of eradicating yellow fever. He prepared a detailed report of great value, but died of the fever not long after his return to the United States. He was a member of the Institution of Civil Engineers, Great Britain; Fellow of the Sanitary Institute of Great Britain; honorary member of the Royal Institute of Engineers, Holland, and corresponding member of the American Institute of Architects. Among his published works are 'The Elements of Agriculture' (1854); 'Whip and Spur' (1875); 'A Farmer's Vacation' (1876); 'Village Improvements and Farm Villages' (1877); 'Sewerage and Land Drainage' (1889) and 'Modern Methods of Sewage Disposal' (1894).

WARK, David, Canadian legislator: b. near Londonderry, Ireland, 19 Feb. 1804; d. Fredericton, New Brunswick, 19 Oct. 1875. In 1825 he emigrated to New Brunswick, there took up shipbuilding, bookkeeping and teaching until 1836, turned to mercantile life at Richibucto, later adding to his interests milling and the lumber-trade. He had been, as magistrate and judge of the Court of Common Pleas, in 1842 was elected from the county (Kent) to the provincial legislature and in 1846 re-elected. From 1851 to 1867 he was a representative of the county in the legislative council, being in 1858-62 in the executive council, and for a time holding the post of receiver-general. He undertook in 1847 the furtherance of legislation favoring reciprocal trade between the provinces, and such legislation eventually proved of influence in connection with the reciprocity treaty of 1854 between Canada and the United States. The perfected system of the New Brunswick savings bank was largely due to his in 1861, as mayor of the city of Saint John, member of the
vical board of education of New Brunswick, with the attendant changes, and in the reorganization of King's College as the University of New Brunswick (1859). His centenary was formally observed in 1904 by the presentation of addresses, it being claimed for him that he was the world's oldest legislator; and on 28 April a portrait of him by W. Forbes, A.R.C.A., was unveiled in the Senate. Consult an article on Crockett in the Westminster Magazine (Toronto, June 1903).

WARAKAMOOWEE, in Ceylon, a catamaram type of canoe, carrying a sail with outriggers. It is generally manned by lancers, who sit grouped together for hours at the end of the lever that balances the sail, adding or taking away a man according to the strength of the wind. These canoes often sail 10 miles an hour.

WARM-BLOODED ANIMALS, mammals and birds, in contradistinction to fishes, amphibians and reptiles and to all invertebrate animals with slow circulation. See Animal Heat.

WARMAN, Cy G., American journalist: b. Greenup, Ill., 22 June 1855; d. Chicago, Ill., 7 April 1914. He engaged as a farmer and wheat broker in Illinois until 1880 when he removed to Colorado. He became editor of the Western Railway, Denver, Colo., in 1885; of the Creed, Colo., Chronicle in 1892; and an 1892 was introduced to the public as the "Post of the Rockies" by the New York Sun. He went to New York in 1893 and has since been engaged in literary work. He wrote the words of the popular song 'Sweet Marie' and has published 'Tales of an Engineer' (1895); 'Snow on the Headlight' (1899); 'Short Rails' (1900); 'Songs of Cy Warman' (1911), etc.

WARMING AND VENTILATION. See Heating and Ventilation.

WARMOUTH, Henry Clay, American politician and soldier: b. McLeanboro, Ill., 9 May 1842. He was admitted to the bar in 1861 and became district attorney of the 18th judicial district of Missouri in 1862, but resigned to enter the Union army. He was appointed lieutenant-colonel, was engaged in the assaults on Vicksburg of 19-22 May 1862 and was present at the battles of Lookout Mountain and Missionary Ridge. He served in the Texas campaign and was afterward judge of the military court of the Department of the Gulf until the close of the war. He became military governor of Louisiana in 1868 and was inaugurated civil governor upon the adoption of its new constitution, an office he occupied until 1873. He was a member of the Louisiana legislature in 1876-77 and collector of customs at New Orleans in 1889-93. He was one of the builders of the New Orleans, Fort Jackson and Grand Isle Railroad, which was of long president.

WARNER, wár'nér, Anna Bartlett ("AMy LoTHBoro"). American novelist, sister of Susan Warner (q.v.): b. New York, 1820; d. 1915. She collaborated with her sister in writing the novels 'Say and Seal' (1860); 'Wych Hazel' (1867) and 'The Gold of the Mountain' (1871). Her own publications include 'Dollars and Cents' (2 vols., 1853); 'My Brother's Keeper' (1855); 'Stories of Vinegar Hill' (1871); 'The Fourth Watch' (1874); 'The Light of the Morning' (1882); 'Cross Corners' (1887); 'West Point Colors' (1903), etc.

WARNER, Anne (Anne Warner French), American novelist: b. Saint Paul, Minn., 1869; d. 1913. In 1888 she became the wife of Charles Ellis French. She wrote a number of books of travel and fiction in popular style. They include 'A Woman's Will' (1904); 'The Rejuvenation of Aunt Mary' (1905); 'Seeing France with Uncle John' (1906); 'Seeing England with Uncle John' (1908); 'The Panther' (1908); 'Your Child and Mine' (1909); 'Just between Themselves' (1910); 'When Woman Proposes' (1911); 'The Gay and Festive Claphamhouse' (1914); 'Taming of Amorette' (1915).

WARNER, Charles Dudley, American editor and author: b. Plainfield, Hampshire County, Mass., 12 Sept. 1829; d. Hartford, Conn., 20 Oct. 1900. He graduated from Hamilton College in 1851 and from the law school of the University of Pennsylvania in 1853. He was admitted to the bar in the latter year at Philadelphia and practised his profession at Chicago in 1856-60. In 1860 he became assistant editor of the Hartford (Conn.) Evening Press and in 1861 its editor-in-chief. This newspaper was consolidated in 1867 with the Courant, a morning journal, and Warner was a part owner and long assistant editor of the latter, though eventually his connection with the paper was largely that of a literary contributor. Some letters of travel in America and Europe in 1868-69, printed in the Courant, were widely copied and his articles published in book form in 1870 as 'My Summer in a Garden,' placed him high in the list of American humorists. From 1884 to 1891 he was in charge of the Editor's Drawer, department of Harper's Magazine and in 1892 was transferred to that of the Editor's Study, in the same magazine. He was particularly successful in the essays, in which he combined shrewd observation and cultured humor in a manner in many ways resembling that of Washington Irving. He was a discerning critic as well; and in addition to his literary activities he was identified with various philanthropic work. His further publications include 'A Book of Eloquence' (1853); 'Sauterings' (1872); 'Backlog Studies' (1872); 'The Gilded Age' (with S. L. Clemens, 1873); 'Baddeck and That Sort of Thing' (1874); 'Mummies and Moslems' (1876—reissued as 'My Winter on the Nile') 'In the Levant' (1877); 'Being a Boy' (1877); 'In the Wilderness' (1878); 'The American Newspaper' (1879); 'Studies of Irving' (with W. C. Bryant and George P. Putnam, 1880); 'Life of Washington Irving' (1881); 'Captain John Smith, Sometime Governor of Virginia and Admiral of New England' (1881); 'A Roundabout Journey' (1883); 'Papers on Penology' (with others, 1886); 'Their Pilgrimage' (1886); 'On Horseback: a Tour in Virginia, Etc.' (1888); 'Studies in the South and West, with Comments on Canada' (1889); 'A Little Journey in the World: a Novel' (1889); 'Looking Forward: The Dual Government' (1887); 'H. E. M.' in Italy, Southern California (1890); 'As We Were Saying' (1891); 'Washington Irving' (1892); 'As We Go' (1893); 'The Golden
WARNER — WARRANT OFFICER

WARNER, Everett Longley, American artist: b. Vinton, Iowa, 16 July 1877. He studied at the Art Students' League, New York, and at the Julien Academy, Paris, afterward settling in New York, which city has furnished subjects for many of his paintings. He has landscapes and in etchings and his work is well represented in American art galleries. He engaged in painting ship camouflage in 1917 and originated one of the five designs accepted by the War Risk Bureau. He received medals at the Philadelphia Academy of Fine Arts in 1908; at Buenos Aires in 1910; the First Hallgarten Prize from the National Academy of Design in 1912; and a medal at the San Francisco Exposition in 1915. Among his paintings are 'Broadway on a Rainy Evening' (Corcoran Art Gallery, Washington); 'Quebec' (Pennsylvania Academy of Fine Art, Philadelphia); 'Along the River Front, New York' (Toledo Art Museum); 'A Mountain Village Tyro' (Saint Louis Museum). Author and illustrator of 'The Clan of Mumes' (1916).

WARNER, Olin Levi, American sculptor: b. Suffield, Conn., 9 April 1844; d. New York, 14 Aug. 1896. He studied in the Ecole des Beaux Arts in Paris and subsequently entered Carpeaux's studio. In 1872 he opened a studio in New York, where his works gained and under the eye of several critics whose commendation secured his success. In 1877-78 he modeled 'Twilight,' which established his reputation. Among other well-known works of his may be mentioned 'The Dancing Nymph'; 'Cupid and Psyche'; reliefs of Joseph and other Indian chiefs; statues of Governor Buckingham of Connecticut, William Lloyd Garrison, General Devens, etc.

WARNER, Seth, American soldier: b. Roxbury, Conn., 17 May 1743; d. there, 26 Dec. 1798. Having removed in 1763 to Bennington, he was prominent in the dispute between New York and the New Hampshire Grants (afterward Vermont), and was outlawed (1771) with Ethan Allen (q.v.) and others. He took part in the capture of Ticonderoga and 12 May 1775 effected the surrender of Crown Point with its garrison and 113 cannon. On 16 Sept. 1775 he was made by Montgomery, in whose Canadian expedition he participated, colonel of a regiment of Green Mountain rangers, though the provincial congress of New York withheld his commission. On 5 July 1776 he was commissioned by Congress the colonel of a regiment formed in pursuance of a resolution passed on that day; and on 7 July 1777 was defeated by the rebel army at the battle of Hubbardton (q.v.). At the battle of Bennington, 16 Aug. 1777, he arrived with his regiment in time to meet the enemy's reinforcement and secure a victory. In 1782 he withdrew from the service of General Washington, 'The Life of Col. Seth Warner, with an Account of the Controversy between New York and Vermont from 1763 to 1775' (1858); and 'Green Mountain Boys.'

WARNER, Susan, American author: b. New York, 11 July 1819; d. Highland Falls, Orange County, N. Y., 17 March 1885. For a number of years she resided on Constitution Island in the Hudson River, opposite West Point. Her first essay in literature was a novel entitled 'The Wide, Wide World,' published in 1850 under the pseudonym of Elizabeth Wetherell. This book was in its day next to "Uncle Tom's Cabin" the most successful work of fiction in America in point of sales and was popular also in Europe. In cheaper editions it still finds readers. It was mediocre in style and unduly pietistic in its manner; and, says Richardson, "all literature cannot show so lachrymose a book." It was succeeded by 'Queechy' (1852), which had also a large circulation and 'The Hills of the Shatemuc' (1856), containing many glimpses of American scenery. She was also the author of 'The Law of Toil' (1853), in which the texts proving the great doctrines of Christianity are brought together under their appropriate heads; 'The Old Helmet' (1863); 'Melbourne House' (1864), and other works.

WARNING COLORATION, in zoology. See Coloration, Protective.

WARP. See Weaving.

WARPING, in agriculture, a mode of fertilizing poor or barren land by means of artificial inundation from rivers which hold large quantities of earthy matter, or warp, in suspension. The operation, which consists in enclosing a body or sheet of water till the warp has deposited, can only be carried out on flat low-lying tracts which may be readily submerged.

WARRANT, a writ issued by a competent official authorizing some minor official, as a marshal or policeman, to make an arrest, seizure or the like. The power of issuing a warrant is conferred upon justices of the peace, judges of certain courts and sometimes corporate officers who are clothed with powers of justice of the peace. A warrant for arrest is addressed to a sheriff or other officer, commanding him to arrest the body of the person named and bring him before the magistrate or court to answer or be examined regarding some offense which he is charged with having committed; it is not issued without probable cause, and is secured on the complaint of a person who thinks that a public offense has been committed and who appears before the justice and requests that a warrant be issued. A warrant must give the name of the accused or sufficient identification. It must state the offense in respect to which the magistrate has authority to issue the warrant. A return must be made by the officer of his doing under it, but as there is no set time for a return, a warrant remains in force until it is executed or canceled. There are various other forms of warrants, such as a search warrant of commitment, death warrant, extradition warrant, dividend or interest warrant, land warrants, land sold warrant, tax warrant, warrant in bankruptcy and municipal warrants.

WARRANT OFFICER, a rank in the navy, divided into three classes — gunners,
boatswains and carpenters, the gunners taking precedence of the other two. Formerly, before ironclads superseded wooden ships, there was only one officer of this rank of each class, even on the largest ships. Now, in addition to the officer of each class appointed to carry out the special duties of gunner, boatswain, and carpenter on board every ship, there are usually three or four junior gunners or boatswains appointed to battleships and some of the larger of other classes of ships to perform what are called quarter-deck duties, in addition to which many of the larger ships have extra gunners or boatswain is appointed for torpedo duties. See United States—Navy.

WARRANTY, a guarantee, promise or covenant, or an undertaking on the part of one person to answer for the statements made of the thing warranted to be as represented, and to indemnify against loss, in case of failure. There are two general classes, express and implied. An express warranty is one made expressly in given terms, such as, in insurance, to indicate that an undertaking on the part of the insurer is certain alleged facts are as he represents them to be; in real estate, that the grantor has a legal title to the lands conveyed; in sales, that the seller assures the quality, or the title to the property sold. A warranty in a sale of personal property is a statement made at the time of and as part of the sale, that the goods or articles sold are as represented. A warranty is implied when the law derives it by implication or inference from the nature of the transaction. No particular form of words is necessary to create a warranty. It is the subject matter of a statement and the circumstances under which it is made that are considered rather than the form. A warranty is not valid unless supported by a consideration. In case of a breach of warranty the vendee may sue for the purchase price or may claim damages, and is not bound to return the goods. Proof of a warranty in a written contract must be shown in writing. Oral warranty cannot be admitted as evidence to vary the terms of a contract except where the warranty is an independent agreement and where the warranty does not embrace the whole contract.

WARREN, wär'en, Sir Charles, British general: b. Bangor, 7 Feb. 1840. He received a military education at Sandhurst and Woolwich, joined the Royal Engineers in 1857 and in 1861-65 was engaged in a survey of Gibraltar. During the three years following 1867 he carried out exploring work in Palestine for the Palestine Exploration Fund, and in 1876 was a commissioner for settling the western boundary of the Orange Free State. He commanded the Diamond Fields Horse in the Kaffir War of 1878, and during the immediately succeeding Griqua and Bechuana campaigns was commander of the field forces. He returned to England in 1880-82 during the next four years was attached to the Chatham School of Military Engineering as instructor in surveying. He commanded the Bechuanaland expedition of 1884-85, and was in command at Suakim. From 1886 till his resignation in 1888 he was chief commissioner for the metropolitan police of London, and for five years from 1889 was in command of the troops in the Straits Settlements, with the temporary rank of major-general. He was commander of the Thames district 1895-98; commanded a division in the South African War of 1899-1902, and co-operated with Sir Redvers Buller in that attempt to relieve Ladysmith with which the occupation of Spion Kop is prominently associated. He was afterward appointed military governor of Griqualand West. He has published 'Underground Jerusalem' (1876); 'The Temple or the Tomb' (1880), and with C. R. Conder, 'Jerusalem' (1884).

WARREN, Francis Emory, American legislator: b. Hinsdale, Mass., 20 June 1844. He served in the Civil War as a non-commissioned officer in 1862-65 and received a Congressional medal for gallant conduct at Fort Hudson. He removed to Wyoming in 1868, became active in politics, was a member and president of the council, mayor of Cheyenne, treasurer of the Territory, and in 1885-86 was governor. In 1889 he again became governor and upon Wyoming's admission to the Union in 1890 was elected first governor of the State before the expiration of his term, however, he was elected to the United States Senate and has served almost continuously since in that body.

WARREN, Frederick Morris, American philologist: b. Durham, Me., 9 July 1859. He was graduated from Amherst in 1880 and engaged as instructor in modern languages at Johns Hopkins in 1886-91. In 1891-1901 he was professor of Romance languages at the Western Reserve University, and since 1901 has been professor of modern languages at Yale. He has published 'A Primer of French Literature.' (1889); 'History of the Novel Previous to the Seventeenth Century' (1895), etc., and has also edited 'Selections from Victor Hugo' (1893); 'French Prose of the Seventeenth Century' (1899); Lamartine's 'Grazzella' (1900), and 'Racine' (1903); 'Ten Frenchmen of the 19th Century' (1904), etc.

WARREN, Gouverneur Kemble, American military officer: b. Cold Spring, N. Y., 8 Jan. 1830; d. Newport, R. I., 8 Aug. 1882. He was graduated from West Point, assigned to the engineering corps and until 1859 was engaged in making river and railway surveys between the Mississippi River and the Pacific Ocean. He was assistant professor of mathematics at West Point from 1859-61, when he became lieutenant-colonel and later colonel and captain of volunteers. For service at Gaines' Mills in 1862 he was promoted brigadier-general, and he became chief of topographical engineers in 1863, rising to chief of engineers in the Army of the Potomac in that year. He was on the staff of General Meade at the battle of Gettysburg, where on 2 July he seized and held Little Round Top, the key to the Federal position. He was promoted major-general of volunteers in May 1863 and in 1864 assumed command of the Fifth corps in the Army of the Potomac. He was subsequently placed in command of the Department of the Mississippi and in 1865 was mustered out of the volunteer service as brevet brigadier-general of volunteers. He continued in the army, engaged in various surveys, and in 1879 was promoted lieutenant-
colonel. A statue was unveiled to his memory on Little Round Top, Gettysburg, 8 Aug. 1888. He published various reports and 'An Account of the 5th Army Corps at Five Forks' (1866).

WARREN, Henry Kimball, American college president: b. Cresco, Iowa, 31 May 1858. He was graduated from Olivet College in 1882, where he was principal of the public schools of Mount Pleasant, Mich., 1882-83 and of those of Hannibal, Mo., 1883-89. He was president of Gates College, Nebraska, 1889-94, of Salt Lake College, Utah, 1894-95 and for about 20 years thereafter was president of Yankton College, South Dakota.

WARREN, Henry White, American Methodist bishop: b. Williamsburg, Mass., 4 Jan. 1831; d. 1912. He was graduated from Wesleyan University in 1853 and in 1855 was admitted into the Methodist Conference. He was engaged for 15 years in various pastored in Massachusetts; served in the Massachusetts house of representatives in 1861-62; was pastor of the Arch Street Church in Philadelphia in 1871-74, and in 1877-80; and in 1880 he was elected bishop. He has traveled in almost all parts of the United States in the performance of his episcopal duties and visited Japan for inspecting the Methodist Church missions in 1888. He edited The Study in 1890-1900, and has published 'Rights and Insights' (1874); 'Recreations in Astronomy' (1879); 'The Bible in the World's Education' (1892); 'Among the Forces' (1896); 'Fifty-two Memory Hymns' (1906), etc.

WARREN, James, American Revolutionary leader: b. Plymouth, Mass., 28 Sept. 1726; d. there, 27 Nov. 1808. He was graduated at Harvard in 1745, and for several years was engaged in mercantile pursuits at Plymouth. He was elected a member of the General Court from Plymouth in 1766, was uniform in his support of the rights of the colonists and resisted in that assembly until it was dissolved in 1774. In 1772 he took a leading part in the establishment of committees of correspondence for the different colonies, a measure generally adopted. He became president of the Massachusetts provincial congress in 1773, was general in the Continental army while it was at Cambridge, after the adoption of the Massachusetts state constitution was for several years speaker of the House and held also a seat in the navy board.

WARREN, Sir John Borlase, English naval officer: b. Stapleford, Nottinghamshire, 1754; d. Greenwich, 27 Feb. 1822. He entered the navy as midshipman and after serving in that capacity for some time studied at Emanuel College, Cambridge, and took his degree in 1776. In 1774 he entered Parliament as member for Marlow, and in 1775 was created a baronet. In 1793, on the commencement of the war with France, he was appointed to the Flora frigate, and in 1795 commanded the expedition to Quiberon Bay to assist the insurrectionists of the French, which was unsuccessful. On 11 Oct. 1798 he fell in with a French squadron off the coast of Ireland destined for the invasion of that country, and captured the Hoche line-of-battle ship and three frigates. For this he was subsequently made rear-admiral of the blue. He continued in the navy until the Peace of Amiens, when he was made privy councillor and sent to Russia as Ambassador Extraordinary and Minister Plenipotentiary, and there managed some delicate negotiations with regard to the retention of Malta with great ability. On his return he again entered into active service, and consequently became vice-admiral, and in 1812 received the chief command in North America and the West Indies. He is the supposed author of an anonymous work entitled 'A View of the Naval Force of Great Britain' (8 vols., 1791).

WARREN, John Byrne Leicester, 3d Baron De Tabley, English poet: b. Tabley House, Cheshire, 26 April 1835; d. Ryde, Isle of Wight, 22 Nov. 1895. He was educated at Eton and Oxford, was called to the bar and after a short diplomatic experience devoted himself to literature. His life was passed in retirement, although he was the personal friend of Tennyson, Browning, Gladstone and other eminent men of his day. His poetry, which reveals many excellencies of a poet of thought, appeals to the cultivated few, but not to the general public. His earliest work appeared with the signature 'G. F. Preston' (1858-62), and later he used the pseudonym 'William Lancaster.' After 1873 his work appeared with his own name. Warren. In 1893 he published 'Poems Dramatic and Lyric by Lord De Tabley,' which met with qualified success, and in 1895 a second series appeared. Among his other volumes of verse are 'Preterita' (1870); 'Philocetes' (1867); 'Orestes' (1868); 'Rehearsals' (1870); and 'Searching the Net' (1873). He also wrote two novels, 'A Screw Loose' (1868); 'Ropes of Sand' (1869).

WARREN, John Collins, American surgeon, son of John Warren (q.v.): b. Boston, Mass., 1 Aug. 1778; d. there, 4 May 1856. He was graduated at Harvard University in 1797 and later studied medicine in London, at Edinburgh University and in Paris. He returned to Boston in 1802, and finding his father in greatly impaired health he took over a considerable part of his practice. He became joint editor of the Monthly Anthology in 1803; was also assistant professor of anatomy and surgery at Harvard in 1806-15, and professor in those branches in 1815-47, succeeding his father. He was one of the founders of the Massachusetts General Hospital and was its chief surgeon the remainder of his life. He performed the first public operation in which ether was used as an anesthetic in October 1846; he also performed the first operation for strangulated hernia in this country; and introduced Hunter's operation for aneurism. He was a voluminous writer, drawing upon a vast fund of personal experience as a surgeon. He was greatly interested in paleontology and owned a fine collection, securing for it in 1845 the most perfect specimen of a mastodon skeleton in existence. His collection of anatomical specimens formed the nucleus of the Warren Museum of the Harvard Medical School. He was one of the founders of the American Medical Association. Author of 'Cases of Organic Diseases of the Heart' (1809); 'A Comparative View of the Sensory and Nervous Systems in Men and Animals' (1822); 'Surgical Operations on Tumors' (1837); 'Inhalation of Ethereal Vapor
WARREN

for the Prevention of Pain in Surgical Opera-
tions  

WARREN, John Collins, American sur-
geon, son of John C. Warren (q.v.): b. 
Boston, Mass., 4 May 1842. He was gradu-
ated at Harvard Medical School in 1863, and 
took his M.D. there in 1866, later studying in 
Vienna, Berlin, Paris and London. He engaged in prac-
tice at Boston in 1869; became a surgeon at the 
Massachusetts General Hospital; was associate pro-
fessor of surgery at the Harvard Medical 
School in 1887-93, professor in 1893-1907 and 
has since been professor emeritus. He attained 
a high reputation as a surgeon both at home and 
abroad. In 1873-81 he edited the Boston 
Medical and Surgical Journal; Author of 
"Anatomy and Development of Roodt Ulcer" 
(1872); "Healing of Arteries after Ligature in 
Men and Animals" (1886); "Surgical Patho-
logy and Therapeutics" (1895), etc. He was 
also editor and part owner of the International 
Textbook of Surgery" (2 vols., 1900).

WARREN, Joseph, American patriot: b. 
Roxbury, Mass., 11 June 1741; d. Charlestown, 
Mass., 17 June 1775. He was graduated from 
Harvard in 1769, studied medicine with Dr. 
James Lloyd of Boston, entered the practice of 
his profession in 1764, and from the time of the 
Stamp Act (q.v.) (1765) contributed to the 
press. On the occasion of the Townshend reve-
 nue acts (see TOWNSHEND, CHARLES, 1725-67), 
imposing duties on paper, glass and tea, legaliz-
ing writs of assistance and forming a board of 
customs, Warren printed in the Boston Gazette 
over the signature "A True Patriot," a letter 
which caused Governor Francis Bernard to at-
tempt the prosecution of the publishers on the 
ground that the article tended to bring the royal 
government into contempt. The attorney-gen-
eral began proceedings, but the grand jury 
refused to find a bill. In 1770 Warren was one 
of the committee of safety appointed after the 
"Boston Massacre" of 5 March, and in 1772 he 
pronounced the memorial oration at the anni-
versary of that event. With Samuel Adams (q.v.) 
and James Otis (q.v.) he was recorded in 
November 1772 as a member of the first 
committee of correspondence, and during the 
revolution he co-operated with Adams. When 
the latter left Boston, 10 Aug. 1774, to 
attend the meeting of the Continental Congress 
at Philadelphia, Warren became the leading 
figure in Massachusetts political movements. 
When the towns of Suffolk County assembled in 
convention at Milton, 9 Sept. 1774, Warren 
read a set of resolutions, drawn up by himself 
and since known as the "Suffolk resolves," 
which declared that a king who has violated 
the right and liberty of the towns, and by force 
of the people's allegiance; that the "Regulating act," which had 
deprived Massachusetts without a previous no-
tice and without a hearing of most important 
rights and liberties, was null and void; and 
directed tax-collectors to refuse to pay the 
moneys collected to Gates' treasurer, warned 
Gates that if patriots were arrested for political 
reasons royal officers would be held as hostages 
and counselled the towns to choose their own 
officers. After the meeting of the 
Provincial Congress in October 1774, Warren 
was chairman of the committee for safety for 
collecting military stores and organizing a mili-
tia, and on 5 March 1775 delivered his second 
oration on the anniversary of the "massacre." 
He was unanimously elected president of the 
Provincial Congress at its Watertown meeting, 
31 May, being thus made chief executive under 
the provisional government. On 14 June he was 
chosen second major-general of Massachusetts 
forces, and on 17 June went to Bunker (Breed's) 
Hill, where he told Putnam and Prescott 
that he would come to serve as a rear guard. 
At the final conflict near Prescott's redoubt he 
was shot and killed. Webster's apostrophe to him in 
the "Bunker Hill Oration" as the "first great 
martyr in this great cause" is well known. The 
biography by Everett's "American Biography," Vol. X (1838), has been super-
seeded by that of Frothingham, "Life and Times 
of Joseph Warren" (1865).

WARREN, Josiah, American social refor-
mer: b. near Boston, Mass., 1799; d. Boston, 
14 April 1874. He was an enthusiastic sup-
porter of Robert Owen's communistic settle-
ment at New Harmony, Ind., in 1825-26, and 
on its failure he for a time abandoned the 
idea of communal living. He then formulated 
a theory of a time valuation of labor, placing 
all grades, skilled and unskilled, upon an equal 
basis. He established a time store at Cincinnati, 
Ohio, in 1826 and conducted it for two years 
on a plan of his own invention. His merchan-
dise was sold at cost, plus a charge of 7 per 
cent to cover store maintenance, the customer 
paying in addition for the time of the salesman. 
In this experiment he also made use of labor 
notes with success. He later returned to the 
idea of communistic living, and his theories are 
still held in high esteem by the philosophical 
bourgeois. Some of his opinions received 
favorable notice from John Stuart Mill. Au-
thor of "True Civilization" (1846); "Equitable 
Commerce" (1853).

WARREN, Mercy Otis, American patriot: 
b. Barnstable, Mass., 25 Sept. 1728; d. Ply-
mouth, Mass., 19 Oct. 1814. She was Mrs. 
James Warren (see WARREN, JAMES), sister 
of James Otis (q.v.). An ardent patriot she 
corresponded with the leaders of the 
Revolution, among them Samuel and John 
Adams and Thomas Jefferson. She wrote some 
dramatic works which were included in her 
volume of "Poems, Dramatic and Miscellaneous" 
(1790). Of these attempts at criticism none 
was met with more ridicule than the metric "Group," satirizing British and 
Tory leaders. The chief of her writings, how-
ever, is the three-volume "History of the Rise, 
Progress and Termination of the American 
Revolution, Interspersed with Biographical, Pol-
itical and Moral Observations" (1805). Tyler 
admits the "tone of undisguised partisanship 
ringing through the book," but calls it a "power-
ful delineation of a great period," and says its 
character-sketches may still be found of interest.

WARREN, Minton, American philologist 
and educator: b. Providence, R. I., 29 Jan. 1850; 
d. 26 Nov. 1907. He was graduated at Tufts 
College in 1870, and took his Ph.D. at Strass-
burg University in 1879. He was professor of 
Latin at Johns Hopkins University until 1899, 
and held that chair at Harvard University from 
1899 until he died. In 1896-97 he was director of 
the American School for Classical Studies 
at Rome, Italy; and in 1897 he was president of 
the American Philological Association. He con-
tributed many papers on epigraphy and Latin comedy to the learned journals.

WARREN, Samuel, English novelist; b. Denbighshire, Wales, 23 May 1807; d. London, 29 July 1877. He studied medicine at Edinburgh and law at the Inner Temple, was called to the bar in 1837 and was made queen's coun-
sel in 1851. He was recorder of Hull (1854-74), represented Midhurst in Parliament (1856-59) and was appointed master in lunacy in 1859. His earliest work, "Passages from the Diary of a Late Physician" (1832), appeared in several editions in both England and the United States, but his most popular work was 'Ten Thousand a Year' (1841), which has passed through many editions. It appeared in an abridged form in 1903. He published various other works, including 'Now and Then' (1847); 'The Lily and the Bee' (1851); and several law books.

WARREN, Whitney, American architect; b. New York. He studied architecture in New York and under Daumet and Girault at the Ecole des Beaux Arts, Paris. In 1894 he established himself as an architect in New York, and in 1899 he designed the New York Yacht Club building. He afterward became a member of the firm of Warren and Wetmore, and designer of the Grand Central Station, New York, completed in 1913; the Grand Trunk Station, Winnipeg, Canada; the Ritz-Carlton and Belmont hotels, New York; many fine private residences; the bronzing gates at the cathedral of Saint John the Divine; and many other notable works. He received a silver medal at the Paris Exposition in 1900; became a member of the Academie des Beaux Arts of the French Institute in 1905; and was elected to the National Institute of Arts and Letters.

WARREN, William Fairfield, American educator; b. Williamsburg, Mass., 13 March 1833. He was graduated from Wesleyan University in 1853, ordained in the Methodist min-
istry in 1855 and for several years was professor of systematic theology at Frankfort, Ger-
many. In 1866 he became acting president of the Boston Theological Seminary, and from 1873-1903 he was president of Boston University, occupying, also, during that time, the chair of philosophy of religion and comparative theol-
ogy. His writings include 'The True Key to Ancient Cosmology' (1882); 'Paradise Found,' published also in Japanese, Chinese, Spanish and German (1885); 'The Story of Gottlieb,' translated into German and Arabic (1890); 'Constitutional Law Questions in the Metho-
dist Episcopal Church' (1894); 'The Religion of the World and the World's Religion' (1900), etc.

WARREN, Ark., city and county-seat of Bradley County, situated in the north central part of the state. It is on the Mississippi, and the Osage River, about 50 miles southeast of Little Rock. It contains several cottonseed-oil, saw, hardwood and stove mills. It has a high school, a junior high school, two public schools, a negro public school, also a negro industrial school (Walters Institute), a courthouse and two banks with resources over $1,000,000; taxable property, $440,000. Pop. (including mill sections outside of corporation on account of taxes) about 5,000.

WARREN, Ill., village in Jo Davies County, on the Illinois Central and the Chicago, Milwaukee and Saint Paul railroads, about 25 miles east by north of Galena and 25 miles northwest of Freeport. It is in an agricultural and stock-raising region, and near the lead mines of the Galena district. A good quality of tobacco is grown in the vicinity. The chief industrial establishments are flour mills, creameries and tobacco factories. The village has a high school, graded schools, a public library and a State bank. Pop. 1,330.

WARREN, Ind., town in Huntington County, on the Salomonie River, and on the Toledo, Saint Louis and Kansas City Railroad, about 75 miles north by west of Indianapolis and 15 miles south of Huntington, the county seat. It is in a region of good farm lands and in a natural-gas and petroleum belt. The chief manufacturing establishments are flour and lumber mills, cooperage and machine shops. There are large shipments of hay, grain and live stock. Pop. 1,189.

WARREN, Me., town in Knox County, on Saint George's River, and on the Maine Central Railroad, 60 miles northeast of Portland. It was first permanently settled in 1736, though it was known as a trading post as early as 1631; it was incorporated as a town in 1776. There are large deposits of limestone in the town; and the river affords power for manufacturing; the town contains cotton and shoe factories, and a powder mill. There is a public high school. Pop. about 1,812.

WARREN, Mass., town in Worcester County, on the Chicopee River, and on the Bos-
ton and Albany Railroad, 18 miles west of Worcester. It includes the villages of Warren and West Warren. It was first settled in 1731, and in 1741 was incorporated as a town under the name of Western. In 1834 the name was changed to Warren. It contains cheese fac-
tories, cotton and woolen mills and manufactur-
eries of steam pumps and engines. It has a public high school established in 1870, and a public library of about 15,000 volumes, founded in 1876 by a library association. Pop. about 4,188.

WARREN, Ohio, city, county-seat of Trumbull County, on the Mahoning River, and on the Pennsylvania, the Erie and the Pittsburgh and Western railroads, about 50 miles southeast of Cleveland and 15 miles northwest of Youngstown. It is a region where much of the land is good for farming, but the chief industries of the city are connected with manufacturing iron products. Some of the principal manufactures are rolling mill products, flour, lumber products, automobiles, tubing, bath tubs, electric lamps, foundry and machine tools. It has about 75 factories, giving employment to 3,500 people, the annual value of products being about $7,000,000. The principal public buildings are the county courthouse, the municipal build-
ings, churches and schools. There are a high school, public graded schools and a public li-

and has grown very rapidly in recent years. Pop. about 27,050.

WARREN, Pa., borough, county-seat of Warren County, on the Allegheny River, and on the Pennsylvania and the Western New York and Pennsylvania railroads, about 120 miles northeast of Pittsburgh and 20 miles south of Chautauqua Lake, N. Y. Warren was settled in 1795 by Daniel McQuay and was incorporated in 1832. The village of Gade was annexed in 1895. There are a large number of foreign-born inhabitants, chiefly Germans and Scandinavians. It is in an agricultural and oil region, but the chief industries are connected with oil products and manufacturing. The principal manufacturing establishments are iron and steel works, machinery, lumber mills, oil and gas engine factories, boiler works, piano and furniture factories. Other manufactures are wood alcohol, oil and the by-products, glue, barrels, machinery used with oil wells and for manufactories. In 1910 (government census) there were 72 manufacturing establishments. These give employment to about 2,000 persons, and produce about $6,000,000 annually. The principal public institutions are the county courthouse, the State Hospital for Insane, the churches and educational institutions. There are 15 churches representing seven different denominations. There are seven public schools, one Roman Catholic parish school, four private schools and a public library containing about 12,000 volumes. There are five banks and three daily newspapers. The government is administered according to the Pennsylvania statutes for boroughs, which provides for a burgess and a council of 14 members who hold office three years. Pop. 15,000.

WARREN, R. I., town in Bristol County, on the Warren River and Narragansett Bay, and on the New York, New Haven and Hartford Railroad, 10 miles southeast of Providence. It was the old Indian town of Sowamset; a trading post was established there by white men as early as 1631. The present settlement dates from 1677. It was in the territory in dispute between Rhode Island and Massachusetts, and originally formed a part of the town of Swansea, Mass.; after the boundary was settled and Warren came under the jurisdiction of Rhode Island it was incorporated as a town (1747); in 1770 the town of Barrington was separated from it. From 1764-70 it was the seat of the College of Rhode Island (now Brown University). During the Revolutionary War the town was pillaged by the British, and a number of houses burned. It is now largely a manufacturing town, its products including cotton goods, braid and twine. It has a public high school, and the George Hall Free Library, several banks and a daily paper. Pop. 7,240. Consult Fessenden, 'History of Warren.'

WARREN, (1) a tract of ground appropriated to the breeding and preservation of game or rabbits; also, a preserve for fish in a river. (2) In English law, a franchise or place privileged by prescription or grant from the Crown for keeping beasts and fowls of warren, which are hares, rabbit, partridge, and pheasants, though some add quail, woodcock and water fowl. The warren is the next franchise in degree to the park, and a forest, which is the highest in dignity, comprehends a chase, a park, and a free warren.

WARRENSBURG, wär'en-zôr'g, Mo., city, county-seat of Johnson County, on the Black River, and on the Missouri Pacific Railroad, about 65 miles south of Kansas City. It is in a fertile agricultural region and in the vicinity are large sandstone quarries. It has several mineral springs, noted for their medicinal properties. The springs and climate have much to do with making the city a favorite pleasure and health resort. The chief manufacturing establishments are flour mills, foundries and machine shops, wagon and carriage factories and woolen mills. It has grain elevators, coal and stock yards. The city has the State Normal School for the Second district, a high school and graded elementary schools. There are three banks and four newspapers. Pop. about 4,689.

WARRENTON, Va., town, county-seat of Fauquier County, on the Southern Railroad, about 42 miles southwest of Washington, D. C. It is in the region of the Blue Ridge and its picturesque scenery and cool climate in summer have made it a favorite summer resort. It has seven churches, a high school, Fauquier Institute, private select schools, a national bank and a private bank, and two newspapers. The town has gravity waterworks. Pop. 1,427.

WARRINGTON, wär'in-tông, England, a manufacturing town in Lancashire, on the river Mersey and the Manchester Ship Canal, near the Sankey and Bridgewater canals, 15 miles east of Liverpool. The Latchford locks are notable features of the ship canal at Warrington. The public buildings and institutions include the restored parish church of Saint Elphin, in decorated style; other modern parish churches; Nonconformist and Roman Catholic churches; the town-hall, in classical style; the museum, containing a free library and municipal art-gallery; the grammar school, blue-coat school, clergy orphan daughters' school, Saint Elphin's schools, a training college for school mistresses, a municipal school of art, technical schools and other educational institutions; post office; public baths; the market-hall; municipal gas works, waterworks, tramways, electric light works; hospitals and an infirmary; a gymnasium; public parks and gardens; and military barracks. Of the numerous industries of the town the most important are the manufacture of iron and iron goods, wire, feather, soap and beer. Warrington is an ancient town and had at one time a house of Augustinian friars. The famous academy, which existed here from 1757 till 1783, had among its teachers Dr. Joseph Priestley, Dr. William Enfield, Dr. Aikin, Dr. John Taylor, the Rev. Gilbert Wakefield and other eminent men; it is now represented by Manchester College, Oxford. Pop. 74,157.

WARMANBOOIL, wär'nam-bool, Australia, a seaport town in Victoria, on Warrnambool or Lady Bay, 166 miles southwest of Melbourne. The principal public buildings are the Episcopal Church, St. Pauls, other churches, various banking and insurance offices, mechanics' institute, the Odd Fellows' and the volunteer artillery halls, a hospital and benevo-
lent asylum, etc. Steamers ply several times a week to Melbourne and a good trade is done from the port in wool and other agricultural produce. The town contains a flour mill, a soap factory, tanneries, breweries, etc. Pop., about 7,500.

WARS OF THE WORLD. The story of the wars of the world, if told in anything like its entirety, would be practically a history of the human race, for wherever nations have risen to greatness and have bred men capable of performing great deeds the records of these acts of heroism have almost invariably been made on those fields of battle upon which the supremacy of the nation itself has been accomplished. In the record of the wars of the world the student may read the tale of human progress — the story of the advance of civilization — for it cannot be denied that man’s high place in the world to-day is largely a reward bestowed upon him in return for the brutality and bloodshed of the battlefields upon which his ancestors fought. That there have been wars that have been unnecessary is a fact that cannot be questioned, any more than one would deny that warfare has often been unnecessarily brutal. But, and yet, from a logical point of view, these are merely incidents which reflect upon but do not detract from the integrity of the original propositions: that war is the means by which superior nations have attained their superiority; that many wars have brought about some good to humanity as a whole; that by war civilization was extended and that in the winnowing process afforded by such international conflicts the fittest alone have survived and all that which was opposed to human progress or contrary to the best interests of civilization has been cast aside, to be lost and, eventually, forgotten by all save the historian who does not deign to record the most ignoble things in the life and customs of the earth’s peoples.

Early History.—Unfortunately it is impossible to state, even approximately, when the first battle of the world was fought. In the early ages, of course, primitive man had the means to do so to himself and preserve himself against the fury of the wild beasts so eager to attack him; but even tradition furnishes no clue to enable the student to discover at what period men first turned against other men to do battle with the crude instruments that had been devised only as a means of protecting themselves from the savage animals in the forests. Probably there were wars many thousands of years before recorded history. All we know is that Osymandias of Egypt, supposed by some to be the Osiris of the priests, is the first warlike king mentioned by history. He passed into Asia and conquered Bactria, about the year 2100 B.C. If Osymandias was the first warlike king, however, he was not the last, for in 1000 B.C. it was estimated that since his time no less than 6,860,000,000 men have lost their lives on fields of battle and the millions slain in the Great World War are yet uncounted; but, in spite of this gruesome record, men have fought and died probably since the dawn of time, against each other, while all nations will be compelled to arm themselves with the latest fighting inventions, for, with the history of the past to guide them, they realize only too well the Power that is not always prepared to protect its rights and properties with the sword may not unlike find itself, with very little except its honor to defend, with its power destructed by the sword. Wars originated in nomad life and these conflicts were undoubtedly occasioned by the disputes which arose between the various tribes in regard to their rights of possession in favorable pastures. When all had devoted themselves to the flocks and herds there was little to discriminate between them, but, gradually, certain tribes began to assume different characteristics. One became attached to the art of agriculture; another, devoted its time to hunting and fishing, while a third class still remained shepherds of the flocks. It was this difference of occupation which finally became the natural source of hostilities, for it established a series of classes, the stronger of which began to prey upon the weaker. Naturally, those who devoted themselves to the hunt became the victors in war, and, by reducing their victims to a condition of slavery, threw the manual labor, which they despised, upon the shoulders of others. In an edition in ancient Assyria, that Nimrod, who is mentioned in the Bible as "a mighty hunter before the Lord," was the first person to engage upon an extensive system of warfare for the express purpose of obtaining slaves and that it was he who introduced the practice of requiring conquered nations to pay an annual tribute, or, in other words, a ransom for their release. However true this may be we find that the ancient Old Testament days were full of such warfare, in which the outcome was either tribute or slavery. History began in the banks of the Nile and along the Tigris and the Euphrates; for these valleys, like two great oases, were practically the only habitable spots in the great desert. Fitted with all known conveniences for travel, with roads suitable for the passage of vast armies, these two centres of habitation finally became great rivals. In fact, whenever any particularly energetic ruler appeared in either spot he at once set on the line of his empire, and, in impetus, to conquer his rival and so control western Asia. It may truthfully be said, therefore, that the history of this time is little more than one continuous record of struggles between Egypt and Mesopotamia, a condition which existed until Europe entered the lists and became the conqueror. In Egypt, during this age, the military class held such a prominent position in society that fully one-third of the land was in the possession of the 410,000 men who composed the army.

As the Persians trusted for success mainly to numbers, war to them was little more than an exhibition of brute force. Sometimes as many as 1,000,000 men were brought into service for one campaign. In battle the troops were massed in deep ranks, those which were supposed to be the bravest being in front, but, if the line of battle was once broken, defeat appears to have been inevitable, for the army lost heart, even if the commander himself did not set the example of flight and the wild stampede that followed usually cleared the battlefield. Rawlinson’s description of the appearance of the Persian forces in time of
war is one of the most vivid word pictures painted by any historian:

The troops were drawn from the entire empire, and were marshaled in the field according to nations, each tribe accompanied by its own standard of war. Here were seen the gleaming breastplates and scarlet kilts of the Persians and Medes; there the wooden skirt of the Arab, the leathern jerkin of the Indian, the brilliant dress of the native of Hindustan. Smart savage Ethiopians from the Upper Nile, adorned with a war paint of white and red, and scantily clad with the skins of leopards and lions, fought in one place with huge clubs, arrows tipped with stone, and spears terminating in the horn of a rhinoceros. Other troops were in loose spears, their tattered capes over their ears; moving slowly, while others steadied behind them, and wore corselets of quilted linen, wielded the tough spear or the still more formidable iron mace. Rudes weapons, like cane bows, unfeathered arrows, and stakes hardened at one end and in the fire, were seen side by side with keen swords and daggers of the best steel, the finished productions of the work-shop of Phoenicia and Greece. Here the bronze helmet was surrounded with the ears and horns of an ox; there it was superseded by a fox-skin, a leathern or wooden skell cap, or a head dress fashioned out of a horse’s scalp. Besides horses and mules, elephants, camels and wild asses diversified the scene, and rendered it still more strange and wonderful.

Wars of the Romans.—Although the Persians fought and won battles in spite of their crude methods of fighting, Greece was the mother of the art of warfare. It must not be imagined, however, that the splendid body of perfectly trained soldiery comprising the armies of Athens, Sparta, Thebes or Macedon was the product of a day, or of the genius of a single man, for nothing less than centuries were required for the perfection of this wonderful force. In the heroic days, the days of the Homeric battles, the Greek soldiers were no more to be commended than their Persian rivals. Loosely organized, poorly drilled and badly equipped, the mass of the army was capable of doing little more than give the inspiration of numerical strength to the small bodies of heroes who did all the fighting. At length, however, the idea of the phalanx evolved itself, and, in a remarkably brief period of time, the history of the world was changed. At no time prior to the invention of the modern instruments of war has man conceived such a formidable weapon as the attack of a charging phalanx. It was this powerful engine of war that accomplished the downfall of the Persian force at Marathon. It was a still more perfect phalanx that resulted in the defeat of Thebes and the victory of Macedon on the fields of Chaeronea. It was clearly the Greek phalanx — solid, erect and terrible in its effect — that enabled Alexander to inaugurate the campaign that had for its purpose the conquering of the entire known world. It was with the aid of the phalanx that Athens was preserved; that the Peloponnesian war was won by Sparta, and it was this same maneuver that saved the day for the Greek forces, until, at last, the Roman legionaries swept down with such a terrible force as to decide the end of the Grecian Empire. The story of Rome’s supremacy is not dissimilar to that of the rise and fall of the Grecian power. She scorned to make use of the phalanx, her legions fighting in such open formation that those in the front rank could fall back, when weary, and allow those in the second file to advance and take their places and yet the discipline and generalship of the great army was so perfect that it succeeded in establishing a wider empire than that of Athens, which, in 133 B.C., included all of Southern Europe from the Atlantic to the Bosporus, as well as a part of Northern Africa. Syria, Egypt and Asia Minor were then Roman dependencies. Her army had made her practically mistress of the civilized world. Several centuries elapsed before Rome’s glories began to fade. During this time her power was still further extended, civil wars had been suppressed and revolutions crushed, for when the Roman army could fight according to the scientific rules of warfare, it was practically an invincible force. When the destroyers of the great empire came, however, they brought with them no knowledge of the science of war which Rome knew so well. To Alaric the Goth, Attila the Hun, and Genseric the Vandal, war was simply a question of mere numerical human strength. They had no more idea of the advancement in military art than had the Saracen horde that swept across the country and that might have planted the standard of Islam in every nook and corner of Europe if Charles Martel had not won his great victory on the plain of Tours. Against these three great barbaric leaders Rome was almost powerless and as they swept down upon her, as the wave of the sea follows the rock, she fell never to rise again. City after city was spoiled and burned; Rome, even, opened her gates without a blow. The tiara and purple robes of the empire were sent to Constantinople and Zeno appointed Odoacer to be Patrick of Italy.

The Middle Ages.—From the fall of Rome and up to the close of the 15th century, wars were less frequent between nation and nation than among the various nations themselves. French fought French; Germans, Germans, and Spaniards, Spaniards and even the war between the English and the French, the war that desolated France for more than a century, was no exception to this rule, for the enmity that was the cause of all the strife was not that of two rival nations, but was due entirely to the fact that the rulers of England were French princes, themselves hereditary sovereigns of French provinces, like Normandy or Poitou. Similar conditions existed in other parts of Europe so that the student who reads of the wars of the Middle Ages is struck by the absence of the well-planned and carefully executed campaigns that characterized warfare of both previous and later periods. There were civil wars, it is true; local insurrections, or single battles of more or less importance, but, with the exception of the invasion of the Saracens, the expeditions of Charlemagne, and the conquests of England by the Danes and the Normans, there is little to remind one of the well-organized systems of warfare which distinguished the days of Greece and Rome and which have since been revived by nations of modern times. It was not until almost the close of the Middle Ages that anything was done to improve the art of war as it was known to the ancients. Then the invention of gunpowder and the abandonment of armor revolutionized the art of fighting. Strange as it may seem, however, gunpowder was known for more than two centuries before the French, at the close of the 16th century, armed their soldiers with matchlock muskets, while conservative England, fearing that archery would be superseded, forbade the use
of the new weapon as late as the time of Henry VII.

Modern Warfare.—By Gustavus Adolphus, "the father of the modern art of war," as he is called by Nolte, whose life and biography of him is the best that has been written, was the first to adopt and use the new weapon. It was accepted at its true worth, and, armed with it, he evolved the system of warfare that may be traced to this great strategist, for it was he who first substituted the line of mass formation, one of the greatest innovations in modern tactics. It was not until the close of the Middle Ages, therefore, that the 14th and 15th centuries, awakened to the possibilities of greater perfection in armament as well as in discipline. From the time of Gustavus Adolphus and Frederick the Great up to and after the close of the Civil War in America, military method were undergoing such a change that the period may be regarded as that of the development of the science of warfare, for nearly every kind of arm or maneuver that was in use during the Middle Ages has now become obsolete. In the further accomplishment of all this improvement in armament and tactics credit is due to all the great generals, including Napoleon, who hired the best mechanics to make experiments for him and who gave to Europe its first breech-loader. To-day, however, everything but the small calibers rifle, and possibly the bayonet, has been relegated to the scrap heap, just as the antique fighting tactics, like the various variations of the phalanx and mass formations, have given place to a more and more open formation, as the perfection in the fighting arm has required such alterations in the fighting methods of the world's armies.

Decisive Battles.—Crassus, the historian of warfare, who treats of incidental battles rather than of connected wars, selects the following as "decisive battles of the World."

1. Marathon, at which, on 28 Sept. 490 B.C., 11,000 Greeks defeated a Persian force numbering more than 110,000 men. The Persian army was commanded by Garamantes, who was killed. The Greek army was commanded by Mardonius, who was defeated. The Persian army was forced to retreat to Asia.

2. Syracusian, at which the besieged Syracusans, upon the invading Athenians, almost completely destroyed their forces, driving them, "with heavy slaughter, over the cliffs, which an hour or two before they had scaled full of hope and confident of success.

3. Arbela, the battle between Alexander the Great and Darius which decided the fate of the Persians; Oct. 1331 B.C.

4. Hasdrubal, at which Hasdrubal, the brother of Hannibal, was defeated and slain by the Roman army under the command of Livius and Claudius Nero; 207 B.C.

5. Teutoburg, 9 A.D., the battle at which Varus and the Romans were defeated by the Germans, and which was regarded at Rome as such a national calamity that Augustus is said to have cried aloud in agony, "Varus, give me my legions!"

6. Chalons, at which, in 451 A.D., Actius defeated Attila the Hun, compelling him to retire into Pannonia.

7. Pavia, at which Charles Martel saved Europe by his great victory over the invading hosts of the Saracens. This conflict is also sometimes known as the battle of Poitiers: 732 A.D.

9. Orleans, besieged by the English during October 1428; it was the successful defense of this city that checked the English advance and would have been the turning point of the war had not the English, through the want of supplies, once more marched back to the coast.

10. The Spanish Armada, the naval battle at which the Spanish fleet was almost completely destroyed by the British fleet; 1588.

11. Blenheim, at which the French and Bavarians were defeated by the English under the Duke of Marlborough, 2 Aug. 1704.

12. Pultowa, where Charles XII of Sweden was completely defeated by the Saxons; 1 May 1703.

13. Saratoga, regarded as the greatest check suffered by the British forces during the Revolutionary War in America. At this battle, fought on 17 Oct. 1777, the British general, Burgoyne, still flushed with his victory at Germantown, was obliged to surrender his entire force of 5,791 men to the American commander, Gates.

15. Waterloo, at which the great Napoleon was compelled to accept defeat at the hands of the Duke of Wellington's forces; 18 June 1815.

And to them we now add the prolonged battle of the Meuse in 1918 when the Allies under Foch turned back the German tide.

Wars of the World.—Irrespective of the character of the individual battles the following list of the most important wars that have been waged between the various nations since the Middle Ages is generally regarded as reasonably complete and thoroughly representative:

1645-1648. The War of the Three Henries, which led to the death of Henry IV. France, under Henry, was defeated by the alliance of England under Charles I., Sweden under Gustavus Adolphus, and Denmark under Christian IV.

1667-1668. The War of the Three Kings, which broke out when Louis XIV, fixing his eye upon the Spanish possessions in South America, invaded the country. The treaty of Breda ended the war.

1688-1697. The War of the Spanish Succession, which broke out when Louis XIV, wishing to add the Spanish throne to the French, invaded the country. The English, under William, Duke ofOrange, the Dutch, under William III, and the Elector Palatine, under the Elector Palatine, were the belligerents. The treaty of Rastatt ended the war.

1701-1713. The War of the Spanish Succession, which broke out when Louis XIV, wishing to add the Spanish throne to the French, invaded the country. The English, under William, Duke ofOrange, the Dutch, under William III, and the Elector Palatine, under the Elector Palatine, were the belligerents. The treaty of Rastatt ended the war.

1741-1748. The War of the Austrian Succession, which broke out when the Elector Palatine of Hesse-Cassel, who was the heir to the throne of Austria, attacked the elector of Bavaria, who was the heir to the throne of Austria.

1756-1763. The Seven Years' War was the result of Maria Theresa's determination to recover the Silesian territory which she had ceded to Prussia. By careful diplomacy an alliance was formed between Austria and France, Russia, Saxony, Sweden, and Poland, leaving England as the only power to which Prussia could look for support. Although it was believed that Frederick would be unable to stand against such odds he was so generally victorious that he was able to retain his control over Silesia, but his successes in battle established the position of Prussia as one of the great nations of the world.

1775-1782. The War of the American Revolution. The revolt of the American colonists as a protest against English oppression is one of the most serious conflicts in which England has ever been engaged, costing it, the greater part of its American possessions. The war culminated with the signing of the treaty of Paris, 30 Nov. 1783.

1789-1794. The War of the French Revolution. The uprising in France was distinctly a class awakening, but it resulted in the abolition of the monarchy and the establishment of the first republic. During this period of internal agitation, however, other nations took advantage of the supposed opportunity to meet France with less danger than before and yet, during the very days when the Terrorists were
view of the strained relations, however, it was but natural that Turkey should declare war against Russia. In 1854 both England and France declared war; Holland's armada was blockaded and peace was signed with Prussia and Spain.

The Crimean War (1853–1856) was a military conflict between the Ottoman Empire and Russia, fought primarily over the successor to the Sultan Abdul Mejid. Russia, seeking to extend its influence in the Balkans, invaded Ottoman territory without declaring war, leading to a conflict that lasted until 1856.

The Russian Empire, under the leadership of Tsar Nicholas I, occupied the Crimean Peninsula and declared war on the Ottoman Empire. The war resulted in a series of defeats for Russia, including the Battle of Alma in 1854 and the Siege of Sevastopol in 1855. The Treaty of Paris, signed in 1856, ended the war and declared Russia's right to the Crimea.

The Mexican War (1846–1848) was a conflict between the United States and Mexico, fought primarily over the question of Texas and the Mexican Cession. The war resulted in the acquisition of California and New Mexico by the United States.

The Spanish-American War (1898) was a conflict between the United States and Spain, fought primarily over control of the Philippines and Hawaii. The war resulted in the United States acquiring a colonial empire in the Pacific and Caribbean regions.

The Russo-Japanese War (1904–1905) was a conflict between the Russian Empire and the Empire of Japan, fought primarily over control of Korea and Manchuria. The war resulted in Japan's victory and the establishment of its colonial empire in East Asia.

The Spanish Civil War (1936–1939) was a conflict between the Republican government and the Nationalist army, led by General Francisco Franco, fought primarily over control of the country. The war resulted in the victory of the Nationalists and the establishment of a fascist dictatorship in Spain.

The Second World War (1939–1945) was a global conflict fought primarily between the Allied Powers (the United States, the United Kingdom, the Soviet Union, and China) and the Axis Powers (Germany, Italy, and Japan). The war resulted in the defeat of the Axis Powers and the establishment of the United Nations and the European Union.

The Cold War (1947–1991) was a global conflict fought primarily between the United States and the Soviet Union, over control of the post-World War II world. The war resulted in the establishment of two opposing alliances, NATO and the Warsaw Pact, and the nuclear arms race.

The collapse of the Soviet Union in 1991 marked the end of the Cold War and the beginning of a new era in international relations. The United States emerged as the dominant power in the post-Cold War world, and the European Union was established as a political and economic union of European states.
WARSAW

the cause of such strenuous objection upon the part of Japan that the Russo-Japanese war resulted.

The European War. Germany's rampant imperialism and her insidious commercial propaganda turned the Europe of the opening 20th century into an armed camp, divided the republican nations into the arms of Teutonic Russia, and obliging Great Britain to relinquish her cherished policy of "splendid isolation." Austria was urged on by Germany to repress the growing Slav sentiment in the Balkans although such a course involved the active participation of Russia and the other member of the Entente. The violation of Belgian neutrality by Germany made Great Britain a defendant, and in the later developments all the leading countries of the world became involved in the conflict, either because of their political or economic alliances, or, as in the case of the United States, because of the violation of the rights of their citizens.

JOHN R. MEADER.

WARSAW, war'sah, Ill., town in Hancock County, on the Mississippi River and on the Toledo, Peoria and Western Railroad, 100 miles southwest of Peoria and five miles from Keokuk, Iowa. Fort Edwards was established within the limits of the town in the War of 1812. The largest river steamers can ascend the Mississippi to the town; and it is a shipping point for the agricultural produce of the region. It also has several manufacturing industries, including cooperage works, flour and woolen mills, pickle works, shoe, button and incubator factories and manufactories of agricultural implements. It contains a public high school, banks and a newspaper. Pop. 2,254.

WARSAW, Ind., city, county-seat of Kosciusko County, on the Tippecanoe River and on the pittsburgh, Fort Wayne and Chicago and Cleveland, Cincinnati, Chicago and Saint Louis railroads, 40 miles west by north of Fort Wayne and 125 miles north of Indianapolis. It was settled in 1836 and chosen as the county-seat in 1837; it was incorporated as a town in 1854 and as a city in 1867. It is in a lake region, and is popular as a summer resort. It is also an agricultural region and is the chief trade centre of the county. It has large canning and pickling works, flour mills, creameries and manufactories of agricultural implements and vacuum cleaners. A large park and the county courthouse are among its notable features. There is also a public high school established in 1872, a public library, banks and two daily newspapers. Pop. 4,430.

WARSAW, N. Y., village, county-seat of Wyoming County, in the valley of the Oatka Creek, on the Erie, and the Buffalo, Rochester and Pittsburgh railroads, 37 miles southwest of Rochester. It was first settled in 1804, and was incorporated as a village in 1816. It is in an agricultural region; and there are important salt deposits in the vicinity. The village contains salt works, broom factories, manufactories of knit goods, a button factory, foundry, carriage factories, lumber and saw mills. It has a public high school established in 1897, with a large library of about 20,000 volumes, two newspapers and several banks. The water works are owned and operated by the village. Pop. 3,424.

WARSAW, Poland, the capital and largest city of the Republic, situated partly on a flat and partly on a height rising gradually from the left bank of the Vistula, here crossed by an iron bridge 1,660 feet long, and by a railway bridge, communicating with the suburb of Praga, 325 miles east of Berlin. It consists of the city proper and several suburbs, enclosed for the most part along with it by a rampart and fosse, and dominated by a vast citadel erected by the Russians.

In the old section of the streets in the narrow, and the houses of indifferent appearance, are huddled together without any order; in the newer part, and more especially in some of the suburbs, the streets are often spacious and many ranges of handsome buildings are seen. There are several large public squares, among which that of Sigismund, adorned with a bronze colossal statue of the third king of that name, is particularly deserving of notice; and the vicinity is well provided with beautiful promenades. The more remarkable public buildings are the Roman Catholic cathedral, the Russian cathedral, the Church of the Holy Cross, the Church of the Carmelites, the Lutheran Church, the Zamek or ancient castle of the Polish kings, a huge pile on a height overhanging the Vistula; the palace of Castimir, occupied by the university and adorned in front with a statue of Copernicus; the Saxon palace, with fine gardens attached to it; the Krasiinsky palace, occupied by the superior courts of law and partly by government offices; several other palaces similarly occupied; the town-house, arsenal, mint, custom-house, exchange, barracks, several theatres, and the bazaar of Maryew, consisting of a large square lined with arcades. The principal educational establishments are the university, suppressed after the rebellion of 1830, reopened in 1864, and having 2,500 students before the outbreak of the World War; a lyceum, technical, commercial, and many other schools. Among the benevolent institutions are a town and a military hospital, a foundling hospital, a deaf and dumb and two lunatic asylums. The manufactures consist of metals, beer, tobacco, textiles, chemical products, furniture, artificial flowers, musical instruments, etc. There are a vast number of small industries and factories, giving employment to over one-third of the population. The trade is very extensive, Warsaw being by far the most important commercial emporium of Russian Poland and carrying on a large traffic both with the interior and with Thorn and Dantzic, by means of the Vistula. Warsaw, though very ancient, did not become the capital of Poland till about the middle of the 16th century, when it surpassed Cracow. It has witnessed much warfare, the suburb Praga generally being the field of action. Here in 1656 the Poles were defeated by Charles Gustavus of Sweden. The chief interest belonging to the city is connected with the insurrection of 1794, when after the capture of Kosciusko at Maciejowice, the dispirited and disorganized remnants of the Polish army defended the ramparts of Praga against the victorious Russian forces. On 3 Nov. 1794, the Russian general ordered an assault, and after a fierce struggle the ramparts were carried, more than 15,000 Polish soldiers being slain, drowned in the Vistula, or taken prisoners, and an almost equal number of unarmed inhabitants being totally massacred. In the evening a great fire arose, which destroyed a large part of the city. In 1807 it was the capital of the Duchy of Warsaw, and in 1813 was acquired by Russia.
WARSHIPS — WARSHIPS 717

(See Poland). The vicinity of Warsaw was also the principal seat of the Polish War in 1831, and the Germans occupied it in 1915. In November 1918 Polish troops occupied Warsaw which again had become the capital of an independent Poland. The population of the city is about 900,000, of whom about a fourth are Jews.

WARSAW, University of, a Polish university founded in 1816 and opened in 1818. It was suppressed in 1830 as a result of the insurrection of that year but was reopened in 1869. After 1884 it was completely Russianized. There are extensive laboratories, an observatory, botanical gardens and a library of nearly 600,000 volumes, including a splendid collection of Polish works, despite the fact that after the suppression of 1830 the university's library was removed to Petrograd. At the outbreak of the European War there were four faculties, those of history and philosophy, law, medicine and physics, and mathematics. There were about 100 instructors and 1,000 students. After the occupation by the Germans in 1915 a Polish faculty was installed.

WARSHIPS, Ancient. The first warships of recorded history were the great rowboats of the Mediterranean, with two or three oar-decks, where galley-slaves were chained to their tasks. These vessels were far superior to sailing craft for fighting purposes, as they could force their way at any time, whereas the sailing ships had to wait for the wind. The fighting naval weapons of those days were bows and arrows, javelins and spears and burning balls flung at the enemy to destroy their ships. It was important to protect the rowers or galley-slaves as well as the fighting men and hence some sort of protective armor was sought from the earliest times. The ships of the Greeks and Romans were often fortified with a thick fence of hides which served to repel the missiles of their enemies and afforded protection to their oarsmen. Thick timbers and hides entered into the construction of the turrets and towers of the great warships of ancient and medieval times were fitted, especially when used for harbor defense, as in the Venetian turret ship of the 9th century. Felt made an early appearance as a material for armor and a sea fighter off Palermo in 1071, between the Normans and Saracens, the former hung their galleys with this material by way of a defensive cuirass. The Norman knights had probably adopted this device from their enemies, for felt had been used for some time for this purpose on board the huge “dromons” of the Saracens. These, the battleships of those days in the Mediterranean, usually rowed 50 oars a side, each oar being manned by two men, so that the size of the ships was evidently large. When the soldiers, sail trimmers and artificers who worked the war engines and siphons for Greek fire were added, it is evident that the crew must have been very large and have required a ship of considerable dimensions. The great warships were armored with woolen cloth soaked in vinegar to render it fireproof and hung with mantlets of red and yellow felt, so that their cuirass was not only useful, but ornamental as well. Periodically and many years later additional protection was afforded to those on deck by the ranging of the bucklers and shields of the warriors on board along the gunwales. Later, in the 15th and 16th centuries, special “pavesades” or bulwarks, were provided in lieu, composed of large oblong shields, supplied for the purpose. In addition to felt, the time-honored leather armor also entered into the defensive panoply of the “dromons” and in the wars of the Sicilian Vespers, Pedro III of Aragon covered two of the largest ships of his fleet with leather before sending it against Charles of Anjou. Conrad of Montferrat, at the siege of Tyre in 1187, either invented, or at all events, caused a special class of leather-protected vessels to be built, which were called barbouts or duckbacks. They would now probably be called turtle-backs. They would appear to have been small craft covered with a strong leather-protected domed roof through portholes or openings in which the archers and crossbowmen could fire without exposing themselves. They proved very effective against the Saracens and in 1218 the entrance of the Nile was forced by 70 of these little armorcads.

It is said that the Great Dromon—whose capture by Richard Lion-Heart is still commemorated—was equipped with leaden armor. This was in 1191 and probably lead was occasionally used for protective purposes throughout the next two or three centuries, although there is no record of any ship so protected until 1530. In this year the Knights of Saint John, those sworn opponents of the Turk, built one or perhaps two leadclads. At any rate, one account says that they built such a ship in this year at Malta, while another describes a ship of this kind called the Santa Anna, launched at Nice in the same year. The Santa Anna’s leaden armor plates were attached to her sides by bolts of brass and it was said for her that she could “resist the artillery of a whole army” and at the same time could sail or row as fast as any of her unarmored contemporaries. She was a big ship, with six decks, a reception salon, a chapel, a specially constructed powder magazine and a bakery. She was present at the taking of Tunis in 1535 and played an important part in its capture. Lead was not infrequently used at this period for sheathing ships under water, in the same way that copper is still found so useful. Thus the Breda Francois, launched in 1527, one of the largest and most famous ships of her day, was sheathed with lead from her keel to the first wale above her waterline.

The Spaniards attempted to protect their galleons of the Invincible Armada by building their exposed sides of exceeding thickness, but the heavy English guns “flashed them through and through.” The first real ironclad ship was constructed in Antwerp in 1835, with a view of breaking through the lines of the Spanish army under Alexander of Parma, which was at that time closely investing the city. It was a large flat-bottomed craft, with a central casemate or battery built of thick balks of timber and plated with iron. It was intended to be and very likely was impenetrable to any artillery that the Spaniards could bring against it; and in hopeful anticipation that their ironclad ship would raise the siege and put an end to hostilities, the men of Antwerp raised the Finis Belli. In addition to a heavy battery of guns, the Finis Belli carried a large body of musketeers, some of whom were stationed
aloft in her four fighting tops, while the rest were well protected by the loopholed bulwarks on the upper deck. Unluckily for the besieged Dutchmen, she ran aground before she reached her objective and fell into the hands of the Spaniards, who nicknamed her the Compendio or Reports for a reason. She was afloat and brought her down to the camp of Alexander of Parma, where she became a great attraction to the sightseers of the period. As for the Dutchmen in the doomed city, they had regarded only refers to their experiments as the Perdita Expense or Wasted Money.

Ten years previous to this, others of the Dutch patriots had built a somewhat similar contrivance, which very possibly was also armored. This was the Ark of Delphi, a twin-bulled vessel supporting a floating fortress, which was propelled by three hand-worked paddle-wheels placed between the two hulls.

It is interesting to note that if we go to the Far East we can find a parallel to almost any Western invention. It is therefore, not astonishing to find that the Japanese possessed a paddle-propelled armclad in the year 1600. This quaint craft, like the old leather-clad "barbotes" of the 12th century, was turretted with ports for musketeers. The covered with iron and copper plates fitted together like the cells of a honeycomb, mounted 10 guns, and, like the Ark of Delphi, was moved by a central paddle wheel. The British navy used various devices to protect its ships in the 18th century. According to a French writer the sailors of his country were astonished at the perfection to which the English had attained in this direction. "Old cables," he writes, "held in place by pieces of iron, barracaded the whole length of the bulwarks; mantlets of old rope hung over the ship's sides to diminish the shock of our cannon balls, and, beneath, a thick rope netting stretched from poop to bowsprit. The English fought under shelter, maneuvering without capsizing, out of musket range, so as to riddle our detachments of fusiliers, with their cannon shot. So we lost 200 men for every 30 of the English put out of action."

This system of armoring was soon adopted by the Spaniards. The Spaniards endeavored to improve on this and in 1725 hoped great things from the celebrated floating batteries employed at the great siege of Gibraltar by the Duke de Crillon. The floating batteries were mounted on ships of the line, cut down to a uniform size, and the top deck was defended by a covering made of cordage and wet hides. This was not the complete protection that was originally intended by the Chevalier d'Arcon, their constructor, according to another account of the same date as the above, which states that "the covering was to have been laid over with strong sheets of copper and by this means the red hot balls, the bombs and other destructive implements would have slid off."

The fate of these experimental armclads offered no inducement to the naval constructors of the day to make further efforts in the direction of protection, so that till comparatively recent times we find sailors depending only on their "wooden walls" to resist the projectiles of the French ships. In the French ships, we may note in passing, were often exceptionally stout and difficult to penetrate. In the fight between the Glutton, 56-gun ship, and four French frigates, a brig and a cutter, mounting 220 guns between them, their 12- and 24-pounders failed to penetrate her sides and she beat them all off with great loss at the cost of one officer and one man wounded.

Americans, from the very commencement of their existence, have been men on the alert to make improvements in naval warfare. David Bushnell constructed a practical submarine boat in 1773. Torpedoes were used by him and others in the war with England and for the purpose of towing these contrivances alongside the British ships, they invented and built in 1814 a paddle-propelled turtle-backed boat lying very low in the water and covered with "half-inch iron plates, not to be injured by shot." About the same period Robert Fulton (q.v.), who had already constructed one or two submarine boats and various classes of torpedoes, built a steam frigate which he called the Demologos, or Voice of the People, but which is sometimes known as the Fulton I. This, the first steam ship ever constructed, had her sides no less than 13 feet thick of alternate layers of oak and ashywood, a thickness impenetrable by shot from any gun then afloat. In 1829 this vessel was blown up by accident and was succeeded by the Fulton II, a ship which appears to have been protected by some kind of iron armor.

Various proposals were made to use iron plating to protect the sides of ships of war from this time forward, but until the French constructed a number of armed-plated batteries for use in the Crimean War, nothing practical came of the suggestions of inventors. Their success at the bombardment of Kinburn demonstrated the value of armor plating. England at once followed with others of the same kind, some of which are still preserved as relics. Then came the French La Golme, the British Warrior, the iron clads and monitors of the American war and henceforward the steady evolution of the armored fighting ship, which has provided us with the majestic battleships of the present day.

WARSHIPS, Modern. The consideration of so comprehensive a subject as Modern Warships must necessarily be confined to the salient features of the principal classes of such vessels. These features are best illustrated by tables giving the principal particulars of the most important individual designs, with supplemental information in the form of outline plans, giving profiles and battery arrangement; also, in some cases, supplemented by photographs of the completed vessel. Before giving and commenting on such definite data, however, it may be well to give general consideration to the development of the principal types of war vessels in two of the most important navies. In an article of this character, consideration must necessarily be confined to fighting vessels, since the article would extend to quite an unwieldy size if all than illusion were made to auxiliary naval vessels. This, in no sense, implies lack of appreciation of the very important service performed by auxiliary vessels. In fact, the mere enumeration of the names of the principal types of vessels employed as fleet auxiliaries tells its own story. Supply vessels, fuel ships, hospital ships, ammunition ships, repair ships, distilling ships, destroyer tenders, submarine tenders, trans-
ports, etc., are vital to the efficiency of the active fleet, and their names indicate clearly the very tremendous part necessarily played by vessels of this character in all naval operations. Moreover, in order to further the article to reasonable proportions, consideration will be largely confined to battleships, battle cruisers, light or scout cruisers, destroyers, submarines, submarine chasers and monitors. While the World War did not afford an opportunity to try out satisfactorily all of the types of vessels above enumerated, some of them were afforded unusual opportunities for demonstrating their offensive and defensive qualities.

**United States Battleships.**

**Connecticut Class** — Length 450 ft.; 16,000 tons; speed 18.1 to 18.5 knots; armament 4-12 in., 8-8 in., secondary armament changed and AA guns added. Connecticut and Louisiana have 11-inch belt tapering to 9 inches instead of uniform 9-inch and have only 2-3-inch guns at the stern. New Hampshire has two military masts in place of the towers, Minnesota has one mast and one tower. New Hampshire has 11-inch barbets for 12-inch turrets instead of 10-inch as in rest of class.

**Nevada Class** — Length 575 ft.; 27,500 tons; speed 20.5 knots; armament 10-14 in.; there are now 12-5 in., and 2-3 in. AA. Completed 1915.

**Georgia Class** — Length 435 ft.; 14,048 tons; speed 19 to 19.4 knots; armament 4-4 in., 8-8 in., secondary armament changed and AA guns added. Completed 1906-1907.

**Pennsylvania Class** — Length 600 ft.; 51,400 tons; speed 21 knots; armament 12-14 in., 4-5 in., are now mounted with 4-3 in. AA. Completed 1916-1919.

It is not the province of an article of this character to go into the subject of the vital importance of a navy for countries with extensive coast lines, and especially where such countries are necessarily dependent upon imports for their vital necessities. Mahan and many other able naval strategists and historians have dealt with this subject in a most complete and adequate manner. Were further exposition of the vital necessity of a navy required, however, the history of the Great War would, in itself, furnish all the argument necessary. While engagements between capital vessels were not frequent and the technical information which might have been obtained from such actions is not as complete as might be desired, rich experience was obtained from the behavior of warships in many phases of naval warfare. It cannot be said that the views which prevailed prior to the Great War with respect to the general type and characteristics of modern warships and the special advantages of each type have undergone any radical change. The battleship still remains the backbone of an offensive navy, and a navy capable of effective offense is the only navy worthy of consideration by any great power whose maritime interests are of commanding importance. The battleship, however, for its most effective employment, requires other types of war vessel in close cooperation. The experience of the Great War has proved this most conclusively, even if such additional proof were desired. To refer to one instance only, the great development in design and use of the submarine has necessitated a correspondingly effective development in battle cruisers, scout cruisers and destroyers. In the presence of submarines or with a possibility of encountering submarines, no battleship fleet would be reasonably secure without an enveloping screen of destroyers. To meet the development of submarine vessels and to counteract the mining of large areas of the open sea, mine sweepers and mine layers had to be provided in large numbers. To obtain suitable information concerning enemy movements and to meet all the requirements of such exacting duty, not only light cruisers and scout cruisers, but the great-

Muzzle energy of one 6 inch gun = 6,350 ft. tons
est development of this type — battle cruisers — must be provided. In this connection, it is of interest to note that, in an earlier stage of naval development, scout cruisers and light cruisers were intended to prey upon enemy commerce. This resulted gradually in the development of the armored cruiser type which, in its turn, gave way to the battle cruiser type, which now has possibilities far in excess of those involved in the original idea of preying upon enemy commerce. This type has, in fact, duties of the highest importance in co-operation with the battleship fleet, and is even capable of doing its full share when in actual contact with enemy battleships. The high speeds desired for battle-

ships and the high degree of armored protection required for battle cruisers tended, toward the close of the Great War, to cause some authorities to recommend merging these two types into one. It is still the opinion of eminent naval authorities, however, that, for highest efficiency, the battleship and the battle cruiser must be kept distinct.

The exigencies of the Great War developed two other types of cruiser which had not heretofore existed. These were the high speed, heavily armed light cruiser of the British Glorious type, and the aircraft carrier, of the Furious type. The Glorious class carried as main armament what, a few years ago, would have been considered an immense battery even for a battleship, namely, four 15-inch guns. These vessels were designed especially for action against less heavily armed enemy craft, and yet their great battery power and high speed permitted them to run the risk of an encounter with battleships less heavily armed, with a good chance of inflicting heavy damage at ranges which would enable them to escape serious punishment themselves. In the event of meeting vessels of equal battery power, their great speed permitted them to avoid action.

The very important part taken by aircraft in the Great War in scouting, bombing and range finding necessitated the provision of a special type of vessel to carry such craft in large quantities, with special deck arrangements which would permit their taking flight from and alighting on board ship at sea under all normal conditions of weather. To provide such facilities, a considerable number of large, high speed merchant vessels were converted into aircraft carriers, and the Furious and other high speed cruisers and one large battleship were rearranged prior to completion and fitted with long, upper, flush decks and other arrangements necessitated by their service as aircraft carriers. The provision of upper decks of great area and without obstructions necessitated very unusual arrangements of smoke pipes, ventila-
tors and other features which, in ships of ordinary design, are carried well above deck. In these vessels they are carried long distances under the upper deck and out to the sides of the ship. The exigencies of naval operations during the Great War also necessitated a great development in destroyers, submarines, submarine chasers and monitors, all of which will be commented upon at greater length under their appropriate headings.

9.2" Monitors (M15 to 28) 6" Monitors (M29 to 33)

In a word, the development of modern warships received an unparalleled stimulus during the Great War, and perhaps nothing could emphasize this development in more effective terms than the mere recital of the fact that authoritative reports indicate that the British government appropriated, in the development of the British navy, between £250,000,000 and £300,000,000 sterling for warship construction during the period subsequent to August 1914, while the Congress of the United States, subsequent to February 1917, made authorization for new naval construction to an extent represented by a total of more than $1,200,000,000.

Distribution of Weights.—One of the most important and controlling elements in warship design is the proportion of the total displacement of the vessel which may be devoted to the vital offensive and defensive characteristics. It goes without saying that the size and form of the hull is largely controlled by the battery and protection to be provided, the speed to be attained and the radius of action at maximum speed and most economical speed. Adequate strength of hull structure and good seagoing characteristics must, in the nature of things, be given priority over all other elements. The development of the other vital characteristics is, therefore, subordinate to adequate strength of structure and seaworthiness. The attainment of high speed is especially dependent upon form of hull. With given dimensions, large radius of action necessarily reduces the amount of space which can be
devoted to armor, armament, propelling machinery and other important elements. The converse is also true. All warship design is, therefore, in the nature of a compromise. If any given design produces an unusual development in any one of the major characteristics above enumerated, it may be taken for granted that others must suffer a corresponding diminution. These conclusions are, in fact, the direct result of immutable physical laws, and no designer, however skilful, can run counter to these laws. The element in which efficiency of manufacture and design can be shown most clearly is dependent upon material and necessities specifying and obtaining a very high grade and so distributing it as to produce the best results with the least expenditure of weight. Reduction in weight is, therefore, possible in both hull and machinery designs, particularly through skilful distribution of the highest class of material. In machinery design, reduction of weight is also possible by improvement in the design of propelling machinery and auxiliaries. In armor and armament, the possibilities of reduction in weight are rather more limited, although improvements have steadily been made in this direction. Given, however, the same skill in design in all the elements of a warship, the proposition enunciated in the beginning of this section is practically axiomatic; namely, over-development of any vital element of warship design can only be effected at the expense of other elements of the design. As indicating the general distribution of displacement required for the principal elements of modern vessels of war, there are given below two tables. The first gives a tabulation of approximate weights for various recent type vessels of the United States navy. The second gives the approximate weight and percentage of displacement absorbed by the various principal elements embodied in recent type vessels of the British navy.

† The percentage of fuel is much greater and all other percentages correspondingly less for the vessels in their fully loaded or deep condition.
‡ A considerable portion of the structure forming the hull is required to be of such thickness for strength in the large vessels given above, that it is useful for protection, in which it might reasonably be included.

The foregoing tables are obviously not directly comparable, since the grouping of the weights for British vessels is not the same as that for United States vessels. It will be noted that, in the table of British weights, all weights are grouped under six headings, while, in the table for United States vessels, they are given under 13 headings. It may be noted also that,
in the table for United States vessels, the hull weights include protective deck, while, in the British table, the protective deck is apparently included under the heading "armament and protection." In the same manner, it will be observed that armament in the British table undoubtedly includes ammunition. Moreover, the types of armored vessels, while of the same general description, vary in many particulars. The tables must, therefore, be taken as applicable only to the particular types of vessels noted, but they have special interests as indicating the distribution of the weights allotted to the major elements of design in the most recently designed vessels of the two largest nations, and they indicate in the most convincing way how over-development of one element must necessarily be reflected in a reduction of some other element or elements.

Propelling Machinery.—The developments in propelling machinery are treated elsewhere in articles dealing with that and allied subjects, so that little more than allusion thereto would seem appropriate at this time. To those who are responsible for the designs of modern warships, however, it is well known that improvements in propelling machinery make possible great improvements in the general efficiency of design of all warships. It is of interest to note, at the outset, that it is only in comparatively recent years that the transition from reciprocating engines to turbine-driven propelling machinery has had full acceptance. In the earlier stages of turbine development, much opposition was expressed by the proponents of reciprocating machinery. With the increasing efficiency of turbine propulsion, however, this opposition has practically disappeared, and the manifold advantages due to turbine installations in warships are such that, for that class of vessels, turbine machinery has largely superseded the reciprocating engine. The introduction of the gear drive instead of direct-acting turbines has had much to do with the increasing favor with which turbine propulsion has been regarded. The introduction of the gear drive has permitted a reduction in the revolutions of the screw and the use of greater blade areas with smaller number of revolutions of propellers. This has contributed greatly to the efficiency of this type of propulsive mechanism. There is also now being steadily developed the internal combustion engine. This type of propelling machinery has not, however, had extensive use in naval vessels, other than submarines. On the other hand, the use of electrically-driven propelling machinery has made rapid advances, even for installation on capital ships. This advance has been so notable that it seems appropriate to refer in greater detail to the results obtained through the installation of this type of propelling machinery on one of the most recently built battleships of the United States navy and its prospective installation on the very latest battleships and battle cruisers designed for that navy. So far as known, practical use of the electric drive for the main propelling machinery
of capital ships has not been made in navies other than that of the United States up to the present time, although this type of machinery is, of course, under consideration. In the United States navy, however, its installation has been attended with conspicuous success. It was first tried on a large scale on the naval collier Jupiter. After most exhaustive tests on this vessel, this type of propelling machinery was further developed and, after the most thorough consideration, was finally adopted for the battleship New Mexico. The New Mexico is one of the most recently constructed battleships of the United States navy, and is one of a group of three vessels of about 32,000 tons designed load displacement. The other two vessels of the class, the Idaho and the Mississippi, are fitted with turbine machinery.

The actual weight as installed was 700 tons. The actual weight of the main propelling machinery, exclusive of auxiliaries and spares, was nearly 215 tons less than the weight of corresponding machinery of the turbine-driven sister ship Mississippi.

The New Mexico was designed for a speed of 21 knots, with 25,400 shaft horse-power. The electric motors not only met the contract requirements, but, on the four-hour full speed run, permitted an average speed of 21.08 knots per hour to be maintained on a total shaft horse power of 31,200. This result was accomplished in spite of the fact that the vessel had extra fuel, stores, etc., on board, making her displacement 800 tons in excess of the designed trial load displacement. In this case, moreover, the speed was adversely affected by the paravanes, which were not contemplated in the original design and allowance for which was not made in determining the original designed speed of 21 knots. Many advantages are claimed for the electric type of propulsion from the point of view of economy of operation, flexibility of control and adaptability of installation. This last-named quality is of particular advantage in permitting increased protection to be given to all vital portions of the machinery spaces of battleships. In this respect, it has apparently great advantages over any other type of propelling machinery. While, as already stated, the space actually occupied by the machinery on the New Mexico is practically the same as that occupied by the turbine machinery on the sister ships Mississippi and Idaho, this fact is due rather to a similar arrangement of machinery spaces having been adopted in the original design of all these vessels. It is, however, a fact that the installa-

tion of the electric drive has permitted, in later designs, an entire rearrangement of the machinery spaces, with consequent great improvement of the protective features of the ship. In actual service the manoeuvring power of the vessel due to the electric drive has proved itself quite satisfactory. In its backing power it appears to be superior to the turbine machinery drive on account of the ease and simplicity of reversing operations, and also by reason of the fact that when operating at speeds not exceeding 17 knots only one turbo-generator had happened far out at sea, as was the case on the New Mexico, the speed of the ship would have had to be reduced and steadiness on her course could only have been obtained by putting the helm over to counteract the effect of the dead screw. This would also have resulted in a very definite reduction of speed. In the case of this accident on the New Mexico, however, it was not necessary to stop the vessel. The trial trip was completed with all four propellers revolving at the fullest speed advisable under the conditions of weather and sea

BRITISH BATTLESHIPS
(1) Royal Sovereign. (2) Agincourt.

is used, all driving motors being then capable of being operated at equal speeds without any special action on the part of the operator. This is true whether the engines are going ahead or backing, a result highly desirable in manoeuvring in confined waters. An accident to one of the turbines of the New Mexico demonstrated quite fully the advantage of the electric type of machinery installation. Had a similar accident happened to the turbine of a turbine-driven vessel, the propeller actuated by that turbine would have been put out of action entirely until the damage had been repaired. If the accident then prevailing. This gratifying result was due to the practicability of using the current generated by the operating turbines for the rotation of all the propeller shafts, thus demonstrating clearly that all shafts could be operated at a uniform speed even though a substantial portion of the turbine power was, through accident or otherwise, out of action. The good performance of the New Mexico on trial has been maintained during the 18 months of her subsequent service, and electric drive for the main propelling machinery of the six battle cruisers of the U. S. S. Lexington class and the six
battleships of the U. S. S. *South Dakota* class has since been authorized.*

**Battleships and Battle Cruisers.—** The development of the battleship in size, offensive and defensive qualities, has been rapid in recent years. The necessity for increasing the power of the armament, providing greater armor protection increase of speed, increase of fuel endurance, increase of ammunition supply, etc., has resulted in a steady and, at the present time, almost prohibitive increase in size. In order that battleship development may be traced, for the last quarter century, in a concrete way, ago, while the displacement has increased fourfold.

In considering the military features of battleship design, the war between guns and armor is ever present. The quality of armor has steadily improved, and this ordinarily would permit reducing the relative weight of this defensive element. But concurrently with the improvement in quality of armor, has come great increase in the power of ordnance. So that instead of the thickness of armor and percentage of total weight allotted to that element undergoing a reduction, there has been a tendency toward increase. Moreover, this increase in protective features is by no means confined to side armor. Possible under-water damage from torpedo and mine and the new dangers arising from overhead aerial attack, in addition to the greater vulnerability of deck armor to damage from gun fire due to increased angles of fall of projectiles fired from great ranges, have necessitated a very great increase in deck and internal bulkhead armor. The necessity for providing against vessels being put out of action or sunk through damage due to attack by torpedoes and mines has also necessitated the provision of large side compartments throughout the vital portions of the length of the ship in

Battleships
(For dimensions and characteristics of vessels see Table I)
wake of magazine and machinery spaces. These compartments are so arranged as to permit of a very considerable absorption of the explosive effect due to shells which explode in the interior after penetrating the side. Some ships already built or whose construction was considerably advanced, the provision of additional explosive compartments for protection against submarine and mine attack took the form of "bulges." There are those, however, who contend that the damage arising from side mine and torpedo attacks can best be guarded against by protecting the vital portions of the vessel by increased wing compartmental subdivisions provided for in the original design of the vessel. This, of course, necessitates increase of beam, but no greater increase than is necessary through the addition of extraneous compartments, as in the case of vessels with "bulges." As indicating the serious increase in heavy ordnance battery for provision of such special explosive compartments, it may be noted that battleships of recent design have been given a beam only limited by the capacity to pass such a vessel through the Panama Canal locks; so that, in the United States navy, from the keel of the USS Pennsylvania of 1906 to over 70 feet, there has now been developed the South Dakota class of 1919, whose beam is 105 feet. There are several serious physical limitations which have to be recognized in battleship development. Among the most important of these is the comparatively shallow depth of many important harbors, both naval and commercial. There is also the limitation imposed by the sizes of existing dry docks and the locks of great inter-oceanic canals. It is essential, therefore, to limit the draft to as small an amount as practicable, not only with respect to entry into such harbors under normal conditions, but also to permit entry under damaged conditions and to permit utilization of existing docks and inter-oceanic canal locks. In developing the designs of battleships and other exceptionally large war vessels, the ship designer is confronted with many conflicting requirements. If he permits himself to overlook any one of the most important characteristics, he invariably does so at the expense of some other characteristic which may be considered of less importance by some and yet by others may be considered of equal or greater importance.

In no particular has the development of battleship design advanced to a greater degree than in the element of offensive power. Thus, it will be seen that the main battery of the Oregon class, which was considered a very heavy ordnance battery for provision of such special explosive compartments, was the 13-inch guns of 35 calibres. Subsequently the 12-inch guns of greater length was adopted for the main battery of United States battleships and up to and including the Arkansas class, the heaviest gun of the main battery for United States battleships was the 12-inch, 50-calibre gun. The primary battery of the South Dakota class, however, consists of twelve 16-inch, 50-calibre guns, mounted in four centre-line turrets, thus making three guns in each turret. It is interesting to note that the general features of location and relative heights of barbettes of the South Dakota class are identical with those of the South Carolina class—the first of the modern all-big-gun ships of the United States navy. There is a very important difference in the battery power, however, in that the South Carolina class have only two 12-inch guns in each turret, while, in the South Dakota class, there are three 16-inch guns in each turret. As the muzzle energy of the 12-inch, 45-calibre gun of the South Carolina is approximately 49,000 foot-tons and the muzzle energy of the 16-inch, 50-calibre gun of the South Dakota is approximately 114,000 foot-tons, it will be observed that the energy of broadside of the main battery of the South Dakota class is three and one-half times that of the main battery of the South Carolina class.

In referring to great developments in ordnance, it is well to bear in mind that not only has the power of guns been greatly increased but the accuracy of fire has been vastly improved due to greater training of personnel and greater precision of instruments and methods of obtaining ranges. It is interesting to note in this connection, that not very many years ago four and five thousand yards was considered a considerable battle range, and just prior to the outbreak of the Great War 10,000 yards was considered a long battle range. The battle of Jutland, however, was begun at a range of 20,000 yards, and the range was maintained at that approximate figure for a considerable period. The number of losses of vessels and great damage to vessels by long-range big-gun fire during this battle gave convincing proof of the great strides which have been made in the development and operation of ordnance material.

The South Carolina class, at the time of their design, represented a definite departure from previous practice in the main battery arrangements of battleships. The idea of the all-big-gun ship is not new. It was not new at the time of the building of the Dreadnought of the British navy, which, was, however, the first all-big-gun modern battleship actually built. Outline designs for an all-big-gun ship for the American navy had been prepared prior to the date of the building of the Dreadnought, and a British all-big-gun battleship had been suggested in outline designs as early as 1905. This earlier British all-big-gun design was thus alluded to in a recent paper published in the 'Transactions' of the British Institution of Naval Architects:

I left the Inflexible shortly before the bombardment of Alexandria. I brought away with me an outline design which had been evolved during the cruise and which was described as a combination of the Demosthenis and Inflexible designs. The armament was an "all-big-gun" armament of four pairs of 16-inch 80-ton guns mounted in turrets, all placed on the upper deck; one pair at each extremity of the vessel on the middle line as in the Demosthenis, and one pair placed on each broadside in a horizontal as in the Inflexible. Thus one pair of guns had direct ahead fire with an arc of training from well abaft the beam on the starboard side to well abaft the beam on the port side; one pair of guns had a direct astern fire with an arc of training from well before the beam on the starboard side to well before the beam on the portside; the pair of guns mounted in the starboard turret in a horizontal as in the Inflexible.
Great Britain. Battleship of the Queen Elizabeth Class
Length 600 ft.; 27,500 tons; speed 25 knots; armament 8-13 in., 12-6 in., 2-3 in. AA. Completed 1915-1916.

Great Britain. Battleship of the Dreadnought Class
Dreadnought — Length 400 ft.; 17,900 tons; speed 21.8 knots; armament 10-12 in., 24-12 pr., 5 small. Completed 1906.
Bellerothe | Length 490 ft.; 18,600 tons; speed 21.6-22 Temeraire | knots; armament 10-12 in., 16-8 in., 4-3 pr.,
Superb | 5 small. Completed 1909. St. Vincent | Length 500 ft.; 19,250 tons; speed 21.5-22.1
Collingwood | knots; armament 10-12 in., 18-4 in.,
4-3 pr., 5 small. N. B. The masts are differently arranged in the later ships.

Great Britain. Battleship of the Iron Duke Class
Length 580 ft.; 25,000 tons; speed 21-22 knots; armament 10-13.5 in., 12-6 in., 2-3 in., 4-3 pr.

Great Britain. Battleship of the Orion Class
Orion | Length 545 ft.; 22,500 tons; speed 21-22 knots; Conqueror | armament 10-13.5 in., 16-4 in., 4-3 pr.,
Monarch | 5 small. Completed 1911-12. Thunderer |
Ajax | Length 555 ft.; 23,000 tons; speed 22 knots; Centurion | armament 10-13.5 in., 10-4 in., 4-3 pr.
King George V. | Completed 1912-13.

Great Britain. Battleship of the Neptune Class
Length 510 ft.; 19,900-20,000 tons; speed 21.5-21.78 knots; armament 10-12 in., 16-4 in., 4-3 pr., 5 small. Completed 1911.

Great Britain. Battleship of the Africa Class
Length 425 ft.; 16,350 tons; speed 18.5-19.5 knots; armament 4-12 in., 4-9.2 in., 12-12 pr., 12-3 pr.
Completed 1905-1906.

Great Britain. Battle-Cruiser Tiger
Length 660 ft.; 28,500 tons; speed 30 knots; armament 8-13.5 in., 12-6 in. Completed 1914.
bear, and subject to certain limitations eight could be brought to bear on any target. The scheme involved a displacement of 16,000 tons, and on this account was considered inadmissible by Sir Nathaniel Barnaby.

Even prior to this all-big-gun ship proposed in 1885, however, the same principle had been carried out on vessels built or begun for the United States navy during the Civil War. This was notably the case with the large, double-turreted monitors of the Montauk class, with four heavy guns in turrets on the middle line of the ship, and the line of battleship New Ironsides, with its heavy, broadside battery arrangement. Although, therefore, this particular idea has been developed in various countries at different times—in some instances this development taking place quite independently of conclusive knowledge of what had been done in other countries—several navies, in turn, have taken the lead in the development of certain important features of the all-big-gun battery arrangement. The United States, in this connection, was the first to adopt the concentration of all big guns in turrets on the centreline, the turrets being so arranged as to permit all guns to fire on each broadside or half the battery to fire dead ahead and the other half dead astern, with large angles of bow and quarter fire in intermediate positions of training. The great increase in efficiency of primary battery fire was obtained by elevating the after turret of the two forward turrets and the forward turret of the two after turrets, as is indicated on the profiles of the Michigan class and all other designs for battleships of the United States navy. It was some time before this particular arrangement was adopted by other navies. It is now, however, practically universally employed. It is also of interest to note, in this connection, that one of the severest criticisms made upon the design of the Michigan and South Carolina class, particularly by foreign critics, was the danger due to firing over the lower turret. In all probability, it was not generally known at that time, that before adopting this design the most exhaustive experiments were made by the United States Navy Department by installing a 12-inch gun on one of the United States monitors in the exact relative location that such a gun would occupy on the

In the final experiments, naval officers occupied the most exposed positions in the turret being fired over, and the net result was that the effect of the blast of the guns upon those actually in the turret being fired over would be no greater upon those stationed on the bridge of the vessel in the immediate vicinity of the gun being fired. In fact, in the most important developments in design of warships for the United States navy, theory has been supplemented wherever practicable by extensive practical experiments prior to making final decision.

There are many who contend that the advantage attained by high-speed battleships is not commensurate with the great additional weight which must be allotted to the longer hull and the more powerful propelling machinery required for such high speeds. This additional weight can only be obtained by reducing the amount allowed for guns, armor, ammunition or other essential elements of offense or defense. Conservative naval opinion holds that armor and armament still take precedence on the battleship and that the more moderate speeds necessary to allow for this heavier armor and armament are preferable for battleships; also, that for vessels in which unusually high speed is particularly desirable, a special type of the battle cruiser order should be adopted. In fact, the battle cruiser is neither more nor less than a battleship in which speed has been given very great prominence at the expense of armor protection and, to a more limited extent, at the expense of battery, the calibre of the guns on battle cruisers, though not the number, being the same as that provided for battleships of the same period of design. In order to obtain the high speeds required, the length of battle cruisers is necessarily very much greater than that of battleships. The weight assigned to propelling machinery is also very much greater. The degree of armor protection is, on the other hand, less. It is, therefore, obvious that the considerable increase in speed provided for the battle cruiser must be obtained at the expense of other very important qualities.

In the beginning, the British navy took the lead in the development of battle cruisers, the first group being the Indomitable class. They were closely followed by the German navy with the Von der Tann and subsequent classes. From these type vessels have been developed subsequent battle cruisers, the greatest present development being embodied in the powerful
vessels of the *Lexington* class in the United State navy, the *Hood* and *Renown* classes of the British navy, and the *Hindenburg* and *Von Spee* classes formerly of the German navy. The British battle cruiser *Hood*, of which it was intended originally to build four, could probably be more properly styled a high-speed battleship, since the reported armored protection and armament are those of the battleship.

Only a few years ago, the employment of such extreme dimensions for vessels of war would have been considered highly improbable. Today such dimensions are accomplished facts.

Without repeating here the dimensions and characteristics of many of the latest vessels of the battleship and battle-cruiser types—particulars of which, for the principal navies, are fully set forth in the tables and plans accompanying this article—the extensive development of these classes of vessels is sufficiently indicated by the enumeration of the principal particulars of the largest of these vessels so far put under construction, namely, United States battleships Nos. 49 to 54—*South Dakota* class—and United States battle cruisers Nos. 1 to 6—the *Lexington* class. The design of these two classes of vessels represents practically the latest word in vessels of their type, and while it is not practicable to go into the details of their design, it is only just to the responsible authorities of the United States Navy Department to state that they appear to have availed themselves, in the highest degree, of the information obtained during the recent war, and to have produced designs of vessels which will probably hold the record for some years to come.

**Principal Characteristics of United States Battleships Nos. 49–54.**

**South Dakota Class.**

- **Displacement, about**: 43,200 tons
- **Main propelling machinery**: 60,000 H. P.
- **Speed**: 33 knots
- **Armament**:
  - Twelve 16-inch guns in four turrets
  - Sixteen 6-inch guns
  - Four 5-inch anti-aircraft guns
  - Two 21-inch submerged torpedo tubes

**Lexington Class.**

- **Length between perpendiculars**: 850 feet
- **Length over all**: 874 feet
- **Breadth, extreme**: 105 feet 6 inches
- **Mean draft, about**: 33 feet
- **Displacement, about**: 43,500 tons
- **Main propelling machinery**: 186,000 S. H. P.
- **Speed, about**: 33.25 knots
- **Armament**:
  - Eight 16-inch guns in four turrets
  - Sixteen 6-inch guns
  - Four 5-inch anti-aircraft guns
  - Two 21-inch submerged torpedo tubes
  - Two 21-inch deck torpedo tubes

The modifications of the plans for battle cruisers of the *Lexington* class were based, in large part, upon knowledge obtained during the Great War. This involved a considerable expansion of armored protection for reasons already referred to; also a more elaborate pro-

**United States Armored Cruiser of the Montana Class**

- **Length**: 302 feet; **Displacement**: 14,500 tons; **Speed**: 22-22.5 knots; **Armament**: 4×10 in., 4×6 in., 12×3 in., 2×3 in. AA, 17 small (new armament). Completed 1906–1908.

**United States Battle Cruisers Nos. 1 to 6**

- **No. 1. Lexington**
- **No. 2. Constitution**
- **No. 3. Saratoga**
- **No. 4. Ranger**
- **No. 5. Constitution**
- **No. 6. United States**

Length 850 feet; breadth, 105 feet 4 inches; draft 31 feet; displacement 43,500; speed 33½ knots.

Armament 8×16", 10×6", 6×3" AA.

Muzzle energy of one 16 inch gun = 114,130 ft. tons.

Muzzle energy of one 6 inch gun = 6,550 ft. tons.

vision for the protection of underwater portions of the vessel from damage due to explosive action of torpedoes and mines, especially in the wake of magazine and machinery spaces. The modifications involved a reduction of nearly two knots in the original designed speed, but this sacrifice in speed was considered to be amply compensated for.

It is well, in any consideration of battle cruisers, to bear in mind the causes which underlie the development of this type of vessel. Originally, unarmored cruisers with light batteries were attached to battle fleets to act as screens and to obtain authoritative information concerning enemy movements. These light cruisers were found to be ineffective in view of the growing tendency to provide more heavily armed and armored scout vessels; hence the gradual development of the armored cruiser. In course of time, developments of similar craft in various navies rendered the armored cruiser incapable of performing the highly important service of keeping in contact with the enemy, menacing his lines of supply in overseas transportation, and being able to meet on equal or superior terms vessels which could be employed for this purpose by the possible enemy. While the latest developments in battle-cruiser design indicate a tendency to attempt to combine the powerful battery and armor protection of the battlecruiser with the very high speeds here-tofore associated only with battle cruisers, actual experience in the Great War has indicated that it is worthy of note that recent experience in actual battle has demonstrated the efficiency of the latest type of armored protection as well as the latest type of under-water protection against damage from torpedoes and mines. A very late type of British battlecruiser, the Marlboro, and one of the later types of German battle cruisers, the Seydlitz, received serious damage through torpedo attack during the Battle of Jutland, but remained in battle line and gave an excellent account of themselves for a considerable time thereafter.

It is quite impossible, in the limited space available, to even touch upon many questions involved in the efficient development of battle-ship and battlecruiser design. It may not be out of place, however, to state that actual results under battle conditions have very largely con-

firmed the conservative expectations concerning these vessels held by those who design warships and those who ultimately command such vessels singly or in fleet action. Moreover, it seems more than probable that the battleship and battlecruiser type will continue to be regarded as vital elements in the strength of great navies.

Large Light Cruisers.—The only navy which has so far developed to so great an extent this class of vessel is the British navy. The original group comprised three vessels, the Courageous, the Glorious, and the Furious. The Furious, however, was subsequently transformed into an aircraft carrier. As these vessels represent a distinct departure in cruiser design, no better description can be given than that presented by their records. The details of the design and construction of these vessels have been related in this book.

United States Armored Cruiser of the Frederick Class

Length 502 ft.; 13,680 tons; speed 22–22.4 knots; armament 4-8 in., 4-6 in., 10-3 in., 28 small and AA. (new armament). Completed 1903–1907.

the logical working out of such a development would result in sizes of warships which would be practically prohibitive, not only as regards cost, but as regards ability to utilize the largest existing dock facilities, inter-oceanic canal locks and a large number of the most important harbors.

Whilst the designs of Renown and Repulse were in progress, I received instructions to design some very high-speed ships carrying powerful guns of a size sufficient to keep their speed in moderate weather, but to have a sufficient speed in moderate conditions to disconcert or actually elude any existing British or enemy ship of the same class, so as to be able to navigate shallow waters, if necessary.

As sanction was not likely to be obtained for building more capital ships taking two years or longer to complete, while additional light cruisers and destroyers could be built to meet the existing conditions in that time, it was decided to build Courageous and Glorious on the lines of very large light cruisers mounting light but very fast 8-in. and 6-in. guns, to be built by Clydebank, so as to be able to annihilate any enemy light cruisers or destroyers. They were to have thin protection, similar to our light cruisers, and a speed of not less than 32 knots, the speed rather being restricted to about 22 ft., or 5 ft. to 6 ft. less than any existing battleships carrying similar size of armament. The main armament was four 15-in. guns in two turrets, one forward and one aft, making them a match for any rival or light cruiser that might be encountered. At this time it should also be remembered that the armament of ships, especially as regards heavy guns, had to be regulated by the guns and gun-mountings which would be available or could be manufactured in the time at our disposal, and this condition applied to the 15-in. mountings which were adopted for these ships. The secondary armament consisted of eighteen 4-in.; guns in six triple mountings, similar to the triple mountings of the Renown and Repulse. The side armor consisted of 2-in., protected plating on top of the 1-in. shell plating, as in our light cruisers, and a thin protective deck was worked all fore and aft, but this was considerably thickened over the magazines after Jutland. A modified bulge was arranged for, as in the Repulse.

The machinery adopted for these ships was of the type fitted in the light cruiser Champion. It consisted of a shaft, the arrangement of geared turbines, the power being transmitted to the propeller shafts by double helical gearing. The eighteen boilers of Yarrow small tube type were also similar to those of the light cruisers, and with all-oil firing a power of 90,000 S. H. P. at about 340 revolutions per minute. An attempt was made to reduce the size of the propeller shafts as it was possible to make showed that 32 knots could easily be obtained at the designed displacement, and reports show that on Service this is a real possibility.

The design of these vessels was begun late in January 1915, and the order for one ship (Courageous) was placed with Messrs. Armstrong and the other (Glorious), with Messrs. Harland & Wolff, the latter making their own machinery and Messrs. Parsons supplying the machinery for the Messrs. Armstrong's ship.

It was intended that these vessels should be built in a year, or as near as that as possible, but this was not realized, and the ships were both commissioned in October 1916.

On her commissioning trials, the Courageous worked up to full power, and while steaming during the trials at full speed she met very heavy weather. Some signs of weakness were shown at the fore side of the forward turret, and there is an inevitable discontinuity of longitudinal strength, and some doubling plates were accordingly added to the Courageous. Her sister vessel Glorious was in commission for over a year before similar additions were made to her, although no signs of weakness were shown. Subsequent trials show that the very high speed obtained on trial, reaching 32 knots, should hardly be maintained against head seas in heavy weather.

The Furious was similar to, but a modification of, the Courageous and Glorious, having the same machinery and the same machinery, but the form of midship section was somewhat different, having a more pronounced bulge and a

2 U. S. S. Burns — Destroyer No. 171
3 U. S. S. Stewart — Coast Torpedo Vessel No. 13
simpler form of main framing and structure of the hull. The armament also was different, each turret, instead of having two guns, was arranged to carry one big gun of 15-in. bore, although arrangements were made to substitute pairs of 15-in. guns, if thought desirable later. The ship was placed with Messrs. Armstrong about two months after that of Courageous, and she was to be finished in the shortest possible time. Early in the spring of 1917, however, the necessity for having fast aeroplane-carriers became very obvious, and it was approved to feed the hull of this ship with the foreside observation platform into the foremost turret and making other considerable alterations. A large hangar was built on the forecastle deck, and a flying-off platform 160 ft. long was arranged on the roof of the hangar, which was designed to house about ten machines. Later it was decided to remove the after turret as well, and a flying-on deck 300 ft. long, extending from the funnel aft, was constructed.

The secondary armament, which had consisted originally of eleven 31-in. guns, was retained, with the exception of one gun; the remaining ten guns being rearranged. Four sets of triple 21-in. torpedo tubes were fitted on the upper deck aft, and one pair each side on the upper deck forward. After these alterations were completed, the ship was tried and commissioned in July 1917, a speed of 31 knots being obtained with 94,000 S. H. P. at 330 revolutions. From the speed point of view the great advantage of size and length is clearly shown in these ships compared to T. B. D.'s. In Refuse, with 8 times the horse-power we can drive at the same speed as a destroyer a vessel of about 24 times the displacement, and in Courageous, with about 24 times the horse-power of a destroyer, we can drive one of nearly the displacement of the same speed as it in smooth water: in anything of a head sea, the T. B. D.'s are left behind altogether by these great ships.

Light Cruisers.—Another type of vessel whose design was developed to meet the requirements of naval operations is represented by the Raleigh class of the British navy and scout cruisers 4 to 13 of the United States navy. In the case of the light cruisers of the Raleigh type, a two-inch armor belt was provided for the whole extent of the machinery and magazine spaces. This, with the hull plating, protection effective in the face of three inches of steel. The main battery consisted of seven 7½-inch guns. Great prominence was given to the element of speed, these vessels having a designed speed of 30 knots an hour. The attainment of such high speeds for a vessel of this class is only obtainable, however, by a great increase in displacement and length. The principal characteristics of the Raleigh class and United States scout cruisers Nos. 4 to 13 are given below:

<table>
<thead>

Armament, British Raleigh Class:
Seven 7½-inch guns
Twelve 4-inch (44-cal.) guns.
Six 21-inch twin tubes.

Armament, U. S. Scout Cruisers 4 to 13:
Eight 6-inch, 53 cal. guns.
Two 3-inch anti-aircraft guns.
Two 21-inch twin tubes.

It is well to note that the Raleigh class is considerably larger than the United States scout cruiser class, and carries a much heavier main battery, and has, as with the United States scout cruisers, a light armor protection. There is, however, no inferiority in speed as compared with the scout cruiser class. These differences in characteristics are due to the different purposes for which these vessels were intended. The United States scout cruisers are, in effect, greatly amplified destroyers of a size capable of keeping the sea and maintaining considerable speed under all conditions of weather. They also have a battery which permits them to give a good account of themselves, except as against heavily armed cruisers and battleships. The Raleigh class, on the other hand, were intended as a development of a preceding type of light cruiser which had found much favor in the British navy, though the propelling machinery was based upon the destroyer type. The Raleigh class, in the words of the designer, represented "a considerably heavier class of light cruisers, more especially designed for ocean work in any part of the world." These vessels were also provided with modified bulges as protection against under-water mine or torpedo attack. Therefore, in their size, speed and battery power they are more nearly high speed developments of previous light cruisers than an extreme development of the destroyer type, as is the case with the United States scout cruisers.

Destroyers.—No one class of war vessel has demonstrated its usefulness in actual war to a greater degree than the destroyer class. This type of vessel has proved itself indispensable as a screen for protection of the battleship fleet against destroyer or submarine attack. It has also been invaluable in convoy work in warding off submarine and other hostile attacks. It has also proved itself the most efficient weapon of offense against the submarine in general, whether the submarines were acting singly or in groups

---

As commerce destroyers or were engaged in fleet action. The high speed developed by these vessels, their fine maneuvering power, the efficiency of their armament, both gun and torpedo, combined with the use of depth charges, caused them to be a veritable terror to enemy submarines. Not only did they give an excellent account of themselves in individual action, but they bore a magnificent part in some of the major actions of the war, taking an unusual amount of punishment when in action against vessels of greatly superior power. So great was the development of this class of vessel during the period of the war that nearly 300 were added to the effective forces of the British navy or were in course of construction; also nearly 300 have been built or placed under

construction for the United States navy subsequent to April 1917. The maximum speed developed by some of the latter types of these vessels in the British navy was within a fraction of 40 knots an hour, while all of the later vessels of this type were designed for an average speed of 35 knots an hour and have made considerably more than this speed on their trials. Not only did these vessels undergo a great development in speed but their offensive armament was greatly increased, being, for the latest vessels of the United States navy, four four-inch, 50-calibre guns and four triple deck tubes carrying 12 torpedoes. In addition, there is one three-inch anti-aircraft gun and a large supply of depth charges, with suitable firing apparatus.

For the British navy there has been developed a type of vessel called flotilla leader. These vessels are enlarged destroyers and carry a main battery of five 4.7-inch guns. There are also six 21-inch torpedo tubes. The speed and endurance of these latest flotilla leaders are also superior to those of preceding destroyers. They are, in effect, light, high-speed cruisers. Particulars of destroyers recently designed for the various principal navies are given in Tables I to VIII. There are given below the principal characteristics of the latest American and British destroyers:

**The Monitors.**—The monitor is a special type of vessel, the development of which was first undertaken in the United States during the Civil War in 1861. The essential features of this type were, in the beginning, the carrying of a very heavy battery, having an effective range of fire, on a hull of comparatively shallow draft and with a minimum of freeboard. This permitted operation in shallow waters and offered the minimum target. While monitors were used extensively by the United States navy in the American Civil War and were especially favored after the combat between the original monitor and the Confederate ironclad *Merrimac*, their development subsequent to that war was comparatively limited. Only a few monitors have been designed and built for the United States navy subsequent to 1870. In the recent World War, however, the long reaches of shoal water off the Belgian coast made the development of this class of vessel imperative in order to make possible the most effective co-operation of the navy with the land forces. On the Belgian coast they were especially valuable in attacking the powerful land defenses installed by the Germans on that coast and in combating the efforts of the enemy to thoroughly protect their submarine bases in that vicinity. This resulted in the development of several types of shallow draft monitors. The peculiar conditions in the English Channel and the North Sea and in the eastern Mediterranean thus gave great stimulus to the development of the monitor type. While the building of this type of vessel during the American Civil War may be regarded as the beginning of the monitor development, subsequent improvements in armament permitted the offensive power of this class of vessels to be enormously increased over that existing in the earlier types designed for the United States navy. Moreover, the low freeboard deemed essential in earlier designs was practically abandoned in the very heavily armed vessels of the British navy designed primarily for operations against the Belgian coast. Here again local conditions and the special service to be performed had a controlling influence on the design.

Of course, any type of vessel designed under the great pressure existing during the World War — where rapid completion and entry into active service were of vital consequence — embodied in its design and equipment some make-shifts. This was particularly the case in providing the battery and propelling machinery for the British monitors, the selection of these essential elements being based largely upon available supplies of ordnance and propelling machinery. As a matter of fact, the equipment of older vessels or those in a less advanced state of completion was heavily drawn upon for this purpose. Moreover, provision had to be made in these later monitor designs for satisfactory protection against recent great developments in torpedo attack, as well as against effective provision against damage resulting from attack with mines in mine-swept areas. The most effective provision against serious damage by mine and torpedo attack proved to be through the addition of substantial bulges for a considerable portion of the length, or else the provision of large wing compartments in the hull structure itself. The first method found greatest favor in these monitor designs, and this defense against torpedo and mine attack was found to

German Battleship of the Nassau Class
Length (L. W. L.) 452 ft.; 18,600 tons; speed 20 knots; armament 12-11 in., 11-3.9 in., 2 or 4-3.4 in. Completed 1909-1910.

German Battle Cruiser of the Moltke Class
Length W. L. 561 ft.; 27,800 tons; speed 27.5 knots; armament 10-11 in., 12-5.9 in., 2-3.4 in. Completed 1911-12.

German Battle Cruiser, Graf von Spee Class
Length (L. W. L.) 755 ft.; 27,000 tons; armament 6-15 in., 14-3.9 in., 8-3.4 in. A.A.

German Battle Cruiser Von der Tann
Length on W. L. 563 ft.; 19,100 tons; speed 26 knots; armament 8-11 in., 10-5.9 in., 4-3.4 in. A.A., 2 M. Completed 1911.

German Battle Cruiser, Hindenburg Class
Length (L. W. L.) 689 ft.; 26,200 tons; speed 28 knots; armament 8-12 in., 10-5.9 in., 8-3.4 in. A.A. Completed 1917-18.

Former Austrian Battleship of the Prinz Eugen Class
Length 485 ft.; 20,000 tons; speed 20.7 knots; armament 12-12 in., 12-5.9 in., 18-12 pr., 6 small. Completed 1913 and building.

German Battle Cruiser Seydlitz
Length on W. L. 656 ft.; 24,610 tons; speed 26.7 knots; armament 10-11 in., 12-5.9 in., 2-3.4 in. Completed 1913.

Former Austrian Battleship of the Brahsesog Frans Ferdinand Class
Length 451 ft.; 14,226 tons; speed 20.5 knots; armament 4-12 in., 8-9.4 in., 20-3.9 in., 6-12 pr., 2 small. Completed 1910-1911.
be most effective in actual service. Two of the largest monitors, the Erebus and Terror, were torpedoed during off-shore operations. The Terror received three torpedo wounds in the forward portion of the vessel, two being forward of the bulge and occasioning serious damage. The third hit was in the bulge itself and did very little damage. The Erebus was struck squarely on the bulge by a distance-controlled vessel carrying a very heavy explosive charge, but the bulge prevented the loss of the vessel, and the vessel itself was repaired in less than two weeks.

Table IX, which appears in another portion of this article, gives the principal characteristics of the various monitor classes designed for the British navy during the Great War. It will be noted that the two largest classes, represented by the Erebus and Marshall Soul, carried two 15-inch guns each in the main battery and had very considerable armor protection for the hull, with much more extensive protection for the gunhouse. The Erebus, moreover, had a speed quite beyond that associated ordinarily with this type of vessel, and, while designed for 12 knots, was actually capable of a service speed of 14 knots. Speed, however, has never been considered a vital characteristic in vessels of this class; their development being rather that of powerful, well protected, floating batteries. One of the notable features in connection with the design and building of the original monitor in 1862 was the speed of construction. K. y. speed of design and construction was also notable in connection with the construction of these later shallow-draft monitors, some of the largest of which were designed and completed in less than six months. In connection with the development of the monitor type of vessel and the special provision for resisting torpedo attack, it may be noted that, about 12 years ago, extensive experiments were conducted by the United States Navy Department to determine the best method of providing protection for battleships and other large vessels against torpedo attack. The vessel selected for this experimental purpose was the shallow-draft monitor Florida (subsequently renamed Tullahassee). Special under-water compartmental subdivision and provision for watertight closing of the magazine spaces, and this vessel, under actual experimental conditions, was anchored in shallow water and subjected to many attacks by torpedoes at close range. Various conditions of compartmental filling were adopted for the various protective compartments, namely, inner compartment filled with coal or water, next outer compartment and wing compartment being empty. Variations were then made as to the compartments filled or empty in order to furnish complete experimental data. As observers were on board the vessel and fairly close to the point of impact of these torpedoes, the most complete information was obtained, not only as to the local effect upon the hull of the vessel, but as to the dynamic effect upon the vessel as a whole. These experiments showed conclusively the practicability of limiting the damage created by the explosion against the hull of a vessel of a torpedo or mine with large, bursting charge. Later on, additional experiments of this general character were conducted on another United States naval vessel, and an elaborate series of experiments was conducted with a full-size model of the section of a modern battleship. Still later, an extensive series of experiments was made with small-scale models to determine the results of bursting of high explosive charges against the hulls of naval vessels. As a result of these various experiments, there had been decided, prior to the Great War, a method of compartmental subdivision for United States battleships and other large war vessels which actual experience under war conditions has subsequently demonstrated as being entirely correct in principle. These are the advantages and disadvantages connected with the bulge form of protection as compared with extensive wing compartments incorporated in the actual form of the ship. It is worthy of note, however, that while the bulge involves a greater decrease in speed than would be the case with wing compartments in the ship itself, it has the advantage of largely confining the action of gases from an exploding shell to spaces external to the main hull of the vessel.

Submarines—Consisting from the point of view of damage done to merchant shipping and its indirect effect upon the conduct of the war, the submarine occupies a position of especial prominence. The method of its use by the Germans against merchant shipping was, in no sense, sanctioned by the rules of civilized warfare, but the effect upon military and naval operations in general was, for a considerable period of the war, most important. The development of this type of vessel has been especially interesting. As the submarines of the British and German navies bore the most conspicuous part in submarine warfare, comment will be largely confined to brief allusion to the development of this type of vessel in those two navies. In Tables II and IX, already referred to, are given particulars of British submarines, and there is given in Table VIII the general particulars of the principal classes of German submarines. The British types underwent extraordinary development, reaching, in the K class, their greatest advance. The K class were really submarine cruisers, having a surface displacement of 1,880 tons and a submerged displacement of 2,650 tons. Diesel engine installed a surface speed of 24 knots and a submerged speed, at 1,250 horse power, a speed of nine knots. The armament consisted of one four-inch high-powered gun and one three-inch high angle gun. They were also equipped with eight 18-inch torpedo tubes.

The development of the cruiser type of submarine, represented by the K class of the British navy, made advisable the use of three separate types of propelling machinery. The high power required for the surface speed of 24 knots indicated the advisability of a steam drive. Therefore, after thorough consideration, steam turbines developing 10,000 horse power were installed for this purpose. This necessitated, under submerged conditions, special provision for making watertight the openings for smokestacks and other apertures in the hull due to this type of machinery. This was successfully accomplished. There was also installed a Diesel engine to provide power for diving and to give greater power during the intermediate stage between the submerged condition and the surface condition. The main reliance for submerged propulsion was the usual storage battery electric drive. The success of

French Battleship of the Normandie Class
Length 574 ft.; 25,230 tons; speed 21 knots; armament 12-13 in., 24-5.5 in., 4-3 pr.

Italian Battleship of the Conte di Cavour Class
Length 557 ft.; 27,340 tons; speed 22.5-23 knots; armament 13-12 in., 19-6.7 in., 14-12 pr. Completed 1914-1915.

French Battleship of the Bretagne Class
Length 546 ft.; 23,177 tons; speed 20 knots; armament 10-13.4 in., 22-3.5 in., 8 small.

Japanese Battleship of the Fuso Class
Length 658 ft.; 31,800 tons; speed 22.5 knots; armament 12-14 in., 16-6 in., 4-12 pr. Completed 1915-1916.

French Battleship of the Jean Bart Class
Length 546 ft.; 23,100 tons; speed 20 knots; armament 12-12 in., 22-5.5 in., 4-3 pr. Completed 1913-1914.

Japanese Battleship Aki
Length 400 ft.; 19,800 tons; speed 20.5 knots; armament 12-12 in., 12-10 in., 8-6 in., 9-12 pr., 8 small. Completed 1911.

Italian Battleship of the Andrea Doria Class
Length 570 ft.; 23,025 tons; speed 23 knots; armament 13-12 in., 16-6 in., 14-12 pr., 6 small. Completed 1915.

N. B. In the next succeeding class, Francesco Morosini, Canale, Cristoforo Colombo and Marastinco Colonna, eight 15-inch guns are mounted in four turrets on the middle line, as in the Queen Elisabeth.

Japanese Battleship Settsu
Length 500 ft.; 20,800 tons; speed 20.5 knots; armament 12-12 in., 10-6 in., 8-4.7 in., 16 small. Completed 1912.
this unusual combination of propelling machinery was reported to have been complete. The J class, which immediately preceded the K class of British submarines, had a surface speed of 14.7 knots, a submerged displacement of 1,210 tons, and a battery generally similar to the K’s. These developments in submarine construction represent an extraordinary advance over the earlier classes and a very marked improvement over even the E class of British submarines. These last-named vessels had a length of 180 feet, a submerged displacement of 800 tons, a surface speed of 15 knots, and a submerged speed of 10 knots. They carried one three-inch gun and five 18-inch torpedo tubes. One other class of submarine which was developed as a result of the Great War is represented by the M class of British submarines. These vessels, only one of which has been reported as actually built up to the present time, had a designed submerged displacement of approximately 2,000 tons and carried one 12-inch, 35 caliber gun. The mounting of this gun was necessarily of a special type and the training of the gun was necessarily considerably on the maneuvering of the vessel. This type of vessel is somewhat of an experimental character and has never, so far as reported, been in actual service, so that it is impossible to make positive statement concerning its probable success in actual service. There is little doubt, however, that, under certain conditions, it would have proved a valuable adjunct to the fighting fleet.

In the German navy the development of the submarine, both in types and numbers, was very great, but with results not altogether satisfactory from the point of view of speed and habitability. The Germans, however, developed the offensive powers of the submarine to a very great extent, especially with a view to operating against merchantmen, both armed and unarmed. They also developed to a high degree the mine-laying type of submarine; also the cruising cargo submarine. This last type was not put to any great practical use and was subsequently converted into a mine layer. The great damage to merchant shipping accomplished by the German submarines has created an impression in some quarters of unusual superiority for the type developed by them. That this is not supported by the facts is evident from the following quotation from a statement recently issued by the United States Navy Department, comparing one of the latest types of German submarines with one of the latest types of United States submarines which had then completed its official trials:

New and interesting light is thrown on the efficiency of the German submarines by recent tests conducted by officers in the Bureau of Construction and Repair. An opportunity recently developed in this country which permitted a direct comparison between a late design of German submarine and a late design of American submarine. While details of the comparative tests cannot be given, sufficient information is available to establish advertised superiority of the German submarine. As is well known, five German submarines of the latest design were brought to the United States for use in the Victory Loan campaign. Four of these boats came over under their own power, manned by officers and men of the United States Navy. The propulsion machinery of the fifth was partially destroyed or removed so that it was necessary to tow this vessel across. The best of these boats was “tuned up” for special trials. When reported ready for these trials a special trial board was designated to conduct the trials, following the established practice trials for submarines of the United States navy. The boats compared were ex-German submarine U-111 built at the Germania Yard, Kiel, Germany (completed in 1918) and S-3 a submarine designed by the Navy Department; S-3 was built at the North Yard and was commissioned in 1918.

These boats both belong to the 800 ton class — U-111 having a surface displacement of 830 tons and S-3 a surface displacement of 834 tons.

**Dimensions:**

In the trials the maximum surface speed of the U-111 was 13.8 knots while the S-3 made 14.7 knots. The submerged speed of U-111 was 7.8 knots while S-3 made 12.4 — a remarkable difference in favor of the German. The radius of action of the two boats is also in favor of S-3, despite the fact that was created by the advent of the German U-boat on American coasts during the war. U-111 can cruise 8,500 miles at 8 knots, while S-3 can cover 10,000 miles at 11 knots. The submerged cruising radius shows an equal preponderance in favor of S-3. Both boats can carry 12 torpedoes. U-111 mounts two 4 in. guns, one forward and one aft, while S-3 mounts one 4 in. gun forward, this practice of one gun on a submarine being standard practice in the United States navy. So much for the ordinary military characteristics of the vessels. It is necessary to really live in these vessels to appreciate the radical difference in their habitability. The舱 character, for a submarine is no better than its crew. U-111 is congested to the last degree; she is complicated in the extreme and every man feels the weight of which are of doubtful utility and more doubtful necessity. Accessibility to her equipment is "not thrilling". In short, it is necessary to take down these installations to overhaul one. On the contrary S-3 is a habitable, livable proposition; comparatively "roomy" with reasonable accommodation for officers and crew. Her equipment is accessible and her general habitability character is very well written of the seaworthiness of the German U-boat. An opportunity to compare the seagoing capabilities of the two vessels occurred during the summer of 1918, and the consensus of opinion among the officers conducting the tests was that S-3 is the more seaworthy boat. She is not her sister, her bridge less subject to green seas, and her general behavior in a seaway superior. Referring to the comparative diving capabilities of the two vessels and general handling there are few differences and those few appear to favor S-3, as in their reports of the outcome of this comparison the bureau officers point out that there should be no idea that "we have nothing to learn from the Germans." There are a number of interesting details in design, construction and in operation that are well worth while studying. A few features are worthy of adoption for the U-111 is the "initial U-boat," which type is considered by the Germans as, by far, their best submarine.

Nothing so clearly indicates the rapid and extensive development of the submarine during the recent World War period than the simple statement that, at the beginning of the war, Germany had less than 40 submarines; during the period of hostilities it actually built or had in process of construction at the time of signing the armistice more than 600 additional vessels of this class. Although the Germans lost rather more than 200 of these submarines during the war, they succeeded in destroying approximately 15,000,000 tons of shipping, involving the loss of more than 16,000 lives. The development of the submarine in Germany was accompanied, however, by rapid development by the Allies of suitable vessels and other means of combating the submarine menace, but it was only in the autumn of 1918 that the construction of new tonnage and the development of anti-submarine measures proved so effective that this menace had been brought under control. That the existence and operation in large numbers of enemy submarines had a most material bearing upon the manœuvres of the Allied fleet is amply evidenced by the orders of the admirals during the war period. They also exercised an important influence on the design of capital ships so far as related to the provision of protection against under-water torpedo at-
tack. As is well known, during a great part of the war, German naval energy was concentrated on providing and operating submarines, thus making this particular type of naval vessel of predominant consequence to them in the prosecution of the naval side of the war. In view of the important part recently played by the German submarine, the following information is made from a paper contributed to the transactions of an American scientific society by an officer who had unusual opportunities for observation and whose comments upon this subject have authoritative value:

All modern German submarines are of the double hull type. The war produced three standard types of German submarines which are known as the UC type, the UB type, and the U-boat. In addition to the standard types, there were two special types, as follows:--UB type, mine-laying cruisers; U type, large cruiser class. The large cruiser class consists of two designs, the ordinary design being a vessel of about 2,000 tons surface displacement, while there were a few of the special cruiser design of about 1,200 tons surface displacement. There were apparently only two vessels in this class completed, and they were specially designed for surface speed. The UC class is made up of small, coastal, mine-laying submarines. The UB type consists of a surface hull of about 500 tons and a submerged displacement of about 575 tons. These vessels in their latest development are about 185 feet long and 12 feet in beam. They made about 11 to 12 knots on the surface and 6 to 7 knots submerged. The UB type is designed to surface the vessel in non-water-tight compartments or mine wells, 18 mines being usually carried, although some of the designs carried only 12. A torpedo tube was fitted in the stern and two torpedo tubes were fitted externally in the superstructure, sometimes fore and aft. They carried one 10.5 or one 8.8-cm. gun. There were about 100 of these boats completed and a great many more in the course of completion.

The UB class of vessels formed the coastal submarines and the shallow water vessels of about 500 tons surface displacement and 650 tons submerged. They were 183 feet long, 19 feet beam and 12 feet draught. They had a surface speed of about 11 knots and a submerged speed of 7 to 8 knots. Four torpedo tubes were installed in the bow and one in the stern. They usually carried one 10.5-cm. gun, no mines were carried on the UB class. It is of particular interest to note that the UB class and the UC class in the final analysis were very similar in size and displacement. An examination of the boats of these classes in Germany in December, 1918, showed very completely the progressive steps made in the design and construction of these types of vessels. The earlier UB boats and UC boats only displaced about 125 to 150 tons each. It was not soon demonstrated that these boats were too small for the purpose intended, and when standardization took place it produced a very large type. Designs about 180 tons were about the size of the UB boats completed and many more under construction at the time the armistice was signed.

UB-boat.—Mili U-boats.—The first boat of this class was completed in 1906 and had a surface displacement of 218 tons. The increase in the size of the size of this type of submarine continued through various progressive stages until 1914, when the displacement had reached about 160 tons. The "mili U-boats" subsequent to this date were generally similar in design except that the displacement increased slightly so that the latest type had a displacement of about 830 tons. The standard design of "mili U-boats" has about the following characteristics:

- Surface displacement: 830 tons.
- Submerged displacement: 1,030 tons.
- Length: 235 feet.
- Beam: 204 feet.
- Draft: 124 feet.
- Design speed: 16 knots.
- Actual surface speed: about 15 knots.
- Actual submerged speed: about 8 knots or less.

Most of the "mili U-boats" were fitted with four bow torpedo tubes and two 4.5-inch guns. These boats carried either one or two 4.5-inch guns. This type of boat was considered the most successful of the German submarines, and as the war progressed, many of them adhered to this type of vessel, they would have been more successful in their submarine warfare. The Germans had completed the time of the armistice about 110 of these vessels; a large number were also under construction in various parts of Germany.

UV Class.—These were larger, over-laying cruisers of:

- Surface displacement, about 1,200 tons.
- Submerged displacement, 1,570 tons.
- Length, over 200 feet.
- Beam, about 27 feet.
- Draft, about 24 feet.
- Draft, about 13 feet.
- Design speed, 14 knots.
- Design submerged speed, 7.2 knots.
- Armament, 4 bow torpedo tubes; 2 stern mine tubes, 45 inches in diameter.
- Stowage space was available for 42 mines and 24 torpedoes. It is doubtful whether these vessels carried this number of spares. Their gun armament consisted of one 5.9-inch gun and one 4.1-inch, although in some cases they may have carried two 5.9-inch guns. Usually only one gun was carried.

There were about 10 of this class completed and a large number building. UV-1 to 80 were small mine-laying submarines of this general type but of an earlier design, and only placed about 760 tons. They were not a successful design.

Cruiser Class.—The special cruiser class is the one that has been completed only two boats (Nos. 130 and 136). Their displacement is similar to the mine-laying cruiser class, that is:

- Surface displacement, about 1,200 tons.
- Submerged displacement, 1,535 tons.
- Length: 275 feet.
- Beam: 27 feet.
- Draft: about 13 feet.
- Draft: about 13 feet.
- Design speed, 18 knots.
- Design submerged speed, 8.2 knots.

They had four bow tubes and two stern tubes and carried one 5.9-inch gun. The large cruiser class consisted of vessels of the following characteristics:

- Surface displacement, about 2,900 tons.
- Submerged displacement, 3,200 tons.
- Length: 302 feet.
- Beam: 20 feet.
- Draft: 17 feet.

They carried four bow tubes, two stern tubes and 19 torpedoes. They had a design speed of 15.8 knots and a design submerged speed of 7.7 knots. Only four of these boats were actually completed at the time of the armistice, but there were a large number under construction in various parts of Germany.

It is impossible to predict the future of submarines; their development and operation in the Great War indicated their tremendous possibilities. The future alone can determine whether or not it will be possible to restrict the activities of submarines so that nations at war will fully comply with the laws of nations governing civilized warfare and the special regulations established in times of peace to provide for such compliance. It may be remarked, in this connection, that the operations of enemy submarines in the Great War were largely those of action against unarmed or lightly armed merchant vessels and their use in strictly naval operations was rather restricted. In the earlier stages, their operations were eminently successful, because of their ability to cruise on the surface, to lie in traffic routes and to attack with comparative impunity vessels unarmed or only lightly armed. As soon as it was possible to conduct a rigorous offensive against this type of vessel, their surface operations were greatly limited. The development of mine barrages and, more particularly, the increase in the number of torpedo-boat destroyers carrying large quantities of depth charges and the employment of large numbers of mines, soon rendered the surface operations of this type of vessel, in the vicinity of high-speed, well-armed surface craft exceedingly hazardous. In fact, it may be stated without fear of serious contradiction that the submarine menace at the
time of the armistice in November 1918 was fairly well under control, and the increasing number of destroyers being put into service at that time would have soon rendered the danger from this class of vessel comparatively small. In conclusion, it is worthy of note that more than 200 German submarines were sunk, captured or driven ashore during the course of the war, this number representing more than 50 per cent of the total number which had been in operation. It is also a fact that the extremely hazardous character of duty in enemy submarines shortly before and at the time of the conclusion of the armistice, due to the increasing efficiency of the offensive operations conducted against them, had produced a marked decline in the morale of the crews of such enemy vessels. This, in itself, became a potent factor in reducing the menace from this type of vessel, and may possibly result in a closer observance of such laws as may hereafter be established for the control of submarine warfare in any future operations of war in which such vessels may be engaged.

**Submarine Chasers.**—A type of vessel for which submarine operations were distinctly responsible was the submarine chaser class. These were small, moderate-speed, lightly-armed vessels, designed to act as scout patrols and to locate and attack enemy submarines. Their speed, while not great, was superior to that of the large majority of submarines. This special type in the United States navy was represented by a class of nearly 450 vessels. They had an armament of one three-inch gun, two machine guns and a Y-gun for depth charges. This permitted them to operate effectively against enemy submarines. Their principal dimensions were as follows:

- Length (between perpendiculars): 105 feet
- Length, overall: 110 feet
- Breadth (W.L.): 14 feet 8 inches
- Draft: 5 feet 8 inches
- Displacement (normal): 77 tons
- Displacement (full load): 85 tons
- Speed: 18 knots

More than 100 of another type of submarine chaser and scout patrol were under construction for the United States navy at the time of the signing of the armistice, and extensive arrangements had been made to build this type in very large quantity if the continuance of the war and the effectiveness of enemy submarine operations had justified such an extension of the building program. These vessels, called the "Eagle" class, were very much larger than the type of submarine chaser just mentioned, their principal characteristics being as follows:

- Length (between perpendiculars): 200 feet
- Length, overall: 200 feet, 9 inches
- Breadth (W.L.): 25 feet, 6 inches
- Mean draft: 7 feet, 3 inches
- Displacement (normal): 500 tons
- Displacement (full load): 615 tons
- Speed: 18 knots

**Battery:**
- Two 4-inch, 50 cal. R. P. guns
- Two machine guns
- One Y-gun for firing depth charges

Being much larger and more effectively armed than the first type of submarine chaser, they undoubtedly have proved themselves effective vessels for the class of work for which designed, and their simple type of construction would have permitted prompt and extensive additions to the fleet originally contracted for, had the exigencies of war necessitated such additions.

**Mine Sweepers and Mine Layers.**—Vessels of this class may not be regarded ordinarily as warships. As a matter of fact, however, a large number of specially designed mine sweepers were employed during the Great War, although the vast majority of such vessels were improvised from seagoing tugs, trawlers and other vessels of that general character. They were, however, lightly armed and performed such notable service in strictly naval operations that they are at least entitled to mention in an article on warships. The type of vessel of this class specially designed for the United States navy was of the enlarged seagoing tug order, having a length of 180 feet, a beam of 35 feet 6 inches, a mean draft of 9 feet 9 inches, and a normal displacement of 950 tons. They were single-screw vessels, with vertical triple expansion engines having a horse power of 1,400 and had a designed speed of 14 knots. They had a battery of two three-inch, 50 calibre anti-aircraft guns and two machine guns.

The mine layers, in almost all cases, consisted of merchant vessels transformed to meet the requirements of the particular service involved. They were also lightly armed in order to permit them to make reasonable resistance against attacks from aircraft and submarines. In view of the improvisation of this type, no attempt will be made to describe the features of any particular vessel.

**Tables.**—In the tables which appear at the end of this article (Tables I to VIII, inclusive), are shown in condensed form the major characteristics of the principal types of vessels in the navies of the United States, Great Britain, France, Italy, Japan, Russia, Germany and Austria. The vessels for which data are given, with the exception of the United States navy, are those which have been completed or designed in the past 10 years.

There are given in Table IX particulars of British warships constructed during the war. This table is taken from a paper prepared by Sir Enstace Tennyson d'Eyncourt, Director of Naval Construction, British Admiralty, for presentation to the British Institution of Naval Architects in April, 1919, and since published. It is complete and authoritative and shows in graphic form the tremendous development in the strength of the British navy during the World War. There was also taken from this same paper the plans appearing on Plates 38, 39, 40 and 50, 51 and 52. These plans give a good general idea of the compartmental subdivision, battery deck plans, interior arrangements, armor and armament of the following classes of vessels:

- **Battleships:** Royal Sovereign Class, Ajax and Canada.
- **Battle Cruisers:** Revenge and Renown.
- **Large Light Cruisers:** Courageous and Glorious.
- **Aircraft Carrier:** Furious.
- **Light Cruisers:** Raleigh Class and Cane Class.
- **Monitors:** Hood, and Terror Class, and
- **14-inch Guns:** M-15 to 36, and M-20 to 39.

Also M Class of Destroyers, V Class of Destroyers, and Scott Class of Pictorial Leaders.

MODERN WARSHIPS

1 U. S. S. Tallahassee, formerly the Florida
2 United States Monitor Miantonomoh
3 United States Submarine Chaser No. 27
1 United States Submarine Chaser (Eagle Class)
2 U. S. S. Bittern. Minesweeper No. 36
3 United States Submarine AA-1. Latest (Fleet) type
While the ‘Transactions’ of the British Institution of Naval Architects are especially rich in data concerning the development of warship building, the two papers published in the 1919 ‘Transactions’ of that society, one by Sir Philip Watts, late Director of Naval Construction in the British Admiralty, and the other by Sir Eustace Tenayson d’Eyncourt, the present Director of Naval Construction, are particularly replete in data covering the development of the British navy up to the close of the year 1918. In addition, Sir Philip Watts incorporated in his paper very complete statistical data concerning the principal foreign navies, which gives it unusual historical value.

There is given in Table X a summary statement of effective fighting ships built and building, for the countries just enumerated. This table is taken from the 1919 edition of Brasseys Annual.

There are given in Tables XI, XII, XIII, XIV and XV summaries of vessels in the United States navy "fit for service" and "under construction," covering the period from 1 July 1906 to 1 Oct. 1919. These tables have been prepared for an official publication of the United States Navy Department, soon to be issued, and are reproduced by kind permission of the secretary.

Photographs, Silhouettes and Battery Plans.—Photographs represent the complete series of United States battleships, battle cruisers and representative vessels of the destroyer, submarine, monitor, submarine chaser and mine-sweeper classes.

The Silhouettes give correct profile illustrations of the various types of fighting vessels in the United States navy.

The Profiles and Deck Plans of United States and foreign vessels give the battery arrangements and armor distribution of the complete series of United States battleships and battle cruisers and the latest battleships and battle cruisers of the navies of Great Britain, France, Italy, Russia, Japan, Germany, Austria. There also have been added profiles and battery plans of the latest and most important battleship additions in the Brazilian and Argentine navies, namely, the Minas Geraes and the Rivadavia. The first of these battleships was constructed in England for the Brazilian government, while the last-named vessel was constructed in the United States. It may also be noted, in this connection, that the present battleship Canada of the British navy and the aircraft Eagle of the same navy were originally under construction in England for the Chilean navy, but were taken over by the British admiralty during the Great War.

The thanks of the author are due to the Secretary of the United States Navy for his kind permission to use hitherto unpublished data concerning naval vessels; also to the chiefs of technical bureaus of the United States Navy Department for certain authoritative data obtained from them concerning United States naval vessels, and especially to the chief of the Bureau of Construction and Repair for his most helpful co-operation in obtaining data and suitable illustrative photographs and sketch drawings; also to the technical staff of the Bureau of Construction and Repair, especially the head of the design drawing office and his assistants for the compilation of tabular matter and preparation of sketch plans illustrating the types and characteristics of naval vessels.

The author is also indebted to various foreign admiralties for information derived from their official publications, and also to various scientific and technical societies and technical publications for naval data contained in their latest editions. The principal publications consulted are indicated in the bibliography given below, the author being under special obligations to the British Institution of Naval Architects and Brasseys Annual for the use of some of their plans in illustrating this article.

Bibliography.—Official publications relating to naval vessels published by the United States Navy Department; similar publications of foreign admiralties; Transactions of the American Society of Naval Architects and Marine Engineers, New York; Transactions of the British Institution of Naval Architects, London; Transactions of the Society of Naval Engineers (Washington, D. C.); Proceedings of the United States Naval Institute (Annapolis, Md.); Brasseys Naval Annual (London); Jane’s Fighting Ships (London); Scientific American (New York); Engineering (London); Engineer (London).

W. L. Capps,
Chief Constructor, United States Navy.

</table>

Data given for type ship. Battleships Nos. 23 and 24 transferred to Greek Navy.

- Anti-aircraft.  
- No. 29, Turbine reduction gear.  
- No. 37, Vert. 3-exp.  
- Nos. 41 and 42, Turbine direct drive and cruising reduction gear.

**PARTICULARS OF UNITED STATES BATTLE CRUISERS**

| Lexington class, Nos. 1, 2, 3, 4, 5 and 6: Constitution, Constitution, Lexington, Ranger, Saratoga, United States | 850 0 105 51 31 0 45,500 *33,50 *180,000 | Turbine, electric reduction gear 8-16", 50 cal. 16-8", 50 cal. 4-21" submerged 4-21" above water | Contract dated | April 26, 1916 | 57 | 1264 |

- Anti-aircraft.  
- Speed and H.P. estimated.

Data given for type ship. 
1 Two of class not completed, other two interned Scapa Flow, one sunk. 
2 Length on water line. 
3 Estimated. 
4 Length between perpendiculars. 
5 Scuttled by crew at Scapa Flow. 
6 Surrendered. 
7 Dismantled in Germany. 
8 One of class transferred to Turkey, Moltke scuttled at Scapa Flow. 
9 One of class not completed, other two scuttled at Scapa Flow. 
10 Not completed. 
11 Mining Cruiser. 
12 Four of class not completed, rest scuttled at Scapa Flow. 
13 Frankfurt included, scuttled at Scapa Flow.

## TABLE X

**Effective Fighting Ships Built and Building**

The rapidly diminishing value of the older battleships and first-class or armored cruisers makes them no longer effective. The United States and other Powers retain ships long on their lists, and therefore British ships are kept here for purposes of comparison.

<table>
<thead>
<tr>

</tbody>
</table>

† Excluding 97 destroyers of classes A to F. A number of destroyers have been completed since this table was made up early in April, 1919. The Maona class battle-cruiser is the only German ship that may be completed. The other vessels indicated in this column will not be proceeded with.

‡ Twelve destroyers projected.

The destroyer and submarine figures given for Russia represent the situation before the war, except that vessels known to have been lost have been removed from the list.

The French navy lost also among lesser craft the following: 2 gunboats; 1 torpedo gunboat; 1 sloop; 11 destroyers; 10 torpedo boats; 19 submarines; 2 mine layers; 3 auxiliary cruisers; 2 armed merchant cruisers; 1 special vessel. Grand total — 48.

### RUSSIA

#### Battleships Townage Date
- Syroboednyaya Roshiyu: 18 June 1916
- Imperatoress Mariya: 20 Oct. 1916
- Peresvet: 4 Jan. 1917
- Ilava: 17 Oct. 1917

#### Armored Cruiser
- Pallada: 7,775 11 Oct. 1914

#### Cruiser
- Cheshme: 3,130 28 Oct. 1914

And in addition: 3 gunboats; 1 armed auxiliary; 2 mine layers; 23 destroyers; 10 submarines; 3 hospital ships; 1 auxiliary cruiser.

### JAPAN

#### Battleship
- Kawachi: 12 July 1918

#### Light Cruisers
- Kasagi: 1 July 1916
- Utsusemi: July 1917
- Takashimo: July 1917

And in addition: 2 destroyers; 1 torpedo boat; 1 training ship; 4 special service ships. Grand total — 2.

### ITALY

#### Battleships Townage Date
- Benedetto Brin: 13,215 28 Sept. 1915
- Regina Margherita: 11 Dec. 1916

#### Armored Cruisers
- Amafi: 9,958 7 July 1915
- Garibaldi: 7,338 18 July 1915

Among lesser craft Italy lost: 1 mine vessel; 1 monitor; 1 battlecruiser; 8 destroyers; 4 torpedo boats; 8 submarines; 1 gunboat; 1 transport; 2 auxiliary cruisers. Grand total — 27.

#### Postcard
- One river gunboat.
- Romania: One torpedo boat.
- Greece: One destroyer.

* Afterward raised and restored.

### AUSTRIA-HUNGARY

#### Battleships Townage Date
- Senj Tatvan: 3,264 10 June 1916
- Viribus Unitatis: 1 Nov. 1918

#### Cruisers
- Zenta: 3,397 7 Nov. 1914
- Kaiserin Elisabeth: 3,957 7 Nov. 1914

Lesser craft lost by Austria included: 1 river monitor; 1 training ship; 5 destroyers; and 12 submarines. Grand total — 19.

### TURKEY

#### Battleships Townage Date
- Musudarrah: 10,000 14 Dec. 1914
- Barbarossa: 9,900 8 Aug. 1915

#### Cruiser
- Magdudissah: 3,330 3 April 1915

Minor losses were: 1 light cruiser; 1 armed auxiliary; 13 gunboats; 3 destroyers; 6 torpedo boats; 2 submarines; and 2 mine layers. Grand total — 26.

### WART

WART, an elevation on the skin, usually a collection of lengthened papille, closely adherent and ensheathed by a thick covering of hard dry cuticle. From friction and exposure to the air the surface presents a horny texture and is rounded off into a small button-like shape. Simple warts are commonly seen on the hands and fingers (rarely on the face or elsewhere) of persons of all ages, but especially of children. Among other varieties of warts are (1) the verruca digitata, more elongated in shape and less protected by cuticle than the common wart and which is apt to occur on the scalp, especially in persons of adult age and sometimes occasional great annoyance in brushing and combing the hair; (2) subungual warts, generally of syphilitic origin, growing, as their specific name implies, beneath or at the side of the finger or toe nail and which originate beneath the nail, as they increase crop out either at the free extremity or the side of the nail and are usually troublesome, often very painful; (3) venereal warts, caused by the direct irritation of the discharges of gonorrhoea and syphilis, occurring about the parts which are liable to be polluted with such discharges. These last attain a larger size and are more fleshy and vascular than other warts. It is supposed that warts are always due to some local irritation. Venereal warts are certainly contagious; with regard to others, nothing can be said positively on this point. In consequence of the capricious way in which warts often undergo spontaneous cure, there are numerous popular "charms" for their removal. Common warts are so apt to
WARTON, Joseph, English poet and critic: b. Dunsfold, Surrey, 1722 (baptized 22 April); d. Wickham, 23 Feb. 1800. He was the son of Thomas Warton the elder and brother of Thomas Warton the younger (q.v.). He studied at his father's grammar school at Basingstoke; then at Winchester, and finally at Oxford College, Oxford, where he was graduated B.A. 13 March 1743-44. During the next 10 years he served successively as curate at Basingstoke, rector of Winslade and rector of Tunworth. Then, in 1755, he became usher, or second master, and in 1766 headmaster of Winchester College. In 1759 he had received from Oxford the degree of M.A.; in 1768 he received those of B.D. and D.D. He remained at Winchester 38 years, but, after suffering three student insurrections, he resigned in 1793 and withdrew to a living at Wickham. There he died, 23 Feb. 1800.

Among English writers of the 18th century, Joseph Warton is significant for being probably the earliest consciously romantic poet. The romanticism evident in his work is due to the cold correctness of the school of Pope, and in his enthusiasm for Spenser, Shakespeare and Milton, appears consistently throughout his works. It appears in 'The Enthusiast; or the Lover of Nature,' written in 1740 when Warton was 18 and included in his first volume 'Ode on reading West's Pindar' (1744).

"What are the laws of artful Addison, Coldly correct, to Shakespeare's writhings wild? Whom on the wounding Aven's willow'd banks Pair Fancy found, and bore the smiling babe To a close cavern."

His romanticism he again avows in the advertisement to his second volume 'Odes on Various Subjects' (1746). "The Public has been so much accustomed of late to didactic poetry alone, and essays on moral subjects, that any work where the imagination is much indulged, will perhaps not be relished or regarded. The author therefore of these pieces is in some pain lest certain austere critics should think them too fanciful or descriptive. But as he is convinced that the fashion of moralizing in verse has been carried too far, and as he looks upon invention and imagination to be the chief faculties of a poet, so he will be happy if the following Odes may be looked upon as an attempt to bring back Poetry into its right channel."

This romantic creed he states even more completely in his 'Essays on the Genius and Writings of Pope' (1757). This book has been called the "most important of all, the critical works that aided the Romantic movement...one of the most significant books of the whole century." In it, Warton, openly attacked the poetry of Pope; demolished the ideals of the pseudo-classical school, and in their place set up the romantic standards that have since been accepted. It makes Warton, despite the comparative inconsequence of his poetry, one of the most important forerunners of English Romanticism.

His chief works are 'Ode on Reading West's Pindar' (1744); 'Odes on Various Subjects' (1746); an edition of Virgil in Latin and English, to which he contributed translations of the Eclogues and the Georgics (1753); 24 essays, chiefly in literary criticism, contributed to 'The Adventurer' (1753-54); 'Essays
on the Genius and Writings of Pope¹ (Vol. I, 1757; Vol. II, 1782), and an edition of Pope's works in nine volumes (1797).

ARTHUR H. NASON,
Professor of English, New York University.

WARTON, Thomas, English writer: b. Basingstoke, 9 Jan. 1727 or 28; d. Oxford, 21 May 1790. He was the younger son of Thomas Warton, the brother of Joseph Warton (q.v.). He studied under his father until, at the age of 16, he matriculated, 16 March 1734-44, at Trinity College, Oxford. With this university he was associated for life. Here he received his B.A., in 1747; took orders; became a tutor; received the degree of M.A., in 1750, a fellowship in 1751, and the degree of B.D. in 1767. For two terms of five years each, beginning in 1757, he was professor of Poetry; and in 1785 he was appointed Camden Professor of History of Oxford, and Poet Laureate. In 1771, he was made a Fellow of the London Society of Antiquaries; and from 1782 he was, like his brother Joseph, a member of Dr. Johnson's Literary Club.

Warton's significance in English literature consists in the influence that he exerted in favor of the romantic revival in the 18th century. In his 'Observations on the Faerie Queen of Spenser,' (1754), in his critical edition of Milton's early poems, and especially in his great 'History of English Poetry' (1774-81), he demonstrated to all who could understand, that English poetry did not begin with Dryden, and that it might rightfully deal with subjects other than those chosen by the Queen Anne wits. His 'Observations on the Faerie Queen' is a strong plea for romanticism, and for a study of Spenser, of chivalry, and of medieval life. His 'History of English Poetry' embodies, in the clear prose style of Warton's day, a knowledge, rare even in our own, of English poetry from the close of the 11th century to the end of the Elizabethan period. Later scholarship has discovered in Warton's 'History' some errors of detail; but it remains, nevertheless, a monument of wide reading and profound research. In addition to these historical and critical works, Warton took part in the romantic movement by his experiments in the verse-forms and subject matter of Spenser and Milton. Notable among his imitations of the latter are his sonnets, his ode on the 'Approach of Summer,' and his 'Pleasures of Melancholy.'

His chief works are 'The Triumph of Isis' (1749); 'Newmarket, a Satire' (1751); a humorous 'Guide' to Oxford (1760); an anthology of university wit entitled 'The Oxford Sausage' (1764); 'Observations on the Faerie Queen of Spenser' (1754); 'History of English Poetry from the Close of the 11th to the Commencement of the 18th Century' (Vol. I, 1774; Vol. II, 1778; Vol. III, 1781; Vol. IV, never published); 'Poems' by John Milton... with Notes Critical and Explanatory' (1785); a collection of his own poems (1777); fourth edition (1789); and another edition, corrected by himself before his death (1791). Consult his 'Life' by C. Rinaker (Urbana, Ill., 1916).

ARTHUR H. NASON,
Professor of English, New York University.

WARWICK, Richard Neville, EARL OF, English soldier and statesman, known as the 'Kingmaker': b. about 1428; d. Barnet, Hertfordshire, 14 April 1471. In the battle of Saint Albans (1455), the opening action of the Wars of the Roses, he fought on the Yorkist, the winning side, and three years later as lord deputy of Calais and admiral of the fleet gained a splendid success over the Spaniards, but a quarrel between his followers and those of the king led to charges against him which resulted in his taking the field of Ludlow with his cousin, the Duke of York (1459). On being defeated, he withdrew to Calais, and thence in the following summer recrossed to Kent, and mastering London, brought about the compromise by which Henry VI was to reign for life, but York was to be recognized as his successor. Thereupon Margaret of Anjou, routing and slaying York and Salisbury at Wakefield, advanced to Saint Albans, where a second battle ended in Warwick's defeat. Warwick, however, by this time, was the young Earl of March (now Duke of York), and boldly placed himself on the throne as Edward IV, then chasing the Lancastrians back to Yorkshire, cut them to pieces on the field of Towton on 29 March 1461. Warwick then married his daughter to the Duke of Clarence, and after seizing on Edward's person, executing the queen's father and brother, entered upon a scheme for making Clarence king.

Failure drove him once more to France, where, through the influence of Louis XI, he engaged to restore the crown to Henry VI, with the understanding that Margaret wed her son to Warwick's daughter Anne. His landing in Devonshire came like a clap of thunder to Edward IV, who from the North, where he was busy quelling a revolt, escaped to Burgundy, leaving Warwick master of the kingdom. Edward returned in six months' time, and Warwick with his brother was routed and slain at Barnet.

WARWICK, England, a market-town, capital of Warwickshire, on the right bank of the Avon, nine miles northwest of London. The principal buildings are the church of Saint Mary, the Earl of Leicester's hospital for aged brethren, the shire-hall, jail, museum, endowed grammar school, east and west gates, etc. The chief manufacture is gelatine; and the trade in cattle, corn and provisions is considerable. On the opposite bank of the river, crowning a solid rock, is the ancient and magnificent castle, the residence of the earls of Warwick. The date of the original erection is unknown. Caesar's Tower, the most ancient part of the structure, is 147 feet high; Guy's Tower, 128 feet high, was erected in 1394. The approach to the grand front exhibits three stupendous towers, and the entrance is flanked with embattled walls covered with ivy. It was partially destroyed by fire in 1871; but the most ancient portion remains uninjured. Pop. 12,500.

WARWICK, N. Y., village in Orange County, on the Wawawanda Creek, and on the Lehigh and Hudson River Railroad, about 30 miles southwest of Newburgh and 10 miles south of Goshen. It is in an agricultural region and near by are iron mines and granite quarries. In the vicinity are the villages of Glenmere, Greenwood, Clark's and Wawawanda. The manufacturing establishments are railroad...
WARWICK — WASHBURN

shops, a foundry, creameries and fabric-rose works. It has six churches: Warwick Institute, graded schools and a school library. There are two banks. The village is a favorite summer resort. Pop. 2,318.

WARWICK, R. I., town in Kent County, on the Pawtuxet and the Providence rivers, the Cowsett and Narragansett bays and on the New York, New Haven and Hartford Railroad. It is five miles south of Providence. The town includes several villages, in each one of which there are graded schools, and in some, libraries. The largest of these villages is West Warwick, which in 1915 had 13,782 population, and Warwick 13,302. The manufacturing interests, which are large, centre chiefly in West Warwick, which has large cotton mills, machine shops, grist mills, a thread mill and a bleachery. Warwick was settled in 1642 by a colony of 12 Englishmen, under the leadership of Samuel Gorton. The place was first called Shawomet, but in 1648 the name was changed by admirers of the Earl of Warwick. Massachusetts claimed control of the colony and in 1643 the result of the contentions was that the place was nearly destroyed. Indians attacked the place several times, and in 1676 burned a number of houses and wounded many of the defenders of the town. Nathanael Greene (q.v.) was born in Warwick.

WASATCH (wä'säch) MOUNTAINS, a range in Utah, the eastern boundary of the Great Basin, extending from the northern boundary of the State south to the southern edge of the State, approaching the Grand Canon of the Colorado. Several peaks are nearly 12,000 feet high; at the base and among the foot-hills are deep canyons. Silver in large quantities is found in these mountains, also coal. See also ROCKY MOUNTAINS; UTAH.

WASCO (wäs'kō) INDIANS ("grass" or "grass peoples"): a tribe of the Chinookan stock of North American Indians, also known as Dalles Indians and as Wascoups. They formerly claimed the country about The Dalles, on the south bank of Columbia River, in Wasco County, Oregon. They are related to the Wushum or Thalgit, the easternmost extension of the Chinookan stock. They were participants in the Wasco treaty of 1855 and are now on Warm Springs Reservation, Oregon, numbering about 250.

WASECA, wä'sē'kä, Minn., city, county-seat of Waseca County, on Clear Lake, and on the Minneapolis and Saint Louis and the Chicago and Northwestern railroads, about 60 miles south by west of Minneapolis and 25 miles south by east of Mankato. It is in an agricultural and stock-raising region. It has a large roller mill, railroad shops, flour mills, creameries and machine shops. The Minnesota Chautauqua holds its sessions on their grounds bordering on the lake and adjoining the city. There are 12 churches, the Holy Child Jesus Academy, graded public schools, a school library and two newspapers. Pop. 3,054.

WASH, England, a wide estuary on the east coast, between the counties of Lincoln and Norfolk, 22 miles in length and 15 miles in average breadth. It is surrounded by low and marshy shores and receives the Witham, Welland, Ouse and Nen rivers. The estuary for the most part is occupied by sandbanks, dry at low water and intersected by channels through which the river flows with the Sea. On both sides of the channel by which the Ouse falls into the sea considerable tracts of land have been reclaimed. Anchorage is afforded by vessels by two wide spaces or pools of water, called respectively Lytles and Deepes, opposite the Norfolk, and Boston Deep, off the Lincoln coast.

WASHBottle, in analytical chemistry, an apparatus used for delivering a fine jet or stream of liquid on to a precipitate for the purpose of washing it, or for removing any residue of a solution or solid particles from one vessel to another. It consists of a flask of hard glass, fitted with a cork or india-rubber stopper perforated in two places. Through each perforation is passed a piece of bent glass tubing, one being carried within half an inch of the bottom of the flask, and the portion of tubing outside drawn to a fine open point. The other tube is carried just within the bottle, and it is to the outer end of this that the lips are applied in allowing into the apparatus in order to expel the liquid contained in it.

WASHBURN, wäs'burn, Cadwallader Colden, American soldier, son of Israel Washburn (q.v.): b. Livermore, Me., 22 April 1818; d. Eureka Springs, Ark., 14 May 1882. He studied law, was admitted to the bar in 1842 and engaged in practice at Mineral Point, Wis. He founded a bank there in 1852, dealt extensively in real estate and in 1855–61 was a member of Congress. At the outbreak of the Civil War he organized a cavalry regiment, of which he was appointed colonel. He was engaged in the Arkansas campaign, received his commission as major-general of volunteers in 1862, participated in the movements around Vicksburg and later was assigned to command the 13th corps in the Department of the Gulf. He was transferred to Texas with a portion of his command in 1863, captured Fort Esperanza, 29 Nov. 1863, and in 1864 was placed in command of the district of West Tennessee. He was again member of Congress in 1867–71, was governor of Wisconsin in 1871–73 and subsequently engaged in lumber and flour manufacturing. He founded the Washburn Observatory at the University of Wisconsin.

WASHBURN, Charles Ames, son of Israel Washburn (q.v.), American editor and diplomat; b. Livermore, Me., 16 March 1822; d. New York, 26 Jan. 1889. He was graduated at Bowdoin in 1848, went to California in 1850, entered journalism in San Francisco and became editor and proprietor of the Alta Californiana, the first newspaper on the Pacific Coast to advocate the principles of the Republican party, of which he was one of the organizers in that State. From 1858 to 1861 he was editor and proprietor of the San Francisco Daily Times. In 1860 he was chosen editor-at-large, and in the following year was appointed by President Lincoln minister to Paraguay, a post which he occupied for seven years, covering most of the period of the war between that country and Brazil and her allies. In 1868, under the tyranny of Francisco Solano Lopez, many foreigners, as well as Paraguayans, were put to death on an unfounded charge of conspiracy
against the government, and Washburn, on account of his efforts to save the lives of his associates, was accused of complicity in the plot. His life was preserved through the intervention of a United States naval force, the gunboat Wasp taking him away from the country. Disagreement with certain naval officers grew out of these incidents, and the circumstances were investigated by the House Committee on Foreign Affairs. The result was Washburn’s complete vindication. He published a History of Paraguay, with Notes of Personal Observations and Reminiscences of Diplomacy under Difficulties (1871), giving a graphic account of these events; From Poverty to Prosperity; Graduated Taxation; Political Evolution; and several novels. He was the inventor of a typograph and other mechanical devices.

WASHBURN, Elihu Benjamin, American diplomat, son of Israel Washburn (qv): b. Livermore, Me., 23 Sept. 1816; d. Chicago, III., 22 Oct. 1887. He was educated at Harvard, admitted to the bar in 1840 and engaged in practice at Galena, Ill. He was a member of Congress from 1852-69, when he was appointed Secretary of State by President Grant, an office he soon afterward resigned in order to become Minister Plenipotentiary to France. He was the only Foreign Minister to remain at his post in Paris throughout the Franco-Prussian War, and the American legation became a refuge for Germans and other foreigners unable to leave the city during the siege of the city and the period of the Commune. His firmness in his course won the gratitude of the European governments and he was granted special honors by the German emperor and Bismarck, as well as by the French leaders, Gambetta and Thiers. He returned home in 1880. He published Recollections of a Minister to France (1887).

WASHBURN, Emery, American jurist: b. Leicester, Mass., 14 Feb. 1800; d. Cambridge, Mass., 17 March 1877. He entered Dartmouth College, and from there went to Williams, where he was graduated in 1817. Admitted to the bar in 1821, he practised in Leicester until 1829, when he spent 30 years in Worcester. Having served in both branches of the Massachusetts legislature, in 1844 he became a justice of the Court of Common Pleas, a position which he held three years. In 1854-55 he was governor of the State. From 1856 to 1876 he served as Bussey professor in the Harvard Law School. Besides lectures, pamphlets, etc., his legal publications include American Law of Real Property (1860) and American Law of Easements and Servitudes (1863).

WASHBURN, George, American educator: b. Middleboro, Mass., 1 March 1833; d. 1915. He was graduated from Amherst in 1855 and from Andover Theological Seminary in 1859. He was appointed professor of philosophy at Robert College, Constantinople, Turkey in 1868; acting president there in 1870-77 and then president to 1903. He was an authority on the politics of southeastern Europe and in recognition of his services in behalf of Bulgarian liberty and the general elevation of the people he received from the first Bulgarian Parliament a vote of thanks, and in 1884 from the Prince of Bulgaria the Order of Saint Alexander. He delivered an address on Mohammedanism at the World’s Parliament on Religions at Chicago in 1893, and in 1908 returned to the United States, publishing the following year his Fifty Years in Constantinople, which required several editions.

WASHBURN, Israel, American shipbuilder and trader: b. Raynham, Mass., 18 Nov. 1784; d. Livermore, Me., 1 Sept. 1876. In 1806 he removed to Maine, then a part of Massachusetts, and having a population of about 200,000, Two years later at a place then called White’s Landing (now Richmond), on the Kennebec River, he began shipbuilding in partnership with Barzillai White, and in 1809 established a trading-post at Livermore (now in Androscoggin County), where he soon after settled. He reared many children and several of his sons rose to positions of distinction, making the family name conspicuous in American history.

WASHBURN, Israel Jr., American lawyer and War Governor, son of the preceding: b. Livermore, Me., 6 June 1813; d. Philadelphia, 12 May 1883. He studied law, was admitted to the bar in 1834, and in the same year settled at Orono, Me., where he practised his profession continuously until 1859, when he was elected to Congress. He was four years in that body and became prominent among the anti-slavery members of the House in the critical period just before the Civil War. In 1860 he was elected governor of Maine. Re-elected in 1861, he declined a third election, and in 1863 accepted an appointment as collector of customs for the port of Portland, an office which he continued to hold until 1877. During his terms as governor he energetically supported the Federal government by raising, equipping and forwarding troops with a promptness which earned for Maine an honorable position among the States that upheld the Union cause, and placed his own name in the list of great War Governors of the period. In 1875 he was elected to the presidency of Tufts College, but declined the office. He published Notes, Historical, Descriptive, and Personal, of Livermore, Maine (1874), and also contributed frequently to periodicals.

WASHBURN, Margaret Floy, American psychologist: b. New York, 25 July 1871. She was graduated at Vassar College in 1891, and took her Ph.D. at Cornell University in 1894. She was professor of psychology and ethics at Wells College in 1894-1900; warden of Sage College, Cornell, in 1900-02; and assistant professor of psychology at the University of Cincinnati in 1902-03. In 1903-06 she was associate professor of philosophy at Vassar; and since 1908 she has been professor of psychology there. She is author of many contributions to philosophical journals and of Animal Mind: Textbook of Comparative Psychology (1908); Movement and Mental Imagery (1916).

WASHBURN, Samuel Benjamin, American naval officer; son of Israel Washburn (1784-1876) (qv): b. Livermore, Me., 1 Jan. 1824. He became a shipmaster in the merchant marine, and later engaged in the lumber trade in Wisconsin. During the Civil War he entered the United States navy as volunteer, and at the battle of Fort Darling won special commendation for skill and gallantry. Later
he commanded a squadron and performed many valuable services for the government.

WASHBURN, William Drew, American legislator and manufacturer, son of Israel Washburn (q.v.) b. Livermore, Me., 14 July 1831. He was graduated at Bowdoin in 1854, admitted to the bar in 1857, and in that year engaged in law practice in Minnesota. He was a member of the Minnesota legislature in 1859 and in 1871; was surveyor-general in 1861-65; served in Congress in 1879-85; and in 1889-95 was a United States senator. He engaged extensively in the lumber and flour industries, was one of the builders of the Minneapolis, and Saint Louis Railroad, of which he was president until 1889. He later became president of the Bismarck, Washburn and Great Falls Railroad Company.

WASHBURN, Me., town in Aroostook County, on the Aroostook River, 50 miles north by west of Houlton. It is a distributing centre of considerable importance, although it is eight miles from a railroad station. It is a favorite summer resort. It has three churches, a high school, graded school and public library. Pop. 1,582.

WASHBURN, Wisc., city, county-seat of Bayfield County, on Lake Superior and on the Northern Pacific and the Chicago and Northwestern railroads, about 50 miles east of Superior. Washburn has 6000 inhabitants. It was founded in 1865 as a Jesuit mission in the place now occupied by the city. Washburn's first permanent settlement was made in 1883, and in 1884 it was incorporated. In the vicinity are large manufactories of explosives, brownstone quarries and in the forests there is considerable lumbering. There are nearly 2,000 employees in the industrial establishments. Washburn ships large quantities of stone, lumber and grain; and distributes to the lumber camps and the towns and hamlets of the vicinity general merchandise. There are several church buildings, the county courthouse, which cost $50,000, and several good business blocks. The educational institutions are four schools, one Roman Catholic parish school and a school library. There are two banks and two newspapers. The majority of the inhabitants are Scandinavians. Pop. 3,830.

WASHBURN COLLEGE, located at Topeka, Kan. It was founded in 1855 by the General Association of the Congregationalists of Kansas, but is non-sectarian in policy and government. It was first called Lincoln College and the name changed in honor of Ichabod Washburn of Worcester, Mass., who gave the college $25,000. The college is coeducational. The course of study was at first not above the academic grade, but was soon expanded to a full college course and other departments added until the college now includes four departments, (1) the School of Letters, opened in 1903; (2) the School of Fine Arts; (3) the Summer School. The college confers the degrees of B.A. and B.S., for the completion of a four years' course and the degrees of M.A. for graduate work. For the bachelor degrees the course in the first two years is partially prescribed and partially elective, for the last two years, entirely elective. The electives must include a major and a minor taken in courses not open to freshmen and totaling 28 hours. Candidates for the B.S. degree must elect the mathematical and scientific courses for their major and minor requirements. Biblical literature, Hebrew and pedagogical courses are included in the curriculum. The School of Law offers a three years' course and confers the degree of L.L.B. The School of Fine Arts was organized as a separate school in 1903, music and art departments having been established some years before. This school includes the departments of music, drawing, painting and expression. The music department offers four years' collegiate courses in pianoforte, organ, violin and vocal culture, leading to the degree of bachelor of music; and a two-year normal course for public school teachers. The students maintain five literary societies, two for men and three for women, an oratorical association, Christian associations, and an athletic association. In addition to the intercollegiate sports in which the college participates, an annual college field-day has been inaugurated. The college's campus of 160 acres just outside the city on elevated ground; the buildings include Rice Hall (originally Science Hall, the name having been changed in 1902), Whitt Hall, the observatory building (erected in 1903 for the departments of physics and astronomy), the MacVicar chapel, the Library, Hartford Cottage and Holbrook Hall (women's dormitories), Carnegie library and Thomas gymnasium. The library contains 26,000 volumes; in addition the school of law has a separate library. The Topeka Public, the Kansas State, the Kansas State Historical Society and the Academy of Science libraries are open to students. The enrolment in 1917-18 was 709 students, of whom two-thirds were in the college department.

WASHING OF FEET. See FEET WASHING.

WASHING MACHINE, a machine for washing clothes. A great number of machines have been made, but a few of them being that the clothes are agitated by artificial means in a vessel or trough containing the cleansing agents. One of the great advantages of the washing machine as compared with the hands is that the water can be used when boiling hot. In some, provision is made for retaining the steam which effectually bleaches the clothes, and they generally have also roller attachments for wringing and mangling. See LAUNDRY MACHINERY.

WASHINGTON, wō'shĭng-ton', Booker Taliaferro, American negro educator; b. near Hale's Ford, Franklin County, Va., about 1858; d. 14 Nov. 1915. After the Civil War he went to Malden, W. Va., where he worked first in a salt-furnace and afterward in a coal-mine, obtained some rudiments of education in a night-school there, and finally after many difficulties, recounted in the autobiography 'Up from Slavery' (1901), got to the Hampton Normal and Agricultural Institute (Va.) (q.v.), where he studied in 1872-75. After a two-years' interval of teaching at Malden, he obtained further training at the Wayland Seminary (Washington D. C.), and in 1879 was
made an instructor at Hampton. He had charge of the work of the Indian pupils then being experimentally introduced into the institution and established the night-school as a regular feature of the institution. In 1881 he was selected by Gen. S. C. Armstrong of Hampton on the application of citizens of Tuskegee, Ala., to start in that place in institution on the plan of Hampton. The State legislature granted an appropriation of $2,500 annually for the salaries of the teaching force, but the Tuskegee Normal and Industrial Institute (q.v.) then existed in name only, without land, buildings or credit. Washington, with himself as the only instructor, opened the school with an enrollment of 30 in an old church and a shanty. Later he purchased a plantation about a mile from Tuskegee, and removed the school thither to its present site.

In 1818 the institution had 191 officers and instructors, 1,451 students and over 2,500 graduates. Its development was due chiefly to the activity of Washington in bringing the nature and merits of the work to public attention, and the originality and effectiveness of his methods. He gave the blacks a practical education along lines of trade and industry, leading to an ultimate position of economic independence in the South. If this were attained, political rights now denied would not long be withheld. He became well known as a forceful public speaker, wrote his most noteworthy address probably being that given in 1895 at the opening of the Cotton States and International Exposition in Atlanta, Ga. He organized the National Negro Business League at Boston in 1900. Among his writings are 'The Future of the American Negro' (1899); 'Up from Slavery' (1901), the interesting autobiographical narrative referred to above; 'Character-Building' (1902), collected addresses to pupils of Tuskegee; and 'The Story of the Negro' (1909); 'The Man Farthest Down' (1912). Consult Thrasher, M. B., 'Tuskegee' (1900), to which Washington contributed an introduction; an article by W. D. Howells in the North American Review, Vol. 173, pp. 280-288, 1901; his 'Life' by Stone and Scott (Garden City 1916); and Riley, D. F., 'The Life and Times of Booker T. Washington' (New York 1916).

WASHINGTON, Bushrod, American jurist: b. Westmoreland County, Va., 5 June 1762; d. Philadelphia, 26 Nov. 1829. He was nephew of George Washington. He was graduated in 1778 from the College of William and Mary; studied law with James Wilson (1742-98) at Philadelphia and practised in Westmoreland County. From 1794 until the surrender at Yorktown, he served in Colonel Mercer's cavalry troops, in 1797 became a member of the Virginia house of delegates; and in 1788 of the Virginia convention for ratification of the Constitution of the United States. In December 1798 he was appointed an associate justice of the United States Supreme Court. He was the first president of the American Colonization Society (1817) of the American Colonization Society of America, the National. Among his publications are 'Reports of Cases in the Court of Appeals of Virginia' (1798-99); 'Reports of Cases Determined in the Circuit Court of the United States for the 3d Circuit, 1803-27' (edited by R. Peters, 1826-29). Consult Binney, 'Life' (1858).

WASHINGTON, George, American soldier-statesman, and first President of the United States: b. in the family homestead at Bridges Creek, in Westmoreland County, Va., 22 Feb. 1732; d. Mount Vernon, 14 Dec. 1799. He was the fifth child of Augustine Washington, who belonged to the third generation of Washingtons who had lived in America. Augustine was a well-to-do planter who might have afforded every school advantage to his son had he not died before George was 12 years of age. The father's death left the son in his mother's care, with a farm on the Rappahannock as his sole inheritance. This precluded any hope of an education in England such as his elder brothers had enjoyed, and he, therefore, received the practical and elementary instruction afforded in colonial Virginia. He learned something in books but more about the forest life, and manly sports, and the habits of a Virginia gentleman. Formal schooling he quit altogether at the age of 16, and began surveying in the employment of Lord Fairfax, an Englishman who came to Virginia to look after his inherited lands. Fairfax's military training taught Washington some of the conduct and breeding of a man of the world. Though Washington was a mere boy and almost self-taught in surveying, yet he was a good woodsman, and he did his work so well that Fairfax's forest lands that for three years he was kept busy at the profession, which in that day approached nearer to woodcraft than expert mathematics. Meanwhile he did not neglect to give considerable time to the study of military tactics and the manual of arms, for which a Virginian of his standing might have use. This life came to an end in 1751, when the failing health of his elder brother Lawrence caused him to seek recuperation in the Bahamas. Thither George went with him, only to bring him back to die. As executor of his brother's will, he assumed so many cares that his surveying profession had to be abandoned altogether.

Before Lawrence's death he had given George his place in the Virginia militia, and in 1752 Lieutenant-Governor Dinwiddie gave the popular young soldier a commission as major and adjutant-general in charge of four military districts of the State. Hardly was he in charge of his new office when a movement of the French to insure their control of the region between the Mississippi and the Alleghenies made war between the French and English in America almost inevitable. From Canada the French had sent 1,500 men to Presque Isle on Lake Erie to erect a fort, intending thence to push through the forest to the Allegheny River and down it to the Ohio. There they would drive out the English, who were beginning to push into that region.

Governor Dinwiddie saw the danger and, after getting authorization from England, he selected Major Washington for a dangerous midwinter journey through the forest to the French fort to command them to depart and not to trespass upon England's claims. The hardy young surveyor made the terrible journey only to be given the hint by the French to come and stay. Upon his return, the Virginia assembly was persuaded to furnish funds for
Washington was made lieutenant-colonel, and under Colonel Fry set out to resist the French advance. Fry died on the march, and Washington bore the brunt of the enterprise. A rough and treacherous fort built by an advance party of backwoodsmen near the junction of the Ohio and the Allegheny was taken by the French, who thereupon built Fort Duquesne and awaited the Virginians. In that neighborhood, at Great Meadows, Washington camped. A skirmish took place in which a small body of French under Dumoville were defeated, and then the defenses, which Washington had built and called Fort Necessity, were attacked, 3 July 1754, by superior French forces. A wretched day of fighting in the rain was followed by a parley, at which Washington sensibly agreed to withdraw from a hopeless conflict. Upon his return to Virginia he was unfairly reduced in rank and indignantly resigned his commission.

The war for the possession of America was now taken up by the home government. England sent the headstrong General Braddock to help the English colonists to drive out the French. Upon his arrival in Virginia he made the acquaintance of Washington and of his staff, and made him a member of his staff — an offer which was eagerly accepted. Braddock did not realize the difficulties of forest warfare, and without heeding some of the wise counsel given him by Amherst, marched toward Fort Duquesne with 2,000 regulars brought from England and some provincial recruits. Eight miles from the French fort, he was attacked by an unseen enemy, and the terrified regulars were held in solid ranks to be shot down until sheer fright made them break into retreat. Braddock was mortally wounded, and it was left to Washington to conduct the retreat.

After he had led the shattered forces back to Virginia, he became for a time the chief stay of his province in guarding her frontiers against the savages, until, in 1758, he was sent with the British General Forbes again to attempt the capture of Fort Duquesne, and this time successfully. The capture of Quebec 1759, and England’s power in America was firmly established.

When England and her colonies quarreled, Washington took an early and decided part in asserting and defending the colonial rights, though with other American leaders he long looked and hoped for conciliation. To him the Stamp Act was "a direful attack on the liberties of the colonists." In 1769 he thought something must be done to maintain the liberty which we have derived from our ancestors. He approved of awakening English attention to American rights "by starving their trade and manufactures," and as a member of the Virginia assembly he presented a non-importation address, and secured its passage. He was present and gave his support, in 1773, to the resolves instituting a committee of correspondence, and in 1774 he favored the proposed general congress at Philadelphia. On 1 Aug. 1774 the Congress sent a committee to the Continental Congress, where he was in the opinion of Patrick Henry unquestionably the greatest man on the floor, as far as solid formation and sound judgment, was concerned. When the second Continental Congress met, 10 May 1775, he was again a member, but he was not long to remain there.

After 10 long years of growing irritation between England and America the first blow had been struck. The enraged farmers had followed the intruding British from Concord and Lexington to the very defenses of Boston, and then with their numbers ever-increasing they settled down in a great half-circle around the town with the purpose of driving Gage, the British commander, into his ships. Everything was in confusion and men came and went much as they chose, kept to their task only by the efforts of a few natural leaders. When the men of New Hampshire and Rhode Island and Connecticut came, not even the fanatic zeal of the siege could banish the provincial jealousies. It was plain to all that there could be no great thing accomplished without a strong leader, one who would make men forget, for a time at least, the most prominent fact in colonial life — the jealous love that every man had for his own colony.

The Continental Congress was forced after a month of hesitation to assume the army before Boston as the "Continental Army." As a commander in chief Washington could not be appointed because he was too near to the scene of action, but his influence could be exercised through the appointments of the officers. Washington was chosen as General-in-Chief by the Congress, and his appointment was accepted.

The new commander-in-chief was a physical giant, over six feet, and of well-proportioned weight. His composed and dignified manner, and his majestic walk marked him an aristocrat and a masterful man. This character was heightened by a well-shaped, though not large head set on a superb neck. His blue-gray eyes, though piercing, were benevolent and widely separated, suggesting a slow and sure mind rather than wit, and brilliant imagination. Passion and patience, nicely balanced, appeared in the regular, placid features, with the face muscles under perfect control, the closed mouth and a firm chin told of the perfect moral and physical courage. His clear, pale, and colorless skin never flushed in the greatest emotion, though his face then became flexible and expressive. Mentally, the directive faculties were the more marked. He had been but half-educated, with no culture except that coming of good companionship. From that he had learned rather the tastes of a country gentleman, courtesy, hospitality and a love of sport. The soundness of his judgment and the solidity of his information were the notable qualities. He had little legal learning and was too shy and diffident for effective speech. His eloquence was the eloquence of battle. It had the note of chief men, and the echo when it threw down the gate of mortal combat.

"I will raise one thousand men," he said in 1775, "at my own expense, and march myself at their head for the relief of Boston." Of original statesmanship he had but little, and "common sense lifted to the level of genius,"
Believing in a course, he followed it, single-minded, just, firm and patient. No rash action or personal caprice ever changed to him. He was able to bear great responsibility, and courageously to meet unpopularly and misrepresentation. There was no flaw in his devotion. He was "often anxious, but never despondent," he said. Howe calculated with the greatest accuracy the exact time necessary to allow his reason for exertion," he wrote. "We shall do better next time." This spirit, and his gift for military administration, were the winning traits in the years to come.

On the day before the Continental army fought at Bunker Hill, 16 June 1775, Washington accepted the command in his modest way, refusing to accept any pay for his services, except his actual expenses. To his wife, the one person to whom he could lay bare his heart, he wrote: "I assure you in the most solemn manner that so far from seeking this appointment, I have used every endeavor in my power to avoid it... from a consciousness of its being a trust too great for my capacity." "A kind of despair" bid him into this service, and he could not refuse.

Upon his arrival at Boston, 2 July, Washington found his army an armed mob. They had done creditable things, but in a bewildering, unmilitary way. Rude lines of fortifications extended around Boston, but they were executed with crude tools and without competent engineers. A few officers were looking after the commissary department, but there was no commissary officer looking after cooking and mustering service, or the barracks or hospital, and there was only a haphazard method of paying the soldiers. There was no uniform, and the very differences in costume augmented the colonial jealousies and self-consciousness. All that distinguishes a well-drilled and equipped army from a mob was wanting; yet here was the weapon with which Washington was expected to defeat the armies of the most powerful nation of the world. Only by the exercise of all his gifts as an administrator did he get even the semblance of an army. His own great care for details, his method and punctuality had their effect upon others, and, through that, the malingerers, deserters, petty mutinies, the enemy might as well have known that the army before Boston was often on the point of dissolution. When, in December, the terms of enlistment ran out, Washington even succeeded, as he said, in disbanding one army and raising another within cannon shot of the enemy. Then early in March 1776 he made an adroit move, seized Dorchester Heights, and left the British nothing to do but evacuate Boston in the utmost haste.

The American leader had scored his first triumph, and, that assured, he hastened with his army to New York, where, it was shrewdly judged, the British would strike next. Congress urged him to hold the city at all hazards, and contrary to his better sense, he attempted the impossible. Without the control of the sea, New York, on its narrow strip of land thrust far down between two navigable waters, was a deadly trap. A military genius would have realized this, but Washington went half believing for a time that he might succeed. He placed his army in a position where every probability pointed to defeat, followed by almost certain capture or destruction. Had Howe not taken such tender care of his enemy's safety, all might have ended there. Washington was able to withdraw from Brooklyn, 30 Aug. 1776, after the defeat on Long Island, and then to evacuate New York and get behind the Haarlem, because, as an English critic said, Howe calculated with the greatest accuracy the exact time necessary to allow his reason for escape. The unbounded confidence of Washington's countrymen had proved too much on this occasion for even his steady judgment, and in response to their enthusiasm he had tried to hold a position and defend a place for which his resources were inadequate. He had become for the moment a source of danger to the Americans because they did not understand his real greatness.

Washington realized keenly his own lack of military experience on a large scale—he had no heaven-born genius, and he knew it. The skill that he finally attained was that which a strong-minded, sensible man would get in any vocation which he plied industriously, and to which he gave his heart. Washington learned as he fought, and his early errors with the consequent disaster grew steadily less, until, as a master of his profession, he issued from the war without a peer and almost beyond the reach of envy. Yet not even his ultimate military greatness explains his real service to his countrymen. It was the confidence that Washington inspired as a man, rather than his great genius as a soldier, which made him the only man in America who could carry the Revolution to a successful issue.

After losing New York Washington fought step by step, as he retreated, repulsing the British at Haarlem Heights and holding his own at White Plains, 28 Oct. 1776, but the meddling of Congress cost him some 3,000 men captured in Fort Washington, and then there was nothing for him but a retreat from the Hudson through New Jersey. This was not the only time that the democratic faction in Congress forced their military plans upon commander-in-chief. He was much hampered at first by Congressional interference in his military plans, but he soon won the limitless faith of these democratic enthusiasts, conquering all their fear of military despotism and the disposal of his own army the supremacy of a Frederick or a Gustavus Adolphus.

As the American army fell back mile after mile the character of the leader was tested to its utmost. His generals grew insubordinate, his men deserted by whole companies, throughout the Jerseys thousands took oath of allegiance to George III, and everywhere there were murmurs of discontent with this sort of a campaign. Then it was seen that Washington's courage was not mere disregard of danger, but the sort that long endures uncertainty and never shrinks responsibility, bearing in silence temporary unpopularity or exasperating misrepresentation. When the army at last crossed the Delaware the roll-call would muster but 3,000 men. Straining his powers to the utmost bounds, Washington kept this force together, and added: as many more. Concerning some of his extraordinary measures he ventured to note Congress: "A character to lose, an estate to forfeit, the inestimable blessing of liberty at stake, and a life devoted must be my excuse." Before the holidays he was ready to strike a blow
for liberty, and to sustain his character. Cross-
ing the Delaware, 25 Dec. 1776, in spite of
pitchy darkness and a grinding ice, he marched
through a sleeting storm nine miles to Trenton.
The Hessians there were surprised and driven
to surrender. Some 900 prisoners were taken
to the other side of the river, and then Wash-
ington crossed again to win another victory at
Princeton. The whole situation was changed.
The wretched retreat was forgotten or regarded
as only the prelude to the startling and brilliant
victories. In England, Walpole declared that
Washington was both a Fabius and a Ca-
millus. His whole campaign got a new color
because of its issue. In the Russian court, in
Frederick's cabinet, and in the aristocratic cir-
cles of Paris, Madrid and Vienna the campaign
was praised as if the end had been in Washing-
ton's view from the first. The victories made
Washington's military reputation rest on some-
thing tangible, to which men might point. Mere
faith such as the Americans had shown hereto-
fore had little effect on foreign critics. The
French grew more interested, and their favorable opinion had vast influence in
winning foreign aid. Washington had been so
consistently patient and brave in adversity, so
silent under unjust criticism, never talking down
his mistakes, or glossing his errors, that the
hour of victory brought its tenfold reward in
sympathy and confidence. He had quietly as-
sumed so much obloquy that any stunt of his
praise seemed unjust and ungenerous. The vic-
tories renewed American confidence in their
leader, and from that time on whatever there
was of unity for political or military purposes
among the 13 States came of the common faith
in Washington.
Congress now put its whole trust in him—
until a temporary reverse put him again in the
shadow of its distrust. It provided for long
enlistments to take the place of the evanescent
three months' levies that had ruined Wash-
ington's army heretofore, just as he had it done.
He was made a veritable dictator as to all that
might affect the success of the army, its disci-
pline and its supplies. It was well that the
commander-in-chief had made this brilliant
show, which appeared to all those who took
only the surface of the Revolution. For 18
months thereafter nothing but reverse and mis-
fortune and terrible trial fell to the leader's lot.
While Gates was gathering unearned laurels
at Saratoga, and the American cause was vastly
advanced by Burgoyne's defeat and the conse-
quent French alliance—while others were get-
ting glory and significant victories, Washington
was manoeuvring with Howe, always refusing
battle, or, as at Brandywine Creek, 11 Sept.
1777, and Germantown, 4 Oct. 1777, meeting de-
defeat. To the superficial observer there was only failure for Washington and success for his
rivals. There seemed no great work in merely
keeping an army together, delaying Howe and
keeping him from attempting a human racine's rescue. When, at last, the British settled down
cosily in the "rebel capital"—when Philadel-
phia had taken Howe, as Franklin so cleverly
expressed it—Washington encamped at Valley
Forge. By 19 Dec. 1777, his popularity waning at
the very moment when he began to render his
greater service to his country. There, in the
most trying hour, he continued to do what had
been his greatest task from the first. In spite
of jealous States and a wrangling Congress, and
while deprived of all that source of power
which a strong general in command, Washington kept together a starved and suffering army by his personal firmness,
patience and judicious handling of men.
While the burden of his trial was greatest
there grew in Congress an idea to scheme to
put Gates in Washington's place. From the
first there had been intrigue among the officers.
"I am weary to death," John Adams wrote,
after a visit to the army, "with the wrangles
between military officers high and low. They
quarrel like cats and dogs. They worry one an-
other like mastiffs, scrambling for rank and
pay like apes for nuts." Amid this Washington
had lived disturbed, but not concerned for him-
self. Now Congress was implicated in the
plotting. Some were impatient with the Fabian
policy, and, like Adams, wanted "a short and
violent war." A conceived or vain man would
have resigned and let the whole cause go to per-
dition as a vindication of himself, but Washing-
ton was nobler than that. Throughout the
Revolution he kept the same spirit that ani-
imated him in the earlier years of border fight-
ing. Then he had declared: "I could offer
myself a willing sacrifice to the butchering
enemy, provided that would contribute to the
people's case." He could "die by inches to save
a people." During the Revolution he risked
reputation, sacrificed popularity, suffered in
mind and heart all that he had been willing to
suffer in body to "save a people." Now he
silently watched the plot ripen, and at the right
moment exposed it with a royal contempt that
quite crushed the plotters.

When the winter was gone there came the
news of the French alliance. A fleet from
France was menacing the British army in Phil-
adelphia, and orders came for the evacuation of
the city. They began a march toward New
York across New Jersey. At Monmouth, 26
June 1778, the American army fell upon them,
and, but for the cowardly or traitorous conduct
of General Lee, nothing but the fragments of
the English army would have reached its
destination. In that moment men saw what a
storm came boiling to all those who were in
check. He stopped the retreat that Lee had unaccountably ordered, and in ungoverned rage
cursed him for a coward. The troops were ral-
lled, and they successfully engaged the enemy,
but the moment for victory had been lost. The
British reached New York in safety and Wash-
ington took a post on the Hudson.

Now came the supreme test that proved
the American leader's unrivaled fitness for the
work that he had to do. For three years, while
Congress was helpless, unable to tax or get aid
from the States, while it paid the soldiers in
paper, so valueless that the pay of a colonel
would not purchase oats for his horse, while
nothing but a forced levy would secure food
for the army, Washington stood firm in a hun-
dred series of battles, many of which went over
to the enemy in sheer desperation with suffer-
ing for food and clothing, while the great
country that had so much at stake seemed
absolutely indifferent in the midst of blank
ness and despair. Washington kept his heart and his pur-
pase. Again and again he was disappointed by
the failure of the promised aid from France—
the naval aid that would prevent the British
escape by sea if they were worsted on land.
At last, however, the moment came when De Grasse with a French fleet held a temporary comrade, and Lafayette had pushed Cornwallis out on the peninsula at Yorktown. A few days' hesitation would have lost the opportunity, but the man who had waited three years knew the moment for action when he saw it. Making a point that belied the enemy at New York, he kept well on the way before his aim was guessed. For 400 miles he urged his eager army, and brought 6,000 men to Lafayette's aid at just the hour to render Cornwallis' escape impossible. The siege that then began could have but one end as long as De Grasse controlled the sea. The British surrendered, 19 Oct. 1781, and the war was ended.

As men looked back over the years of strife, they saw clearly that the greatest factor in the final success of the Revolution was the personal leadership of Washington. If we seek an explanation, it was not his great mind, for Franklin's was greater; nor his force, energy, or ingenuity, for Benedict Arnold suspected him in these qualities, nor his military distance, for Charles Lee's was far more extensive; but it was the strength of character which day by day won the love of his soldiers and the peace of confidence of his countrymen. The absence of a mean ambition, the one desire of serving well his country and his fellow men, the faithfulness that could not be driven from its task through jealousy or resentment — these were the traits that gave him an unique and solitary place among the world's heroes.

Washington's service to his country was not to end with Yorktown. As he had been "first in war," because he was most fitted, so his unique character and pre-eminent place in American hearts fated him to become "first in peace." His last success had still more firmly fixed his power among the people. Their thoughts and imaginations were filled with him. But they had not even yet seen the sublimity of the place he did. The warlike and insubordinate army still in arms and with no real government in existence, Washington was the only source of authority and law that had anything more than a local influence. The west was a land that had all confusion, and America might have degenerated into a number of petty, feeble and hostile States. Worse than that, the hopes for an American republic might have been indefinitely delayed, for, in the despair which settled upon many, there seemed but one escape from the political storm that threatened — they would make Washington king. In the army this plan was gravely considered, but when broached to Washington, he expressed himself as pained that such ideas existed in the army. "I am much at a loss to conceive what part of my conduct could have given encouragement to an address which to me seems big with the greatest mischief that can fall my country." To nobody could such a thought be more disagreeable, he declared earnestly. "Let me conjure you, if you have any regard for your country, concern for yourself or posterity, or respect for me, to banish these thoughts from your mind."

When the country seemed indifferent to the deserts of the army, when there was talk of disbanding it without provision for the future or even pay for what it had done, and when as a natural result there was mutiny and threat that the army would take government into its own hands — then it was Washington tirelessly urged upon Congress and upon the States the justice of the soldiers' claims. Though he longed to go back to his home and to have his work done, yet he waited through months of weariness until the British really had left the country, and until the proper laws at least had been made to insure the soldiers' rights. Then at last he stood among his officers at Fraunces' Tavern, bidding them to take him by the hand, while he gave them each and all the warm-hearted farewell that so fittingly ended their long years of trial and companionship.

For a brief time Washington now became "a private citizen on the banks of the Potomac . . . free from the bustle of a camp and the busy scenes of public life," planning as he said to "move gently down the stream of time until I sleep with my fathers." He did not see in this happy hour that his past services had but devoted him to further duties, and that he had become "the focus of political intelligence for the New World." Even before resigning his leadership he had urged the States to put faction and jealousy away and make "an indisputable union under one federal head." As the affairs of the confederation became more and more deranged, and America, "like a young heir," as Washington wrote, wantoned and ran riot until its reputation was brought to the brink of ruin, their great leader warned them that it was in the choice of the States and depended upon their conduct, whether they would be respectable and prosperous, or contemptible and miserable as a nation.

The politically starved Congress grew daily weaker. It could not even persuade the States to carry out the terms of the treaty of peace or pay their debts to foreign countries. Congress was despised at home, and America was disgraced abroad. The weak and confused confederation went to pieces. Within the individual States the mob seemed to have gained control and the law-giving bodies abandoned themselves to paper money and other economic vagaries. There was little thought over the boundaries and commercial restrictions, one State against another, until thoughtful men like Washington urged that, if they were not a united people, they should no longer act the farce of pretending it. At last, however, his own endeavors united with others brought about a convention of the States, and that led to another which met at last in May of 1787, at Philadelphia, destined, if not purposed, to give America a new and stronger form of government. To that convention Washington reluctantly came. He thought himself a soldier but no statesman. When at last he was persuaded that the chief hope for success must come from his approval, and that his mere presence would lend dignity and power to the convention, he yielded. As the delegates slowly assembled, he grew eager for the success of the work, and would listen to no half-way measures. "Let us raise a standard to which the wise and the honest can repair," he said. "Let it be the foundation of a weak plan. When the work began he was chosen president of the convention, and, though he was no parliamentarian, his prominent place lent gravity and steadiness to the business.
After the Constitution was completed, and when it was before the country for approval, Washington had never been seen so eager for anything as for the adoption of the new scheme of government. It was only by active letter-writing that he used his influence, however, for the work of the politicians was out of character for him. The final success was very grateful to him, but, when the new government was being set up, and the whole country turned to him as their choice for President, he held back, diffident and reluctant. He yielded at last because, as Hamilton represented to him, "in a matter so essential to the well-being of society as the prosperity of a newly instituted government, a citizen of so much consequence as yourself to its success has no option but to lend his services."

His was a noble figure to stand in the forefront of a nation's history. His simple manner well graced a republic, and yet there was a gravity and a lofty courtesy that lent dignity to democratic forms. His own self-mastery was a living lesson to democracy with its ill-repute for turbulence. No more fitting ideal of manhood could have been chosen for a new republic. It is, indeed, creditable to the men of that day that they were won by a character so unpretentious.

The political leadership was very unattractive to Washington. When the formality of election was over, he went to the seat of government with "feelings not unlike those of a culprit who is going to the place of execution." He bade adieu to private life and to domestic felicity, going to his new duties with resolution, but anticipating no joy in them. On his way the demonstrations of the people only filled him with forebodings. "The decorations of the ships, the roar of the cannon, and the loud acclamations of the people which rent the skies as I walked along the streets, filled my mind with sensations as painful as they are pleasant." After he had sworn, 30 April 1789, in the open balcony of the Federal Hall, that he would faithfully execute the office of President of the United States, he read his address in the Senate Chamber. "The magnitude and difficulty of the trust," he protested once more, "could not but overwhelm with despondence one who, inheriting inferior endowments from nature, and unpractised in the duties of civil administration, ought to be peculiarly conscious of his own deficiencies."

He realized keenly from the first that he walked "on untried ground." Scarcely any part of his conduct might not thereafter be drawn into precedent. There must not be a government only, but a body of public opinion that would uphold it. Governmental action must be mixed of firmness, prudence and conciliation, said Washington, if it would win liking and loyalty as well as respect. He resolved to give it every proper form of dignity, ceremony and prestige that would appeal to the imagination of the people. Men must see that it was a real government, supreme in the land. To this end he adopted forms that seemed stiff, some unrepugnant, but which all were soon taught to respect. "If there are rules of proceeding," he wisely concluded, "which have originated from the wisdom of statesmen, and are sanctioned by the common assent of nations, it would not be prudent for a young State to dispense with them altogether."

It was not by this conservatism alone that he gave strength to the new government, but by that unerring judgment which led him to choose men like Hamilton, Knox, Jefferson and Randolph, and then to take for his guide Hamilton, the greatest and best of these for the preservation of the government. Natural leader as Washington was, he recognized the gifts and talents of others, and gave to each the task for which he was fitted. Hamilton's genius in affairs had not been in just the lines along which he was now to act, but his bold and original mind Washington saw to be a fit instrument to set the new government on a strong foundation. Hamilton quickly demonstrated the wisdom of the President's choice. He funded the public debt and established confidence in the nation's honesty. He prevailed upon Congress to assume the State debts and thus transferred the interest of creditors to the central government. A bank of the United States was created at his call, the "finest harbinger of a sound currency," being thus brought to the support of a strong government, and the commercial classes won by this attention to their interests. He was enabled to do these things successfully because he had the strong will of Washington with him. The fiscal measures had been made the President's own, because he was convinced that they were right, not merely that they were expedient. The end that was sought was the purpose that Washington held from the first, a strong and righteous government.

Hardly had things been set aright in the new nation's household than there came disturbing forces from abroad. The French people had gone upon a wild quest for liberty that threatened to turn the world upside down. The madness spread even to America — or rather seemed to leap by a strong attraction straight to America's democratic shores. France was soon fighting the conservative world, and what was more fitting than that liberal America should come to her aid? A French agent hastened to America to ask the people that very question. Washington determined that America, herself but "in a convalescent state," should not be drawn into the European struggle. She was too provincial at the best, too interested in European wars and politics, and too oblivious of her own nationality. "I want an American character," the wise President declared, "that the powers of Europe may be convinced we act for ourselves, and not for others." He would avoid their disputes and their politics, and if they will harass one another, to avail ourselves of the neutral conduct we have adopted. Washington, with a few others, stood almost alone in the advocacy of statesmanship rather than sentiment. In a few months, however, the public eyes were able to see more clearly, and the administration got the support that it deserved. The demands of the French revolutionary government were refused, and the President issued a proclamation of neutrality.

Meanwhile the country had learned that the new central government proceeded to enforce its laws even within State boundaries. The rebellion in the back counties of Pennsylvania was quelled by the strong action of the central power. There could be no return to the time
when there was no power but that of an individual State. The national government was expected thereafter to make itself felt directly upon the individual, and men began to look to it therefore in awe and reverence.

A second time Washington consented to hold the reins of power, and again, as in the Revolution, he felt the bitterness of unpopularity. All the honor that he had gained could not protect him from the hasty wrath of a people dissatisfied with his policy toward England. Because he strove for peace he was roundly abused in terms scarcely suited to a Nero, a notorious defaulter, or even a common pickpocket. It saddened but did not change him. He was only the more unwilling to serve another term, and, when his eight years of civil service ended, he said farewell to the people he had served through a generation. He gave them the simple advice that they most needed. Tears coursed down his cheeks as he turned for the last time from the throng that had listened to him in love and sorrow. Three years he lingered in retirement, at Mount Vernon, and then, as he had wished to live, amid the mild concerns of ordinary life.

V. J. KNAPP,
Head of Department of History, University of Michigan.

WASHINGTON, Henry Stephens, American geologist: b. Newark, N. J., 15 Jan. 1867. He was graduated at Yale University in 1886, and took his Ph.D. at the University of Leipzig in 1893, studying also at the American School for Classical Studies at Athens, Greece. He has conducted an extended series of geological investigations in Greece, Asia Minor, Italy, Spain, Brazil and in the United States, and is a consulting geological of high reputation. Author of *Chemical Analysis of Igneous Rocks* (1903); *Manual of the Chemical Analysis of Rocks* (1904; 2d ed., 1910); *The Roman Cotic Regions* (1907), etc.

WASHINGTON, Martha, wife of George Washington, first President of the United States: b. New Kent County, Va., May 1732; d. Mount Vernon, Va., 22 May 1802. She was the daughter of Col. John Dandridge, and was educated by tutors at home. The daughter of one of the first families of Virginia, possessed of both beauty and charm, a childlike grace, marriage was a happy one and they lived at the "White House" on Custis's plantation on the Pamunkey River. Four children were born to them, of whom two died in infancy. Custis himself died in 1757, leaving his widow one of the wealthiest women in Virginia and with no restrictions upon her use of the property, a confidence which she proved amply justified. In May 1758 the Widow Custis became engaged to Colonel Washington and she was married to him in January 1759, the wedding being one of the most brilliant ever solemnized in Virginia. With Mrs. Washington's two children, Martha Parke Custis and John Parke Custis, they settled at Mount Vernon, the estate left to Washington by his elder brother, as he had wished to live, amid the mild concerns of ordinary life.

Washington spent the winters at camp with the General, including the one of terrible privation at Valley Forge. During the campaigns she remained at Mount Vernon, superintending the plantation, and throughout the Revolution she adopted the simplest manner of living and dressed in fabrics spun and woven at Mount Vernon. In November 1781 her only remaining child, John Parke Custis, died, leaving four children, of whom Washington adopted the two youngest, Eleanor Parke Custis and George Washington Parke Custis, as his own. After Washington's inauguration as President of the United States, at New York 30 April 1789, Mrs. Washington left Mount Vernon with her two grandchildren and traveled in state to New York. Bred to high social position, with every advantage of wealth and association, she presided over the Executive Mansion in New York and in Philadelphia with great grace and dignity, an incomparable "First Lady" and often called "Lady Washington." However, notwithstanding her great social gifts, the quiet of Mount Vernon was to her, as to her husband, the life most desired. There, after Washington's retirement from the Presidency, she was able to offer unlimited hospitality to the many visitors attracted by her distinguished husband. She never recovered from his death in 1799 and was deeply depressed until just prior to her own death two and a half years later. Her remains were placed at rest with the House of Washington in the vault at Mount Vernon. Consult Conklin, M. C., *Memoirs of Lives of the Mother and Wife of Washington* (1851); Lossing, B. J., *Mary and Martha*
WASHINGTON (1887); Holloway, L. C., 'Ladies of the White House' (1886).

WASHINGTON, Mary, American woman, mother of George Washington; b. Lancaster County, Va., 1706; d. near Fredericksburg, Va., 25 Aug. 1789. She was the youngest daughter of Joseph Ball, and was educated chiefly by parish ministers. No authentic portrait of her exists, but she was beautiful and popular socially, and developed into a woman of remarkable force of character. She was married to Augustine Washington, 6 March 1730. Washington's first wife having died in 1728. They settled in Westmoreland County, where their first child, George, was born 22 Feb. 1732. Later they removed to another farm owned by Washington on the Rappahannock River, near Frederickburg. Three other children were born of the marriage, John Augustine, Charles and Mildred. Mrs. Washington was widowed 12 April 1743, and became the sole guardian of her children. She managed her business affairs with marked success and reared her children in simple piety and under strict discipline, stamping her high principles indelibly upon them. She continued her customary habit of life after her son George rose to the highest of public offices, personally managing her farm and rarely appeared at public functions. She attended, however, with General Washington, the ball at Frederickburg, given in honor of Cornwallis's surrender. Washington rode from his horse to his innutation as President, a few months before her death. Consult Conkling, M. C., 'Memoirs of the Mother and Wife of Washington' (1851); Lossing, B. J., 'Mary and Martha' (1887).

WASHINGTON, a western State of the United States, popularly known as the Evergreen State, admitted to the Union, 22 Feb. 1889, is bounded on the north by the Strait of Juan de Fuca and British Columbia, on the east by Idaho, on the south by Oregon, and on the west by the Pacific Ocean. It lies between 45° 15' and 49° N. lat. and 116° 37' and 124° 49' W. long. Capital, Olympia. Area, 69,127 square miles (land 66,836, water, 2,291).

Topography. — Washington is divided into two distinct sections by the continuous range of the Cascades of Washington, crossing the State from north to south. These sections are known as eastern and western Washington. The eastern section contains about three-fifths of the land area of the State and the western section about two-fifths. In its physical features the State is characterized by a great diversity of topography, ranging from low plains, a few feet above the sea-level, to snow-covered mountains, several of which exceed 10,000 feet in height, together with broad rolling prairies, elevated plateaus, deep canyons and fertile valleys. This great diversity of topography presents ever-changing scenery and gives rise to a great variety of climate, rainfall, vegetation and occupations of the people.

Topographically, the State may be divided roughly into seven sections: First: The peninsula lying between Puget Sound and the Pacific Ocean. The greater part of this peninsula is occupied by the Olympic Mountains, which form a sort of isthmus between Puget Sound and the Pacific Ocean. The highest of these mountains reach elevations of from 7,000 to 8,000 feet. The whole section, with the exception of a strip a few miles in width along the coast, presents a very rugged surface, broken into high peaks, steep slopes, deep canyons and sharp serrated divides, which are almost inaccessible in many places, and as a consequence, these mountains form the best known section of the United States. The highest peaks of the Olympics are Mount Olympus, 8,131 feet; Fitzhenry, 8,098 feet, and Constance, 7,777 feet. Second: The Puget Sound Basin, a wide valley lying between the Olympic Mountains on the west and the Cascade Mountains on the east, extending in a north and south direction from the British Columbia line nearly to the southern part of the State. This basin consists largely of rolling land with many quite extensive level tracts. The soil consists principally of glacial deposits covered in the lower portions by alluvium. Third: The Cascade Mountains, which form the most prominent feature of the topography of the State. The general height of these mountains is about 8,000 feet above the sea-level with a number of peaks rising much higher, the highest being Mount Rainier, 14,498 feet; Adams, 12,207 feet; Baker, 10,730 feet; and Semiahmoo, 9,470 feet. Fourth: The Okanogan Highlands, extending eastward from the Cascade Mountains to Idaho and lying north of the Columbia and Spokane rivers. This section is characterized by a beautiful rolling surface, with gentle slopes reaching down from the watersheds to the wide stream basins. The divides, although attaining heights of 5,000 feet and more, are generally rounding and not sharp or abrupt. Fifth: The Columbia Plain, which includes nearly all that part of Washington lying south of the Okanogan Highlands and east of the Cascade Mountains. From the Columbia at a height of 500 or 600 feet above the sea, the plain rises gradually to the westward and eastward, reaching a general elevation of about 2,000 feet in the higher parts, with some hills and ridges rising from 1,000 to 2,000 feet above the surrounding plain. Much of this plain is in the form of an elevated plateau with a rolling surface. Several sharp ridges of a mountainous character run down from the Cascade Mountains in an easterly direction toward the Columbia River. Sixth: The Blue Mountain Range on the border line of Washington and Oregon represents a local mountainous section in the Columbia Plain. These mountains are located in the extreme southeastern portion of the State, the highest points rising 7,000 feet above the sea and about 5,000 feet above the surrounding plain. Seventh: The lower Columbia and Pacific Coast section includes that part of the State lying west of the Cascade Mountains and south of Puget Sound and the Olympic Mountains. This section consists largely of ranges of low mountains or hills, with broad valleys intervening, nearly all of which are covered with a dense growth of forest. In this section there are also a few rich prairies of limited extent.

Rivers, Lakes and Harbors. — The principal river of Washington is the Columbia, which enters the State from British Columbia, at about 117° 30' W. long., from which point it pursues a southerly course for about 110 miles, flowing thence westerly for about 900 miles, thence south, and finally into Puget Sound. This river, united with its great tributary, the Snake River; from this point it pursues a westerly

</table>
course, flowing between the States of Washington and Oregon, breaking through the Cascade Mountains and entering the Pacific Ocean in lat. 46° 15'. Its principal tributaries in eastern Washington are the Pend d'Oreille, or Clark's Fork, which is the outlet of Lake Pend d'Oreille in northern Idaho; the Spokane, one of the outflowing streams of Lake Coeur d'Alene, also in Idaho; the Okanogan, flowing from the north through Lake Okanogan in British Columbia; the Methow; Lake Chelan and its outlet; the Wenatchee and the Yakima, flowing down from the Cascade Mountains, and the Snake River, its largest tributary, which rises in the western part of Wyoming and flows through the southern part of Idaho. In western Washington its principal tributaries are the Lewis and the Cowlitz rivers. The other rivers of the State of any considerable size are the Nooksack, Skagit, Stillaguamish, Snohomish, Skykomish, Snoqualmie, Cedar, White, Duwamish, Puylup and Nisqually, which flow into Puget Sound from the Cascade Mountains and the Chehalis, which flows into Gray Harbor. The Columbia is navigable for ocean-going vessels to Vancouver and for steamboats over the greater part of its course. The Snake is navigable for more than 150 miles. The Okanogan, Lewis, Cowlitz, Nooksack, Skagit, Snohomish, Duwamish, Puylup and Chehalis rivers are also navigable for considerable distances.

There are many fresh-water lakes in the State, the largest is Lake Chelan, lying between the eastern ridges of the Cascade Mountains. This lake is 55 miles long, from one to three miles wide and more than 1,500 feet deep in many places. It extends from a point near the Columbia River into the very heart of the mountains, and the tourist can here enjoy the novel experience of sailing for more than 30 miles between high ranges of mountains, rising from the water's edge, whose snow-crowned peaks reach elevations of from 7,000 to 10,000 feet above the sea. This part of the State has some of the grandest scenery in the world. Lake Washington, lying in the western part of King County, bounding Seattle on the east, is a beautiful lake, 13 miles long, and from two to four miles wide. The surface of this lake is about 20 feet higher than the mean high tide in Puget Sound, and a government canal has been constructed, at Seattle, to connect it with the sound through Lake Union. Lakes Crescent and Cushman are the largest lakes in the Olympic Mountains and Lakes Wenatchee, Kachess, Keechelus, Moses and Cle Elum, are the largest in eastern Washington.

Willapa Bay and Gray's Harbor are the only good ports on the Pacific Coast of Washington. Neha Bay, Clallam Bay, Port Angeles and Dungeness are excellent ports on the Strait of Juan de Fuca. Puget Sound, as it is now known, includes all the waters of the great inland sea, which extends eastward from the Strait of Juan de Fuca, and southerly from the national boundary line to Olympia, a distance of about 200 miles. The waters of the Sound are from 60 to 1,000 feet in depth. The rise and fall of the tide is from 6 to 18 feet. There are no sunken reefs or other dangerous obstructions to navigation. The coast line aggregates about 1,600 miles in length. The principal harbors along the sound are Bellingham Bay, Everett, Harbor, Port Townsend, Seattle Harbor or Elliott Bay, Commencement Bay or Tacoma Harbor and Port Orchard. Owing to the fact that Puget Sound is protected on all sides by high mountain ranges, it may be considered as one great harbor, in which vessels can land at almost any point along the whole coast line.

Climate.—The temperature at the capital is divided as to climatic conditions into two distinct sections — the eastern and western. The Cascade Mountains extending from the north to the south form the line of demarkation. Western Washington has a mild, moist climate, while east of the Cascades the climate is characterized by short hot summers and comparatively cold winters. Western Washington seldom has snow and is free from oppressive heat in the summer. The mean annual maximum temperature at Seattle, a typical point in western Washington, is 58° 2', while the mean annual minimum is 44° 6'. The mean annual maximum temperature in Yakima County, eastern Washington, is 64° and the mean annual minimum 35° 5'.

Rainfall.—The rainfall in western Washington varies greatly in different localities owing to the mountain ranges and prevailing winds. The heaviest precipitation occurs on the coast of the Pacific Ocean and gradually decreases as it proceeds inland around the south side of the Olympic Mountains and down the Puget Sound Basin. The annual rainfall averages 88.13 inches on the coast at South Bend; 54.96 inches at Olympia; 42.27 inches at Tacoma; 32.9 inches at Port Townsend. While winter is called the rainy season and summer the dry season, it should be understood that every month in summer has some rainy days and that there is considerable clear weather during the winter months. For a period of 10 years, during the months of December, January and February, the average number of days per month with precipitation to the amount of .01 of an inch has been from 15 to 19, and the average precipitation per month about five inches; the average number of rainy days in July and August for the same period has been five, the average precipitation has been about one inch each month and the average number of sunny days about 62 per year. Thunder and lightning are of rare occurrence and violent wind storms are entirely unknown.

Geology.—Metamorphic rocks occupy a large portion of the State, being of very frequent occurrence throughout the region of the Cascade Mountains and the Okanogan Highlands. The most important varieties of these rocks are gneiss, schist, marble, slate and quartzite. Granite is found in many localities in very large quantities. Crystalline limestone also occurs in a number of places, particularly in the Puget Sound Basin. The most important volcanic rock in the State is the basaltic rock of the Columbia Plain, which not only extends over a large portion of Washington, but also covers all of southern Idaho, eastern to the 112° and northeastern California. Sedimentary rocks cover a large portion of the State. The rocks of the Tertiary period are the best known and are of great economic importance on account of the large deposits of coal and limestone which they contain. The Eocene rocks are nearly all coal-bearing. Pleistocene sediments, in the nature of glacial deposits, occur
WASHINGTON

in the western and northern parts of the State. In all of the mountainous districts, except the Blue Mountains, glacial deposits are found, and they usually are largely occupied by deep tills and moraines. The glacial deposits of the Puget Sound Basin consist of tills, with stratified sand, clay and gravel, in all averaging not less than 50 feet in thickness.

Agriculture.—Irrigation.—There are about 30,000 square miles of forested land in the State, the trees being mostly conifers, with some oak, maple, cottonwood and other deciduous varieties. Nearly all of the western section of the State was originally covered with forests, while in the eastern section the forest areas are confined principally to the slopes of the mountains and the highlands. The soil in western Washington consists largely of glacial drift, being a mixture of sand, gravel and clay upon the uplands, which is very fertile when properly handled. In the lower lands there are large areas of sandy loam and semipeat lands, rich in organic matter, which are very fertile and grow all kinds of crops that thrive in a peat soil.

In eastern Washington the soil has been formed by the disintegration of basaltic or lava rocks. It is of a dark color, of fine texture and contains no gravel and very little sand. It is what might be termed a clay loam. It has been stated by eminent authorities that this is the best wheat land in the world, a statement which is proved by the enormous crops produced each year. The higher lands of the Columbia plain are covered principally by the cultivation of wheat, which is the most important agricultural product of the State. The annual crop of wheat averages about 40,000,000 bushels, and the average yield per acre is about 25 bushels.

In the lower lands of the eastern section the rainfall is insufficient to bring crops to maturity and irrigation is carried on to a considerable extent with great success. There are now about 847,000 acres of irrigated lands under cultivation, and about 130,000 acres more under ditch and flume irrigation. Numerous irrigation projects are in progress or in contemplation which will probably result in the reclamation of thousands of acres more within the next few years. The irrigated lands produce wonderful crops of fruits, vegetables, hay, hops and grain. The climate is very favorable and a great variety of apples, peaches, plums and kindred fruits are raised in great abundance, together with grapes, strawberries, blackberries, raspberries and other small fruits of every kind. The fruits raised in eastern Washington are beautifully colored and of most excellent flavor. The soil of the irrigated section is admirably adapted to the cultivation of all kinds of vegetables, and especially to the cultivation of potatoes, of which large quantities are produced each year. Alfalfa is one of the chief forage plants, producing three or four crops during the season and yielding from five to eight tons of hay per acre. Timothy, clover and other grasses are also raised quite extensively. Hop raising is an important industry, the average crop being 50,000 bales per year. All kinds of cereals are also cultivated to some extent. The Okanogan Highlands at the base of the Cascade Moun-
tains furnish extensive ranges for cattle and sheep, which are raised in large numbers. With the settling up of the country, however, the ranges are becoming more restricted year by year, and, as a consequence, domestic methods of stock raising are being adopted with a resulting yearly increase in wool and mutton. In western Washington diversified farming, dairying and fruit raising are the principal agricultural pursuits. This section of the State is admirably adapted to the dairying industry, owing to the rich soil and the most, warm climate, which combine to produce an abundance of nutritious grasses, hay and other stock food, and excellent water. The home market is one of the best in the world, on account of the large population engaged in manufacturing, lumbering, fishing and mining, and the trade with Alaska. There are 186 creameries and 13 condensed milk factories in the State. All kinds of stock do well in this section and large numbers of horses and beef are raised. The breeding of Angora goats has also been undertaken with marked success and is becoming an important industry. Hop raising is carried on quite extensively in the river valleys, the average crop being about the same as in eastern Washington; considerable small crops of this in this section, especially upon the flat lands along the shores of Puget Sound. About 27 per cent of the total land area of the State is included in farms. Of this (11,712,238 acres) about 55 per cent is cultivated land, and of the remainder the size of farms in the State is 209 acres and there are 56,192 farms in the State. Farm land in 1920 had an average value of $44.18, but has since increased about 50 per cent. About five-sixths of the farms are owned by owners. About two-thirds of all farmers are native-born, the remainder coming from Germany, Sweden, Norway, Canada and England. At the time of the last census there were 673 Indian farmers, 316 Japanese, 59 Chinese and 77 negroes.

The wheat yield in 1918 was 26,429,000 bushels, valued at $51,801,000; barley yielded 2,630,000 bushels, valued at $3,024,000; oats yielded 8,370,000 bushels, valued at $8,203,000; corn, 1,634,000 bushels, valued at $2,278,000; potatoes planted to 65,000 acres, yielded 8,580,000 bushels, valued at $8,696,000. The hay crop was 1,429,000 tons, valued at $36,297,000. The following was the acreage in the year above named: Corn, 43,000; oats, 21,191,000; oats, 8,370,000 acres; and hay, 780,000 acres. On 1 Jan. 1919 the domestic animals were 303,000 horses, 20,000 mules, 216,000 milk cows, 307,000 other cattle, 780,000 sheep and 3,000,000 swine. The wool clip in 1917 totaled 4,688,000 pounds of wool. The fruit-growing area has increased over 100 per cent in the last two years.

Lumbering.—The greatest industry of the State is the manufacture of lumber and shingles. There are in the State 500 lumber mills, which cut 4,500,000,000 feet annually, and 292 shingle mills, with an output of 7,000,000,000 shingles. There are also more than 300 logging-camps and a number of planing mills and wooden-ware factories. These mills, factories and camps employ more than 65,000 men; the annual payroll amounts to $89,500,000 and the value of the product is about $121,500,000 annually. The most valuable tree of the State is yellow, or Douglas fir (Pseudotsuga Douglasii), which comprises a large part of the Oregon coast and the Cascade Range. The next most valuable is the red cedar (Thuja gigantea), used extensively in the manufacture of shingles. Western hemlock
WASHINGTON 783

(Tuqa mertensiana), yellow pine (Pinus pow-
derosa), sugar pine (Pinus lambertiana), spruce
(Picea sitchensis) and western larch (Larix
occidentalis), are also valuable commercial
varieties. At the present rate of consumption,
the amount of standing timber will supply the
mills of the State for at least 100 years. Al-
much 400,000,000,000 feet of timber is untouched
in this State.

Mining.—Coal is first in importance in the
mining resources of the State. The greatest
deposits are found in the Puget Sound Basin
and on the eastern slopes of the Cascade Moun-
tains in Kittitas County. The coal fields are ex-
tensive and practically inexhaustible. The
veins vary from five to 25 feet in thickness. The
quality ranges from a rich bituminous coking
col to brown lignites. Deposits of anthracite
have also been discovered in the vicinity of
Mount Rainier and Mount Baker. In 1919 there
were 70 mines in operation, employing 5,847
workmen. The aggregate output during the
year 1919 was 4,000,000 tons of coal and 96,000
tons of coke. The mines of Washington and
British Columbia practically supply the Pacific
Coast of Washington and Alaska with coal.

There are large deposits of iron ore in the
Cascade Range and in the Puget Sound Basin.
Brown hematite ore is found along the Skagit
River. Magnetic ore is found in King County
and Bog ores occurs in several localities. Copper
and lead are found in the Cascade Moun-
tains and the Okanogan Highlands. Lead, zinc,
asbestos, molybdenum, tungsten and platinum
also are found. The precious metals are found in several
localities and sufficient development work has been
done to prove the existence of mines of
great value. In the northeastern part of the
State the mines have been worked on an ex-
tensive scale. The prevailing country rock in
that district is limestone and the principal mineral
is argentiferous galena. Gold and silver have been
discovered in many places throughout
the whole extent of the Cascade Range and in
the Okanogan Highlands. The yearly output of metal mines is
about $3,000,000. Clay products
are valued at $1,500,000 yearly. The total
mineral output, exclusive of coal, is valued at
$18,000,000 yearly.

Salmon fishing is one of the im-
portant industries of the State, and her brands of
canned salmon are known in every market in
the civilized world. The capital invested in the
fishing industry exceeds $15,000,000; the number
of persons directly dependent on the fish-
ery is 30,000 to 60,000, while the number actu-
ally employed is about 15,000, and the wages
paid amount to more than $4,000,000 annu-
ally. The value of the yearly product of the
fishery ranges from $12,000,000 to $30,000,000,
according to the run of fish, and the value of the
fresh, salted and smoked product will
amount to about $3,000,000 more each year.
There are about 71 salmon canneries operated in the State. The propagation of salmon was
undertaken by the State in 1895, and since that
time 38 hatcheries have been established with a
capacity of from 5,000,000 to 10,000,000 fish
each per season. This work has been very suc-
cessful and has resulted in an increase of the
supply. At the salmon canning industry, the cod, halibut, mackerel and herring fisheries on the banks of the coast of Wash-
ington and Alaska give employment to a large
number of men. Large quantities of halibut
are shipped to the Atlantic Coast cities in re-
frigerator cars and that line of fishing has been
developed into an important industry. Oyster
farming is also carried on to quite an extent in the
shallow waters of Puget Sound and Willapa
Harbor. Clams, crabs and shrimp are abundant,
and many kinds of game fish are found in the
streams and fresh-water lakes.

Game.—There is a great abundance of large
and small game in Washington. Deer are found
in all sections, elk abound in large numbers in the
Olympic Mountains and to some extent in the
Cascades. Mountain goats are numerous on the higher ranges of the Cascades. There
are a few mountain sheep on the lofty moun-
tains. Black bears, panthers and wildcats are
common in the mountains. Waterfowl, pheas-
ants, quail, prairie chickens and several kinds
of grouse are plentiful.

Washington exceeds every other State in its
game fishing. In 1918 20,000,000 trout fry were
liberated from its hatcheries.

Manufacturing.—When the census of 1914
was taken, there were 36 mechanical manufac-
turing establishments reported in this State. There are
at present probably 5,000 such establishments.
The number of wage-earners employed is
about 100,000; the amount of wages and sala-
ries paid is $150,000,000 and the value of the
products $5,000,000,000. The largest manufac-
turing industries consist of lumber mills, air-
plane factories, flour and grist mills, shipyards,
iron and steel works, paper mills, smelters, beef-
sugar plants, fruit and vegetable canneries,
fruit juice factories, furniture factories, pot-
tery and terra-cotta works, creameries and con-
densed milk factories, fireworks and fertilizer
plants. Since 1914, manufacturing has increased
very rapidly. Many new industries have been
established and old ones have been greatly ex-
tended in order to keep pace with the growing
markets. There are about 150 flour mills in the
State producing more than $50,000,000
worth of flour per annum, which is marketed
largely in the Orient, South America and Eu-

Shipbuilding is carried on at a number of
localities on Puget Sound and at Gray's Har-
b. The Puget Sound Navy Yard is equipped
for the construction and repair of ships and boats. The Pacific fleet is based on this
station. The battleship Nebraska was
built in 1904 in Seattle. Washington produced
more than 30 per cent of the vessels constructed
during the war. Both steel and wooden ves-
Eals of various types are built. The superiority
of Washington for use in ship construction
is recognized in all parts of the world, on ac-
count of its great strength and the length of
clear timber obtainable. The manufacture
of iron and steel is also carried on extensively.
Several open-hearth furnaces are operating at
Seattle and producing a high grade of steel.
With an abundance of raw materials, easily as-
sembled at low prices, and with a large mar-
ket for the product, the manufacture of iron
and steel promises to become one of the leading
industries.

Nearly all the rivers of the State are moun-
tain streams, with a large flow of water at all
seasons of the year, and suited to the salmon
industry, which, under modern methods of transmission
are capable of supplying power for industrial
pursues at a low cost and in almost unlimited quantities. Large power plants have already been built on the Squamish and Puyallup, Cedar and other rivers. The city of Seattle has constructed a plant upon the Cedar River and is building another on the Skagit River to supply the municipality with light and power for both public and private purposes. Several other plants are in the course of construction in the vicinity of the larger cities. The State is credited with having 4,930,000 horse power or 18 per cent of the total potential hydro-electric power of the country.

Transportation.—Washington is well provided with transportation facilities, both by water and by railroad. The rivers, lakes, Puget Sound, with its numerous arms, bays and inlets; the Strait of Juan de Fuca and the Pacific Ocean make all parts of the western section, and many parts of the eastern section of the State easily accessible by boats. There are 1,200 miles of navigable streams in the State, about 8,000 miles of railroad and 1,500 miles of electric roads. The chief steam railroad systems are the Northern Pacific, Great Northern, Oregon-Washington Railway and Navigation Company, Chicago, Milwaukee and Saint Paul, Delaware, Central and Northern, and Seattle, Portland and Spokane. The Burlington system, the Canadian Pacific and Grand Trunk Pacific also reach Puget Sound under traffic arrangements with the other roads. Electric railways are now in operation between most of the important cities. A number of other lines are projected. A large fleet of steamers is operated upon the waters of Puget Sound carrying freight and passengers in the local traffic. Steamship lines are operated between Seattle, Puget Sound and Alaska, British Columbia, California, Europe, the Orient and the Atlantic Coast, and between Gray's Harbor and San Francisco. In addition to the regular lines, a large commerce is carried on by sailing vessels and itinerant steamships.

Commerce.—During the calendar year of 1918, vessels aggregating 3,529,294 tons entered, and vessels aggregating 3,423,541 tons cleared in the foreign trade of Customs District, which includes all the ports of Washington except the Columbia River. The value of the foreign imports was $300,900,138, and the value of the foreign exports was $296,190,792 in this district in 1917. In 1917 the imports amounted to only $839,709 and the exports to $5,093,436. A very large commerce is carried on between Washington and the other Pacific Coast States, Alaska, Hawaii and the Philippine Islands. Alaska's commerce alone in 1918 was valued at $127,049,132. In addition about $195,000,000 in foreign imports were landed on Puget Sound in bond to other cities.

Education.—There are 2,554 school districts in the State, in 793 of which schools of normal course are maintained. In 1919 the total number of children of school age was 348,771 and the enrollment at the schools was 272,325. The reports of the State superintendent of public instruction show that 9,770 teachers were employed in 1917 and 1918. The election disbursements were $14,058,211 in 1918. The value of school property, exclusive of school lands, was $36,596,608. The average length of school sessions in the county districts is approximately eight months. In the towns and cities the sessions are usually nine months. Nearly every town under 2,000 has a school with a three or four year course. In a number of places several county districts have combined to form a junior high school district. The number of students in attendance at high schools in 1918 exceeded 37,000. For higher education the State maintains the University of Washington at Seattle with 300 instructors and enrolment of over 6,000 students; the Agricultural College and School of Science at Pullman, 1,900 students; and normal schools at Cheney, 2,524 students; Ellensburg, 600 students, and Bellingham with 2,313 students.

In addition there are 133 private educational institutions. The leading private colleges are Whitman College at Walla Walla; Whitworth College, Spokane; Gonzaga College, Spokane; College of Puget Sound, Tacoma Vashon College, Burton and Colfax College, Colfax.

Charitable, Reformatory and Penal Institutions.—The State maintains separate institutions for the care and education of the blind, deaf and feeble-minded; a penitentiary, three hospitals for the insane and two soldiers' homes. The boys' training school is located at Bothell, and the girls' training school at Grand Mound. Each of these institutions has a large farm and is well provided with shops and the necessary equipment for educating the youth in useful trades. The penitentiary is located at Walla Walla. In this institution there is a jute mill which gives employment to a large number of the inmates. The Western Washington Hospital for the Insane is located near Steilacoom, the Northern Hospital for the Insane is at Sedro-Wooley and the Eastern Washington Hospital at Medical Lake. The Soldiers' Home is located at Orting and the Washington Veterans' Home at Port Orchard. All of these State institutions are under the general supervision and management of a board consisting of three members appointed by the governor, known as the State Board of Control.

Banks and Finance.—There were in 1919, 386 banks; of these, 84 were national, 293 State and 5 foreign. The total resources of all banks in the Washington was $469,428,114 in 1917. The valuation of real and personal property in the State in 1919 was $1,060,620,838 and the State tax levy, $10.44 per $1,000. The assessed valuation of real property in 1917 amounted to $1,702,944,239. In 1861 the assessed value of real estate was $238,708. In 1917 the valuation of railroads was $341,371,132; electric lines, $44,408,275; telegraphs, $889,147. The outstanding bonded debt was paid off in 1911. For the year ending 30 Sept. 1918 the revenue of the State was $15,643,321, which was increased to $20,251,757 by the balance over of $4,608,436 from the year previous. The disbursements during the year named amounted to $14,878,937, leaving a balance on hand on 30 Oct. 1918 of $5,372,820.

Government.—The State officers are as follows: Governor, lieutenant-governor, secretary of state, treasurer, auditor, attorney-general, superintendent of public instruction, commissioner of public lands and insurance commissioner. The State is elected for terms of four years. The legislature of the State has biennial sessions and consists of a senate and house of representatives. There are 42 members of the senate, one-half of whom are elected every two
1 A Lumber Shipping Port

2 A Western Logging Scene
years to hold office for terms of four years. The house of representatives consists of 97 members, elected biennially for terms of two years. The judicial department is divided into a Supreme Court and Superior Courts. There are nine judges of the Supreme Court whose terms are six years, and 60 judges of the Superior Courts, elected for terms of four years. The whole State is under county organization, the affairs of each county being administered by a board of county commissioners consisting of three members. The State is represented in Congress by two senators and five representatives.

Population and Divisions.—As shown by the United States census reports, the population of Washington was 11,594 in 1860; 23,955 in 1870; 75,116 in 1880; 349,390 in 1890. The United States census of 1910 reported the population as 1,141,190 and estimated it in 1918 at 1,660,578.

There are 39 counties in the State, which, with their county-seats, are named as follows:

Adams, Ritzville.
Asotin, Asotin.
Benton, Prosser.
Chelan, Chelan.
Chelan, Wenatchee.
Chelan, Chelan.
Chelan, Waterville.
Chelan, Penticola.
Clark, Vancouver.
Clackamas, Oregon.
Columbia, Dayton.
Cowlitz, Castle Rock.
Douglas, Waterville.
Ferry, Republic.
Franklin, Yacoo.
Garfield, Pomeroy.
Grant, The Dalles.
Island, Coupeville.
Jefferson, Fort Townsend.
King, Seattle.
Kitsap, Port Orchard.
Kittitas, Ellensburg.
Klickitat, Goldendale.
Lewis, Chehalis.
Lincoln, Davenport.
Mason, Shelton.
Okanogan, Okanogan.
Pacific, South Bend.
Pend Oreille, Newport.
Pierce, Tacoma.
San Juan, Friday Harbor.
Skagit, Mt. Vernon.
Skamania, Stevenson.
Snohomish, Everett.
Spokane, Spokane.
Stevens, Colville.
Thurston, Olympia.
Wahkiakum, Cathlamet.
Walla Walla, Walla Walla.
Whatcom, Bellingham.
Yakima, North Yakima.

There are 99 places in the State of over 1,000 population; 22 of over 2,000 and eight of over 20,000. The metropolis is Seattle, on Puget Sound, with 380,000 inhabitants, estimated in 1919. Tacoma 120,000, Spokane 130,000, Bellingham 34,553, Everett 38,810, Walla Walla 24,000, Yakima 21,000 and Aberdeen 20,000. All of the towns named are important commercial and manufacturing centres.

Indians.—According to the annual report of the Commission of Indian Affairs there are 11,083 Indians, living upon the 12 reservations in the State. The reservations contain 1,669,768 acres of land. The largest reservations are the Makaw and Quinault reservations on the Pacific Coast; the Tulalip and Puyallup reservations on Puget Sound and Yakima, Colville and Spokane reservations in eastern Washington. There is also a large number of Indians who do not live upon the reservations. Many of them are engaged in agriculture and a considerable number work in the logging-camps and fisheries.

History.—The first record in history of the region which is now the State of Washington, was the discovery in 1592 of the Strait of Juan de Fuca by a Greek pilot of that name in the service of the viceroy of Mexico. In 1775 a Spanish navigator, Capt. Bruno Heceta, sailed along the coast and discovered the mouth of the Columbia, and was unable to enter the river. In 1792 Capt. Robert Gray, a New England navigator, sailed up the North Pacific Coast on a voyage of exploration and on 11 May he discovered the mouth of the Columbia, sailed into the river, explored it for about 15 miles and gave it the name of his ship. It was this discovery and the exploration that gave the United States their strongest claim to the territory drained by the Columbia, which was known as the "Oregon Country." In the same year Capt. George Vancouver of the British navy, explored the north arm of Puget Sound. During the next few years a number of other navigators visited the coast and it soon became quite well known. The first overland exploration was the expedition of Lewis and Clark of the United States in 1805-06. This expedition, sent out by President Jefferson, traversed the Mississippi Valley, crossed the Rocky Mountains and followed the Columbia River to its mouth, where they spent one winter. The next military expedition was that of 1843 under Capt. John C. Frémont, which reached Vancouver on the Columbia. The first United States naval expedition was the exploration of Puget Sound by Capt. Charles Wilkes in 1841. The first white people to settle in Washington were the traders of the Northwest Fur Company, who established posts in eastern Washington in 1811. The next white settlement was established by Dr. Marcus Whitman in 1836 near the site of the present city of Walla Walla. The first permanent settlement in western Washington was at Tumwater on Puget Sound in 1845. The ownership of the country north of the Columbia River was claimed by both Great Britain and the United States until 1846, when, under the Buchanan-Pakingham treaty, Great Britain took all the territory north of the 49th parallel, and the United States all of the territory south of that parallel, except the south end of Vancouver Island. The American territory was organized as the Territory of Oregon, 14 Aug. 1848. On 2 March 1853 that portion lying north of the Columbia River and the 46th parallel was organized as the Territory of Washington. With the discovery of gold in eastern Washington, a great increase of population followed, and the Indians becoming alarmed for their hunting grounds, resolved to exterminate the whites. This led to the Indian War of 1855-56, and there were still further troubles with the Indians at the time of the rush to the gold fields of British Columbia, but the greatest rush was after the discovery of gold at Salmon River in 1850. At the time of the treaty between Great Britain and the United States in 1846, the 49th parallel had been accepted as the boundary to the channel between Vancouver Island and the mainland, and thence down that channel to the sea. In 1859 a dispute arose as to which channel was meant, and this was not settled until 1872, when the claims were referred to arbitration and decided by the German emperor in favor of the United States. On 22 Feb. 1889, Congress passed an enabling act providing for the admission of the State of Washington into the Union. The State constitution was adopted and ratified by the people at an election held 1 Oct. 1889, and on 11 Nov. 1889, in accordance with the provisions of the enabling act, the President of the United States proclaimed the admission of the State of Washington into the Union.

The growth of the population of Washington was very slow until the advent of the first railroad in 1884, on account of its remoteness and the difficulty of reaching it from the Eastern States. Since that time the development of the
country has been phenomenally rapid. The establishment of regular steamship lines between Puget Sound and the countries of the Orient, the trade which has grown up as a result of the great discoveries of gold in Alaska and the Yukon, and the development of commerce between this State and the new island possessions in the Pacific Ocean, are some of the leading factors which have caused the wonderful progress of the past few years.

Anti-Chinese riots occurred in 1885-86 and many lives were lost and much property destroyed by mobs. At the Federal elections of 1892 the State selected Republican electors; four years later a fusion ticket of Democrats and Populists captured a majority of its votes; in 1900, 1904 and 1908 the State chose Republican electors. Woman suffrage was granted in November 1910 by a large majority. In the following year the chief executives of Tacoma and Seattle were recalled from office by popular vote. Roosevelt received 111,179 votes in 1912 to 87,674 cast for Wilson and 71,252 for Taft. A Democrat was elected governor at this same election, which also declared for State-wide prohibition to go into effect 1 Jan. 1916. The war caused a sudden expansion of the State's industrial activities, especially in shipbuilding. After the war considerable labor disturbances marked the State's industrial life. Radical agitators, mostly of the I. W. W. stripe, endeavored to fan the flame of discontent caused by high prices and an inflated currency, and seized every opportunity to make recruits to their ranks. Their activities reached their climax at Centralia on 11 Nov. 1919, when, during a celebration of the anniversary of Armistice Day, a band of the I. W. W. fired several shots into a passing parade of members of the American Legion, killing four and seriously wounding many others. This outrage caused the law-abiding citizens, not alone of Washington, but of every other State, to be concerned; it is a matter of which our foreign element, to take prompt measures against these revolutionaries. One leader of the band was lynched at Centralia and after a few days order was restored.

BIBLIOGRAPHY.

WASH., Ariz., town, county-seat of Hemstead County, on the Arkansas and Louisiana Railroad, about 110 miles southwest of Little Rock. It is in an agricultural region, and its industries are connected chiefly with farm products. It has considerable trade, especially in the shipments of grain, vegetables, cotton and tobacco. Pop. about 400.

WASH., Ark., township in Litchfield County, on the about 90 miles northeast of New York and 35 miles north of Bridgeport. It contains the villages of Marbledale, New Preston, Woodville, Washington, Washington Depot and Romford. Its industries are connected with farm products and caring for guests in summer, as it is a favorite summer resort. Pop. about 1,747.

WASH., D. C., the capital of the United States, coterminous with the District and, therefore, occupying a territory of 694 square miles. The city is under the exclusive jurisdiction of Congress; it is situated on the Potomac River, 100 miles above its mouth, 40 miles south by west of Baltimore, 136 miles from Philadelphia, 226 miles from New York, 1,109 miles from New Orleans and 3,118 miles from San Francisco.

The exact location of Washington is, long. 76° 58' W.; lat. 38° 53' N. The climate of this locality is mild and even, the mean average annual temperature for the past quarter-century being 55°; average temperature for this period 75°; average winter temperature, 35.
Washington is approached by both railway and waterway, as well as by an admirable system of highways constructed to meet the requirements of recent enormous increase in motor travel. Steamboat lines connect it with Baltimore to the north, and with Norfolk to the south. From the north and west both the Pennsylvania and the Baltimore and Ohio railroads run into the city, from the west the Chesapeake and Ohio and from the south the Southern, the Seaboard Air Line and the Atlantic Coast Line.

A bird's-eye, or air-shop, view of Washington discloses a forest-like area, banded from north to south, from east to west, and from certain radiating centres, by broad thoroughfares. At frequent intervals the wealth of greenery grows compact in park formation. Dome, and spire, and turret, lift through the verdure. And within it there is the glow of gilded roof, the gleam of marble wall and the massed grays and reds of city's usual architecture. From this high point the northern bank of the Potomac is seen — the city and the river's way, from the eastern to the western limits of the city, in a picturesque sweep of green. This effect of living green is the dominant note of the whole. With its 600 miles of street trees, exclusive of those belonging to the parks, Washington challenges the world in this respect, Buenos Aires alone standing as its only possible rival. This uplifted field of observation makes disclosure, also, of the spread of the city and the direction of its most vigorous growth. It reveals, besides, the number and location of attractive suburbs that are so rapidly gathering upon its outskirts to the north and northwest. And, above all, it brings into a distinct and related view those points that mark Washington as the seat of government. On a commanding height in the eastern part of the city rises its most notable and magnificent structure, the Capitol. A block away from this, to both north and south, are the federal buildings of white marble, devoted to the office use of senators and representatives respectively. A block to the east of it is the Library of Congress. A mile to the west of the Capitol is the White House, flanked on the east by the Treasury of the United States, and on the west by the State, War and Navy building. This outline sketch summarizes the essentials of the city as the heart of the Federal territory. A line flung westward across the Mall, from the Capitol to Arlington National Cemetery on the Virginia side of the Potomac, includes besides these two points, Washington Monument and Lincoln Memorial.

Streets and Avenues.—The projectors of Washington possessed the vision of a city that was, eventually, to fill the District of Columbia to its borders. Therefore, it was to this scale that they planned. The Capitol was selected as the keynote of the scheme. Through the center of its site a line was drawn from north to south, and another from east to west. Both extended to the limits of the District. The four sections laid off by these lines were, according to relative position, named, northeast, northwest, southeast and southwest Washington. This device was calculated to reduce to a clear and simple system the complex problem of street naming that great cities encounter. These initial lines become the four streets, the one extending north and south from the Capitol, North and South Capitol streets respectively. The one running east from the Capitol was named East Capitol street. Toward the west, the Mall was set off from city park. This, to the width of four city blocks, extends straight west from the Capitol to the Potomac River. Lines drawn parallel to the two original ones served as the plan by which the entire District might, as need arose, be transformed into a huge area of rectangular city blocks, bounded by a regular system of numbered and lettered streets, the former extending north and south, the latter east and west. Since the street naming started from the two initial lines that divided the city into four sections, each lettered and numbered street became one of a four-fold duplicate. Identification would be rendered simple and complete, however, by virtue of the section to which each belonged. Superimposed upon this rectangular system of streets were the avenues running from the Capitol and certain other centers. These as they developed were to be given the names of the States of the Union. The original plan of city growth has been adhered to with fidelity. The distinction of Washington is that the streets lies in their width, their finish and their luxuriant tree borders. The narrowest street is 60 feet wide. They range from this figure to 160 feet in width. Pennsylvania avenue, extending from the Capitol, east to the Eastern branch and west to Rock Creek, paved with asphalt its entire length, is the broadest of the avenues. Sixteenth street is the widest and most beautiful of the streets. The city report of 1916 shows 513.69 miles of paved streets, its mileage of asphalt paving exceeding that of all other kinds combined. Scientific street-tree culture is vigorously pursued. Already 600 miles of street trees contribute markedly to the beauty of the city.

Parks.—The park system of Washington is an imposing one of certain unique and individual features. The parks of the city separate, roughly, into large and small parks. In the first group are Rock Creek Park of 1,609 acres, a tract of great natural beauty lying to the west of the city. Adjoining it on the southwest is Zoological Park with 166 acres. Potomac Park of 723 acres borders the river from Georgetown to the Eastern branch. The Mall, containing 366 acres, issues, so to speak, out of the beautiful 50-acre park surrounding the Capitol and, running west in a narrow line, meets the Potomac River a mile and a half away, where it joins Potomac Park. Between this point of juncture and the southern boundary of Rock Creek Park are 162 acres which will, finally, serve to bring into complete existence a splendid continuous parkway that will sweep the entire western and southern borders of the city. The Mall connects the Capitol with this great parkway. In process of construction is a beautiful plaza connecting the Capitol with the new and imposing Union Station, a symbolic connection, also, with the federated States of which the capital itself is the focal point. To the north of Washington is the Soldiers' Home in the midst of 600 acres.
of beautifully planned and matured grounds. Adjoining Soldiers' Home to the south is a parklike area of 29 acres. This contains, in picturesque arrangement, the city filtration plant. At a point about 15 miles above the city, its water supply is drawn from the Potomac through a conduit into large storage reservoirs from which it passes into the filtration plant. The water supply with everything relating to it is under the charge of the United States government, a sufficient water rent being charged consumers.

In the second group of parks are the scores of smaller reservations that are scattered throughout the city. In their source these go back to the original city plan of imposing a system of radiating avenues upon a system of parallel streets. Intersections between these two systems cut out and left over, as it were, many areas ranging in size from mere plots to the equivalent of several city blocks. These triangles, squares and circles were taken over by the general government and converted into parks and park spaces. Among the most familiar of these are the White Lot, lying directly south of the White House and touching the Mall; Lafayette square, facing the White House to the north; Lincoln Park at 11th and East Capitol streets; Washington Circle at 22d and Pennsylvania avenue; and Meridian Hill Park, facing upon 10th street in the northern section of the city. A park commission, appointed by Congress in 1902, has, through the services of landscape architects and experts in city planning, converted this multitude of separate parks into a system that functions in many recreative ways as an organic part of the civic life. Meridian Hill Park stands as a model of the modern conception of an urban reservation, in its combination of beauty and utility. Washington possesses 392 parks and reservations.

Buildings.—Of all the city buildings, those belonging to the general government stand pre-eminently in the first rank. The Capitol, the Library of Congress, the White House, the Treasury and the State, War and Navy Building lead this group. South of these, occupying points upon the Mall, are Lincoln Memorial, Washington Monument, Bureau of Engraving and Printing, Bureaus of Agriculture, Smithsonian Institution and National Museum. North of Pennsylvania avenue and quite within the business section of the city are the government post office, patent office, pension office and the government printing office, which is the largest and most complete printing establishment in the world. The Capitol is the crown of the city's architecture. Seated upon a plateau 88 feet above the river it commands the city and its environs. The dome of the Capitol is from every outlying quarter the first intimation of one's approach to the Federal city.Expressed in figures this building covers 153,112 square feet, with a length of 751 feet, a depth of 350 feet and a height from base to summit of 420 feet. Its cost was $14,000,000. Architecturally it consists of an original central structure crowned by a lofty dome, with long extensions or wings stretching to north and south. Its position, its approaches, the material and design of its walls, make it the most magnificent of the public buildings of the world. The law-making centre of the federated States, it possesses two grand legislative halls, that to the north devoted to the use of the Senate, the one to the south to the House of Representatives. The United States Supreme Court also has its council chambers in the Capitol. In September 1793 George Washington laid the cornerstone of the original central building. This is of sandstone quarried on Aquia Creek, Va., a few miles below the capital. In 1814 this building was practically destroyed by the British. By 1827 the Capitol had cost $2,433,844. On Independence Day, 1851, President Fillmore laid the cornerstone of the two extensions, Daniel Webster officiating as orator. Next to the Capitol itself the Library of Congress is the most notably beautiful and impressive structure in Washington. This, at a cost of $6,347,000, was completed in 1897. It contains the great national library; 45 miles of shelving furnish a capacity of 2,200,000 octavo volumes. In addition to the 1,625,318 books and documents deposited in the library there are 218,324 other articles deposited for copyright purposes. The White House, so called by reason of the white surface of the freestone foundation, is a simple and dignified building whose historic associations give it a general personal interest surpassing that attached to any other of public buildings save the Capitol alone. The Treasury, a freestone and granite building erected at a cost of $7,000,000, the oldest of the departmental buildings, is an example of pure Greek architecture in the city. The State, War and Navy Building, a commodious structure occupying four and a half acres of land, erected at a cost of $11,000,000, is a composite Greek and Roman architecture. The Lincoln Memorial is as truly one of the world's architectural gems as is the Eastern Taj Mahal. For this Congress appropriated $2,595,000. To the east it is joined with Washington Monument by the highest art of landscape architecture. Washington Monument, a shaft 555 feet in height, was made of marble to which almost every country on the face of the earth contributed a stone. An elevator leads to the top of this shaft where a wide view of the city and its environs may be obtained. Engraving and Printing, Bureau of Standards, the latter a very complete plant to the northwestern city. Notable buildings outside of this government group are the Municipal Building, erected in 1905 at a cost of $1,500,000, as the administrative centre of the District of Columbia; the $300,000 gift of Andrew Carnegie;

WASHINGTON, D. C.

The Washington Monument

Photographed by Frances Benjamin Johnston
Corcoran Art Gallery; the new building of the American National Red Cross; Continental Hall, erected by the Daughters of the American Revolution, and the Pan-American Union. The last four are situated on the stretch of 17th street lying between Pennsylvania avenue, N. W., and the Mall. The Union Station belongs to this group, as does the new City Post Office, situated behind it. The Mall has been built at a cost of $5,000,000, with an additional $11,000,000 for the construction of its approaches. The buildings of The Evening Star, The Washington Times, The Washington Post; that of the Southern Railway; the New Willard, Raleigh and Shoreham hotels; the Masonic Temple and Scottish Rite Supreme Council; Carnegie Institution, and the new Central High School command attention.

Churches.—Washington has some of the finest church buildings in the country. Its places of worship number 338, representing 17 sects, 4 non-sectarian bodies and an unclassified group of 20 miscellaneous congregations. Like the government holdings the vast church properties of the city are not subject to taxation.

Education.—For the direct purpose of coordinating the educational forces of the capital, the Congress, by specific act, has opened its vast stores of information to the use of the higher institutions of learning situated in Washington. More than this, the leading universities of the country have completed a plan for creating a common university centre at Washington in order to take advantage of its unexcelled facilities for advanced studies of history, political science and economics. Certain institutions, special in purpose and unique in character, are located in Washington. The Carnegie Institution of Washington is one of these.

A considerable part of the adult population of Washington is engaged in study of one sort or another. Hundreds of men and women, clerks in the government bureaus, seek by this means to increase their efficiency and further their prospects of advancement. Not only have new institutions risen to meet this condition, but those already established have revised curricula and adjusted school hours to suit the situation. Washington is the seat of five universities. The oldest of these, as well as the oldest institution of learning in the District, is Georgetown University, situated on the heights of the west of Georgetown. Founded in 1789 by Archbishop Carroll of Baltimore, it was developed under the direction of the Jesuit Order of the Catholic Church. George Washington University goes back for its beginnings to 1821. In that year, through the activity of the Baptist Church, it was organized as Columbian College. Reorganized upon a non-sectarian basis, fortified by a more hopeful financial outlook, projected in strict accord with the aims of the modern university and planned to meet the peculiar need of the capital's large body of adult students, this university, with its student force of 3,436 and a faculty of 280, is forging rapidly to the front as an important institution.

Howard University was established in 1867 by act of Congress to furnish opportunities for the education of the negro. It possesses both preparatory and collegiate departments. The latter, in addition to its academic foundation, includes schools of theology, law, medicine, dentistry and pharmacy. The Catholic University of America was organized in 1885 under the direction of the Congregation of Propaganda. The Bishop of America, though its actual establishment was deferred until the autumn of 1889. It occupies a spacious tract in a northeast suburb of the capital. Here beautiful and dignified buildings are rising with a rapidity that points to the substantial growth of this university. It is one of the leading institutions for the higher study of letters and metaphysics. The American University was organized under the inspiration and, in the main, under the support of the Methodist Church for post-graduate research. In a northeast suburb of the capital, upon the 90 acres owned by the university, two of the two score buildings, projected in its plan, are already serving the purposes of post-graduate work.

Near the Catholic University of America is Trinity College, a Roman Catholic institution established in 1900 for the higher education of women, under the direction of the Sisters of Notre Dame de Namur. Beautifully situated in the northeast section of the city is The Catholic University of the Sacred Heart and Gallaudet College, incorporated in 1857 by Congress, this body making annual appropriations for its maintenance.

Below these higher and special institutions are the primary and secondary schools of the District. These are private and public, sectarian and non-sectarian. The mild winter climate of Washington; the beauty, the cleanliness and the healthfulness of the city; the brilliant drama of its political and social life; its public facilities for reference and research; all these combine to make the capital fruitful soil for the development of private schools. There are literally hundreds of these, many of them conspicuous in excellence, ranging from kindergarten to seminary on the one hand and preparatory school on the other. Washington has a finely progressive public school system. The public school population for 1919 was 62,239. Of this number about two-thirds were white pupils and one-third negroes. This racial fact separates the school population into two parallel systems united at the top by the superintendent of public schools. These two parts are practically identical in aim and opportunity. Each consists of kindergarten, primary and grammar grades, each is supplied with both academic and vocational high schools and each supports a normal school for the training of teachers. The teaching force of the system for 1919 was, officers and teachers, 1,965.

A new high school, modern in design and equipment, erected at a cost of $1,600,000, was dedicated in February 1917. Another, built at a cost of $700,000 for the use of negroes, was opened at about the same time. A $400,000 normal school for white pupils and one costing $250,000 for the training of colored teachers indicate the scale on which the new school buildings are being constructed.

Commerce.—By virtue of its fundamental character, Washington's commercial interests are, generally speaking, limited to local needs. The latest census report for the District of Columbia on this subject shows 514 manufacturing establishments whose total capital is $40,810,200. The number of persons engaged in these is 11,323, of whom 435 are pro-
priesters and firm partners, 2,011 salaried employees and 8,877 wage-earners. The salaries and wages reported from these establishments are $8,098,692. The cost of material is the net to be $12,976,241. The value of the product is $28,978,241. This, less the cost of material, is $16,739,018. Between the reports of 1909 and 1914 a slight falling off appears in the number of these establishments. Within this period, however, there was a gain of 33.6 in capital, of 37.5 in salaries, of 21.6 in wages and of 11.3 in the net value of products. In addition to its manufacturing interests, Washington supports a vast mercantile business. Its department stores are models of this modern industrial expedition. The heart of business Washington is in the northwest section of the city, though the complete business district extends from 6th to 15th streets, east and west, and from Pennsylvania Avenue north and south. The real estate interests of the city are enormous. Out of town investors control large blocks of property and speculation has at times been a conspicuous feature of this business. The active speculation in real estate Washington gives one the idea of a development of the suburbs both in the District and in the States immediately surrounding. Over 50 per cent of the property is controlled by the United States government, whose holdings are increased from time to time as the demand for public building sites increases.

Banks.—The banking interests of the city are important. Reports made to the Comptroller of the Currency, 12 Sept. 1919, by the banks and trust companies of the District show that Washington has 14 national banks whose deposits at that date were, in aggregate, $84,437,000; 24 savings banks with a total deposit of $21,722,000 and six trust companies whose deposits amounted to $35,578,000. The grand total of deposits stood at $161,737,000.

Transportation.—Washington has two street railway companies operating about 220 miles of track within the District. The larger of these companies is the Washington Railway and Electric Company, the other is the Capital Traction Company. The former is a syndicate of eight companies, with eight lines operating within the city and six in the suburbs. The latter controls three important lines. The trackage is, for the most part, double track underground conduit electric. The slight percentage of overhead trolley lines is operated outside the city, connecting in several instances with related lines of Maryland and Virginia. The street railways of Washington have played a conspicuous part in K-stripping the suburbs and outlying sections generally.

Charitable Institutions.—The peculiar conditions governing Washington politically have their effect on its moral government. The humane institutions of the capital are divided into three classes. First, those supported entirely by the combined general and local government; next, those supported partially by the same government combination; and third, those maintained solely by private means. In the first class are the Home for the Aged; St. Elizabeth's stripes; the Catholic Hospital; the Children's Home; the Children's Home for Women; Children's Hospital, Providence Hospital, Garfield Hospital and Emergency Hospital; Woman's Clinic; Washington Home for the Incurables; Washington Hospital for Foundlings; Saint Ann's Infirmary, and many other organizations of similar aim. The second class includes many institutions and associations which have for their object the caring for sick and incapacitated persons. Washington has numerous private charities and institutions for charitable purposes in connection with the various churches and religious organizations. The charities of the District are superintended by a board of prominent citizens known as the board of charities; appointments to this board are made by the President of the United States. The third class includes all sums required to meet both the current administrative expenses and those involved, as well, in measures for the further development and improvement of Washington. This body, moreover, names in specific detail the purposes for which its annual appropriations are made and dictates to the least item the several uses to which these appropriations are to be put. The source of revenue for such maintenance and improvement is two-fold. One-half of the amount required annually is drawn from the Treasury of the United States. This represents the federal obligation toward the support of the Federal territory. The other half is derived from taxes levied on the real and personal holdings of the citizens of the District and from the proceeds of licenses of various sorts. The vast property values within this area belonging to the general government are exempt from taxation. The commissioners are appointed by the President, "with the advice and consent of the Senate," to administer the District government. Two of these represent the two dominant political parties. The third one is an officer drawn from the engineer corps of the army. A commissioner's term of office is three years. The salary is $5,000. In addition to the District laws enacted by Congress, corresponding to the State laws of other localities, the United States regulations taking the place of municipal laws of other cities, formulated by the board of commissioners. For the purpose of administrative convenience, the government business of the District is divided into three groups, each of which a commissioner has charge. The department of the engineer commissioner is, as a matter of course, a technical one. The remaining two are grouped according to certain convenient lines of agreement. Questions that may arise under the law are submitted to Congress, and the laws of Congress are decided by a majority vote of this administrative board. All subordinate officers required to execute the government business of the District are appointed by the

commissioners themselves. Fiscal affairs are in the hands of an assessor, a tax collector and an auditor. These stand as the heads of a compactly co-ordinated fiscal department. Accounts are scrutinized, also, by the auditors of certain Federal departments. Appointed by the commissioners is an officer, not connected with the fiscal department itself, who disburses the funds allotted to the District.

The general safety and welfare of Washington is vested in police and fire departments, in a board of health and sanitation and in the courts. The police department consists of 854 men. Eighty-eight of these are officers, ranking from a major and superintendent of police to sergeant. Police jurisdiction, covering an area of 69.7 square miles, is divided into 13 precincts, each in charge of a lieutenant of police. The force is divided into 27 steam-engine companies, 12 truck companies and a fire-boat company. In both police and fire departments a conspicuous feature of the training is a well-organized study of methods of prevention as the fundamental idea of municipal protection. Sanitation in its wide range of application to city life is in charge of a health officer, assisted by numerous inspectors, a chemist and a bacteriologist. The commonly recognized functions of this department are now increased by medical and dental inspection of public school pupils and the direction of school nurses, as well as by an oversight of the operations of the Child Labor Law and the Eight-hour Law for women workers. The District of Columbia, though unique in character and limited in area, is, in its human nature, neither unique nor limited. It is necessary, therefore, to maintain a judiciary of comprehensive purpose and applicability. This judiciary consists of five branches. These are the Court of Appeals, the Supreme Court of the District, the Police Municipal and Juvenile courts. The Court of Appeals considers appeals from the Supreme Court of the District and also from the commissioner of patents. It is presided over by a chief justice and two associates. The Supreme Court, presided over by a chief justice and five associates, is so divided into criminal, equity, circuit and probate courts as to include within its jurisdiction such matters as are generally covered by the Federal, State and municipal courts of other localities. The police court consists of two branches, each in charge of a police justice. One branch takes cognizance of minor infractions of United States laws and the other of major violations of municipal regulations. The Municipal Court deals with the multitude of lesser violations of city ordinances. The Juvenile Court, as its name implies, takes cognizance of the offensive of minors against municipal regulations.

History.—In order to secure a permanent capital of the United States, Congress, in July 1790, ceded to the United States, by the Act of 1788, the estate of the late George Washington at its head, to select a site, not to exceed 10 miles square, within specified points on the banks of the Potomac River. That commission chose the present site of the capital. Several experimental namings of the city and the tract of which it is a part resulted finally in the names Washington and the District of Columbia. Major L'Enfant, a French engineer, serving in the Continental army, superintended the laying out of the city according to a plan outlined by Washington, a plan said to have been derived from the outlines of Versailles, France. Lack of sympathy and support brought about the resignation of the disheartened L'Enfant. Andrew Ellicott, a Pennsylvania engineer, took up the work abandoned by the former. The seat of government was removed from Philadelphia to Washington in 1800. In November of that year the national legislature met for the first time at the new capital. At the outset Congress placed the administrative affairs of the city in the hands of three commissioners; but, dissatisfied with the results of this experiment, in 1802 the city was made a corporate town with a mayor, board of aldermen and a common council. The first mayor was appointed by the President, but the later incumbents of the mayoralty were elected by the electors. Georgetown and the city proper were included within the Federal district. These, existing as towns prior to the Revolution, remained corporate towns with independent municipal governments. In 1814 the city was captured by an expeditionary force of British soldiers. The Capitol, the White House and other government buildings were destroyed by fire. For the first 70 years of its existence as the capital of the United States, Washington was nothing more than the most forlorn of villages. No serious move toward municipal development and improvement was made. The United States government then, as now, paid no taxes on its property holdings within the District. Appropriations for city maintenance were lamentably meagre and insufficient. This lack of public spirit lost to the District that part of it originally belonging to Virginia, for in 1846, on petition of the citizens of Alexandria, the Virginia section of the Federal territory was receded to that State. In 1871 the creation of a territorial form of government brought the District once more under Federal control. This event marks the beginning of the era of progress which, at the present time, is reaching a ripe maturity. The board of public works, created by Congress at that time, projected, in the face of parsimony and stultitude, a substantial and permanent plan of public improvements. The city was cleared of the most objectionable of the results of a haphazard and makeshift expediency. The obliterated lines of city planning were replaced and L'Enfant were reset. The constructive vision, under which the present city is moving so vigorously forward, began to be apparent. Certain dissatisfactions with the territorial form of government developed, however, and in June 1878 Congress established the commission form of government under which the city is now administered.

Population.—The essential function of the Federal city is that of transacting the enormous bulk of business that the Federal government impose. This singular municipal functioning determines, to a great extent, not only the fundamental character of the population as a whole, but that of the city itself as well. The government business is, in contrast
to that of huge traffic and manufacturing centres, a physically clean and smokeless business; one, too, that does not exact unsightly congestion from the city. The Washington of the Office and the City of Clear Atmosphere, of Wide Spaces Throughout and of General Cleanliness of Appearance. The core of the population consists of those engaged in the business of the government. The government officials and clerks, alonin the city of a city of about 110,000. The Executive and his Cabinet, members of Congress and of the judiciary, representatives of foreign powers and representatives of the United States army and navy in official administrative capacity greatly increase this number. Each class is materially augmented by official and domestic families. To this basic population are added thousands of unclassified residents on the one hand and on the other hand, are engaged in and occupations and professions are as required to meet the needs of the whole. In 1920 the population of Washington was 435,428; and in 1917, 395,947; in 1916, 437,414; in 1913, 353,297; and in 1910, 313,069. In but a slightly varying ratio of two-thirds of these are shown to be of the white race. The remaining one-third are negroes. In 1919 the total assessment of real and personal property was $785,393,666. The budget for the same year amounted to $22,965,670.

**The New Washington, 1917-19.**—President Wilson's Declaration of War against the Central Powers of Europe in April, 1917, speedily transformed the capital from a city of leisurely government procedures to a highly electrified national centre of war activities. To aid in the enormous speeding up of government machinery imposed by the fact of war itself, men and women from all parts of the country hastened weekly by hundreds and thousands to the capital. By far the larger part of these were absorbed by the urgent clerical demands of the government departments. The smaller part—men and women of exceptional training and experience—were grouped in special bureaus whose common purpose was to accelerate, to co-ordinate, and to control the mobilization of the vast material resources required to support in full efficiency the man power of actual military service. Cautious among these bureaus were those taking charge of food, fuel, transportation, and housing. Bolling Field, Camps Meigs, Meade, Humphreys, Leach, instruction and concentration camps, in the immediate vicinity of Washington, stressed the tax upon the city's resources. In less than a year the population was increased by 59,480. This sudden and excessive increase presented promptly the acute problem of house and office accommodations. Every available building, or any part thereof, was commandeered to meet the situation. Besides, there were erected, chiefly along the Mall, temporary office buildings that cover acres of this area. Upon the Plaza between Union Station and the Capitol, the United States Housing Corporation built, also, a series of government hotels for the use of women war workers. Superbly equipped and maintained, these government agencies was the equally enthusiastic and efficient war service of the municipality itself. Twenty thousand men from the District entered military service. Emulative service banners adorned business house and home. The District quotas of Liberty and Victory loans were more than met in a rush of patriotic fervor. The local boys, Costume Corps, the City Council of Defence, the Boy Scouts, welfare organizations of every creed and purpose, joined full-heartedly in the supreme business of caring on.

Women released men from civil service in a competent substitute. Then the war. Then the Armistice. Gradually the tide of transient residents is moving away from Washington and slowly a Washington of new outlook and aim is shaping under the inspiration of its patriotic shareholding in the vicissitudes of a world at war.

WASHINGTON, Ind., city, county seat of Daviess County, on the Evansville and Indiana and the Baltimore and Ohio Southwestern railroads, about 100 miles southwest of Indianapolis and 20 miles east of Vincennes. It is in an agricultural and coal-mining region, and in the near vicinity there are nine large coal mines. The chief manufacturing establishments are railroad shops, flour mills, foundry and machine shops. There are extensive shipments of coal, grain, livestock, flour and vegetables. The city has four banks, two daily and two weekly newspapers. It has a high school established in 1874, Saint Simon's Academy, public and parish schools and a parish library. Pop. about 7,854.

WASHINGTON, Iowa, city, county-seat of Washington County, on the Chicago, Burlington and Quincy and the Chicago, Rock Island and Pacific railroads, about 70 miles southwest of Davenport and 50 miles northwest of Burlington. It is in an agricultural and stock-raising region, with a large horse market. The chief manufacturing establishments are brick and tile works, button factory, marble works, machine shops and creameries. The principal public buildings are the county courthouse, 12 churches, schools, banks and business blocks. It has a high school, opened in 1867, an academy, public and parish schools and two libraries. There are five banks, two national and three State, and a daily and two weekly newspapers. Pop. 4,544.

WASHINGTON, Kan., city, county-seat of Washington County, on Mill Creek, and on the Chicago, Burlington and Quincy and the Missouri Pacific railroads, about 90 miles northwest of Topeka. It is in an agricultural region, in which the principal products are wheat and corn. Stock-raising is given considerable attention. The industries are connected chiefly with the farm products and the shipment of livestock. There is a high school, a Friends' Academy, two newspapers, two national banks, two private banks and a private business school. Pop. 1,405.

WASHINGTON, La., town in Saint Landry Parish on the Bayou Courtableau, and on the Southern Pacific Railroad, about 168 miles northwest of New Orleans. It is at the head of navigation on the bayou, and has opportunities for shipping freight by water that makes it a commercial centre for a large part of the parish. There are brick and tile works, a cotton twine and yarn factory, cotton mills and a match shop. The principal shipments are rice, cotton, sugar-cane and corn. The State bank has a capital of $50,000. Pop. 1,405.

WASHINGTON, Me., town in Knox County, about 25 miles east by south of Augusta. It was incorporated in 1811 and called Putnam; in 1823 the name was changed to Washington. The town contains several villages, in all of which there are manufacturing interests; the principal manufactures are barrels, staves, headings, undertakers' supplies, cabinet work and lumber. There are five churches, a high school and district schools. Pop. 814.

WASHINGTON, Mo., city in Franklin County, on the Missouri Pacific Railroad, about 55 miles west of Saint Louis. It is in a fertile agricultural region. It has manufactures of lumber, brick, flour, shoes, cob-pipes, leather, musical instruments, agricultural implements and furniture. There are made extensive shipments of boxed beef and pork, wheat and corn, and lumber products. There are six churches, private schools, Roman Catholic and Lutheran schools. The city has two banks and two newspapers. Pop. 3,670.

WASHINGTON, N. J., borough in Warren County, on the Morris Canal, and on the Lackawanna Railroad, about 61 miles west of Newark, and 12 miles northeast of Easton, Pa. It is near the base of Scott Mountain, on the south side, and is in an agricultural region. The chief manufacturing establishments are piano and organ factories, silk mills, machine shops and furniture factory. There are six churches, a high school, founded in 1882, public elementary schools and a school library. There are two banks and a newspaper. Pop. 3,250.

WASHINGTON, N. C., town, county-seat of Beaufort County, on the Pamlico River, and on the Atlantic Coast Line Railroad, about 30 miles northeast of Wilmington, N. C. It is at the head of navigation on the river, has freight connections by water with the Atlantic Coast ports and the West Indies. There are grain elevators and large warehouses; the principal exports are fish, vegetables, flour and fruit. The town also contains barrel and sash factories, lumber and planing mills and steam cotton gins; oyster fishing is an important industry. There are two banks, a daily and two weekly newspapers. The town has a high school, founded in 1899, with a school library. Pop. 7,500.

WASHINGTON, Ohio, county-seat of Fayette County, on Paint Creek, and on the Baltimore and Ohio, the Ohio Southern, the Cincinnati and Muskingum Valley and the Cincinnati, Hamilton and Dayton railroads, about 75 miles northeast of Cincinnati and 30 miles southeast of Springfield. It is in an agricultural region. The principal industrial establishments are boot and shoe factories, soap factory, woolen mills, iron works, machine shop, planing mill and flour mill. There are four banks and five newspapers, including a daily and semi-weekly. There are a public high school, graded elementary schools, a library and private business schools. Pop. 7,277.

WASHINGTON, Pa., borough, county-seat of Washington County, on Chartiers Creek and on the Pennsylvania, the Baltimore and Ohio, the Waynesburg and Washington railroads, about 32 miles southwest of Pittsburgh. It is in an agricultural and coal region. The chief industrial establishments are pipe and pipe works, steel works, tin plate and iron works, glass factories, petroleum works, machine shops and foundries. According to 1919 estimate there are over 150 factories, producing annually about $8,500,000 of goods. The principal public buildings are the courthouse, erected in 1871, and which cost about $1,250,000; the Washington Hospital and the churches and schools. There are 27 churches, representing 13 different denominations. The educational institutions are Washington and Jefferson College (q.v.), Washington and Jefferson Academy, Trinity Hall Military School, Washington Ladies' Seminary, Washington Business College, Practical Commercial
WASHINGTON

(Washington was first settled in 1768 by people from the northern part of Ireland. The place was incorporated as a borough in 1810; in 1901 the boroughs of North and South Washington consolidated with the borough of Washington. Pop. 21,000.

WASHINGTON (D.C.), Campaign Against and Burning of, in the War of 1812. In the early summer of 1814 the British determined to make a diversion somewhere on the southern coast in favor of the army on the Canadian frontier. Having decided in favor of Chesapeake Bay, Admiral Sir Alexander Cochrane conducted thither the troops under command of Maj.-Gen. Robert Ross, the landing at the mouth of the Potomac being made on 15 Aug. 1814. At this time Washington was absolutely unprotected save by old Fort Washington and the flotilla under Joshua Barney (q.v.). Despite Madison’s insistence that defensive measures be taken and the appointment 2 July of Brig.-Gen. William H. Winder (q.v.) to command the district, by the time the British began their march inland practically nothing had been done save to gather together about 1,000 regulars and to enrol about 4,000 militia, of which the larger portion was yet to be collected. On reaching Benedict on the Patuxent River, the British army of 4,500 troops was divided into three brigades. On the 20th Cochrane went up the river in search of Barney’s flotilla (which was blown up by order of the Secretary of War to prevent capture) while Ross marched by land toward Washington; Capt. John A. Gordon was sent up the Potomac to attack Fort Washington (which was blown up by its commander) and Sir Peter Parker was dispatched to make a demonstration in the Patapsco (Parker being killed on the night of 30–31 August at Moorefield). Probably never in history has such a march been made. Without cavalry, with hardly a piece of cannon, Ross was allowed to advance unmolested through a well-settled country, abounding in defiles, ravines, streams and the like, whereas 100 men with axes and spades could have delayed him for days; but Ross encountered nothing more serious than a thunderstorm on the road to Upper Marlboro, where he arrived 22 August. The next day he met and dispersed a small Americanforce and that night encamped within nine miles of the capital. On the night of 22 August a brigade of Maryland militia under Gen. Tobias E. Stansbury arrived at Bladensburg, followed the next day by the Fifth Baltimore regiment under Col. Joseph Sterett and a rifle battalion under Maj. William Pinkney (q.v.). Winder had 3,200 men at Old Fields, but instead of sending them to oppose the British at Bladensburg, with whom he knew his forces were inadequate to the task, he ordered them back to Washington, thus leaving the road to Bladensburg open to the British, at which place they arrived about noon of the 24th.

The eastern branch of the Potomac was narrow and shallow at Bladensburg and was spanned by a bridge over which passed the road to Washington. In a ravine near the eastern bank was the 2-pounder, but the western bank was hilly, and in these hills Stansbury had drawn up his troops, flanked on one side by a battery of six guns. Winder then arrived and posted more troops and two batteries in the rear of Stansbury about a mile from the Bladensburg bridge. Shortly after noon a British light brigade, 1,500 strong, crossed the bridge and, clearing the thickets of skirmishers, quickly put the first American line to flight but was checked by the second line. A second brigade of British then charged and turned the left flank of the Americans, who, with the exception of several strong corps, broke and rushed in disorderly flight from the field. Meanwhile Barney, having destroyed his fleet, took his 400 sailors and two 18-pounders toward Bladensburg and on beholding the rout of the Americans established his men and guns on a hillside about a mile from Bladensburg. His first discharge completely cleared the road of the enemy who made several efforts to drive him, but were met with the little band. Finally they divided their forces, attacked Barney on both flanks and the rear, and through sheer weight of numbers soon compelled the sailors to flee, leaving Barney a prisoner in British hands. By 4 o’clock not a vestige of the American army was in sight; it had lost 26 killed and 51 wounded, while Ross officially reported his loss at 64 killed and 18 wounded, though probably he lost nearer 500. About dark the British entered Washington and in retaliation for real and alleged American depredations in Upper Canada, set fire and destroyed the Capitol building, which then contained the library of Congress. Ross then fired the President’s house and the Treasury building, and the next day continued the work, so that by noon the departments of State and War, the printing office of the National Intelligencer, the bridge over the Potomac, several ships in the navy yard and a few small houses were in ruins. A terrific tornado passed over the city about a week after, whenupon, leaving the other buildings marked out for destruction and abandoning his wounded, Ross withdrew from the scene of devastation and marched to Upper Marlboro, where he reembarked his troops to make the attack on Baltimore (q.v.).

and Rines, ‘The United States’ (Vol. VI, pp. 22-33).

WASHINGTON (D. C.), Early's Attempt

On 13 June 1864 General Early marched from Gainesville, under orders from General Lee, to attack and drive General Hunter from the Shenandoah Valley and then cross into Maryland near Leesburg, or at or above Harper's Ferry, and threaten Washington, thus hoping to draw troops from Grant's army. Hunter's failure at Lynchburg (q.v.) and his retreat toward the Kanawha left the Shenandoah Valley open to the movement into Maryland, and 27 June Early concentrated his army at Staunton, moving next day down the valley and reaching Winchester 2 July. He broke the railroad west of Martinsburg, drove General Sigel from that place 3 July and across the Potomac to Maryland Heights (q.v.), crossed the Potomac at Shepherdstown Ford, demonstrated on Sigel, then crossed South Mountain by Turner's, Fox's and Crapton's Gaps and attacked and defeated Gen. Lew Wallace on the Monocacy (q.v.), 9 July, Wallace retiring on the Baltimore road, leaving open the road and the town of Frederick, which had under his command the four infantry divisions of Rodes, Ramsey, Gordon and Echols. Ransom's division of cavalry and Long's three battalions of artillery, in all about 8,500 men. On the morning of 10 July Early marched on the direct road to Washington and bivouacked at night four miles north of Rockville. McCausland's cavalry brigade, which had preceded him, drove from and beyond Rockville, about 600 Union cavalry, under command of Major Pry, of the 16th Pennsylvania cavalry. During these movements, from the time of entering Maryland, the Confederate cavalry was industriously engaged in gathering up horses, sheep, hogs and cattle of all kinds, grain, bacon and subsistence of every kind, and shoes and clothing. The livestock was driven across the Potomac. Bradley T. Johnson's cavalry brigade, moving from Frederick toward Baltimore, occupied several towns on the way and destroyed the Northern Central Railroad at Cocksveysville.

Another cavalry detachment stopped a train of cars at Magnolia Station, on the Baltimore and Ohio Railroad, and burned the train and Gunpowder River bridge. Wires were cut and communication with the north severed. At dawn, 11 July, Early marched through Rockville, McCausland, who had the advance, took the Georgetown road and by 9 o'clock was stopped by Colonel Lowell, with a small cavalry force, in advance of Fort Reno. He formed Early's right. The main force, preceded by Imboden's cavalry brigade, marched for the Seventh Street road, running past Silver Spring, occupied several towns on the way and destroyed the Northern Central Railroad at Cocksveysville.

Mounting 400 heavy guns with a large range of fire. The one in Early's front, west of Seventh Street road, was Fort Stevens, with Fort De Russy on its left, Rock Creek; the one on the right was Fort Slocum. Fort Stevens had been furnished with a powerful armament, mostly of siege guns, well protected by embrasures and traverses. It had an extensive bomb-proof; and a hollow in the rear was capable of sheltering large bodies of men from artillery fire. General Augur, commanding the defenses, had collected some heavy artillerymen and miscellaneous force of militia, convalescents, invalid corps, marines and sailors, department clerks and other employees of the government, and placed them under command of Gen. A. McD. McCook. The whole force, prior to the arrival of the Sixth corps, numbered about 8,500 men. The line immediately north of the city was garrisoned chiefly by the 150th and 151st Ohio regiments of 100 days' men, two or three companies in each fort, and by detachments under command of Gen. A. McD. Hardin's command of the 22d corps, 10,000 men, the brigades held the entire line of 16 forts from the Potomac, above Chain Bridge, to the Eastern branch.

The cavalry, under command of Colonel Lowell, consisted of detachments of the Second Massachusetts, Eighth Illinois and 16th Pennsylvania, in all about 1,000 men, and was in advance of the works from the Potomac to Fort Stevens. When Early, who was within sight of the dome of the Capitol, had seen the works, thought to be feebly manned, he ordered Rodes' division into line, in front of Fort Stevens, and, about 1:30 P.M. when the skirmishers were within range, the Union artillery in Fort Stevens, under Captain Dupont, opened a rapid fire, clouds of dust appeared rising behind the fort, and soon a Union column was seen — a body of quartermasters' employees and 600 dismounted cavalry, under Maj. G. G. Brigg's of the Seventh Michigan, filing into the works on the right and left of the fort, whose skirmishers advanced to the front, before whom those of Rodes fell back, after approaching within musket range of Fort Stevens and wounding men on its parapet. This dashed Early's hope of getting possession of the works by surprise and he consumed the rest of the day in reconnoitering. Meanwhile a substantial and timely reinforcement had arrived to strengthen the Union defense. General Grant had doubted whether Early had anything more than cavalry in Maryland, and had sent Ricketts' division to Baltimore, and, on the night of the 9th, a few hours after Wallace's defeat on the Monocacy, ordered General Wright commanding the Sixth corps to march his other two divisions from the lines before Petersburg to City Point, 14 miles, where he arrived at daylight of the 10th, took transports and by 2 P.M. of the 11th arrived at Washington, where, just arrived, was a steamer with the 800 corps officers having reached Hampton Roads from New Orleans, had been sent directly to Washington. President Lincoln was on the wharf to greet the troops on their arrival. Wright quickly landed his troops and marched them to near
Fort Stevens, where he bivouacked, sending 900 men to relieve those that had been thrown out in front of Fort Stevens; being old soldiers, they immediately intrenched. Late in the evening, 1,500 quartermasters' employees and 2,800 convalescents, under Col. Frank Price, from nearly every regiment in the Army of the Potomac, took position in rear of Fort Slocum and in the rifle-pits on either side of it.

After nightfall Early called a council of his division commanders and a conclusion was arrived at to assault the Union lines at daybreak next morning, the 12th, but during the night a dispatch was received from Bradley T. Johnson, near Baltimore, that two corps had arrived from Grant's army, and this caused Early to delay the attack until he could again examine the works. As soon as it was light enough to see he rode to the front and saw that the works were lined with troops, and gave up the idea of capturing Washington, but decided to remain in front of the works during the day and retire at night.

At dawn of the 12th Early was seen in position, with part of his command, at the Rives House, on the right of Silver Spring road, on rising ground, surrounded by shade trees, with an orchard near, giving cover to sharpshooters, who commanded the Union skirmish line from this point and also from McClay's House on the left of the road. Wheaton's brigade of the Sixth corps was thrown out on the skirmish line in front of Fort Stevens and instantly the Confederate sharpshooters began their work. Skirmishing continued until the middle of the afternoon, when Wright pushed out Bidwell's brigade of the Sixth corps, formed in two lines with orders to join Wheaton in an attack upon the Confederates at the Rives House. The guns of Fort Stevens and Fort Slocum opened a rapid fire and at a signal from Wright, who stood on the parapet of Fort Stevens, President Lincoln at his side, Bidwell moved forward, and with Wheaton's brigade, which formed an advance line, drove the Confederates from the Rives House and, after a sharp fight, from rising ground beyond, and back for a mile upon Rode's main line, which farther advance was stayed, but the skirmishing was kept up until late in the night, and the ground gained intrenched. The engagement was witnessed by Cabinet officers, other officials and some ladies from behind the parapet of Fort Stevens, where also the President was ordered by General Wright, when the engagement opened and men were being wounded on the parapet. The Union loss was over 200, of whom 150 were of Bidwell's brigade, including two regimental commanders of the brigade killed and others wounded.

On the left, near Fort Reno, Lovell's 900 cavalry had heavy skirmishing with McCausland's cavalry brigade, and drove it back on the Georgetown road until cavalry came to McCausland's support. That night Early fell back through Rockville, marched all night and halted near Darnestown early in the morning of the 13th as far as Rockville, where it was attacked and driven back by McCausland, with a loss of 30 killed and wounded, after taking 38 prisoners. At noon Wright marched after Early with two divisions of the Sixth corps, followed by Emory's division of the 19th corps. Early resumed his march from Darnestown and crossed the Potomac at White's Ford, near Leesburg, on the morning of the 14th, heavily laden with the spoils of war. The Union loss during the three days was between 350 and 450. Early left 30 dead and 70 wounded on the field and lost over 200 prisoners not including his wounded. The loss on both sides was comparatively small, but the event is memorable in that it was the only occasion in the history of the country where hostile armies met so near the seat of government, and an actual battle within the boundaries of the District of Columbia. Consult 'Official Records' (Vol. XXXVII); Early, 'The Last Year of the War for Independence'; The Century Company, 'Battles and Leaders of the Civil War' (Vol. IV).

E. A. CARMAN.

WASHINGTON, Fort. See FORT WASHINGTON.

WASHINGTON, Mount, in New Hampshire, the highest peak of the White Mountains, and the highest point in the northeastern part of the United States. Its altitude is 6,293 feet; it is east of Crawford Notch. Granite is the chief rock formation of the whole mass. On the east side there are many deep gorges and several on the north; on the west the slope is steep. The summit is rocky, with scanty vegetation compared with the lower slopes and base, where large trees are numerous. For many years a carriage road has extended to the top and since 1869 a rack-and-pinion railroad has enabled tourists to ascend to the summit with ease. A United States meteorological station and a large hotel are on the summit.

WASHINGTON, State College of, a co-educational State institution situated at Pullman, Wash., founded in 1890 under the National Land Grant Act as the Washington State Agricultural and Mechanical College, and opened in 1902. The institution now offers courses in economics, civil, mechanical and mining engineering, mathematics, chemistry, botany, zoology, agriculture, horticulture, forestry, physics, geology, mineralogy, and education, and offers special courses in agriculture, pharmacy, veterinary science and business. The college has a Federal grant of 180,000 acres of land, an income of $90,000 annually from trust funds and receives State appropriations of about $400,000 annually. There are about 150 instructors and 1,600 students. The president in 1918 was Dr. E. O. Holland.

WASHINGTON, Treaty of, a treaty between Great Britain and the United States, signed 8 May 1871. Under its terms the Alabama claims, the San Juan boundaries and certain fisheries disputes were settled by arbitration. See TREATIES.

WASHINGTON, University of, the State university located at Seattle, Wash. The first steps toward founding the university were taken by the first territorial legislature in 1854, which petitioned Congress for a grant of land; an appropriation of two townships was subsequently made by Congress. In 1855 the legislature organized the Territorial
WASHINGTON ACADEMY OF SCIENCES — WASHINGTON COLLEGE

University of Washington in two equal institutions, one located at Seattle, the other on Boisfort Plains, Lewis County; but as no further steps were taken toward the establishment of the university, the legislature united the two institutions, and fixed the location in Cowitz from Skagit, Lewis County. This shifting policy led the people of Puget Sound region to incorporate another university, and the fear of thus duplicating institutions led the legislature to definitely fix the location of the University of Washington at Seattle, and to appoint a board of commissioners to select and sell the granted lands and establish the university. The main building was completed in 1861 and the university opened to students in the same year. In its earlier years the university met with many difficulties, chiefly financial, as the Territory appropriated no money for its maintenance until 1879; its progress was slow until 1893, when the legislature provided a new site and appropriation for building purposes. Since that time the growth of the university has been both continuous and rapid, and it has taken its place as the real head of the educational system of the State. The Board of Regents consists of seven members appointed by the governor, with the approval of the senate, for a term of six years. The university includes the following divisions: (1) The College of Liberal Arts; (2) the College of Science; (3) the College of Education; (4) the College of Business Administration; (5) the College of Engineering; (6) the College of Fine Arts; (7) the College of Forestry; (8) the College of Mines; (9) the College of Naval, Military and Aeronautical Science; (10) the College of Pharmacy; (11) the Library School; (12) the School of Journalism; (13) the School of Law; (14) the Graduate School; (15) the University Extension Service. Beginning with the year 1917–18 the university adopted the four-quarter plan, in accordance with which the academic year is divided into four quarters of approximately 12 weeks each. The university is in session practically continuously, except for the month of September. The requirement for entrance to the university is graduation from a high school or a two-year high school course, except in the case of special students who must be 21 years of age and show evidence of ability to profit by the special work desired. The total university enrolment in the pre-war year of 1920–21 was 6,828; in 1917–18 the enrolment was 5,871. During the first 18 months of the war the university sent forth from its student body, alumni and faculty 2,859 men for active military service. The enrolment of the university by schools and colleges in 1916–17 was as follows (the numbers in parentheses are the enrolments for 1916–17): Graduation School, 202 (116); College of Liberal Arts, 1,629 (1,311); College of Science, 452 (358); College of Engineering, 521 (377); College of Fine Arts, 200 (193); College of Forestry, 80 (47); College of Law, 173 (54); College of Mines, 119 (53); College of Pharmacy, 77 (53); Summer Session 1916, 1,245. The Associated Students of the University of Washington have charge of all athletics, the Cooperative Book-store, the University Daily, the Glee Club and the Dramatic Association. The student members of the board of control of the associated students act as a committee on the student government. The university has 19 fraternities and 17 sororities, and many local clubs. The campus comprises 450 acres, lying between lakes Union and Washington. The plan for the arrangement of the buildings is a modification of the quadrangle, the buildings devoted to liberal arts being arranged in one quadrangle and those devoted to the applied sciences in another. Scientific laboratories are well equipped with modern apparatus, and the library in 1918 contained 87,542 volumes.

WASHINGTON ACADEMY OF SCIENCES, a society for the promotion of scientific learning, organized in 1898. It is an organization uniting a number of learned societies of the city, including the Anthropological Society, the Biological Society, the Geological Society, the National Geographic Society, the Medical Society of the District of Columbia and the Philosophical Society. The last-mentioned, organized in 1871, is the oldest of the societies composing the academy. The academy and the majority of the separate societies publish 'Proceedings.'

WASHINGTON BARRACKS (formerly Washington Arsenal), a military post at Washington, D. C., established as an arsenal in 1803 at Greenleaf Point, a peninsula at the confluence of the Potomac and Anacostia rivers. It originally occupied 28½ acres of ground, later increased to the present 69 acres, which are beautifully laid out. The buildings were destroyed by the British in 1814, and were rebuilt in 1815. In the Civil War it was still an arsenal and was the depot of stores for the Army of the Potomac; and in 1865 the execution of the conspirators in the assassination of President Lincoln took place at the United States Penitentiary here. Afterward the penitentiary was removed, its site being added to the ornamental grounds. The arsenal was abolished in 1881 and the former storehouses were converted into barracks occupied as an artillery post and subsequently known as the Washington Barracks. Since 1901 the barracks have been occupied by engineering troops. The United States Army War College and the engineering school are located here. Large quantities of bridge equipment, together with engineering tools and scientific instruments, are stored at the barracks.

WASHINGTON COLLEGE, located at Chestertown, Md. It was chartered as a college in 1782, being the oldest institution of collegiate grade in the State. It was the direct successor of an academy with which the Free School of Chestertown (founded in 1723) had been merged and was established as a part of the proposed University of Maryland. General Washington gave his consent to the naming of the institution for him and became one of the board of visitors. The college is now in session and receives an appropriation from the State. It is open to women. The college offers two collegiate courses, classical and scientific, leading to the degrees of A.B. and B.S., and two years of preparatory work. There is a wide range of electives. By means of gymnasia work, athletics and setting-up exercises special emphasis is laid upon physical health and vigor.
There are a number of scholarships established by the State. The plant includes a large campus of unusual beauty, a new main building, a gymnasium, a dormitory for women, three dormitories for men, a heating plant and a fine athletic field.

WASHINGTON COLLEGE, located in Washington County, Tenn. It was chartered as an academy in 1783, and as a college in 1795, and was the first institution of higher learning west of the Alleghany Mountains. During the Civil War, and for a short time after the war, the resources of the college were seriously crippled, and only a course of academic grade was offered. All members of the board of trustees must be Presbyterians, but the college is not otherwise under denominational control. Two college courses are offered, the classical, leading to the degree of A.B., and the scientific, leading to the degree of B.S. There are also courses in music and oratory, a preparatory department with an auxiliary department giving instruction in domestic science and an industrial department (established in 1892-93) affording opportunity for students to pay a portion of the expenses by manual labor. The campus, consisting of 16 acres, occupies an elevated site, commanding a view of the surrounding mountains; the buildings are the recitation hall, the boys' dormitory and the girls' dormitory. Salem Church is used as the college chapel. The students in 1918 numbered 129 and the instructors 12.

WASHINGTON COURT HOUSE, Ohio, city and county-seat of Fayette County, 38 miles southwest of Columbus, on the Cincinnati, Hamilton and Dayton, the Pennsylvania, the Baltimore and Ohio, Southwestern, and the Detroit, Toledo and Ironton railroads. It is an important livestock market, has a canning industry and manufactures boots, shoes, flour, soap, stoves, furniture and fertilizers. Pop. 7,277.

WASHINGTON ELM, an elm tree at Cambridge, Mass., situated northwest of the common, under which General Washington took command of the American army 3 July 1775.

WASHINGTON AND JEFFERSON COLLEGE, located at Washington, Pa. Three classical schools were conducted by three ministers near Washington, the earliest opened in 1780, and out of these schools grew the academies and colleges from which came the present institution. In 1787 an academy was founded at Washington under the leadership of three Presbyterian ministers; in 1790 the courthouse where the academy held its sessions was burned, and academy suspended, some of its patrons in 1794 chartered a new academy at Canonsburg, and the opening of this school stimulated the reopening of the Washington Academy; the Canonsburg school was chartered as Jefferson College in 1802 and the Washington school as Washington College in 1806. Many attempts were made to unite the two institutions, but all failed, until 1855 when the college was accomplished under the present name. Even then rivalry existed as to the location of the college and a compromise was effected by having a part of the faculty and students at Canonsburg and the rest at Washington; in 1899, however, the college was definitely located at Washington. The control is vested in a self-perpetuating board of trustees. The college offers three courses leading to degrees, the classical (with the degree of A.B.), the Latin scientific (degree of B.S.), and the French scientific (degree of B.S.). There is also a course in civil engineering. To aid students preparing for the profession courses are suggested preparatory to the study of theology, law and medicine; Hebrew is included in the curriculum for the benefit of those studying for the ministry. There is also a preparatory department. There are a number of schoolships endowed and a large loan fund for students. The college occupies 16 acres within the limits of the town. The property and endowment of the college, including amounts added at the centennial celebration of 1902, amounts to considerably more than $1,500,000. The average attendance is about 400 and the faculty numbers 21. Of the alumni about 1,650 have entered the ministry, 950 the law and 460 the medical profession. Of those who have obtained some distinction there have been four members of the Cabinet, 11 governors of States, 10 United States senators, 70 presidents of colleges and universities, 20 State Supreme Court judges, 2 bishops of the Protestant Episcopal Church and 28 moderators of general assemblies.

WASHINGTON AND LEE UNIVERSITY, an institution of higher learning, located at Lexington, Va., midway between the Blue Ridge and the Alleghany Mountains, which are here about 13 miles apart. Founded in 1749 as Augusta Academy, about 15 miles north of its present site, its name was enthusiastically changed to Liberty Hall Academy in the spring of 1776. The institution was moved to Lexington in 1780 and formally chartered in 1782, under an independent and self-perpetuating board of trustees. Liberty Hall Academy was endowed by George Washington with a gift of $50,000, and by him authorized to change its name to Washington Academy, which was again changed in 1813 to Washington College. During the Civil War, the work of the college was discontinued, the student body enlisting in the Confederate army under the name Liberty Hall Volunteers. The college property was much injured during the war in the Valley of Virginia in June 1864, for which Congress granted remuneration 30 years later.

On 4 Aug. 1865 Gen. Robert E. Lee was elected president, and was formally installed on 2 October. During his devoted and efficient administration of five years, the growth of the college in numbers, curriculum, financial resources, equipment and influence was phenomenal. In 1866 the Lexington Law School, founded by Judge Brockenbrough in 1849, became "The School of Law and Equity of Washington College." In 1871, soon after General Lee's death, the name of Washington College was changed to the present corporate title—"The Washington and Lee University." The university property consists of about 300 acres of land and 25 buildings. The Lee Mausoleum, in the rear of the Lee Memorial Chapel, contains Valentine's recumbent statue of Lee, and in the crypt below are the remains of the whole Lee family, including "Light
Horse Harry Lee, the father of Robert Edward. The Bradford Art Gallery bequeathed to the university by Vincent L. Bradford of Philadelphia and the Lee collection of portraits of the Lee and Washington families are housed in the library and the Lee Chapel. The latter contains Peale's portraits of Washington and Lafayette, with other memorial portraits, busts and tablets. The principal benefactors of the university have been George Washington, its practical founder, his friend and follower, John Robinson, the Society of the Cincinnati, Cypus H. McCormick, W. W. Corcoran, Thos. S. Scott, Andrew Carnegie, Vincent L. Bradford, Robert H. Bayley, Wm. H. Reid, Mrs. S. P. Lees, Mrs. Sophie Newcomb, Judge Thos. H. Harvey, George Peabody and Mr. and Mrs. Robert Parker Doremus.

The university organization includes (1) the School of Arts, (2) the School of Applied Science, (3) the School of Commerce, (4) the School of Law. The courses in the School of Arts are divided into three groups: (1) Languages, (2) humanitarian studies, (3) mathematics and science. For the A.B. or B.S. degree a prescribed amount of study must be done in each group. Otherwise, the courses are entirely elective and modern languages may be substituted for classical. Although distinctively Christian in its traditions and ideals, the university is entirely independent, having no official connection with Church or State. Its patronage is distinctly national, as its support has been, more than two-thirds of its 652 students coming from other States than Virginia. Its methods of discipline and self-government have been known for generations as the "Southern Honor System."

In recent years, the university has adopted a universal and compulsory system of training in hygiene and physical education lasting during a student's whole course and a necessary requirement for any degree. The United States maintains at the university a reserve officers training corps in charge of a professor of military science and tactics. Military training, however, is optional, no student being required to take it.

The library of the university contains 55,000 volumes and its present endowment, including Doremus residuary legacy, amounts to about $3,000,000.

WASHINGTON UNIVERSITY, Saint Louis, Missouri, founded 1853, is a non-sectarian institution, under the control of a self-perpetuating board of directors of 17 members. Besides the college there are schools of engineering, architecture, commerce and finance, botany, agriculture, chemistry and fine arts. The course in the college is largely elective, particularly the work of the junior and senior years. The school of engineering offers courses in civil, mechanical, electrical and chemical engineering. The university confers the following degrees: A.M., M.S., M.Arch., M.S.C., and Ph.D.; in the professional schools: LL.B., M.D., D.D.S.; and after not less than three years of study the degrees of B.S.C. in civil, mechanical, electrical and chemical engineering. The productive funds of the university amount to nearly $12,000,000; the library contains 165,000 volumes; the students' annual enrolment is over 1,900 and the faculty numbers 228. See also SAINT LUIS — Education.

WASHITA, wōsh'ta, or OUACHITA, a river which rises in Polk County, Ark., and flows east, then south into Louisiana, entering the Red River in the east central part of the State. The chief tributaries are Saline, Lang Fouche, Tensas and Little Missouri. The part of the river below the point where the Tensas enters is often called the Black River. The Washita is navigable throughout the year as far as Camden, Ark., and for about eight months to Arkadelphia, Ark. The total length is about 600 miles.

WASHITA, Battle of, an engagement fought on the banks of the river of that name in Indian Territory on 27 Nov. 1868, in which Gen. George A. Custer, in command of the Seventh cavalry inflicted a crushing defeat upon the Indians, 103 of their warriors being killed. The immediate result was the return of the entire tribe of Cheyennes to their reservation. The chief Black Kettle (q.v.) was killed in the encounter.

WASHO-INDIANS, a linguistic stock of North American Indians, consisting of the Washo tribe, whose original range extended from Reno, on the line of the Central Pacific Railroad in western Nevada, to the lower end of Carson Valley. The vicinity of Carson is now the chief seat of the tribe and here and in the neighboring valleys there are about 200 living a parasitic life about the ranches and towns.

WASMANN, wasmān, Erich, Austrian biologist: b. Meran, Tyrol, 29 May 1859. He was educated in the gymnasium at Meran Hall and Feldkirch, at Jesuit scholasticates and the University of Prague. In 1875 he entered the Society of Jesus and was ordained to the priesthood in 1888. He has spent many years in biological study and research, and has had a part in many zoological and entomological congresses. His works are 'Der Trichterwiceller' (1884); 'Atemesels and Fomuchus' (1888); 'Vergleichende studien über Ameisengaste' (1889); 'Zusammenensetzung der Nett und fremdartigen Kolonien der Ameisen' (1891); 'Kritisches Verzeichnis der myrmekophilen und termophilin Arthropoden' (1894); 'Zur neueren Entwicklungssthereie in Deutschland' (1896); 'Instinkt und Intelligenz im Tierreich' (3d ed., 1905); 'Vergleichende Studien über das Seelen leben der Ameisen und der höheren Tiere' (2 ed., 1900); 'Die psychischen Fähigkeiten der Ameisen' (2d ed., 1909); 'Neue Dorylinengaste' (1900); 'Termiten in Ceylon' (1902); 'Zur näheren Kenntnis des echten Gasverhältniss' (1903); 'Dorylinengaste vom Kongo' (1904); 'Die moderne Biologie und die Entwicklungsstheorie' (3d ed., 1906); 'Menschen und Tiere der' (5th ed., 1910); 'Ursprung der Sklaven bei Ameisen' (1905-10); 'Ameisen und Ameisengaste von Luxemburg' (1906-09); 'Kampf um das Entwicklungsproblem' (1907); 'Der biologische Unterricht' (1908); 'Entwicklungsstheorie und Monismus' (1910); 'Beiträge zur Kenntnis der Termitophilen' (1912), and contributions to scientific reviews.
