"(prime),” (secondary) accents, to indicate syllabic stress
VENICE, vên(is), (Ital., Venezia; Ger., Venedig), northern Italy, a seaport city and capital of a province in the compartment or division of Venetia, situated on about 100 islands in a lagoon or shallow bay of the Adriatic Sea (Gulf of Venice), north of the mouths of the Adige and Po, 150 miles east of Milan and 70 miles west-southwest of Trieste. The city has a compact, roughly elliptical form, the greater number of the islands being close together and separated only by narrow canals (ri) about 175 in number, over which 378 bridges have been constructed. The city is about two and a half miles from the mainland, with which it is connected by a railway bridge of 222 arches. On the sea side, separating the lagoons from the open sea, are long narrow stretches of sand-hills, known as lidi, strengthened in places by masonry bulwarks. Both the lidi and the coast behind the town are defended by strong forts. Besides the canals, which to a large extent take the place of streets in Venice, there are numerous narrow lanes (calci) between the houses. The broadest street is the Corso Vittorio Emanuele in the north, and the main street is the Merceria, lined by handsome shops, which opens into the Piazza San Marco. The buildings are mostly erected on piles. The main part of the city is traversed by the Grand Canal, about two miles long and from 33 to 60 yards in width, which proceeds from the southeast to the railway station in the northwest by a winding course, somewhat like a letter S. It is lined along its whole length on both banks by a series of splendid palaces and houses. It is crossed by the famous Rialto bridge, in the centre of the city, built in 1588–91 and consisting of a single marble arch, and by two iron bridges. The tramways and cabs of other towns are represented in Venice by gondolas, barcas, steam launches and the steamers of the Societa Veneta Lagonare, which ply on the canal. The chief square is the Piazza San Marco (Saint Mark is the patron saint of Venice) on the southeast, continued by the smaller Piazzetta to the bank of the Canale di San Marco, and lined by some of the chief buildings of the city. It is the fashionable promenade of the Venetians and the centre of the city’s life. Of islands not forming part of the main mass of the city the chief are Giudecca, on the south, separated from Venice proper by the Canal della Giudecca; Isola di San Giorgio Maggiore, immediately east of the former, and separated from Venice by the broad Canale di San Marco; Isola di San Pietro, east of the main group of islands; Murano, a mile and a half to the north, with an ancient glass industry; Cemetery Island, to the northeast; Burano, as the northeast, with lace-foundries; Torcello, to the northeast, with an interesting cathedral; San Lazzaro, to the southeast, with an Armenian Mechetarist monastery; and San Servolo, to the southeast, with the lunatic asylum of the province. Of the sand-banks or lidi already mentioned the Lido di Malamocco fronting the city across the lagoon is a very popular well-equipped resort largely patronized during the bathing season.

Churches.—The great church of Venice is the cathedral of Saint Mark, on the east side of the square of the same name. It was begun in 830 as a brick basilica in Romanesque style and was rebuilt after the fire in 976. It was elaborately decorated and transformed into a Byzantine building in the succeeding two or three centuries, and in the 15th century Gothic elements were added. In its present form it is a Greek cross surmounted by a dome at the end of each arm and one in the center, and it contains about 500 columns, mostly in Oriental style, with richly ornamented capitals. The interior is adorned with a great profusion of splendid mosaics and also by other artistic productions of great beauty, such as the bronze monument of Cardinal Zeno and the Pala d’Oro, an altar-piece exquisitely worked with jewels on plates of gold and silver. Near the cathedral stood till its fall in 1902 the square Campanile, or bell-tower, 322 feet in height, with fine bronze statues and gates, and here is the clock-tower, with two bronze giants for striking the hours. The Campanile has been rebuilt. Among other churches are the following: Saints Giovanni e Paolo, a splendid Gothic domed building erected in 1340–1430, containing the burial-vaults of the doges and many magnificent monuments; San Maria Glorioso dei Frari, a beautiful cruciform structure in Italian-Gothic style, erected in 1250–1388, containing some splendid monuments and several of the finest works of Titian and Giovanni Bellini; San Salvatore, completed in 1534 (facade later) and recently restored, containing Titian’s ‘Annunciation’; Madonna dell’ Orto, with a beautiful façade in late Gothic style and containing many fine pictures by Tintoretto and others; San Zaccaria, built in 1457–1515 in
the style of the Gothic-Renaissance transition, with fine pictures; San Maria Formosa, an early cruciform church, often rebuilt, with good pictures by Palma Vecchio and others; San Maria dei Miracoli, erected in the style of the Early Renaissance in 1481 (restored), adorned with marble outside and beautifully decorated in the interior; San Giacomo di Rialto, the oldest church of the city; San Rocco (1490, restored 1725), containing many of Tintoretto's works; San Sebastiano (1506-18, restored), containing the tomb of Paolo Veronese and fine paintings by him; San Maria della Salute, erected in 1631-32 in memory of the plague, including works by Titian and others; San Giorgio Maggiore, on the island of the same name, begun by Palladio in 1560, with a very beautiful interior; Il Redentore, on the Giudecca, erected by Palladio in 1576; San Giovanni Crisostomo, Renaissance style, containing the Pala di Giorno, a portal next Sebastiano del Piombo; San Marciliano, notable for works by Titian and Tintoretto; San Caterina, with a splendid altar-piece by Paolo Veronese; the Jesuits' church, in baroque style (1635), and finely decorated, with a splendid altar-piece by Titian; San Giorgio degli Schiavoni, with Renaissance façade and containing fine paintings by Carpaccio; San Pietro di Castello, on San Pietro Island, the cathedral of the city till 1807; San Giovanni Elemosinario (1527), containing a splendid altar-piece by Titian, etc. There are also churches for Anglicans, Scottish Presbyterians, Waldensians, German Protestants, Greek Catholics, Armenians, Jews, an Italian Free Church, etc.

Palaces.—The Procuratie Vecchie, so called because the procurators of the republic formerly dwelt in them, is an imposing group of buildings on the north side of the Piazza San Marco, and directly opposite them are the Procuratie Nuove, which together with the magnificent library building now form the royal palace. The Procuratie Vecchie were built in 1496-1520, and the Procuratie Nuove were begun in 1584. The library was begun by Sansovino in 1536 and is one of the finest non-cathedral buildings in Italy. Its interior is adorned with ceiling and wall paintings by Paolo Veronese, Tintoretto, Schiavone and others. Facing the old Library, on the opposite (eastern) side of the Piazzetta, stands the Palazzo Ducale or Palace of the Dukes, which was first erected in 800 and has been rebuilt in styles of ever-increasing grandeur after five destructions. The exterior consists of two arcades, one above the other, and is adorned with colored marbles. It was restored in 1837. The Palazzo della Carta, a portal next to the cathedral, the incomplete court, and the flight of steps (Scala dei Giganti) leading up to the palace deserve special mention. The interior is very fine and contains a splendid collection of works by Tintoretto, Paolo Veronese and other great Venetian masters, including the 'Paradise' of the first named, which is the largest oil-painting in the world. The building also includes the Library of Saint Mark, with its many manuscripts and other treasures, and an archeological museum. The famous Bridge of Sighs (Ponte dei Sospiri) leads from the Palace to the Prigioni Criminali, or prison for ordinary criminals, built in 1512-97 and still in use. The palaces along the banks of the Grand Canal are of all styles from Romanesque to Late Renaissance, among them being the following: Palazzo Corner della Ca Grande (1532), now the seat of the prefecture; Palazzo Grimani (in Renaissance, a very fine building, now containing the Court of Appeals; Palazzo Farsetti and Palazzo Loredan (Romanesque), both now used by the municipal authorities; Palazzo Rezzonico (16th and 18th centuries), in which Robert Brown died; Palazzo Foscarini (Gothic), now containing a higher commercial school; Palazzo Cappello-Layard, the former residence of Sir H. A. Layard; Palazzo Bernardo, said to be the oldest building of the city, now a mosaic factory. Fondaco de' Tedeschi, a German warehouse from the beginning of the 13th century, now the chief post and revenue office; Palazzo Ca Doro (Gothic), now the French consulate; Palazzo Vendramin Calergi (Early Renaissance), one of the finest of all, the place where Wagner died; Paul de Camerlenghi (Early Renaissance), the former repository of the treasures of the republic; and the Fondaco de' Turchi (Romanesque), once a Turkish warehouse, now containing the municipal museum.

Monuments.—These include: in the Piazza San Marco, the pedestals of the flagstaffs (1505) and the marble sarcophagi, supported by lions, of Daniele Manin, the head of the short-lived republic of 1848; in the Riva degli Schiavoni, a marble-paved quay along the north bank of Saint Mark's Canal, an equestrian statue of Victor Emmanuel II (1887); in the Campo San Bartolomeo, a bronze statue of Carlo Goldoni (1883); in the Campo San Polo, a bronze statue of Fra Paolo Sarpi (1892); besides the church of Saints Giovanni e Paolo and an equestrian statue of Bartolomeo Colleoni, modeled by A. Verrocchio (d. 1488) and cast in bronze by A. Leopardi, on a marble pedestal designed by the latter (1490-1502). Ruskin declared this the finest work of sculpture in the world; south of the arsenal, Venenutti's monument (1885) in commemoration of the service of the soldiers in the inundation of 1882; a monument to Garibaldi, the great Italian leader, at the entrance to the public gardens; and a marble statue of Niccolò Tommaseo (1882) in the Campo Francesco Morosini.

Educational Institutions, Collections, Gardens, etc.—The Accademia di Belle Arti, at the southern end of the older iron bridge over the Grand Canal, contains a priceless collection of paintings by Venetian masters, including Titian (his masterpiece is here), Paolo Veronese, Giovanni and Gentile Bellini, Palma Vecchio, Rocco Marconi, Pordenone, Cima da Conegliano, Carloni, Carpaccio, Tintoretto and Tiepolo. The Reale Istituto di Belle Arti is situated beside the academy. The Royal Institute of Sciences, Arts and Industry occupies one of the palaces on the Grand Canal. The Museo Civico Correr, in the Fondaco de' Turchi, comprises both the former municipal and the Correr collections. The town also has lyceums and gymnasium, an Armenian educational institute, a Seminary, a Polytechnical Institute containing some sculptures and pictures, technical schools, a higher commercial school, school of industrial art, a deaf-mute school, conservatory of music, athenaeum, observatories and other similar in-
VENICE

The Cathedral of Saint Mark
VENICE

Institutions. The Giardini Pubblici, in the southeast, were laid out by Napoleon in 1807 on the site of monasteries which he caused to be demolished; their gardens are the most famous in the world, and the Grand Canal, behind the royal palace, and the Giardino Papadopoli, at the northern end of the Grand Canal. The chief theatre of the town is La Fenice.

Public and Commercial Buildings, etc.—Among these are: the archives building, besides the Frari church, containing about 14,000,000 documents, from 883 downward; the Zecca or mint (1536), besides the royal palace; the customs-house, at the southeast end of the Grand Canal; the branch of the Banca d'Italia in the Palazzo Manin; the Monte di Pietà or pawn-office, in the Palazzo Corner della Regina; the arsenal, in the south of the city, with stocks for shipbuilding and large graving-docks; the chiroi or Turkish at Gallipoli and the military prison; barracks, etc. New waterworks were completed in 1890. The public hospital is a large building beside the church of Saints Giovanni e Paolo, and the city also contains a military and a naval hospital, lunatic asylums, orphanages, penal establishments for correction and other institutions of a like kind.

Manufacturers, Trade, etc.—In addition to the glass and lace industries on the islands of Murano and Burano, there are in the city manufactures of glass and glass beads, silk-stuffs, cottons, woollens, tobacco, soap, wax, furniture, gold and silver wares, matches, artificial flowers, machinery, torpedoes, etc. Shipbuilding is also a growing industry. The trade of Venice, though less important than in the 15th century, has been steadily growing for many years and is considerable, the port now, in normal times, ranking second to Genoa in the commercial importance of the kingdom. Vessels drawing 27 feet can reach Venice; a 30-foot channel has been dredged. During the Great War the port was closed. Vessels enter from the sea through the Porto Malamocco and the Porto Lido and there is considerable dock and wharf accommodation in the Bacino della Stazione Marittima. Much modern improvement has been instituted in Venice, including careful sanitation, a new water supply from mainland sources by means of an aqueduct, and an electric lighting and industrial supply, generated by the Cellina torrent near Belluno and transmitted to the city.

History.—The foundation of Venice is attributed to the inhabitants of the surrounding districts, who fled from the cruelty of Attila the Hun and took refuge among the islets off the mouth of the lagoon. At the beginning of the 5th century, they founded two small towns called Malamocco and Rivoalto and devoted themselves to commerce. In 697 Paullucio Anafesto was elected the first doge or duke. In 819 the seat of government was transferred from Malamocco to Rivoalto (Rialto), and the adjacent islands were connected by bridges. The Crusades (1096-1271) gave lucrative employment to the shipping of the Venetians and enabled them to make large additions to their territories. In 1249 the Doge Marino Falieri, who plotted the overthrow of the aristocratic form of government, was beheaded. During the dogeship of Andrea Contarini (1367-82) Padua, Verona, Genoa, Hungary, and Naples waged war against Venice, which, after a severe struggle, lost all its possessions on the mainland. The tide of fortune, however, soon set again in favor of the Venetians. In 1386 they captured Corfu, Durazzo, Argos, etc.; in 1405 their general, Malatesia, conquered Vicenza, Belluno, Feltre, Verona and Padua; in 1408 they gained possession of Lepanto and Patras, and in 1409 of Guastalla, Casalmaggiore and Brescello. In 1416 the Venetian fleet under Loredan defeated the Turkish at Gallipoli and took all their warships. In 1508 between the towns on the Dalmatian coast. The close of the 15th century is the culminating point in the history of Venice. It had a population of 200,000, and was the centre of the entire commerce of Europe. With the beginning of the 16th century its power began to decline. Its commerce was gradually superseded in a great measure by that of the Portuguese in consequence of the discovery of the new sea-route to India. A league to subdue the republic was formed at Cambrai in 1508 between Pope Julius II, the emperor of Germany and the kings of France and Spain. Once again all its possessions on the mainland were taken from it. The work of destruction was all but completed by warfare with the Turks, at intervals from 1649 to 1718, during which the Morea and the islands of Cyprus and Candia were lost and with them the ascendancy in the Levant. After the French Revolution it refused to enter into an alliance with Bonaparte and the French took possession of the city in 1797. It subsequently became part of the Austrian Empire, of Napoleon's kingdom of Italy and of the Lombardo-Venetian kingdom under Austria, in which last it continued from 1815 to 1866. A revolution broke out in 1848, when the citizens endeavored to re-establish their ancient form of government under the Presidency of Manin, but after suffering from a 15 months' siege by the Austrians and from internal dissension, it was compelled to capitulate. In consequence of the misfortunes of Austria in her war with Prussia in 1866 the city and province were ceded to Napoleon III, under whose auspices they were united by a plebiscite to the kingdom of Italy. During the Great War Venice was repeatedly bombèd by hostile aviators and some military buildings were damaged and many priceless works of art were removed to places of safety. During the great Austro-German offensives of 1916-17 hostile forces penetrated to within little more than 20 miles of the city and threatened to debouch on the Venetian plain. But the defense of Venice and the mouth of the Piave was flooded, in order to provide against the Teutonic advance. The greatest names in Venetian art are those of the Lombardi (15th and 16th centuries), Jacopo Sansovino (1486-1570), Palladio (1518-80), Vincenzo Scamozzi (1552-1616) and Baldassare Longhena (1604-75) in architecture; the Mastegne (about 1400), the Buon (15th century), the Rizzi (15th century), together with numerous islands, including Candia, fell to the share of Venice. Under the successors of Dandolo, Genoa contrived to wrest from Venice her eastern possessions. In 1339 the Doge Marino Falieri, who plotted the overthrow of the aristocratic form of government, was beheaded. During the dogeship of Andrea Contarini (1367-82) Padua, Verona, Genoa, Hungary, and Naples waged war against Venice, which, after a severe struggle, lost all its possessions on the mainland. The tide of fortune, however, soon set again in favor of the Venetians. In 1386 they captured Corfu, Durazzo, Argos, etc.; in 1405 their general, Malatesia, conquered Vicenza, Belluno, Feltre, Verona and Padua; in 1408 they gained possession of Lepanto and Patras, and in 1409 of Guastalla, Casalmaggiore and Brescello. In 1416 the Venetian fleet under Loredan defeated the Turkish at Gallipoli and took all their warships. In 1508 between the towns on the Dalmatian coast. The close of the 15th century is the culminating point in the history of Venice. It had a population of 200,000, and was the centre of the entire commerce of Europe. With the beginning of the 16th century its power began to decline. Its commerce was gradually superseded in a great measure by that of the Portuguese in consequence of the discovery of the new sea-route to India. A league to subdue the republic was formed at Cambrai in 1508 between Pope Julius II, the emperor of Germany and the kings of France and Spain. Once again all its possessions on the mainland were taken from it. The work of destruction was all but completed by warfare with the Turks, at intervals from 1649 to 1718, during which the Morea and the islands of Cyprus and Candia were lost and with them the ascendancy in the Levant. After the French Revolution it refused to enter into an alliance with Bonaparte and the French took possession of the city in 1797. It subsequently became part of the Austrian Empire, of Napoleon's kingdom of Italy and of the Lombardo-Venetian kingdom under Austria, in which last it continued from 1815 to 1866. A revolution broke out in 1848, when the citizens endeavored to re-establish their ancient form of government under the Presidency of Manin, but after suffering from a 15 months' siege by the Austrians and from internal dissension, it was compelled to capitulate. In consequence of the misfortunes of Austria in her war with Prussia in 1866 the city and province were ceded to Napoleon III, under whose auspices they were united by a plebiscite to the kingdom of Italy. During the Great War Venice was repeatedly bombèd by hostile aviators and some military buildings were damaged and many priceless works of art were removed to places of safety. During the great Austro-German offensives of 1916-17 hostile forces penetrated to within little more than 20 miles of the city and threatened to debouch on the Venetian plain. But the defense of Venice and the mouth of the Piave was flooded, in order to provide against the Teutonic advance. The greatest names in Venetian art are those of the Lombardi (15th and 16th centuries), Jacopo Sansovino (1486-1570), Palladio (1518-80), Vincenzo Scamozzi (1552-1616) and Baldassare Longhena (1604-75) in architecture; the Mastegne (about 1400), the Buon (15th century), the Rizzi (15th century),
VENICE, BANK OF

VENICE, Bank of. The history of this remarkable institution forms one of the most instructive chapters in the annals of money, finance and banking. In 1171 the government of Venice, needing money to pay the expenses of a war upon which hung the destinies of the republic, plundered the treasury of its coins and bullion belonging to the goldsmiths or bankers who had deposited those species in the mint and exchequer, to the amount of about 100,000,000 ducats. Unlike Genoa (see GENOA, BANK OF), Venice paid its creditors, not by pledging the revenues of the state, nor by surrendering its autonomy to them, but by employing its power and authority to create an artificial bank money more valuable than the gold and silver coins or bullion of which it had dispossessed the bankers. This bank money did not consist of metal or of paper currency nor indeed of anything ponderable or portable, but merely of the registration in a book of so many artificial or imaginary ducats, representing neither coins nor currency notes, as was the case by law the only medium capable of liquidating bills of exchange.

The state opened a chamber of loans (Camera degli Imprestiti), giving credit on its books to each of the parties it had dispossessed for the amount of their loss, with interest at 4 per cent per annum. This interest being always punctually paid, it gave the creditors or assigns a permanent and reliable fund consisting of the right to demand and receive 4 per cent per annum forever. By making the assignment payable only in credits on the books of the chamber or bank, familiarly known as the Giro, it established a permanent income for the Giro, of which it could not be deprived so long as the state survived. This interest and the profits and inheritances presently to be described constituted the bank money. The latter sources of income became in time so great that the allowance of the 4 per cent interest was discontinued as superfluous.

Between the plunder of Asia Minor by the Crusaders, of the Byzantine Empire by the Venetians and the plunder of Moorish Spain by Genoa, Castile, Aragon and others, the stock of metallic money in Europe had fallen so low that the degradation, debasement and clipping of coins had become common. No assurance was to be had for the honest payment of a bill of exchange. By instituting an imaginary money which could neither be clipped nor debased; by reforming its own coinage and keeping it constant; by coined gold ducats (in 1252) containing 54 English grains of fine gold; by establishing a fixed legal relation between its coined money and its imaginary money, and by other measures mentioned below, the Giro gradually became a reliable centre of exchange, not only for the commercial transactions of Venice, but also for those of other states. This movement received great impetus both from the extent of Venetian commerce, the supremacy of its navy and the rigidity and impartiality of its jurisprudence.

In 1423 Venice took that important step which rendered the Giro the clearing-house for practically all Europe. It required that all bills of exchange drawn upon Venice should be paid only at the bank. Such payment was made by debiting the bill-acceptor's account so and so many ducats and adding an equal sum of imaginary ducats to the credit of the bill-holder, who thus became the proprietor of so and so many ducats at the bank.

In presenting his bill of exchange for payment the state required that the holder should effect the transaction in person, or by proxy. The transfer was made in the presence of two bookkeepers. No coins or any right to coins was involved in the transaction. The Giro kept no coins or circulating money. No endorsement was recognized or accepted. Therefore, the possession of the bill could not benefit a robber, whether marauding prince or footpad; it could not be passed around and used as money. Payable only at the Giro and in Giro credits, it was valueless elsewhere, valueless in other hands than those of the drawer. It was only money in and out of the Giro and only money in Giro debits and credits. This system made of the Giro a clearing-house for the entire civilized world. In this sense it was used all over Europe and its colonies.

The government of Venice prohibited the circulation of any foreign coins or paper or leather money in its dominions. It prohibited dealing in foreign coins by private or public banks. All foreign coins were required to be sold to the mint, where they were valued, paid for according to their metallic contents and re-coined into Venetian pieces. All contracts made payable in coins (none of which contracts concerned the Giro) were to be liquidated at the rates for coins named in the laws. The penalties for infraction extended to entire confiscation.

The government of Venice brooked no interference from the pontifical government. It admitted no ecclesiastics into the management of the Giro. It refused to permit the inquisition to be set up in any of its dominions of Venice: a striking contrast with the policy of Genoa.

The Giro seldom received or paid out coins or paper money. It dealt only in its own imaginary money by keeping accounts in its books. All coin transactions were turned over to the depository mentioned further on.
VENICE PRESERVED

For its transfers of accounts it made no charge.

Those who desired a safe place in which to deposit coined money and draw upon it by transfer of account (as in the Giro) were served by a branch department or depository strongly built and well guarded which was established for these purposes by the Giro, but without any further connection between the two inscriptions. The artificial money of the Giro was never mingled or confused with the actual money (coins) of the depository.

Some authorities have imagined that the *Unit* of the money of account (the artificial or imaginary money of the Giro) was the ducat. This is somewhat misleading. Actual ducats seldom or never went into or out of the Giro. The ducat was the integer, not the *unit* of its money. Its unit of money was the whole amount of credits (or debits) on its books, multiplied by their rapidity of circulation from one account to another. This rapidity or velocity is conjectured to have been about twice a day, at least during its halcyon period.

The depository (caisse de comptant) was under pressure of finance, commerce and speculation: the Giro was independent of them all. The fund of the depository *would* be exceedingly fluctuating, because it would correspond with the changes of trade in each year and from year to year. It kept pace with the exigencies of commerce; was perfectly elastic and impressionable to the movements of trade. This depository failed three times, in 1453, 1600 and 1717. The Giro being independent both of commerce, finance and trade, paid no heed to their exigencies. Its fund was neither elastic nor impressionable. Hence it never failed, indeed it could not fail, because it owed no debts.

While there was no physical relation between the imaginative money of the Giro and the ponderable and portable money (coins) of the state of Venice, the government, for the convenience of merchants and others keeping accounts both with the Giro and the depository, created by decree an arbitrary relation between them of 20 per cent, so that it took a hundred ducats in gold to equal in value 80 ducats of account in the Giro. The difference was called *agio*. This agio was afterward raised to 30 per cent and even more, by means of a sur agio, or super-agio; the imaginative money being always more valuable than the real.

The so-called *capita* of the Giro in the 13th century has been estimated at about 2,000,000 ducats; in the 16th century (discovery of America and sea-route to India) about 4,000,000; in 1750, 5,000,000; in 1797, 14,000,000. When in the year 1797 Napoleon captured the Giro the spoil consisted merely of pen, ink and paper: a set of accounts. Not being able to convert these assets, he left them undisturbed and unaltered.

Credits in the Giro being guaranteed by the state and transferable on its books rendered them very desirable, either as investments or as a ready and reliable means of liquidating commercial transactions. These, together with their inviolability and other advantages, explain their superior value compared with coins.

Throughout its earlier history all moneys deposited with the Giro were treated as loans to the state, credited to the depository as Giro money at par and handed over to the treasury. But when the commercial demand for bank money raised it to a premium over coins, the depository was established and the earlier practice ceased. The imaginary money of the Giro had become too valuable to be sold for gold or silver coins at par.

The Council of Venice decreed that bank money should not be liable to seizure for debt, nor the subject of mortgage: a decree that assisted to still further raise its value over that of coins.

The three great decrees affecting the Giro: the provision that bills of exchange, unless otherwise stipulated and so expressed, should be payable only at the Giro; that all payments in gross or in wholesale transactions should be effected through the Giro, and the stoppage of interest payments on the capital of the Giro are all ascribed to the year 1423, when Moncenigo was Doge. There are, however, reasons to believe that these decrees were not coincidental. A later decree of the Council prohibited and severely punished all persons convicted of paying or receiving coins at rates below than their denominational value; a provision that still further enhanced the superiority of bank money.

The bank (Giro) was shut one day in each week and four times in a year, each time 20 days, to balance and supervise the books. These intervals constituted a practical moratorium of 132 days in the year. During the intervals when the bank was thus shut, no bill payable in it matured, none could be protested until six days after the opening. This extended the moratorium to 368 days per annum, during the whole of which time the bank was drawing interest on such of its funds as were disposable in market; while it was paying out none. For the history of other ancient banks see Barcelona, Bank of; Byzantium, Bank of; Fugger, Bank of the; Genoa, Bank of; Medici, Banks of the; Tyre, Bank of.

VENICE PRESERVED, OR A PLOT DISCOVERED. *Venice Preserved* is hailed by some critics as "the greatest tragic drama between Shakespeare and Shelley." This judgment may be accepted if we are careful to exclude plays written during the lifetime of Shakespeare. In its very excellences, and these are of first magnitude, this play reveals how far tragedy had traveled since the Elizabethan era. In all respects of workmanship, constructive power and eloquence, the play is faultless. It lacks only that finer grain of beauty which the prime masterpiece is distinguished from its offspring of the second generation. The
VENIZELOS—VENOMOUS ANIMALS

play falls short by the measure of the qualities that made it one of the most successful plays of a century, by the fact that it is essentially a situational play, and by its sheer theatrical effectiveness.

More than any other work of this time Venice Preserved draws its inspiration from Elizabethan tragedy. Here again are the relevant themes of the tragedy of blood. But these have now turned from comedy into intrigue. The conspiracy that in Julius Caesar occupies a scene or two becomes the theme of a play. The play secured and maintained its popularity largely through the three effective parts which offered scope to the genius of successive generations of actors. Pierre and Jaffier are closely studied figures of conspirators bound by oath of loyalty. Pierre is simple, trustful, direct. Jaffier is irresolute, a lover-warrior. Belvidera is one of the favorite women characters of the 18th century stage. She is the loving wife "shining through tears, like April suns in showers" for love of whom the fatal difficulty first grows and who Cleopatra-like hangs upon Letooldos' arms and will not let him go. The two men correspond to men from Shakespeare's book, but Belvidera is his own creation. The play is marred by some vulgar comedy of a type dear to Restoration audiences.

The author, Thomas Otway, crowded his 33 years full of tragedy, the greater part of more painful than the tragedy of his own life. The story is taken from an historical novel Conjuration des Espagnols contre la Venise en 1618, which existed in an English translation of 1675. It was presented in February 1682, the part of Belvidera being taken by Mrs. Barry, to whom Otway had given his hopeless devotion. As an acting play it was popular down to the freeing of the theatres, the part of Belvidera being assumed by Mrs. Siddons and Miss O'Neill, and the parts of Pierre or Jaffier by Betterton, Quin, Garrick, Kemble, Macready and Phelps. Editions: Noel, R., ed. Mermaid Series (1888); Gollanz, I., ed., Temple Dramatists; McClumpha, C. F., ed., Belvidera Salient Gosses, E., Seventeenth Century Studies.

THOMAS H. DICKINSON.

VENIZELOS, vá'nē-zá'lıōs, Eleutherios, Greek statesman: b. near Canea, Crete, of Greek parentage, 1864. He was educated at his home town, at Smyrna, and the University of Athens, practised law in Crete and was elected deputy for the district of Kedonia in the Cretan assembly in 1888. He first acquired fame in the troubled events that led to the liberation of Crete in the insurrection of 1896-97. He became the leader of his people and president of the new Cretan national assembly. But the advent of Prince George of Greece as high commissioner of Crete was followed by a serious conflict between him and Venizelos. The prince aimed at despotic government, but Venizelos was not overjoyed at the Turk in order to set up a new despotism from Greece. He resigned his office, donned military uniform and headed the insurrection of 1905 which culminated in the fall of the prince and his retreat to Paris. Under the new commissioner, Zaimis, Venizelos returned to power with increased prestige. His fame spread to Athens and fired new hopes in Greece. In the political confusion of 1909, when the throne trembled and the nation itself seemed on the verge of dissolution, the democracy of Greece appealed to the man who had saved Greece to come and be its savior also. The late King George, overlooking the "outrage" Venizelos had committed on his son the prince in Crete, joined in the appeal. Although a confirmed republican, Venizelos came to Greece, saved the dynasty and the country by clearing through a revision of the Constitution and prepared the Balkan League (qq.v.) of 1912. A man of unswerving honesty, he used smooth words neither to his king nor the people; he boldly declared that the Crown had usurped too large a place in the function of government. He reformed the army and navy, swept away the oppressive taxation on the poor, set the throne on its feet and gave the country a stable administration. All this he accomplished in two years. After the overthrow of the Turk in the first Balkan War Venizelos strove hard to avert the disaster of the Bulgarian defection from the League. When Bulgaria was crushed and defeated, Venizelos offered magnanimous concessions to soothe the Bulgarian sentiments of Constantinople, Constan-

ANTHROPOLOGY.-Among the various contrivances for offense and defense found among animals the presence of a poison apparatus, consisting of a poison gland and an organ for introducing the poison into the body of the prey, is a noteworthy feature. In some of the lower forms of animal life, such as Creenterata, peculiar stingings, termed nematosists, are developed in the tissues. Each consists of a sac having a filament coiled up therein. On being touched the thread-cell ruptures and the thread is ejected and enters the surface of any animal it touches with a numbing effect. It centipedes a poison-apparatus is contained within the mouth, one pair of foot-jaws being furnished with the fang which communicates with a poison-gland. Among insects, such as the bees, hornets, etc. (qq.v.), the sting (see OVIPARIS) consists of sharp filaments, perforated for the transmission of a poison, the secretion of a irritating fluid, secreted by a special gland. In the scorpions (q.v.) the poison-gland is situated in the last segment of the jointed tail, the
fang being formed by the modified *telson*. Among higher animals the serpents (q.v.) constitute the chief of these venomous apparatus is present. In these animals certain modified teeth of the upper jaw form grooved fangs, which communicate with the poison-glands, formed by modifications of the salivary glands. (See Rattlesnake.) The venom of serpents appears to act by altering the constitution of the blood and by action on the blood-corpuscles preventing the due purification of the blood. It may be remarked that in all cases the venomous matter must be introduced directly into the circulation to produce its effects. A person may swallow the poison of a snake without experiencing any evil effects.

**VENTADOUR,** van'ta'dour, Bernart de, one of the most famous of the early Provençal writers. He was born toward the beginning of the 12th century at Ventadour in Limousin. He early developed a talent for the poetry of the troubadours and as a traveling troubadour he is known to have visited most if not all of the Provençal countries, at the courts of all of which, as a singer, he made them welcome. It was, however, at the court of Eleanor of Aquitaine that he was the greatest; and it is believed that when the latter princess married Henry II of England the poet went with her to England; but nothing is known of this. Ventadour's reputation was of a strongly and lasting influence upon Provençal literature and his work is still read in the Provençal countries. (See Provençal Literature.) Consult Raynouard and Mahn for collections of his works. Bischoff, 'Biographie des Troubadours Bernhard von Ventadour' (Berlin 1873); Carducci, 'Un poeta d'amore del secolo XII' (in 'Nuova Antologia').

**VENTILATION.** See Heating and Ventilation.

**VENTILATION,** Medical Aspects of. The air of rooms is frequently rendered more or less impure by the accumulation of dust and other suspended matters, or by an undue proportion of one or more of the normal constituents of the air or by the addition to it of poisonous gases. Dust consists in varying proportions of dust, seeds, cellular tissue, hair, epidermal cells and other animal substances, of flint-like particles and of microscopic organisms, some of which may be disease germs. The gases which most often make the air impure are carbon dioxide, carbon monoxide, illuminating gas, hydrogen sulphide and sewer gas. The organic nitrogenous matter thrown off from the lungs, the emanations from the skin and other impurities, mingled with carbon dioxide and water vapor, give to the atmosphere of a room that odor which is so disagreeable to those who enter from the outer air. They are the cause of that close, oppressive sensation perceived so often in the unventilated rooms of tenements. Of the normal constituents of the air, oxygen is the vitifying principle. To diminish its normal amount in a room by the combustion in stoves and lights and by the expired air mingled with organic matters is to vitiate the atmosphere. To supply oxygen and to remove these other gases is the object of ventilation. An increase in the amount of carbon dioxide results from the combustion of any substance containing carbon, from the decay and putrefaction of any animal or vegetable substance, from fermentation and from the respiration of animals. But the amount of carbon dioxide in a room is also directly dependent upon the amount of organic matter and the amount of this gas present is a guide to the respiratory impurity of the air.

The investigation of the air as to organic impurities is prolonged and tedious, but an increase in the amount of carbon dioxide proportionately diminishes the normal amount of oxygen is readily ascertained. Those who do not fully appreciate the conditions exhibit a tendency in cold weather to keep windows and doors closed, to put on weather-strips and to overheat apartments. Fresh air is kept out and the indoor air is fouled. Sore throats, consumption and various lung troubles result, while disease germs are afforded every opportunity to develop. Many of the dangers arising from impure air may be obviated by suitable ventilation, by chemicals, heat and steam. Impure air undermines the health and changes the character of the blood. Suitable ventilation is the free admixture of outdoor air and of the air of apartments, but so modified as to temperature and velocity of current as to prevent cold drafts, which are injurious, especially to the feeble, the very young and the aged, for they lower the temperature of the body and produce internal congestions.

Ventilation should take place by night as well as by day. In fact, night air is usually purer than day air and contains less carbon dioxide. Insufficient fresh air at night in the bedroom is often the cause of sleeplessness. The airing of one room by introducing the confined air from another is not suitable ventilation; neither is it proper ventilation to draw the air from a cellar, or to rely entirely upon the air-chamber of a furnace. If possible the air should be drawn from above the street-level, in order that it shall be comparatively free from dust and other suspended matters. The air of a room should not only be free from any disagreeable odor, but also from a sense of closeness. To maintain the air sufficiently pure for respiration purposes, 90 cubic meters of fresh air per hour should be supplied to each individual and each individual in health should have not less than 30 cubic meters of air-space. For the sick or hospitals even double this amount of air-space is none too much. Outdoor air may be brought into rooms through one or more layers of fine wire gauze, woolen, cotton or linen cloth fitted in frames into the windows or arranged as screens before the open windows; or it may enter through revolving metal wheels inserted into window-panes; or through small diagonal openings in the windows; or between the two sashes of a window, this being made possible by placing under the lower sash a board, occupying its whole width, and from three to six or more inches high; or, finally, over a cloth fastened to the lower parts of the window-frame, the lower sash of the window being raised.

**VENTNOR,** vent'nor, England, a pleasure-resort on the southeast coast of the Isle of Wight, eight miles southeast of Newport. It is beautifully situated on a terraced site and has an excellent climate. Besides churches and chapels it has a Benedictine convent school; a literary and scientific institution, with library
and museum; Albert Hall; convalescent homes and the usual conveniences of a seaside holiday resort, hotels, boarding-houses, esplanades, pier, park, etc. The permanent population of the urban district is about 6,500.

VENTRILIOQUISMI, the art of speaking in such a way as to cause a hearer to believe that the sound comes not from the person speaking but from a different source. The name originated from the erroneous supposition that the sounds uttered were formed in the abdomen, whereas it is practice alone that produces the illusion to a high degree of perfection. The sounds are formed by the same organs as the emissions of sound commonly the larynx, the palate, the tongue, the lips, etc. The art of the ventriloquist consists merely in this: After drawing a long breath he breathes it out slowly and gradually while he talks, ingeniously modifying the sound of the voice by the muscles of the larynx and the palate; besides this he moves his lips as minutely as possible and by various contrivances diverts the attention of his auditors. This art was known to many of the ancients, and appears to antedate recorded history. It is practised by wandering magicians in many semi-civilized countries and is a common form of entertainment on the vaudeville stage.

VENTURA, vën-too-rä, G. D. Gioachino, jo-a-kë'ño, Italian theologian: b. Palermo, 8 Dec. 1725; d. Versailles, 3 Aug. 1861. At 15 he entered the Jesuit college of his native city and subsequently was received as a novice by the Theatines. Having been admitted to holy orders as general secretary of the order, he contributed largely to its restoration, and published 'La Causa dei Regolari al Tribunale del Buon Senso.' He then was made censor of the press and member of the royal council of public instruction for the kingdom of Naples. He became distinguished for his funeral orations, one of which, on Pius III, gained him the name of the 'Italian Bossuet.' In 1824 he was appointed general of the order of the Theatines, fixed his residence at Rome and was presented to the chair of ecclesiastical law in the University of Rome. In 1855 he published his work 'De Metodo Philosophandi,' in defense of the Christian or scholastic philosophy. This was bitterly attacked by his old friend, the Abbé Lamennais, and, wearied of controversies, Ventura quitted Rome and spent 10 years in retirement. During this period he preached his finest sermons, including the funeral sermon of O'Connell, the liberal opinions advanced in which gave him great influence with the people. In 1848 the government of Sicily made him minister plenipotentiary to the court of Rome. On 4 May he left Rome and retired under the protection of the French to Civita Vecchia and afterward to Montpellier, in France. Here he wrote 'Letters to a Protestant Minister' (1849). Settling in Paris, he drew crowds to the churches of the Madeleine and Saint Louis d'Antin by the eloquence and originality of his discourses. At Paris also he published 'Histoire de Virginie Bruni' (1850); 'Les Femmes de l'Evangelie' (1851); 'La Raison Philosophe et la Raison Catholique' (1852); 'Essai sur l'Origine des Idees' (1853); 'La Femme Catholique' (1854); 'L'Ecole des Maires, ou les Oeuvres de la Puissance et de la Grandeur de Jésus Christ' (1854-55) and 'Le Pouvoir Chrétien' (1857).

VENUSA, vën-too-ra, Cal., city, county-seat of Ventura County, on the Pacific Ocean and on the Southern Pacific Railroad, about 70 miles west by north of Los Angeles and 160 miles south of San Francisco. The name of the post office is Ventura. The legal name of the city is San Buenaventura, from the name of the old Spanish mission established by the Franciscan Fathers in 1782. This mission was next to the last to be built by Father Junipero Serra and is still in use. The city is the centre of an excellent county and State highway system. It has rail and ocean transportation facilities and is a shipping point for the many agricultural industries of the surrounding section. The principal products are beans, sugar beets, oranges, lemons, apricots and English walnuts. In the county are rich oil fields. The city has light, gas and water plants, a fine courthouse, city and county libraries, good hotels and an up-to-date bathhouse with beach attractions. Schools and church facilities are excellent. Pop. 4,000.

VENUE, in law, the place, county or district where an action is to be tried and whence juries are to be summoned for trial of causes. In local actions, as of trespasses on the land or eyesight, the venue is to be from the neighborhood of the place where the lands in question lie; and in all real actions in the United States the venue must be laid in the county where the property is for which the action is brought. Where a defendant verily believes that he cannot receive a fair trial in the county where action is brought against him he is entitled to ask for a change of venue to a locality where there are no prejudices against him or his case. The convenience of witnesses, who may be called, is another reason for granting a change of venue. See Jurisdiction.

VENUS, the Roman name of the goddess of love, identified by the Romans with the Greek goddess Aphrodite. In the 'Iliad' she is described as the daughter of Zeus and Dione, but Hesiod places her as the offspring of Uranus, born among the foam of the sea. She surpassed all other goddesses in beauty and hence received the apple which was to be awarded to the most beautiful by Paris. She was the wife of Hephaestos (Vulcan), but would scarcely be considered a faithful consort, as she bestowed her love on the gods Arés, Dionysos, Hermes and Poseidon, and the mortals Anchises and Adonis. Among her children were Eros (Cupid), Anteros, Hymen and Hermaphroditus. She had the power of granting beauty and irresistible charms to her votaries. Among plants the myrtle, rose, poppy, apple and other fruits were sacred to her, and among animals the dove, sparrow, swan, swallow, hare, and tortoise. The chief place of her worship in Greece were the islands of Cyprus and Cythera. Before she was identified with the Greek Aphrodite, Venus, the Roman goddess, was one of the less prominent divinities in the religion, but Pompeii and other worship seems to have been established in Rome at an early period. Here several temples were erected to her at different times and under different names. In the best days of art this god-
VENUS—VENUS GIRDLE

dess was sometimes represented draped, at other times nude. The most celebrated ancient statue of Aphrodite was that in Cnidus by Praxiteles; there are copies of it in the Vatican and at Munich. Consult Gayley's 'Classic Myths in English Literature' (Boston 1911).

VENUS, in astronomy, the second planet in order of distance from the sun. The mean distance of Venus from the sun is 67,200,000 miles; its orbit has an eccentricity of .00686 and its plane of its orbit is inclined to the plane of the ecliptic at an angle of 3° 23' 35". It completes one revolution about the sun in 224.7 days and as its orbit lies wholly within the orbit of the earth the planet shows phases as seen by us, being seen full when it is at its greatest distance beyond the sun, half full when farthest to the left or right of that body and new when between the sun and the earth. During its motion around its orbit its distance from us varies enormously and hence also does its apparent size. When at its greatest distance, of 161,200,000 miles, its apparent diameter is but 9".5, while at its nearest approach it is but 24,500,000 miles away and its apparent diameter then is only .75. It is only when near the former or latter position that the illuminated hemisphere is almost entirely turned toward the earth; as the planet draws nearer, this hemisphere is steadily replaced by the dark one, so that near the time of closest approach we see the planet only as an exceedingly narrow crescent. This is why, notwithstanding the fact that Venus draws nearer the earth than do any of the other planets, we nevertheless view it under much less favorable conditions than occur when an outer planet reaches its position of closest approach.

The planet Venus more closely resembles the earth than does any other body in our solar system. Its diameter is but 7,700 miles, its surface gravity is 0.8 of that on the earth and it is surrounded by an atmosphere of considerable density. This last is made evident by the fact that as Venus approaches the crescent phase the horns extend far beyond the 180° points; while at superior conjunction, a thin, bright ring due to its atmosphere has, in fact, several times been seen completely encircling the darkened ball. It is another evidence of an atmosphere that the brilliance of the disc is greatest at the limb and falls off very rapidly as the terminator is approached; twilight effects, also, have been observed along the terminator for more than a century. As a result of the presence of this atmosphere, our knowledge of the surface markings of Venus is practically nothing. Many drawings showing shaded white areas or white spots have been made from a century ago until now, but whether a part of these markings may be continental or oceanic areas dimly seen through the overlying atmosphere, or whether all are merely transient cloud forms we do not know. This uncertainty also prevents any certain answer being given to the important and interesting question of the time of rotation of the planet. The earlier observers and many of the modern ones, believed that this was between 23 and 24 hours; the observations of others led to a rotation period equal in length to the planet's year, thus indicating that Venus keeps always the same face turned toward the sun. A different line of attack is furnished by the utilization of the spectroscope to determine the velocities of different portions of the planet's disc toward or away from the earth. (See SPECTROSCOPY.) But the observations are very difficult and thus far the results from different observatories are contradictory.

In the course of its motion about its orbit Venus sometimes passes between the earth and the sun and is seen crossing the bright disc of the latter as a round, black spot surrounded by a thin, atmospheric ring. These occurrences are known as Transits of Venus; when the transit is central, the passage occupies about eight hours. The earliest observed transit occurred in 1639; four have since occurred, in the years 1761, 1769, 1874 and 1882. Extensive observations were made upon the last two for the purpose of determining the solar parallax but the processes then employed have since been superseded by more accurate methods. (See PARALLAX.) The next two transits of Venus will occur as follows:

1908, June 8, 9 A.M., Greenwich M. T. Duration 6 hours 2 minutes.
2012, June 6, 1 A.M., Greenwich M. T. Duration 6 hours 20 minutes.

Eric Doolittle,
Director, Flower Astronomical Observatory, University of Pennsylvania.

VENUS OF THE CAPITOL, a famous ancient Greek statue preserved in the Capitoline Museum, Rome. The goddess is represented undraped, with her arms in the position of the still more noted Venus of Melos, her drapery being cast upon a vase beside her.

VENUS FLY-TRAP, a plant. See Dionaea Muscipula.

VENUS GENERATRIX, jen'e-triks, a statue of Venus set up in a splendid temple by Julius Caesar in the forum laid out by him just after his victorious return from his campaign against Pharnaces (46 B.C.). He took the title from the first words of the proemium with which the poem of Lucretius 'De Natura Rerum,' then only a few years published, opened—'Eæneumad Genetrix,' "Mother of the Descendants of Aeneas." Julius Caesar traced his descent with that of the whole Julia gens to Julia, the sister of Aeneas, the latter being the son of Venus, according to the Trojan cycle, by Anchises. Hence the whole Roman people were called upon to look upon Venus as their divine ancestor. Hadrian added the title 'Victrix,' victorious, to that of Genetrix, in 134 A.D. and built a double temple to her honor near the Colosseum. The statue which is commonly known as 'Venus Genetrix' is the copy of a Greek original, now in the Louvre, Paris; but the marble statue of the same name in the Vatican is really the only copy extant of the bronze statue by Arcesilaus which stood in the temple built by Caesar in his forum, the Forum Julium.

VENUS GIRDLE, an oceanic ctenophoran (see Ctenophora) remarkable for its shape, which is that of a ribbon, sometimes nearly five feet in length and about two inches in width—a filmy, semi-transparent undulating creature long ago named Cestus Venereus, "girdle of
VENUS OF THE HERMITAGE—VERA CRUZ

Venus. This shape is due to thin wing-like expansions in a vertical plane from opposite sides of the body which is in the middle of the "ribbon," and conforms to the ordinary ctenophoran, especially when young. Two of the ciliated swimming plates are extended along the upper and lower edge of the ribbon, and the creature swims by periodic and unwillful action. This curious and elegant jellyfish occurs frequently in warm seas, at all distances from land.

VENUS OF THE HERMITAGE, a Parian marble antique statue discovered in Rome in 1859, and now in the Hermitage, at Petrograd. It has been only slightly restored and is a close replica of the Venus of Medici, with a somewhat less conscious pose.

VENUS' LOOKING-GLASS, a very pretty little annual plant, Specularia speculum, of the Campanulaeae, which has long been a favorite flower-gardens, and is a native of corn-fields in the south of Europe. It has brilliant blue, white, or violet flowers, which fold up in a pentagonal manner toward evening. This name has been extended to the whole genus. The familiar American species is S. purpurea, a more or less pubescent, stiffly erect herb, having crowded orbicular or broadly ovate leaves, crenulate, diminishing in size toward the top, and clasping the stem closely with their cordate bases. The later rose to the blue corollas, peering out from the upper axils, so that the whole plant looks like a leafy spike of flowers. They frequent dry and sandy fields, are common, and are remarkable for their dimorphic flowers. The primary and lower flowers are small and cleistogamous, the calyx being longer than the minute corolla of valvate, connivent petals, which apparently never open spontaneously, but are self-fertilized and mature perfect seeds. The fruit is an oblong capsule, opening by valves near the middle.

VENUS OF MEDIcj, an antique statue which was found at Tivoli in the villa of Hadrian in the 17th century in 11 fragments, and was deposited in the Medici Palace, whence it passed in 1620 to Florence. In 1808 it was carried off to Paris and placed in the Louvre, but in 1815 was again taken to Florence, and now stands there in the Tribunio of the Uffizi. It represents the nude figure of the Greek Goddess Aphrodite, rising from the foam of the sea. There is much beauty and charm in the face and form. It belongs to the decadent period of Greek art during which the repose and somewhat hieratic action of Sculpture had given place to the expression of momentary emotion.

VENUS OF MELOS, a celebrated Greek statue now in the Louvre, Paris. It is so called on account of its discovery in the island of Melos in 1820. Its date is assumed to be between the time of Phidias and that of Praxiteles, or about 400 B.C. The statue represents a majestic woman, undraped to the hips standing with the weight on the right foot and the head turned slightly to the left. The arms are broken off, and their original position has been much disputed. The statue is also called the Venus of Milo.

VERA CRUZ, vě'rá kroz (Sp., vá'rá krooth), or VERACRUZ, Mexico, a state bounded by Tamaulipas on the north, by the Gulf of Mexico on the east, by Oaxaca on the south, and by San Luis Potosí, Hidalgo and Puebla on the west. The area is about 30,000 square miles, and it is mostly a mountainous region, with a narrow border of hot and unhealthy coast below the Sierra Madre range, which occupies its central and western portions and rises to a height of more than 12,000 feet above sea-level. At elevations of more than 3,000 feet, the climate is comparatively healthful and temperate, and the vegetable products in their variety correspond to the various conditions of temperature and humidity. Thus, cereals are grown in the state, as well as sugar-cane, cotton, tobacco, cacao, coffee and vanilla; and stock raising is carried on successfully. The natural pastureage lands in the Huasteca Potosina region are specially fine, and Vera Cruz shares them with Tamaulipas and San Luis Potosí. Mineral products are silver, gold, coal, copper, lead, iron, mercury, asphaltum, petroleum, and the precious stones, opals, amethysts, etc. But the importance of the state rests mainly upon its commercial relations with other sections of the republic, with the West Indies and South and Central America, and with the western European nations. The total annual value of imports and exports of domestic trade is estimated at $100,000,000, many of the articles that Mexico sends to foreign countries or receives from them passing through the open ports mentioned above. A list of the industrial establishments includes iron foundries, cotton, paper, woolen and sawmills, and manufactories of chocolate, wax, matches, etc. The capital city is Jalapa (q.v.). Pop. about 1,250,000.

VERA CRUZ, Mexico, the most important port on either coast of the republic of Mexico, on the Bay of Campeche, and the Mexican Railway, about 200 miles from Mexico City. As the spot whereon the Spaniards first set foot on Mexican soil, it possesses exceptional interest. The history of the "city" dates from the landing of Cortez, on 22 April 1519. It was not until 1615, almost 100 years later, that the title and privileges of "city" were bestowed by Philip III. Here the republic was proclaimed on 22 Dec. 1822, by Santa Ana. The city was bombarded by the United States forces in 1847. It had been assaulted by the French in 1838, and again in 1861. In 1914 United States troops occupied the city for many months to maintain order and protect American lives and property. The expenditure of $25,000,000 by the government in improving the harbor the area of which is 570 acres; the building of four railways—the Mexican, the Interocianic, the Veracruz and Pacific and the Alvarado, to its doors; the excellence of its steamship service and the recent establishment of its lighthouse service, by the federal government, have made the city a very important element in the commercial and industrial growth of the country. The annual imports and exports exceed $90,000,000 in value. At a manufacturing and wholesale point the city is rapidly advancing. It is particularly noted for the manufacture of cigars, large quantities of ore, chicle, dye woods and

VENUSBERG, vá'noos-bérg. See TAMM-
HAUSER.
hides are exported. The principal buildings are the federal custom house; the new headquarters of the lighthouse service; the church of San Pedro, the old Spanish church, and San Augustine, now occupied by a firm of wholesale merchants; the Hospicio Zamora; the military hospital; the Hospital of San Sebastian, and several extensive cigar factories. The famous fortress of San Juan de Ulua, occupied by a captured American gun near the entrance to the harbor. The Alameda and several fine plazas provide breathing places for the public. In one of these is a bronze statue of Don Manuel Gutierrez Zamora. There are military barracks in a remote section. The financial institutions of the city are the Mercantile Bank, with $2,000,000 capital, the Veracruz Banking Company, a branch of the National Bank and an agency of the Bank of London and Madrid, amounting to about 42,000.

VERA CRUZ, Capture of, in the Mexican War. While the battles of Palo Alto, Resaca de la Palma, Monterey and Buena Vista (qq.v.) were being fought, an expedition was being organized by Gen. Winfield Scott (q.v.) to move from the coast and capture Mexico City. Early in March 1847 Scott's 12,000 troops were landed at a point three miles south of Vera Cruz, and on 10 March the investment of the city was begun, the troops under Gen. William J. Worth (q.v.) occupying the sandhills, while to the northward, carrying the line of investment around the city to the shore north of it, were the divisions of Gen. Robert Patterson and David E. Twiggs (qq.v.). Much time was lost in bringing up siege guns, mortars, etc., and therefore Scott was not prepared to begin the bombardment for some time. The doomed city was surrounded on the land side by an almost unbroken line of bastions and redans mounting 100 guns. In the Gulf of Mexico, on a reef about a mile off shore, was the stone castle of San Juan de Ulua (or Ulúa) built in 1582 at enormous cost, garrisoned by 1,000 men and defended by 128 guns. On 18 March, when the city refused to surrender, Scott permitted the non-combatants to retire, and four days later began the bombardment. Aided by the fleet Scott hurled shot and shell into the city for the next four days and nights, 3,000 90-pound shells and as many shot, chiefly 32-pounders, being thrown from the American guns. The provisions in the city soon began to run low and on the 24th the French, Spanish and British consuls sent a joint note to Scott requesting him to allow the foreigners, both male and female, and the Mexican women and children in the city but Scott refused, since sufficient warning had been given before the bombardment began. Firing was then resumed, but the next day, the 25th, a flag of truce appeared, and after four days of negotiations the city was surrendered, with the castle of Ulúa. During the siege 400 of the garrison were killed and 600 wounded and between 400 and 600 of the inhabitants perished. Appointing Worth temporary governor, Scott resumed his march, subsequently fighting the battles of Cerro Gordo, Corregidora, Churubusco, Molino del Rey and Chapultepec (qq.v.), and finally entering Mexico City in triumph. Consult Cooper, J. F., 'Naval History' (Vol. III, pp. 83-90); Jay, William, 'Mexican War'; Ladd, H. O., 'The War with Mexico' (pp. 207-216); Maclay, E. S., 'History of the Navy' (Vol. II, pp. 178-185); Maury, Daniel H., 'Recollections of a Virginian in the Mexican, Indian and Civil Wars' (pp. 31-35); Schouler, James, 'United States' (Vol. V, pp. 38-47); Scott's 'Memoirs' (Vol. II, pp. 400-428); Wright, M. J., 'Life of Scott' (pp. 162-172); Wiley and Jones, 'The United States' (Vol. VII, pp. 229-231).

VERAGUA, vá-rá'gwá, DUKR or, dukedom created for the lineal descendants of Christopher Columbus: first borne by his grandson, Luis Columbus, in 1536. It was next inherited by Diego Columbus, great-grandson of the discoverer, upon whose death without issue in 1578 the direct male line of Columbus became extinct. The title was 30 years later settled upon the descendants of Isabel, sister of Luis, the first duke, and upon the extinction of that line in 1733, passed to the descendants of Francesca, sister of Diego, the second duke. The 13th incumbent in descent from Christopher Columbus, b. Madrid, Spain, 1837, was, in 1893, the guest of the United States government at the opening ceremonies of the Columbian Exposition, and was received with high honors by the American people.

VERATRINE, or CEVADINE, CaH4O5N, a vegetable alkaloid found in certain species of Veratrum or Hellebore, and along with sabadilline and veratridine, in sabadilla seeds. A colorless crystalline powder, very acrid and highly poisonous. It is almost insoluble in water or alkalies, slightly so in ether, very soluble in alcohol. It is prepared by extracting the finely pulverized seeds with alcohol containing 1 per cent of tartaric acid. This extract is first evaporated to a syrup and then diluted with water to precipitate the resin. To the remaining clear solution soda is added in slight excess, and this mixture is then shaken with ether. The ether solution is separated and mixed with light petroleum oil and filtered. The filtrate being allowed to evaporate spontaneously, crystals of cevadine separate; these are purified by recrystallization from their solution in alcohol. It is used somewhat in medicine as a liniment or ointment for external application in cases of acute neuralgia. A very small amount getting into the nostrils causes violent sneezing. In homœopathic practice it is administered internally in high dilution, in remittent fevers.

VERATRUM (Lat. hellebore), a genus of liliaceous plants, commonly known as hellebore (q.v.).

VERAZANO, vá-rá-tá'sá-no, or VERAZANO, Giovanni da, Italian navigator and explorer in the New World: b. near Florence, about 1480; d. Pico, New Castle, Spain, November 1527. He is described as having traded with the Orient, and about 1505 was in the maritime service of France. By that government he was employed as a privateer, or pirate, for the capture of Spanish prizes. In 1523 he took the treasure-ship sent by Cortes to Charles V. On 17 Jan. 1524 he sailed from the Madeiras on an exploratory voyage to North America. He discovered land near Cape Fear, discovered also a bay—either New York or Narrangansett—went northeastward to lat. 50° N. and then returned to France. He was
later captured and executed by the Spaniards.

The only known evidence for his discoveries is a letter from him to Francis I, published in Italian by Ramusio in 1556, being apparently no extant French original. The genuineness of the letter has been attacked; but is skilfully defended by Bevervoort (Verrazano the Navigator) (1874). Copper also Murphy, The Voyage of Verrazano (1875); Da Costa, Verrazano the Explorer (1880).

**VERBECK, Guido Fridolin, a citizen of no country but honored in Holland, America and Japan; missionary, educator and statesman: b. at Zeist, in the province of Utrecht, 1 Feb. 1830; d. Tokyo, 10 March 1898.** He was educated in the languages and humanities in the Moravian Academy at Zeist, often hearing the returned missionaries, especially Gutzlaff of China. He prepared for the profession of engineer in the School of Technology at Delft. Coming to America he was engaged as mechanical engineer in Wisconsin and Arkansas (1852-56), and entering the Theological Seminary in Auburn, N. Y., graduated in 1859, and as the "Americanized Dutchman" needed for the mission of the Reformed Dutch Church in America, in Japan, went out and settled at Nagasaki. The Japanese government called him to educational work in 1863, and thenceforth for nearly 30 years was in its service, training up many young men who afterward became the rulers of the nation. He organized the national system of education, superintending the foreign teachers and instructors of the Imperial University in Tokio, served as secretary to the Genro-in, or Senate, translating the constitutions of European countries, the code Napoleon, Bluntschi's Statssrecht and various bodies of laws and regulations. He was the originator of the idea of an imperial embassy around the world in 1872, and over one-half of his personnel were his former pupils. He was one of the translators of the Old Testament into Japanese and a member of the New Testament revision committee. Unable to claim citizenship in Holland or the United States, the Japanese government awarded him the unique distinction of permanent residence and protection. He wrote the History of Protestant Missions in Japan (1872-80). Consult Verbeck of Japan: A Citizen of No Country (New York 1900).

**VERBENA, a name applied to any herb used in religious rites, but now restricted to a genus of plants typical of the family Verbenaceae.** The species, of which about 110 have been described, are mostly annual and perennial herbs or shrubs distributed mainly in the American tropics but extending northward in the United States, where some weedy species are common in the gardens and other tilled land. They are characterized by erect or trailing stems which usually bear opposite leaves and terminal, sometimes opposite, sometimes corymb or cymose spikes of often showy flowers, for which some of the species have become widely popular as ornamental garden plants. The European verbena (Verbena officinalis) is an annual herb with slender paniculate spikes of small purplish flowers. It was formerly in high repute in medicine and was probably introduced into America for such purposes and cultivated by early settlers. It has become naturalized in some places along roadsides and waste places, but is not a troublesome weed. The showy garden verbena are derived mainly if not wholly from South American species, the first of which were introduced into cultivation between 1826 and 1838. *V. chamaedryfolia,* a brilliant scarlet, *V. philippinica,* a rose or purple and *V. incisa,* another rose or purple, were the first to be introduced and *V. taeniota,* a white-flowered species, appeared in gardens in 1838. These four species are the most important, since they are the chief progenitors of the garden verbena, though two other species (*V. canadensis* and *V. tenera*) have apparently been employed by florists for hybridizing. Since the progeny of these hybrids rarely produce germinable seed, the species are believed to have had a very small influence upon the present garden forms. A Brazilian species (*V. uenosa*) is a tuberous-rooted plant whose panicked, lilac, bluish-purple or sky-blue flowers are fragrant at night. Its tubers are stored over winter in cold climates. Verbena thrive best in rather rich, deep, light, well-drained loam. If well exposed to the sun for at least part of the day and if the stems are pegged down so as to take root they should give a constant succession of bloom throughout the summer and until frost. Consult Bailey's Standard Encyclopedia of Horticulture (New York 1916).

**VERBEOCKHOVEN,** vër-book'hô-vën, Eugen Joseph, Dutch painter: b. Warneton, West Flanders, 9 June 1798; d. Brussels, 19 Jan. 1881. His father was a sculptor and taught him to draw. In 1821 he produced his first large canvas, "The Cattle Market at Ghent," and the reputation he gained by this success enabled him to settle at Brussels, open a studio, and from 1847 put forth one after the other a series of animal pictures, especially landscapes with sheep, which received much applause from their careful, truthful drawing and the refinement and smoothness of their execution. Of his paintings seven are in Leipzig and three in the Berlin National Gallery. There are two fine examples of this painter's work in the New York Metropolitan Museum.

**VERD ANTIQUE,** vërd an-ték', literally, ancient green, applied to ornamental stone, consisting mainly of serpentine and usually mottled with slight traces of dolomite, iron, calcite, chromite, etc. Very beautiful pedestals and columns are made from it. The stone is still common in Italy. The name is extended to old bronzes, verdigrised by exposure.

**VERDANTI.** See Norns.

**VERDE, vërd, Cape.** See Cape Verde.

**VERDI, vër'dë (Fortunino) Giuseppe (Francesco),** Italian composer: b. Le Roncole near Busseto, Parma, 9 Oct. 1813; d. Milan, 27 Jan. 1901. His earlier musical education he received from a local musician of Le Roncole and Giovanni Provesi, maestro di cappella of the cathedral of Busseto and director of the Società Filarmonica, there. He wrote for this orchestra several marches, a symphony, a requiem. Other instrumental pieces now treasured in manuscript in the Busseto library. In 1831 he went to Milan to continue his studies, but upon his application for a scholarship at the Conservatorio was rejected for want of musical ability, according to the report of the
director. He then studied composition and instrumentation with Vincenzo Lavigna. Upon his return to Busseto, he became conductor of the Filarmonica and organist of San Bortolommeo. From 1838 he was again at Milan, where his first opera, 'Oberto, Conte di San Bonifacio,' was presented with considerable success at La Scala (1839); 'Un Giorno di Regno' (1840), called "un bazar de reminiscences," was an utter failure, but 'Nabuccodonosor' (1842), a Biblical libretto by Solera, was received so well as at once to establish his reputation. 'I Lombardi' (1843) and 'Ernani' (1843), with libretto from Hugo's 'Hernani,' were even more pronouncedly successful. The Austrian government in both cases made objections to the revolutionary ideas contained in the works. The political demonstrations of the time were no doubt of aid to the composer, and, in fact, the name Verdi was employed by the patriot party as an ace. He was the leading spirit of his school. 'Ernani' was the first of Verdi's works to be produced in England. He was now kept busy supplying impresarios with operas. Most of these were inferior to his earlier successes. Perhaps the worst was 'I Masnadieri,' which Verdi traveled to London to conduct (1847), but could not redeem. Yet with 'Rigoletto' (1851) he entered his most brilliant period. This, with 'Il Trovatore' (1852) and 'La Traviata' (1853), are classed as marking his second manner. They reveal a great advance over 'Ernani' in the treatment of both voice and orchestra. Their success in and beyond Italy was very great. They confirmed Verdi's reputation and they have remained incorporated in the general repertoire of Italian opera. Then followed another series of semi-failures. 'Les Vêpres Siciliennes' (1855), written for the Paris Opera, to be produced during the Universal Exhibition, had, indeed, a somewhat temporary success, and 'Un Ballo in Maschera' (1859) has been at intervals revived. Otello, having recently (13 Jan. 1888) made an attempt on the life of Napoleon, the scene of the latter was changed from Sweden to Boston, Mass., and one Riccardo, Earl of Warwick and colonial governor, was assassinated instead of Umberto. 'II Trovatore' III. Verdi was now working out a new method of expression, liberated from the traditional utterance of the Italian school. With 'Aida,' on an Egyptian subject, written at the request of Ismail Pasha and presented at Cairo in 1871, he first declared his third manner, revealing to a considerable degree Wagnerian influence, without, however, surrendering the leading features of Italian music. The orchestral resources were greatly increased but the vocal score was still the major part of his scheme. A 'Requiem Mass,' his only non-operatic work of considerable importance, written in 1874 in commemoration of the death of Manzoni, applied this new manner to sacred music. It was the centre of much discussion, being attacked by von Billow and defended by Brahms. A revised version of 'Simone Boccanegra,' a work which had failed in 1857, was presented with much success at Milan in 1881 and in 1889 at Otello, with a libretto by Boito, who had largely worked on the previous one. 'I Vespri Siciliani' (1855), a comic opera, with a libretto also by Boito, there is an increase in dramatic characterization. In 1898 Verdi wrote four sacred works, a 'Te Deum,' a 'Stabat Mater,' an 'Ave Maria' and 'Laudì alla Virgìne' (words from Dante). Besides these and the Mass in Re, which he wrote for the most part little save operas and a string quartet (1873). A chronological list of his operas is as follows: 'Oberto' (1839); 'Un Giorno di Regno' (1840); 'Nabuccodonosor' (1842); 'I Lombardi' (1843); 'Ernani' (1844); 'I Due Fucilieri' (1844); 'Giovanna d'Arco' (1845); 'Alzira' (1845); 'Attila' (1846); 'Macbeth' (1847); 'I Masnadieri' (1847); 'II Corsaro' (1848); 'La Battaglia di Legnano' (1849); 'Luise Miller' (1849); 'Stiffelio' (1850); 'Rigoletto' (1851); 'II Trovatore' (1853); 'La Traviata' (1853); 'Les Vêpres Sicilienes' (1855); 'Simone Boccanegra' (1857; rev. 1881); 'Aroldo' (revised of 'Stiffelio,' 1857); 'Un Ballo in Maschera' (1859); 'La Forza del Destino' (1862); 'Don Carlos' (1867); 'Aida' (1871); 'Otello' (1887); 'Falstaff' (1893); 'Quattro pezzi sacri' (1898). In his work Verdi was greatly aided by his wife, the famous prima donna, Giuseppina Strepponi, whom he married in 1849, after she had made a successful appearance in several of his operas.

VERDICT, in law, the finding of a jury in a civil or criminal case legally submitted to them and later recorded. A verdict is general when the jurors render a complete decision upon the facts as established by the evidence and properly apply the law thereto as presented by the charge of the court. A verdict is special when the jury merely find the facts in detail, leaving the court to apply the law. The jury may bring in a special verdict in criminal cases, but they are not compelled to do so in any case. A verdict which is illegal may be set aside in civil proceedings, but in criminal cases a verdict of acquittal is conclusive. A verdict must be unanimous or it is void. At present the restrictions surrounding a jury while they are deliberating on a verdict are very much less severe than formerly.

In criminal cases a prisoner has the right to be present when the verdict is rendered and has the further right to "poll" the jury; in other words, to call each jurymen by name and ask him if the verdict found is his verdict.

In case a verdict may not be found until after adjournment of court for the day, the judge, may direct the jury to bring in a sealed verdict, which is delivered to an officer of the court and held until court reconvenes. By the weight of authority a prisoner charged with felony cannot waive the right to the verdict of a jury. The verdict is usually announced by the foreman of a jury in open court. In Scotland the verdict is "not proven" is allowable in criminal cases. This acts as a bar to a second trial on the same charge, but does not exonerate the accused.
VERDIGRIS, a basic acetate of copper that is prepared by exposing copper plates to the action of air and water, is a blue-green amorphous powder, very poisonous and is used as a pigment, as a mordant and as an ingredient in copper paints. As a poison it irritates, the most familiar antidote being raw white of egg and warm milk.

VERDIN, or GOLDTIT, a small yellow bird (Auriparus flaviceps) of southern California and Mexico, which is one of the most attractive in habits and voice of the birds of that region. It is allied to the titmice.

VERDUN, vér-dûn, France, a fortified town in the department of the Meuse, in a valley on the river of that name, 150 miles northeast of Paris. It has a citadel, the work of Vauban, and is defended by 11 detached forts of modern construction which extend to Toul. Probably no city in Europe is more completely fortified. The ring of forts has a circumference of over 30 miles, with a diameter of 10 miles. There are 16 main forts and 21 smaller batteries in the circle. The arrangement presents a double front to the northeast and when the Germans invaded the first line they were subject to a cross fire from adjoining heights. The most important forts are Hardiman, Vaux, Lanfer, Mardi Gras, Elx, Mousilieu, Manzei and Châtillon. These overlook the Valley of the Meuse and have proved impregnable as modern ingenuity could devise. The principal buildings are the cathedral, which dates from the 11th and 12th centuries, the bishop’s palace, and the hôtel de ville. The liqueurs and confectionery of Verdun are famous. The town was captured by the Germans (after a spirited defense) on 9 Nov. 1871. In the great war some of the heaviest fighting and most severe attacks were fought here, the world has ever seen occurred around Verdun, which was long the fartest outpost retained by the French on the northeast front. It was the stronghold of the Allies’ right flank, and the German hordes sent in thousands of men in repeated assaults in the endeavor to break through, in which they were unsuccessful. See War, European.

VERE, vër, Sir Aubrey Hunt. See De Vere, Sir Aubrey Hunt.

VERE, Aubrey Thomas. See De Vere, Aubrey Thomas.

VERE, Edward de, 17th Earl of Oxford, English writer: b. England, 2 April 1550; d. Newington, Middlesex, 24 June 1604. He was educated at Cambridge, and at 12 succeeded to the earldom, with its hereditary dignities, including that of lord great chamberlain of England. He became prominent at the court of Elizabeth when still a boy, took his seat in the House of Lords in 1571, and was subsequently a noted figure in court circles. His wit and poetical gifts made him a favorite with his sovereign. After Defeating the Spanish Armada, he was appointed governor of the coast of the Atlantic; he was famous for his wild extravagance which eventually dissipated his patrimony; and as his years increased he became more than ever eccentric, while his temper, never controlled, acquired a violence which endangered even his favor with the queen. As lord high steward he acted as a weak enregard. As a blue-green amorphous powder, is very poisonous and is used as a pigment, as a mordant and to some slight extent in medicine. The green rust common on copper that has been long exposed to the atmosphere also bears the name. As a pigment it is useful, mixed with white lead and as an ingredient in copper paints. As a poison it irritates, the most familiar antidote being raw white of egg and warm milk.

VERE, Sir Francis, English soldier, grandson of the 15th Earl of Oxford; b. Crepping Hall, Essex, 1560; d. London, 28 Aug. 1609. He entered the army in early youth, served under the Earl of Leicester in the Netherlands in 1585, and in 1588 his conduct at the defense of Bergen-op-Zoom won for him the honor of knighthood. He prepared the way for the capture of Zutphen in 1591, was engaged in the taking of Niméguen in that year, and in 1592 relieved Prince Maurice at Ewden. He remained in the Netherlands until 1595, and in 1596 he led the expedition against Maastricht. He was again ordered to Holland in 1597, engaged with Prince Maurice at Tournhout, and in 1598 was appointed governor of Brill and general of the forces in the Netherlands. At the battle of Newport in 1600 he performed service which turned the tide of battle in favor of Maurice, but was severely wounded and compelled to retire from the field. In 1601-02 he defended Ostend with signal success though against great odds, and in 1606 returned to England, where he was appointed governor of Portsmouth and of the island of Fortesca.

VERENDRYE NATIONAL MONUMENT. A government reservation just south of Sanish on the Missouri River in Mountair county, west central North Dakota. Its area is about one square mile and it includes Crowfoot Mountain, a prominent butte from which observations were made by Verendrye, the French explorer of the Northwest and the first white man known to have entered what is now North Dakota.

VERESTCHAGIN, vë-rësh-châ’gën, Vassili, Russian painter; b. province of Nogovod, 25 Oct. 1842; d. on board the battleship Petrovsk, 13 April 1904. He was educated at the naval school in Saint Petersburg, but devoting himself to painting, he entered the Academy of Fine Arts. In 1861 he traveled in Germany, France and Spain, and in 1864 he entered the École des Beaux Arts at Paris, where Gerôme was his master. He joined the Caucasian expedition under General Kaulfranz in 1867, and in 1869 went to Siberia. In 1874 he went to India with the Prince of Wales, and afterward settled in Paris. He took part in the Russo-Turkish War, and was wounded at Plevna. Subsequently he visited all the chief cities of Europe, as well as the United States, exhibiting his pictures. They are of immense size, extremely realistic, and treat chiefly of the horrors of war. Among his war pictures are ‘an Unexpected Attack’; ‘Before the Victory’; ‘After the Defeat’; ‘A Pigmy with his Intentions; he was famous for his wild extravagance which eventually dissipated his patrimony; and as his years increased he became more than ever eccentric, while his temper, never controlled, acquired a violence which endangered even his favor with the queen. As lord high steward he acted as a weak enregard. As a blue-green amorphous powder, is very poisonous and is used as a pigment, as a mordant and to some slight extent in medicine. The green rust common on copper that has been long exposed to the atmosphere also bears the name. As a pigment it is useful, mixed with white lead and as an ingredient in copper paints. As a poison it irritates, the most familiar antidote being raw white of egg and warm milk.

VERE, Sir Francis, English soldier, grandson of the 15th Earl of Oxford; b. Crepping Hall, Essex, 1560; d. London, 28 Aug. 1609. He entered the army in early youth, served under the Earl of Leicester in the Netherlands in 1585, and in 1588 his conduct at the defense of Bergen-op-Zoom won for him the honor of knighthood. He prepared the way for the capture of Zutphen in 1591, was engaged in the taking of Niméguen in that year, and in 1592 relieved Prince Maurice at Ewden. He remained in the Netherlands until 1595, and in 1596 he led the expedition against Maastricht. He was again ordered to Holland in 1597, engaged with Prince Maurice at Tournhout, and in 1598 was appointed governor of Brill and general of the forces in the Netherlands. At the battle of Newport in 1600 he performed service which turned the tide of battle in favor of Maurice, but was severely wounded and compelled to retire from the field. In 1601-02 he defended Ostend with signal success though against great odds, and in 1606 returned to England, where he was appointed governor of Portsmouth and of the island of Fortesca.

VERESTCHAGIN, vë-rësh-châ’gën, Vassili, Russian painter; b. province of Nogovod, 25 Oct. 1842; d. on board the battleship Petrovsk, 13 April 1904. He was educated at the naval school in Saint Petersburg, but devoting himself to painting, he entered the Academy of Fine Arts. In 1861 he traveled in Germany, France and Spain, and in 1864 he entered the École des Beaux Arts at Paris, where Gerôme was his master. He joined the Caucasian expedition under General Kaulfranz in 1867, and in 1869 went to Siberia. In 1874 he went to India with the Prince of Wales, and afterward settled in Paris. He took part in the Russo-Turkish War, and was wounded at Plevna. Subsequently he visited all the chief cities of Europe, as well as the United States, exhibiting his pictures. They are of immense size, extremely realistic, and treat chiefly of the horrors of war. Among his war pictures are ‘an Unexpected Attack’; ‘Before the Victory’; ‘After the Defeat’; ‘A Pigmy with his Intentions; he was famous for his wild extravagance which eventually dissipated his patrimony; and as his years increased he became more than ever eccentric, while his temper, never controlled, acquired a violence which endangered even his favor with the queen. As lord high steward he acted as a weak enregard. As a blue-green amorphous powder, is very poisonous and is used as a pigment, as a mordant and to some slight extent in medicine. The green rust common on copper that has been long exposed to the atmosphere also bears the name. As a pigment it is useful, mixed with white lead and as an ingredient in copper paints. As a poison it irritates, the most familiar antidote being raw white of egg and warm milk.
and, his latest work, a fanciful picture of the battle of San Juan Hill in the Spanish-American War, as the hero. He also took up religious subjects, and his 'Family of Jesus' and 'Resurrection' attracted some attention. He wrote reminiscences, translated into English, such as Vereschagin, Painter, Soldier, Traveller (1889); 'Napoleon I in Russia' (1899), etc. On the opening of the Russo-Japanese War he accompanied the Russian forces and on the sinking of the battleship Potemkin went down with the ship. Vereschagin was much more than a realist; he was in essentials a poet of tragedy. By his great war pictures he brought home to national consciousness the intense significance of the pain to the individual in its relation to the supposed interests of government.

VERGA, vër'ga, Giovanni, Italian author and dramatist; b. Catania, Sicily, 1840. A leading interpreter of Sicilian life, he was most widely known as the author, among numerous short stories, of 'Cavalleria Rusticana' used by Mascagni for the libretto of his popular operatic work. His other works are 'I Malavoglia' (1881); and 'Maestro Don Gesualdo' (1889). See CAVALLERIA RUSTICANA; and for biography consult Croce, B., in Critica (Vol I, I Bar, 1903).

VERGENNES, vér-jenz', Vt., city in Addison County, on Otter Creek, and on the Central Vermont Railroad about 35 miles west by south of Montpelier, 22 miles south of Burlington, and seven miles from Lake Champlain. In the summer there are regular steamboat connections with the lake ports. There is here a fall of 40 feet in Otter Creek. The city is the seat of the State Reform School, and has public and parish schools and a public library. There is one national bank with a capital of $150,000. The industries are connected chiefly with farm products. Vergennes was settled in 1766 and in 1788 was incorporated. It was the first incorporated city in the State. During the War of 1812 the city was an important naval depot; the fleet of Commodore McDonough (q.v.) was fitted out here. Pop. 1,485.

VERGINHAUD, vër-n-yô, Pierre Victorien, French orator; b. Limoges, 31 May 1753; d. Paris, 31 Oct. 1793. He settled as an advocate at Bordeaux in 1781, and quickly gained a large practice and was elected a deputy to the National Assembly in 1791. His eloquence and the charm of his personality soon made him the leader of the Girondists, but he cared little for political intrigue, and was rather the orator than the statesman. Representing in the Convention the department of the Gironde, he supported in the question of the king's trial, the proposal of Salle to make an appeal to the people. When the decisive moment came he voted for death, and as president it was his duty to announce the result. He opposed Robespierre and the party of the Mountain, but the Girondists were guillotined, the last of the 21 who died together. Consult Lamarine, 'History of the Girondists' (1847); Vatel, 'Vergniaud: Manuscrits, lettres et papiers' (1875); Aulard, 'Les Orateurs de la Législative de la Convention' (Vol I); the Lives by Touchard-Laidise (1848), and Verdière (1866); Stephens, H. M., 'The Principal Speeches of the Statesmen and Orators of the French Revolution' (1892).

VERHAEREN, vër-há-rén, Emile, Belgian poet; b. Saint Amand, near Tournai, 21 May 1855; d. Rouen, 27 Nov. 1916. His works comprise over 40 volumes of lyrical and dithyrambic verses, four plays, and some monographs on painters. Though his writings had long been familiar among a small circle in America and England, it was not until after World War I drove him into exile across the Channel that his reputation spread; and he became the greatest exponent of universal ideals in European poetry. The universities of England, Scotland and Wales conferred honorary degrees upon him and the English press published poems and articles from his pen. His last work, 'The Red Wings of War' contains a graceful tribute to England. 'Toute la Flandre, a series of Flemish historical and legendary studies; 'Les Flamandes'; 'Les Tendresses premières,' and 'Les Aubes' ('The Dawn'), are some of his best works. He was accidentally killed while attempting to enter a moving train. See Dawn, Tils.

VERHAS, vér-hás', Jan, Belgian painter; b. Termende, 1834. He was educated in his native town and under Nicaise de Keyser, whose painting school at Antwerp he attended. Among his works may be mentioned 'On the Landing Bridge at Blankenberghe' (1885) and 'The Inundation.' He is one of the leading genre painters of the modern Belgian school.

VERJUICE, literally, green juice, applied to the sour juice of green fruit, especially from unripe grapes or crab-apples.

VERKOLJE, Johannes, Dutch painter; b. Amsterdam, Netherlands, 9 Feb. 1650; d. Delft, Netherlands, 8 May 1693. He was a pupil of Jan Livens, who, finding him possessed of ability, set him to finish some uncompleted pictures of Ghoardt van Zeijl, with the result that later an original painting of Verkolje's was mistaken for one of Zeijl's. The influence of Livens is not shown in Verkolje's work. He settled in Delft in 1672. His work consists of portraits, though he painted in his leisure various mythological and historical subjects. His work includes 'Mother and Child,' Louvre; 'Lady and Trumpeter' (1678), Dresden Gallery; 'Cupid and Psyche,' Liechtenstein Gallery, Vienna; 'Vertumnus and Pomona' (1678), Wörthitz Gallery, etc.

VERLAINE, vér-lân, Paul, French poet; b. Metz, Lorraine, 30 March 1844; d. Paris, 8 Jan. 1896. He was one of the earliest and most prominent of the so-called 'Symbolists.' Among his first works were 'Poèmes Saturiennes' (1865); 'Les Fêtes Galantes' (1869); and 'La Bonne Chanson' (1870). His next volumes ("Sagesse" (1881) and 'Les Poètes Inaudits' (1884), a volume of literary criticism, were followed by "Jadis et Naguère" (1885); "Romances sans Paroles" (1887); "A Tour" (1888); "Bonheur" (1889) and "Parallèle" (1890); "Dédicaces" (1894) and "Confessions: Notes autobiographiques" (1895). He is credited with introducing new possibilities of rhythm into French as a poetic medium. His collected "Works" were published in Paris (1900). Consult Lemaître, J., "Les Contemporains."
VERMEER — VERMIN

(Paris 1889); Thorley, W., 'Paul Verlaine' (London 1914).

VERMEER, fér-mär', Johannes (erroneously styled JAN VAN DER MEER OF DELFT), Dutch painter: b. Delft, 31 Oct. 1632; d. there, 15 Dec. 1675. He was a pupil of Leonard Bramer and of Fabricius and painted landscape and architectural views, with special care in the painting of figures to people such scenes. He also produced some portraits and genre pictures. While during his lifetime he filled a larger place in the contemporary art world and was dean of the Guild of Saint Luke at Delft, 20 years after his death he was almost forgotten, and omitted from Dutch and French 'Lives of Painters,' his very name up to 1816 being confounded with that of three other Dutch artists (Van der Meers). It has been ascertained that his father was Jansoon Vermeer, and written documents amply prove that his pictures were sold at a high price at a time when Rembrandt became bankrupt and poverty prevailed in Holland. One of Vermeer's finest works is 'A View of Delft' (now at The Hague); 'A Dutch Town' (crowded with figures) which was sold in 1872 for $1,785; and among his genres may be mentioned 'The Musical Party'; 'The Guitar-player'; and 'Young Woman with her Servant.'

VERMEERSCH, vër-mërsch, Arthur, Belgian canonist and author; b. Ervelde, East Flanders, Belgium, 26 Aug. 1858. He was educated at the Episcopal College, Ervelde, at the Jesuit colleges of Liège and Namur, and at the universities of Louvain and the Gregorian, Rome. In 1879 he entered the Society of Jesus; was ordained in 1889, and in 1892 was made professor of canon law and subsequently also of moral theology at the Jesuit scholasticate of Louvain. In 1904 Dr. Vermeersch was appointed a collaborator in the codification of canon law ordered by Pope Pius X. In 1906 his writings on the Congo question attracted general attention. He was vice-president of the colonial section at the Catholic Congress of Mechlin in 1909 and in 1910 founded La Revue Congolaise. His published works are: 'Manuel social' (2 vols.); 'Questions de Justice'; 'La nouvelle Encyclopédie sociale'; 'La question Congolaise'; 'Les destinées du Congo Belge'; 'Le Belge et la personne civile'; 'De Probatione et Censura Librorum'; 'De Religioso Institutos et Personis' (2 vols.); 'De forma Sponsaliun ac Matrimonii'; 'De Modernismo'; 'Acta Sante Sedis'; 'Les missions Catholiques au Congo Belge'; 'Le peur de l'enfant dans les classes dirigeantes'; 'L'intérieur, et le devoir en Belgique'; 'La question Flamande'; 'Le problème de la natalité en Belgique'; 'Matrimoni et neomalthusianismo saggio religiososo medico-social'; and contributions to sociological and religious journals.

VERMEJO, vër-mä-hô', or BERMEOJO, an affluent of the Paraguay. See Beemajo.

VERMES, vër-mëz, a class-name in the system of Linnaeus under which he grouped as *worms* all the lower invertebrate animals except the arthropods (his "Insectae"). The varied components of this heterogeneous or omnibus group were first separated by Lamarck, and later have been still more minutely classified, as increased knowledge dictated until now the old Linnæan *class*  is found to consist of nine phyla, and only a small proportion retains the name "worms," while "Vermes" has disappeared altogether as a scientific term. VERMICELLI, vér-mil-sèl or vér-mil-chèlt. See MACARONI.

VERMICULITES, a large group of micaeous minerals. The word is derived from the Latin vermiculāris, "little worms," and has been applied because of the peculiar property of exfoliation which they possess. Some of the vermiculites exhibit this property in a very striking manner, unfolding when slowly heated, into curious curled filaments whose resemblance to worms seems more than fanciful. They are all hydrous silicates, formed by the alteration of the micas, chiefly biotite and phlogopite. They generally retain the eminent micaceous cleavage and pearly lustre of the original mineral. The laminae are usually flexible, but not elastic. Included in the group are the minerals vermiculite, jefferisite and over a dozen others.

VERMIFORM APPENDIX. See APENDICITIS.

VERMIGLI, vér-míg'-gë, Pietro Martire. See PETER MARTYR.

VERMILION, S. D., city, county-seat of Clay County; on the Missouri River at the mouth of the Vermillion and on the Chicago, Milwaukee and Saint Paul Railroad; about 34 miles northwest of Sioux City, and 28 miles southeast of Yankton. It was settled in 1859 by a colony from the Eastern States and was incorporated in 1877, it is an agricultural and stock-raising region. The chief manufactures are flour, wagons, sash, doors and blinds, and dairy products. There is considerable trade in farm products and livestock. The principal public buildings are the county courthouse, the opera house, and the school houses. There are seven churches. The educational institutions are the State University, a high school, founded in 1880; Saint Agnes' Academy, public and parish schools, and a public library. The three banks have a combined capital of $500,000. The average amount of business annually is $700,000. The government is vested in a mayor and a council of eight members, elected biennially. Pop. 2,376.

VERMILION, a bright red pigment, or the color of this pigment, obtained from crystallized mercuric sulphide.

VERMILION RANGE. See IRON ORES, Iron Ore District.

VERMIN, a term comparable to "weed," signifying small animals obnoxious in some particular to human plans and operations. Animals may be regarded as vermin in one place which in another would be classed as innocent or even beneficial. Thus among English gamekeepers all the weasel tribe—stoats, polecats and weasels—are typical vermin, because they kill game and eat eggs of preserved pheasants, etc., whereas in America they are regarded as useful fur-bearers; and in the United States rats, mice and the various "gophers" are the animals which mostly fall into that class. Rats and mice, especially field mice, may increase in such numbers as to destroy large quantities of grain and thus become directly destructive vermin, while serious loss may also be caused to
the farmer by hares and burrowing ground-squirrels, etc., especially in the Western States. Among birds, some of the hawks (see Hen-Hawks) and owls are occasionally destructive to poultry and game and have been classified as State enemies; but as they feed chiefly on insects and mice, they are on the whole beneficial to man by repressing animals which are far more typically named vermin than themselves.

In the economy of nature a balance of power is rigidly observed and in the maintenance of such a balance the vermin play an important part. The lemmings (q.v.) present an instance of how the equilibrium is naturally restored. It is rarely needful or wise, at any rate with reference to birds and small mammals, for man to interfere when a case like that of the prairie-dogs (q.v.) of the western United States arises; where repression is necessary, it is usually the result of previous human interference with nature’s arrangements. Agriculturists are beginning to recognize that the birds which visit their fields are of extreme value in the repression of the insects and their larvae which feed on the tender shoots of the grain. But even admitting that the fields may occasionally be overrun by one or other of the common birds, the damage inflicted thereby is but trifling when compared with their services in repressing the insect species. Even the much persecuted mole has been shown by Darwin to be beneficial in destroying the worms and grubs and the earthworm itself acts in this way also. Both animals, in fact, by their operations in turning over the soil, in bringing fresh layers to the surface and in breaking the clods, tend to open up the ground and thus to ensure favorable conditions for the germination of the seed. The despised and hunted rats may be shown like the wheelers and crabs of the sea, to play no unimportant part in nature’s sanitary arrangements, by the wholesale destruction of offal and garbage in which they indulge. In America the use of the term vermin is often applied mainly to obnoxious insects, as fleas, bedbugs, lice, itch-mites, etc., that seek to live on human beings.

VERMONT, a North Atlantic State of the North American Union, situated in the northwestern corner of New England. It is bounded on the north by the province of Quebec, the border line corresponding nearly to the latitude of 45° 0’ 43”, but the dividing line does not coincide exactly with the parallel as it is not quite straight, being here north of it and there south, though but very little. The eastern boundary was fixed many years ago as the west bank of the Connecticut River at low water. Since this was done the river has in some places changed its course more or less and from this difficulty has arisen between New Hampshire and Vermont and the matter is still undecided. On the south Vermont is separated from Massachusetts by the parallel of 42° 44’, while on the west is New York, from which Vermont is separated for 100 miles by Lake Champlain. Both the eastern and western borders of the State are irregular; as the whole area lies between 71° 33’ 37’’ and 73° 25’ W. The northern border is 90 miles long and from this south the width decreases until at the Massachusetts line it is 41 miles. The length is 158 miles. The area is 9,565 square miles. The population in 1791 was given as 30,000 from which it has slowly increased to over 350,000. Vermont is thus one of the smaller States and this fact should be remembered when its resources and products are compared with those of other States. Notwithstanding this it is probably true that no other State has through the migration of its citizens to all parts of the United States, so deeply affected the character of other States where by reason of industry, thrift and intelligence they have become prosperous and influential. The Vermont delegation in Congress has always exercised a power quite out of proportion to the size of the State. The capital of Vermont is Montpelier in Washington County, a city located near the geographical centre of the State.

At first the whole area of what is now the State of Vermont was claimed by New York and included in Albany County, the courts of that county exercising jurisdiction. In 1768 a tract east of the Green Mountains was named Cumberland County. This included approximately what is now Windham and Windsor counties. Two years later Gloucester County was defined north of Cumberland and in 1772 on the western side of the mountains Charlotte and Bennington County were formed. Finally, beginning in 1793 the present division of the State into 14 counties was made in the order given under “State Government.” The coat-of-arms adopted in 1862 consists of a landscape of green occupying half of the shield, on the right and left in the background are high mountains, Mansfield and Camel’s Hump, in blue with a sky of yellow. From near the base, extending nearly to the top of the shield, is a pine tree in green between yellow sheaves of grain and a red cow on the left side of the field. The crest is a buck’s head on a scroll of yellow and blue; the motto is “Vermont, Freedom and Unity”; the seal is the same as the shield, but circular and without any crest and the motto encircles the border.

Climate.—The climate of Vermont is, as is common in the north temperate zone, very changeable and subject to great differences. There is also considerable difference between the mountainous and less mountainous parts of the State. The Champlain Valley, which includes most of that portion west of the Green Mountains, is more mild than elsewhere. Everywhere the winters are long and often cold while the summers are warm, but not often, nor for more than a few days, hot. The average temperature at the weather bureau in Burlington for five years (1913–17, inclusive) was 43.2° F. For each month the mean temperature for the same five years was as follows: January, 19.2°; February, 15.9°; March, 27°; April, 29°; May, 52.2°; June, 63°; July, 69°; August, 66.3°; September, 59°; October, 49°; November, 35°; December, 21.3°.

In most parts of the State the thermometer (Fahrenheit) in winter occasionally falls as low as 24° or lower and at times in midsummer it may rise to 90° or more, but these are unusual extremes and of short duration.

Severe storms are uncommon. Notwithstanding the uncertainty of winter, the longevity of the inhabitants is reported to be above the average for the whole country.

The rainfall is from 30 to 40 inches. During the winter the ground over most of the State is covered with snow and there may be good
sleighing for three months or more, but sometimes, in the western part especially, there is little good sleighing.

Physiography.—As has been shown, Vermont is long from north to south, narrow from east to west and the main physical features have a north and south trend. The Green Mountains dominate the State and have determined its physiography in a large degree. These mountains enter from Canada in two irregular ranges, uniting in one about the middle of the State and continue into Massachusetts. The range culminates in Mansfield, one point of which, the chin, is 4,406 feet above sea-level. By the range the whole State is divided into an eastern and western part and, while it is easy to pass from north to south, it is usually very difficult to find a passable road across from east to west. The mountainous character of Vermont is shown by the fact that, aside from innumerable smaller mountains and hills, there are in the State seven peaks over 4,000 feet, more than 40 over 3,000, more than 100 over 2,000 feet above sea-level. The Green Mountains are well-named for nearly all are covered by forests of pine. The trees at and near the tops of these mountains are mostly spruce, though there are other conifers intermingled to some extent with these such as balsam fir, white spruce, cedar, pine. Below the summits, or the sides of the mountains, are all sorts of deciduous trees, that grow in a temperate, especially birch, beech, maple, etc. So dominating are the Green Mountains that some part of the range is in sight from nearly every town in the State, but these are not the only elevations. Between them and the New York border is a considerable range, the Taconics, which extend from somewhat north of the middle of the State south into Massachusetts. The principal mountains of the Taconic Range are Equinox, 3,816 feet; Bear Mountain, 3,290; Dorset, 3,804, and others 2,000 to 3,000 feet high. A third series of elevations is seen in the Red Sandrock Hills. These do not form a range but are simply a few isolated hills, mostly less than 1,000 feet high, though one, Hogback, is at the highest point, 1,850. Cobble Hill in Milton, Mount Philo in Charlotte and Snake Mountain in Addison County are the most prominent. Remnants of a great mass of Lower Cambrian sandstone with a little shale and quartzite, most of which has been carried off. All of these elevations are near Lake Champlain, that is, they are along the extreme western border of the State. Between the Green Mountains and the Connecticut River there is a series of low mountains or hills which extend nearly the whole length of the State, but only as separate elevations usually at a considerable distance from each other. These are the Granite Hills such as Burke Mountain, Robeson Mountain, Millstone Hill, Black Mountain, etc. From them come the granite which is so important an item in the industries of the State. One mountain, Vermont's, is a modification, last by itself, a hill of unique structure, being composed of material unlike that found elsewhere. The "Windsor Green Granite" is a syenite from this mountain.

Nestled in hollows among the numerous mountains are many lakes and ponds, probably not less than 400 in all. Most of these are small, less than two miles long and usually narrow, but a few, as Willoughby, Dunmore, Bomoseen and Saint Catherine are several miles in length and breadth. All of these bodies of water are very attractive and many wild and romantic.

Four rivers of considerable size flow into Lake Champlain, the Missisquoi, Lamoille, Winooski and Otter. The White, Passumpic, West and others smaller, flow east into the Connecticut and several small streams enter Lake Memphremagog on the north. Along the valleys of these streams there is much level and fertile land and everywhere charming scenery. It may easily be understood that this delightful combination of mountains, lakes, rivers and the less frequent plains gives a character and variety to the physiography of Vermont such as forrest beauty can scarcely be equaled. Excellent roads make much of this easily accessible to the tourist.

Geology.—The geological features of much of Vermont are very complex and often obscure in detail, but the general structure has been satisfactorily studied. Practically the whole of what is now Vermont was formed as rock by the end of Ordovician time. By far the greater part of the rock is Cambrian and Ordovician but there is some pre-Cambrian to be seen and very likely there is more, completely covered. Thus Vermont is geographically one of the oldest portions of the United States. The oldest rock, as would be expected, is found in the axis of the Green and Taconic Mountains, while probably this old rock exists throughout these ranges, it is found at the surface only in a few places. The great mass of these elevations being highly metamorphic Ordovician material. The Red Sandrock Hills as before stated, are Lower Cambrian and the Granite Hills are probably untrusht of volcanic rock formed in the Devonian. In the immediate vicinity of Lake Champlain and on its islands unchanged beds representing Lower Cambrian and all the groups of Ordovician from Beekmantown to Utica are well-displayed and often full of characteristic fossils, but in other parts of the State fossils, though occasionally found in limited number, are rare and lightly wanting. The rocks being schists, slates, gneiss and similar rocks. They are probably remnants of the Green Mountains is gneiss; formed, as has been stated, by metamorphic action from older stratified beds. There is a small strip of Tertiary, best seen near Brandon, but except very small areas, no beds appear to have been deposited until the Pleistocene. It is, however, indicated by the structure of some of the granites that these were solidified under pressure of overlying masses which, now wholly carried away, may have been of some age not now represented in Vermont.

If what has been stated above be true then for an interval of time almost incalculable the surface of Vermont lay exposed to erosional agencies by which it must have been greatly modified, for except the narrow band of tertiary mentioned, there are no strata between the Ordovician and the Pleistocene. These latter deposits are everywhere the conspicuous features of the surface below the hills and mountains.

The great ice-sheet of the Early Pleistocene;
and the floods that followed its melting have left abundant evidence of their activity everywhere. While the movement of the ice over the surface or several cannot be determined. There was one so great that if there were others before it, as in many parts of the country, all traces of them have been obliterated and we have traces of but one of that of Later Wisconsin time. By the age-long erosion before the Pleistocene and the more rapid wearing and tearing of the rocks during glacial activity enormous quantities of solid rock were crushed, ground, worn to small bits and this loose material was seized by the torrents that followed the melting of the ice and distributed in sand hills, plains and deltas, gravel mounds, clay banks and all the rest of the many and plain evidences of the work of ice, water and atmospheric forces during long geological periods.

Mineral Resources.—Although mines of iron, copper, gold, manganese have in past years been opened and worked more or less in Vermont, none of them have in the long run been profitable, though iron and especially copper mines have for a time paid for working and there are still a few deposits of copper (Chateaugay) which are still being worked. Talc has been mined to some extent. Talc is now mined more than ever before. There is good promise of increased work at these mines and during the last few years Vermont has produced more than twice the amount of the best fire clay are dug and purified, ready for market at Brandon, Bennington and several other localities. These industries are small when compared with the very large amount of marble granite and slate which is annually quarried and sold. For more than a century Vermont has produced these materials in large quantities than any other State except Pennsylvania, which has exceeded this in slate. For many years the slate sold from Vermont was from 50 to 85 per cent of the entire for the whole country and, though latterly other localities have produced considerable amounts of good marble, Vermont still produces 43 per cent of the country’s total.

Marble is quarried in Vermont at least as early as 1785, but only a few blocks were taken from small quarries in Dorset and West Rutland in the early days and the business did not become very important before 1850. Since this time the production and sale of marble has increased until at the outbreak of the war (1917) the annual sales reached a million cubic feet or more. While there are a few quarries outside of Rutland County, most of the marble comes from that region and is generally known as Rutland marble. Here the stone is a very pure lime carbonate and is mainly the result of more or less completely metamorphosed Ordovician limestone. The marble is mostly light in color and the variety in shade and tint is well nigh endless from pure white to almost black. Blue, pink, yellow, gray and black veins, clouds and blotches are seen in different layers. These shades are distributed through a lighter mass and in varying proportions so that hardly two slabs of marble that are officially the same are exactly alike. There may be more than 20 varieties, all fine, in a single quarry. On the other hand the standard varieties can readily be matched, if necessary, in color and shade. More than 100 shades of marble can be obtained in the quarries of the Vermont Marble Company, which controls a large portion of the marble of the State, but about 50 are as many as are usually kept on the market. The others are quarried when called for. At Swanton, in northern Vermont, a red and white dolomite is quarried and sold largely for floor tiling as it is very hard and durable and in Roxbury a very handsome serpentine marble, verde antique, is obtained, both by this company. These are not true marbles, but they are very beautiful for interior finish. The granite industry is of more recent development and it is only within a few years that Vermont has led the world in the production of this stone, but it has now a pre-eminence which seems certain to remain. The granite quarries are far more numerous and widely distributed than those of marble. As all the producing marble quarries are in the western part of the State, so all the granite is quarried east of the Green Mountains. It is of igneous origin and geologically later than the marble or slate. Barre, Hardwick, Woodbury and Bethel are the most important granite centres, but there are many other localities that produce smaller quantities. All Vermont granites are of lighter or darker shades of gray, red granite being quarried, though there is a little in the State. The claim of Barre that it is the greatest granite centre in the world appears well-founded. At this place the annual payroll is reported but as high as not less than $4,000,000. Mount Ascutney in Windsor, near the Connecticut River, is a peculiar intrusive mass and on its slopes there has been quarried the "Windsor Green Granite," which is a dark syenite of various shades of olive green. Columns in the library of Columbia University and the sarcophagi of President McKinley and his wife are examples of this stone. In normal business years the mineral products of the State reach an aggregate value of about $99,000,000 and is spread on both sides of the Green Mountains, but for a long time all that has been sold has been taken from quarries in the extreme western border in Rutland County. Though not a very close second, Vermont produces or more than any other State except Pennsylvania. The colors are mostly shades of green and purple, though gray slate is found.

The total amount of marble, granite and slate sold is large and increasing. It is difficult to get exact figures, but probably the sales are not less than $3,500,000 for marble, $3,500,000 for granite, $2,000,000 for slate.

Fauna and Flora.—Most of the larger mammals, as elk, moose, beaver, panther, have long been extinct in Vermont, though formerly common, but the deer, mink, otter, fisher, raccoon, black bear are still found more or less commonly, while the weasel, skunk, woodchuck, porcupine, squirrels, etc., are common in many parts of the State. Among the birds are the eagle, white-headed), owls, hawks and many ducks, waders and the common song-birds of New England are seen. In Lake Champlain and some of the smaller lakes many species of fish are taken and the supply is considerably augmented by subsequent stocking by the game and fish commission. There are stringent game laws protecting mammals, birds and fish. A not inconceivable quantity of fish is shipped from Lake
Champlain to the large cities. These are mainly sturgeon,pike, and pickerel.

The flora of Vermont is of great interest and beauty as it includes many species rarely found elsewhere, especially in the mountain localities. Nearly 1,700 botanical families and over 2,000 species are growing wild in the State. The families most numerously represented are the ranunculus, saxifrage, rose, composite, heath, lily, grass, sedge, orchid and fern. Forests once covered a large part of the State, but except on the mountains they have largely disappeared. Originally the white pine on the lower land and spruce on the upper were the predominant species but there are now more hardwood trees where the second growth has sprung up. At present the forests outside of the higher slopes are mainly composed of 11 species of oak, 8 of birch, 22 of willow, besides maple, beech, poplar, walnut, elm and others. The American elm grows to perfection in the river valleys and often in such localities is a most attractive feature of the landscape. At least 125 species of trees and shrubs grow here in the State, and the flora of the Champlain Valley presents a number of species not seen elsewhere in New England and the flora of the region of Willoughby Lake and Mount Mansfield have long been well-known to botanists.

Soil and Agriculture.—Although so irregular and often mountainous over much of its surface, Vermont possesses considerable fertile land and many excellent farms and very valuable products are obtained by agricultural operations. In most regions in which the soil is the result, directly or indirectly, of glacial work there is great variety, often within small areas. Sand, clay, gravel, loam, may all be found in the same not large field, but this is not always true. In some parts of the State there are wide stretches of heavy clay soil, elsewhere lighter and even sandy soil prevails, elsewhere loam. Large crops are raised on many of the farms, though there is, of course, in so mountainous a country, much barren or at least unproductive land. According to the most recent figure, in 1891, there are in the State 32,600 farms which range in size from 50 acres to over 1,000. Although there are more than 100 farms of over 1,000 acres, but the larger number are small, the average size for the entire State being about 142 acres. The table below shows the main crops raised on the Vermont farms in normal years.

In 1918 the hay crop amounted to 1,291,000 tons; in 1918 the yield of oats was 4,223,000 bushels; corn 1,710,000 bushels; wheat 395,000 bushels, and barley 496,000 bushels. The potato crop in the same year was 1,743,500 bushels; the tobacco crop, 165,000 pounds. Apples, maple sugar and maple syrup are also of importance.

The average crop per acre is much greater in Vermont than the average for the whole United States, notwithstanding the rocky nature of many farms.

The above figures should be greatly increased to include unreported farming, for not only are there more acres of all crops planted, but the market value is much greater than before. The latest estimates available, however, are those given.

Formerly Vermont was noted for its Morgan horses and fine grades of sheep, but of late both of these have declined to small numbers, though there are still some fine sheep raised and exported and also some horses. An effort to revive the production of Morgan horses has been made with some success. Many fine cattle are also raised and sold, especially Holsteins. The value of livestock was in 1917 as follows: Horses, $8,591,000; cattle, $11,828,892; sheep, $559,000; swine, $974,779. The total value of all agricultural products in 1917 was $38,943,301. The value of all farm property in 1910 was estimated at $145,399,728.

When the first white settlers came to Vermont they found the Indians making rude fashion sugar from maple sap and by methods constantly improving maple sugar and syrup have been made from earliest times. In the early spring before most farm work can be undertaken the trees are tapped and the sap boiled, often before the snow is off the ground. Seasons vary, but the average annual production is given at 10,000,000 pounds having a value of over $2,000,000.

Vermont has long been known for the quantity and excellence of its dairy products. Much of the grain and hay raised is fed to dairy cattle and much land otherwise valuable for crops is given over to pasture for the same purpose. The value of these products for 1917 is given as $12,128,000. In addition to butter and cheese a great deal of milk is sent to Boston and New York. In some parts of the State there is the immediate vicinity of Lake Champlain, many apples, pears and other fruits are raised, the crop for 1917 amounting to $1,191,429. The extensive forests which cover the mountains and their slopes afford a large amount of lumber which is sold at a value annually of $8,500,000. There are a State forestry department and 11 State forests which include in all 9,555 acres. Besides these forests which are directly under the control of the department, other forests over the State are administered under its advice and direction.

Manufactures.—Vermont is rightly regarded as an agricultural State, for a large part of its territory is in farm land, and a very large capital is invested in farms and their equipment, but the value of manufactured goods is far greater than that of the productions of the soil.

There are no less than 1,772 establishments, employing 36,467 persons with a capital of $79,846,775 and an output valued at $76,990,974. The 36,467 persons employed in industry in 1914 received $18,617,000 in wages, and by their labor added $34,250,000 to the value of the
raw product. Thus, the wage-earner received an average wage of $510. If we allow 6 per cent interest ($4,790,820) on the capital invested ($79,846,775) and 5 per cent ($4,000,000) for depreciation and other charges, there remains a gross profit of $6,848,180, a sum inordinately high (nearly 20 per cent of the total value added by manufacture) in view of the pittance paid the wage-earner who produced it. Of the total labor force, about 24,000, only 2,215 or about 9 per cent under 16 years of age and for most of them the hours of labor are from 54 to 60 hours per week. The principal manufacturers are paper and wood pulp, lumber and wooden ware, machines, wooden and cotton goods, flour, agricultural implements and besides in less amount many other articles.

Transportation.—Long before the coming of white men in the 16th century Lake Champlain was undoubtably a thoroughfare for the Indians and later the canoes of these people, the bateaux of the French and boats of the English went to and fro on warlike or peaceable errands and the principal rivers were also much used as highways from one part of the State to another. In 1702 the Iroquois Indians on the Seneca land to urge building a ship canal which was to connect Lake Champlain and the Saint Lawrence. Another vain attempt was afterward made to connect the lake and the Connecticut River. In 1823 a canal from Lake Champlain to the Hudson River was finished. In 1808 a steamboat was launched on Lake Champlain and boats have been carrying freight and passengers ever since. A large amount of freight is also carried by canal boats which are towed up and down the lake and there are a few sailing vessels. But the lake traffic is far less than formerly before railroads skirting the shores were built. The first railroad in Vermont was completed in 1848. This ran between White River Junction and Berlin. In 1851 the Central Vermont Railroad was finished and on the west side of the State the Rutland Road about the same time and these two had always remained the principal roads. Next to these the Boston and Maine has most mileage. The Grand Trunk and Canadian Pacific pass through parts of the State, 16 other lines complete the roads of Vermont, the total mileage being 1,101. There are 115 miles of electric lines and numerous stage routes which connect inland towns with the railroads.

Education.—As early as 1761 Vermont appropriated tracts of land for school maintenance and sums of money were voted in 1782 for the same purpose. During the years that have passed since, the school system has gradually developed and in most respects wholly changed until it has attained its present efficiency by which it is in the general rank of the most advanced States. For many years the best secondary schools were the academies and in the 40's there were over 50 of these institutions in flourishing condition. Later as the public schools developed they appeared until in 1900 only 17 remained and at present the high school more than fills their place. There are now 81 high schools and 28 junior high schools, 2,439 public schools, with 3,212 teachers and 63,952 enrolled pupils. The difficulty of securing properly trained teachers for the rural schools led the legislature of 1915 to pass a law by which such teachers are paid by the State an allowance in addition to what they receive from the town in which they teach, this allowance to be more or less as the training of the teachers and the cost of the schools. Under this law it becomes of personal interest to each person who wishes to teach to secure as complete a preparation as possible. From 1856 to 1874 the school system was controlled by a board of education with its secretary as executive officer. This board was abolished in 1874 and its duties vested in a State superintendent who was elected at each session of the general assembly. In 1894 free textbooks were provided for all public schools and in 1906 all these schools were made entirely free. In the same year the State divided into school districts each with its superintendent. In 1908 manual training was adopted in several schools, in 1910 teacher training classes were established and in 1912 courses in domestic science were adopted in some of the larger schools. Soon after courses in agriculture were added. By act of legislature, 1912, a thorough investigation of the entire educational system of Vermont was authorized and a commission was appointed to carry out the provisions of the act. This commission entrusted the survey to the Carnegie Foundation which published a report in 1914. As this report was prepared and the investigation made by educational experts it is of great value for many of its recommendations apply to other States as well as to Vermont. As the result of this work the school system was thoroughly revised. A board of education was appointed which elected a commissioner of education under whom is placed the whole management with the aid of 66 district superintendents. The State budget for schools in 1917 was $2,246,120 and this is increased by the income from over $200,000, a fund given to the State by Arunah Hunting- man, available since 1886. In addition to the public schools, Vermont has four colleges, two normal schools and two agricultural schools. University of Vermont, the first attempt to establish a college in Vermont was the State of New York as a measure of conciliation in 1772. The institution was to be located in the town of Kingsland, now Washington, on the divide between the Connecticut and Lake Champlain. When this plan failed it was proposed to locate the college farther south in Williamstown, but finally through the influence of Ira Allen, who was a generous contributor to the new institution, it was placed in Burlington and chartered in 1791. Ira Allen was not only active in founding the University of Vermont, but was one of its first trustees. The first class was not graduated till 1804. Until 1865 the university was little more than an arts college, but in that year the general assembly established the University of Vermont and State Agricultural College and in the same year the Agricultural Experiment Station was established. Engineering, first a department was developed into a college in 1866, the subject was inaugurated since 1829. A medical college, which was founded in 1809 and since 1853 affiliated with the university, was incorporated with it in 1899. An Agricultural Extension Service was begun in 1912.

Middlebury College is located in the town
of the same name amid beautiful scenery. This college has courses in arts and sciences and is coeducational. It was chartered in 1800. It has a Tuesday in March on a day of each year. At the town meeting local officers are elected and such other business as may require the attention of the inhabitants transacted. State officers are elected biennially on each odd year, the election being set for the first Tuesday of November. Members of Congress are elected at the same time. The Australian ballot is used. Women over 21 years of age are entitled to vote, if they pay taxes, for town officers and for all matters pertaining to schools and temperance. Women may also be elected to several of the offices and to some of the State boards.

Vermont has always been strongly Republican and at present this party is in the proportion of three to one as compared with the Democratic party. The Legislature made up of 30 Republicans in the Senate and 244 Republicans, 25 Democrats and 1 Independent in the House.

Banking.—In the early days the people of Vermont appear to have had distress of banks, and it was not until 1804 that the first State bank was chartered and then after long opposition. After an unprofitable career this bank closed in 1814, but in 1818 another attempt to start banks was made and one bank was established at Burlington and another at Windsor, one by one others followed until in 1841 there were 17 and in 1917 there were 48 national banks, with a capital of over $5,000,000 and surplus of $7,765,079.

There are 20 savings banks with deposits of $95,469,725 belonging to 278,372 depositors and 38 loan and trust companies with $2,050,000 capital and deposits of $47,609,696.

Like many other of the older States Vermont at first issued its own currency. The first bills were put into circulation in 1781. They ranged from a shilling to three pounds. In 1785 copper coins of the value of one cent were made and others of a different design were coined in 1888. Vermont has always greatly aided western industries by numerous subsidies. The assessed value of real estate in Vermont in 1818 was $170,566,493 and of personal property $61,772,240. Of course the actual value is much greater.

Finances.—The income of Vermont is mainly derived from direct taxes, trust funds, loans, inheritance, corporation taxes and numerous smaller sources. The real estate is appraised at $173,380,861, the personal property $66,059,545. For purposes of taxation the Grand List is fixed at $2,561,000, on which the tax for 1918 was $2.36 on the dollar. The usual running expenses are about $4,000,000. For a greater portion of its existence Vermont has been practically free from any debt, but war conditions have now and then made necessary a bond issue, as in 1917. There is a permanent school fund of over $1,000,000.

The Judiciary.—In 1763 an order was issued allowing "all judges, justices and other civil officers" who had commissions from New York to have authority as far east as the Connecticut River. At that time Vermont was entirely within the jurisdiction of Albany courts, but in many cases it was almost impossible to execute the decrees of these courts.
In 1778 special courts were organized in Vermont, but they did not long continue, a Superior Court taking the place, which continued four years.

In 1781 County Courts were established and in 1782 a Supreme Court was the highest authority in all legal affairs continued till 1906. In 1906 the judiciary was reorganized by constituting a Supreme Court with one chief justice and at first three, later four, associate justices and a Superior Court with six judges, both elected at each session of the general assembly. In the latter court the first judge elected was chief. Each superior judge is ex officio chancellor. The Supreme Court holds five sessions at Montpelier, one at Saint Johnsbury, Rutland and Brattleboro annually. The superior judges appoint one of their number to hold a Court of Chancery and preside in each County Court, two assistant judges sitting with him. These assistants judges are elected by popular vote. In addition to the above there are 14 municipal courts in as many of the larger towns. The Vermont judiciary has always been noted for its high standard, the soundness of its decisions, and clear-cut, logical deductions from the premises presented in pleadings; so much so, that a law library is not considered complete in the United States without a full set of volumes of the 'Vermont Reports.'

The State, moreover, has pursued the policy of life-tenure, notwithstanding frequent elections, or during mental competency, insuring a stability of administration that does not always obtain where the elections of judges are by the people. The contrast between courts of this character and the "rough and ready" methods of dispensing justice to trespassers from New York in the "Grants," by Ethan Allen et al., is a paradox of Vermont's most wonderful history.

Charities and Corrections.—The usual home for destitute poor is found in every town. The State supports a large Hospital for the Insane at Waterbury with capacity of 700 patients and makes provision for the care of 200 at the Retreat at Brattleboro. There are hospitals for the sick or injured in many of the larger towns as well as several sanatoriums, relief for orphans children's homes, State Home for the Feeble Minded, etc. The State Prison at Windsor has usually about 200 inmates and the House of Correction at Rutland has over 700. For offenders who are minors there is a State Industrial School at Vergennes with 200 inmates. The penal institutions of the State are administered by a State board.

Militia.—The militia of the State are under the immediate command of the adjutant-general, the governor being ex-officio commander-in-chief. In peace times there are one regiment of infantry, a squadron of cavalry and sanitary and hospital corps, all enlisted as National Guard. In several of the larger towns there are well-equipped armories for the use of the local companies, built by State appropriations. The adjutant-general has an engineering office in the State House from which the affairs of the National Guard are administered. Legislative appropriations provide for all necessary expense.

In the State there are, in round numbers, 775,000 men of military age from whom such troops as may be needed are taken.

Religion.—The people of Vermont have in general always been a religious community. The predominant denomination from the first has been the Congregational, but there are more than 20 other religious organizations in the State. The Congregationalists founded the first Protestant church in 1762 at Bennington, but there was a Roman Catholic chapel on Isle La Motte in 1666. This, however, was continued for only two years. The table below gives the date of the establishment of the larger denominations.

The religious denominations are Roman Catholic, Congregational, Methodist Episcopal, Baptist, and Universalist, established in the order given. Numerically the churches report as follows: Congregational, 216 churches, 22,079 members; $2,213,675 church property; Methodist Episcopal, 200 churches, 19,000 members; $1,355,000 church property; the Baptists report 115 churches, 9,439 members, $850,000 church property; Episcopal, 65 churches, 6,289 members; Christian Adventists, 22 churches; Seventh Day Adventists, 27 churches, 618 members; Universalists, 54 churches, 3,204 families, $353,000 church property. In addition to these smaller numbers, are Lutherans, Unitarians, Christian Scientists; other sects are very small in numbers. The Roman Catholics report 102 churches and 20 stations with congregations numbering 67,824. In early times there were many Quakers in the State and a number of meeting houses, but for many years no services have been held in any of them. At first the State granted two town lots of 200 acres each to the first permanent minister of whatever denomination and two lots to the Society for the Propagation of the Gospel. The former are devoted to the public schools.

History.—Samuel de Champlain was undoubtedly the first white man to sail through the lake to which his name was afterward given, it having been known to the French settlers as Lac des Iroquois. From his canoe he saw the "very high mountains to the east and the valley of the lake." Champlain tells us that his Algonkin allies with whom he sailed said that the country on both sides of the lake was then, in 1609, occupied by Iroquois and that because of frequent hostilities there were no permanent villages near the lake, since they were too liable to attack by the frequent war
parties who went to and fro through the region. A half century later when the first white settlers came into the Champlain Valley they found it occupied by Algonkins, as was the whole of New England. So far as the numerous stone implements and pottery that have been found in western Vermont indicate, the Iroquois and Algonkin tribes visited it if they did not form settlements. The facts are not to be fully ascertained, but all the evidence obtainable seems to show that the Champlain Valley was during several centuries prior to 1700 held now by the Iroquois, now by the Algonkins and that these latter people held the territory till finally driven out by the coming of Europeans. The New York side of the lake was, apparently, always occupied by the Iroquois as when the French and English settlers came into the region. That the Iroquois had some claim to the east side of the lake is shown by the fact that from 1798 until 1874 some of the Caughnawagas urged a claim to a large part of western Vermont because, as they declared, it had descended to them from their fathers. This claim was discussed for years by the Vermont general assemblies and carefully investigated, to be finally rejected as without foundation.

Several Indian villages were continued for some time after the white settlers took possession of the State. The longest to remain were some Saint Francis Indians who lived until after the Revolution on the Mississippi River a few miles below the present town of Columbus. There was a village of Coosucks on the Connecticut River in Newbury until 1725. A few Mohicans lived near Arlington and near the Massachusetts border the Mohackunmucks lived. These latter made claim to a considerable area as late as 1767 and about 1780 a tract of land was granted them in settlement of their claim. No full-blooded Indians now remain in the State, but there are still among those, counted as whites, a few who are more or less tinctured with Indian blood. Because of Champlain's discovery the territory about Lake Champlain was claimed by France and a part of it was included in New France in a map published at Paris in 1684. New France was bounded by a line drawn from Lake Memphremagog to the southern end of Lake Champlain and from there to the Mohawk River a little north of Schenectady. On the north it included the whole country drained by the Saint Lawrence. It is said that when Champlain first beheld the Green Mountains in the east as he paddled through the lake he exclaimed, "Voila les Verts Monts" and thus the name by which these mountains have since been known originated.

This journey of Champlain was as an ally of his Algonkin companions and with them they landed and attacked the Iroquois foes somewhere near Crown Point. Although aiding effectually his friends, Champlain by this attack with firearms, the first seen by the savages, incurred the hatred of the Iroquois and this led to most direful consequences later.

From this time until 1760 the white settlers as they came into the region were subject to frequent and often terrible attacks from their savage foes. A few years after Champlain's visit the mission of the Green Mountain dancers and uniting zeal visited the Iroquois tribes, suffering incredible tortures, and often death. To protect so far as possible the French interests Fort Saint Anne was built on the western shore of one of the large islands (Isle La Motte) in Lake Champlain in 1664. The garrison was first commanded by Captain de la Motte from whom the island was named. The first Christian worship was conducted in a small chapel built in the fort. There does not appear to have been any settlement, other than a few military outposts, in the Champlain Valley, until, in 1730, a few families came from Canada to locate at Chimney Point where they built a rude fort. The following year a more serviceable fort was built across the narrow lake on what was later called Crown Point. This was named Fort Saint Frederic.

Carillon, later Ticonderoga, was fortified in 1755. The possession of these forts gave the French command of the lake, as at the points named it is very narrow and easily within range of even small guns. While the French had been moving from the north the English had come from the south and had descended to them from their fathers. This claim was discussed for years by the Vermont general assemblies and carefully investigated, to be finally rejected as without foundation.

A few Indian villages were continued for some time after the white settlers took possession of the State. The longest to remain were some Saint Francis Indians who lived until after the Revolution on the Mississippi River a few miles below the present town of Columbus. There was a village of Coosucks on the Connecticut River in Newbury until 1725. A few Mohicans lived near Arlington and near the Massachusetts border the Mohackunmucks lived. These latter made claim to a considerable area as late as 1767 and about 1780 a tract of land was granted them in settlement of their claim. No full-blooded Indians now remain in the State, but there are still among those, counted as whites, a few who are more or less tinctured with Indian blood. Because of Champlain's discovery the territory about Lake Champlain was claimed by France and a part of it was included in New France in a map published at Paris in 1684. New France was bounded by a line drawn from Lake Memphremagog to the southern end of Lake Champlain and from there to the Mohawk River a little north of Schenectady. On the north it included the whole country drained by the Saint Lawrence. It is said that when Champlain first beheld the Green Mountains in the east as he paddled through the lake he exclaimed, "Voila les Verts Monts" and thus the name by which these mountains have since been known originated.

The New Hampshire Grants.—The first grants of lands along Lake Champlain were of course made by France but after the French had been conquered in Canada by the English and had retired from Vermont as elsewhere, these grants were void and new allotments were made by the new rulers.

The territory of the new country was but very rudely divided for the most part, and New York and New Hampshire, both having been settled to a much greater extent, each laid claim to the unoccupied territory of Vermont. This dispute, which became very bitter, began in 1749. At this time Governor Benning Wentworth sent word to Governor Clinton of New York that he should grant unimproved lands as determined by King George's description of the province of New Hampshire, in which it was stated that the authority of New Hampshire extended as far north as the chief Massachusetts which was "to a line twenty miles east of the Hudson River." The Council of New York, however, ordered the governor to reply that "this Province (New York) is bounded eastward by the Connecticut River." At the time he sent his communication to Governor Clinton, Governor Wentworth had already granted one township which in his honor was called Bennington. Later the question was laid before the king who some years afterward gave decision in favor of New York. The authorities of that State considered this decision as annulling all the grants made by Governor Wentworth, which by this time had become numerous.

They divided the territory which they claimed as their own, into four counties. The southwestern part was annexed to Albany, north was Charlotte, east Cumberland and north of this Gloucester Counties, these two being east of the Green Mountains the south of which they had bought lands from New Hampshire were called upon to repurchase them from New York.

</table>
Naturally the occupants of the lands, upon which some of them had expended much money and labor, refused to give them up or to pay for them a second time. New York granted ejectments against the settlers and sent constables to enforce them. A convention of the injured settlers was called and by it Samuel Robinson of Bennington was sent to England to lay the grievances before the king. As the result of Mr. Robinson's visit, the king commanded the governor of New York to make no grants till his majesty's pleasure should be made known. This was in July 1677. The Council of New York did not wholly submit to this decree of the king but declared that it did not apply to lands not already granted by New Hampshire and continued giving grants to those who applied.

As the fees required from the grantees were from $100 to $700 or more, the governors of both States were unwilling to lose the rich harvest thus brought them and it is said that considerable fortunes were gained by each of them from this source. Ethan Allen became first known by the part he took in this controversy. The Vermont settlers resisted by force the attempts of New York sheriffs to take possession of lands held under New Hampshire grants and in some cases confirmed them by the beech seal that is they flogged the sheriffs who came to enforce New York claims with what Allen called twigs of the wilderness. The struggle did not wholly cease till Vermont was admitted into the Union. It was in the enforcement of the claims of the Vermont settlers that the Green Mountain Boys were organized. These were a military force, composed of daring and determined men commanded by Ethan Allen.

Allen and four brothers had come from Connecticut and taken lands under grants from New Hampshire and these they were fully prepared to defend to any extent that might be necessary. In the long and sometimes severe struggle the settlers for the most part held their lands against New York.

Founders of the State.—The experiences undergone during the stormy times just described not only secured beyond further dispute the homes of the settlers on the New Hampshire Grants, but they gave to these hardy pioneers a training which well-fitted them to become founders of a State that should be a power. They were many sturdy, honest and brave men in those days and men of strong thinking as well. It may not be altogether fair to select a few from the many, but probably most would agree that of them all Ethan Allen, Israel Warner, Remember Baker, Thomas Chittenden and Jonas Fay were preeminent. Vermont would not have been what it was during the century following the Revolution had not these men been among its citizens. Most of these are too well known to most Americans to need more than the mention of their names. Perhaps Jonas Fay is least known. He was a clerk of many public meetings, of the Council of Public Safety and wrote the declaration by which the State was established as an independent republic.

Beginning of the Republic of Vermont.—In pre-Revolutionary times Vermont had little that could properly be called a government. Each town was controlled by its Committee of Safety and there was no higher authority recognized. Under such conditions there was of necessity little unity. But the people were not long satisfied with this and on 13 March 1775, there came a change which was far reaching in its results. On that day Judge Chandler was to hold court at Westminster. Those interested assembled without arms, took possession of the court-house (illustration from drawing by Daniel Hall). This building was taken down in 1806.

At first there was no disturbance or attempt to use force to prevent the convening of the court, but a sheriff's posse was collected to disperse the crowd and, apparently without sufficient provocation, fired upon them and mortally wounded William French — who has been called The proto-martyr to the cause of American liberty. 

Court House, Westminster.

No other person was killed at the time but several were wounded and Daniel Houghton died afterward from his wounds. The sheriff's party claimed that they were fired on first, but none of them were in any way injured and a long discussion of the affair which followed did not establish the truth of their claim. This event has ever since been known as the Westminster Massacre. On 11 April 1775 a convention of Committees of Safety held at Westminster, adopted a remonstrance to the court of Great Britain in which they begged "To be taken out of so oppressive a jurisdiction and either annexed to another jurisdiction or incorporated into a new one." Ethan Allen was prominent in this convention and proved himself fully equal to the emergency. For three or four years before this he had organized the settlers, forming councils of safety and military companies.

There were no organizations in the colonies more satisfactory or trustworthy than those which Allen formed and inspired with what of his own vigor and enthusiasm for freedom. The new jurisdiction mentioned in the request of the Westminster Convention was probably a proposed Royal Colony which was to include the New Hampshire Grants west of the Green Mountains and all the territory north of the Mohawk River and east of Lake Ontario, the capital to be at Sketugonoro, N.Y. (Whitehall). It was proposed also that Philip Skene should be governor of this new province. Ethan Allen, William Gililand and Jechiel Haw-
ley and other Vermonters of prominence were active in this undertaking, but the outbreak of hostilities at Lexington, 19 April 1775, only eight days after this convention attempted to put this plan aside. But such people as the early Vermonters could not long remain inactive and even longer another convention was called to meet at Mr. Cephas Kent's in Dorset. This convention was "duly warned" by a committee and was held after this document was "assembled in the name of the people of this State, and the said State in the name of its own Constitutions, and its said Laws," by which means the meeting was held. The warning also contained the significant article 7: To see whether the convention will consent to associate with New York, or act by themselves in the cause of America. This convention met on 16 Jan. 1776 and authorized the drawing up of a remonstrance and petition which should be presented to the Continental Congress. In accordance with this action such document was duly signed and another convention held in the same place on the 24th of July of the same year. The remonstrance and petition were adopted by the convention and with this paper was a recapitulation of more recent occurrences relating to the New Hampshire Grants and included the king's decree of 1767.

The convention begged that they might not be put under the jurisdiction of New York, but allowed to remain in that of New Hampshire. The conditions were rapidly growing worse and were already unbearable. Various rumors of the movements of troops were common and disturbing and the following declaration of loyalty was signed by all but one of the members of the convention.

"We the subscribers, inhabitants of that district of land, commonly called and known by the name of the New Hampshire Grants, do voluntarily and solemnly engage, under all the ties held sacred amongst mankind, at the risk of our lives and fortunes to defend, by arms, the United American States against the hostile attempts of the British fleets and armies, until the present unhappy controversy between the two countries shall be settled."

At an adjourned convention, held at the same place, 25 Sept. 1776, a covenant or compact was formulated.—58 delegates present and 45 delegates in favor of the convention. "Cumberland and Wilmington or Draper by letter," representing the town of Oswego, again on the "East side,"—that still further raised the framework of the future independent State. Ethan Allen was a prisoner with the British. It was voted unanimously: "That suitable application be made to form this district of land, containing the lands and known by the name of the New Hampshire Grants, into a separate district. A "Committee of War" was appointed to act as the government, civil and military, ad interim, namely: Simeon Hathaway, Jonas Fay, Nathan Clark, John Bradly, Martin Powell, Cephas Kent, Joseph Bowker, Joseph Woodward, Nehemiah Howe; 15 Jan. 1777 following were added from the "East side." Thomas Chandler, Stephen Tilden, Ebenezer Harrington, Joshua Webb, Dennis Leonard, Jotham Bigelow, Thomas Johnson, Elijah Gates, Nicholas White. At the October convention, and the January meeting, Ira Allen served as clerk.—both held at Westminster. Events had moved rapidly in the "Grants" or in the embryo commonwealth. The condition of the Grafton Mountains, loyal to freedom from Great Britain and discredited in their contention with contiguous territory, were ready to take an independent step. Accordingly, at Westminster, 15 Jan. 1777 in the Court-House, the following was promulgated:

"This Convention (whose Members are duly Chosen by the Free Votaries of the said Community on the N. Hampshire Grants) in public Meeting Assembled, in our own names and in behalf of our Constitutions, do hereby Proclaim and Publickly declare that we will at all times hereafter consider ourselves as a free and independent State, capable of regulating our internal Concerns, acting in respect whatsoever, and that the people on said Grants have the sole and exclusive right of ruling and governing themselves in such manner and form as in their own wisdom they shall think proper, not inconsistent or repugnant to any resolve of the Honorable Continental Congress. Furthermore, we declare by all the ties which are held sacred among men, that we will firmly stand by and support one another in this our declaration of a State, and in endeavoring as much as in us lies to suppress all unlawful posters and disturbances whatever.

Also we will endeavor to secure to every individual his life, peace, and property against all unlawful invaders of the same.

Lastly we hereby declare, that we are at all times ready in conjunction with our brethren in the United States of America to do our full proportion in maintaining and supporting the just war against the tyrannical invasions of the ministerial fleets and armies, as well as any foreign enemy sent with the express purpose to murder our fellow brethren and with fire and sword to ravage our defenseless country. The said State to be called New Connecticut."

The above is not exactly in the original form, but as it was later revised and published. At the next convention held in June the name New Connecticut, given for the reason that a large part of the original settlers had come from Connecticut, was found to be already used for a district on the Susquehanna. For this reason the new State was renamed Vermont. There is some uncertainty as to the origin of this name. It is generally supposed to have been suggested by Dr. Thomas Young of Philadelphia, an old and enthusiastic friend of the "Grants" and a trusted adviser, but this does not determine where Dr. Young found the name. It did come from the often quoted exclamation of Champlain, "Voila les Verts Monts," or did it come, as some suppose from a letter which once John de Crevecoeur is said to have written to Ethan Allen asking that "as Vermont is entirely French some of the counties have French names given them? Crevecoeur is supposed to have suggested the word because he had in mind L'Abbe de Vermont, reader to Marie Antoinette. This is given for whatever it may be worth. As also the following statement which refers to the Rev. Samuel A. Peters, DD., LL.D., the first Church of England clergyman to visit this district, and who was afterward chosen Bishop of Vermont, but never consecrated. Dr. Peters, in October 1763, climbed a high mountain in the "Grants," where the waters of Lake Champlain could be seen on the one hand, and those of the Connecticut River on the other, and broke a bottle upon a rock, naming the territory "Vermont," dedicating it to God. Little credence was given to this alleged incident, because of the repeated failures to find such a location. Mounts Mansfield and Camel's Hump, and Knox Mountain in Orange County, were each ascended without results; but, in 1880, Spruce Mountain in Plainfield was selected for an ascent from Bradford, where the Peters family settled, and the condition of the Grafton Mountains, loyal to freedom from Great Britain and discredited in their contention with contiguous territory, were ready to take an independent step. Accordingly, at Westminster, 15 Jan. 1777
British government, is a monument to the 72 Vermonters, who again swore fealty to the national cause. The Continental Congress, while failing to give them any satisfactory response to numerous petitions, began to recognize its Green Mountain troops as reliable allies, and the mili-

tary was receptive of honors. Warner had been promoted to colonel, and others prominent in Vermont affairs were possessors of commissions in the Continental line. But the days were dark for the country. Outside the camp of Green Mountain patriots, the probability that the American Colonies would become independent of Great Britain was very faint. Gen. John Burgoyne, with an army deemed invincible, was marching southward from Canada. He was met by the Vermonters so aggressively that he likened them to "a gathering storm on my left." The convention to adopt a constitution for the independent State met in the "Old Constitution House" at Windsor 2-8 July 1777 in the shadow of this environment. The constitution had been read and adopted, "section by section," and was about to be put upon its final passage, when news came, 8 July, of the disastrous situation in the northern department. The result at Hubbardton the previous day was unknown, but many families of the representatives lived in the route of Burgoyne's advancing and victorious army. The motion to immediately adjourn was about to be carried, when the heavens, as is usual under Gen. Burgoyne's metaphor, added the artillery of a terrific thunder-storm as a concomitant. The enforced delay caused a sober second-thought, and the business of the convention was completed before the hurried adjournment and departure occurred.

As soon as possible the new State, adopted such laws as were needed and means of enforcing them. For the first time slavery was forever prohibited, freedom in religious matters, freedom of speech and of the press guaranteed and the right to vote given to every man over 21. Vermont as an independent State was not more liberal than any of the 13.

Vermont in the Revolution.—Although thus independent, Vermont did not shirk such duties as were necessary to the States in the Union. Perhaps the most spectacular event in the Revolutionary history of Vermont is the capture of Ticonderoga 10 May 1775 (on the day the Revolutionary Congress assembled) and the part taken by the "Green Mountain Boys," at Bennington, 16 Aug. 1777. Generalship of this character would not neglect the commissary department, and the Continental storehouse at Bennington, filled with supplies, was a reality. Its capture by Colonel Baum's detachment would have enabled General Burgoyne to rewrite the entire history of his ill-starred expedition. Referring again to this bloodless capture, there may exist honest doubts as to what honors may have been due to Benedict Arnold, but there was none as to Ethan Allen and Seth Warner. Supported by Warner and his "Green Mountain Boys," Ethan Allen entered the fortress at the Ticonderoga command,—"side by side" with Arnold, as he wrote, 11 May 1775,—and the demand for surrender, "In the name of the Great Jehovah, and the Continental Congress," twice repeated, was made by Allen upon Commandant Delaplace. Arnold's commission to command these troops had been repudiated. The next day Warner reduced Crown Point. Making peace among themselves, Arnold and Allen swept Lake Champlain of hostile craft, troops from Connecticut occupied the forts at Crown Point and Ticonderoga, and American patriots thus obtained, within a week, control of the entire waterway. These events, so quickly following Lexington battle, filled royal governmental circles with astonishment. Governor Colden, of New York (who had temporarily returned to power), reported to the British ministry: "The only people of this province who had any hand in this expedition were that lawless people of whom your lordship has heard much under the name of the Bennington mob," referring to the affair of "Breckenridge farm." The "Green Mountain Boys" disbanded and Warner was given the command of a regiment,—composed largely, however, of the same men,—enlisted under the Continental Congress. An "irony of fate" attended its fortunes in that the regiment was mainly engaged in the defense of New York; and yet it should be stated that the State of Vermont, after its organization, paid the entire expenses of these soldiers. Not being recognized as a commonwealth by Congress, the independent State not only defended itself from the British, but materially assisted the general cause of national independence.

A "fast" had been observed 18 June 1777; but disaster following disaster to America, still accompanied the British forces. Ticonderoga and Crown Point, considered hitherto as commanding Lake Champlain, had fallen, but at Bennington the tide of battle turned. Here the combined forces of Massachusetts (Berkshire County), New Hampshire and Vermont, under Gen. John Stark, won the day; and it was Warner's regiment fresh from its defeats at the north, and Hubbardton in particular, which arrived just in time to save the field. Stillwater 19 September and 7 October, subsequently, led up to Burgoyne's surrender at Saratoga 17 Oct. 1777. This series of successes, one of Cressey's 15 pivotal points of history, was thus written in favor of liberty.

A plain gray obelisk of limestone marks the site of the Continental storehouse and commemorates the Battle of Bennington, the field of which forms a portion of the landscape visible from its look-out room. It rises from an elevation 250 feet above the Walloomsac River Valley, 301 feet 10.3 inches; base, 37 by 37 feet; the most imposing strictly battle monument in existence. The cost, $100,000, was contributed by the three States involved in the engagement,
VERMONT

by subscription, and $40,000 by the national government; erected 1887-91 A.D., by the Bennington Battle Monument Association, a Vermont corporation. In the valley is located the 29th. Home of the State.

The convention at Windsor, before adjournment, created a "Council of Safety" and endowed it with all the powers vested in the constitution just adopted. It was the acting executive. Vermont during Bennington. This council of 12 men was constituted by Thomas Chittenden, president; Jonas Fay, vice-president; Ira Allen (to 6 Sept. 1777), Joseph Fay (from that date to 12 March 1778), secretaries; Heman Allen, Jacob Bayley, Timothy Brownson, Benjamin Carpenter (succeeding 24 Dec. 1777 Benjamin Spencer, a Tory), Jeremiah and Nathan Clark, Moses Robinson, Paul Spooner. This provisional body was dissolved 12 March 1776 when the regular State government was inaugurated. Four days later the first legislature divided the State into two counties, Bennington on the west and Unity on the east, the Green Mountains becoming the line of official demarcation. On the 21st the name of New Hampshire was adopted, and the county was divided into two "shires" by the "ancient line" — the Westminster shire and the Newbury shire. Bennington County also was given two shires — Bennington and Rutland.

A readjustment of county and town lines, thus begun, was continued until permanently established.

The Haldimand Incident. — This was a feature of the American Revolution that has received various interpretations. Its ostensible purpose was an exchange of prisoners, Vermont becoming the "via media" between the commanders of the hostile armies. Its effect was to keep a powerful British army inactive — for more than four years, — in Canada on the north, and to bring from the Continental Congress a quasi-recognition of the independent commonwealth. Eight Vermonters only were in the secret motives, namely: Ethan Allen (lately returned from his sojourn in a British prison); Ira Allen, Governor Chittenden, Moses Robinson, Samuel Safford, Timothy Brownson, John Fassett and Joseph Fay. Ira Allen, the diplomat, was the moving force, Governor Chittenden became the trusted counselor of both parties, and Ethan Allen's boldness maintained in status quo the severe criticisms, suspicions and charges of double dealings throughout the period extending from 11 Jan. 1779 to 25 March 1783.

The Great Britain was held out the hope that Vermont would become an English province, but the Americans were more difficult of management. Congress had gratefully acknowledged the service of Vermont during the Burgoyne invasion only to recede, and Ethan Allen was charged, had the Vermont M. militia, carrying consternation into the settlements exposed on the northern frontier, and perplexity to the command of the patriot army. The threatened dissolution and partition of Vermont among the States of Massachusetts, New Hampshire and New York was met by the annexation 5 April 1781 of 35 towns in New Hampshire, extending eastward to the "ancient Mason line"; and 15 June, following, of 12 contiguous towns in New York, formerly claimed by New Hampshire, known as the "East and West Unions." These boundaries were insisted upon by Ethan Allen and accorded by the British. The towns annexed promptly sent representatives to the Vermont legislature and the independence of the enlarged State was unquestionably maintained. The militia was again mobilized, it being significant that the first offer of protection was made by Ethan Allen to New York, and Congress was perfectly well satisfied to enjoy whatever advantages thus inhere to the patriotic battle of Bennington.

Encouraged to believe that Congress would recognize Vermont if the "East and West Unions" were surrendered, on 22 Feb. 1782, in the face of protests by the towns affected, the legislature reduced the State's boundaries to the present limits, but the national body postponed action.

Admission to the Union. — After 14 years of existence as an independent republic of a very democratic kind, Vermont was at last on 14 March 1791 received into the Union as the 14th State. Although fully carrying its part in the recent war, paying its troops and paying New York $30,000 to settle its claims, the State had no debt and this policy of solvency has always been our policy. Allen is credited with the construction of this financial policy. At first the property of Royalists was confiscated and much of the income of the State was thus raised and later a system of taxation was adopted. For a long time after its admission to the Union the constitution accepted at the Windsor Convention of 1777 was retained, and many of its important features remain as greatly cherished as in the former days. No one need be surprised that Vermont has been a State which in proportion to its wealth and population has always exercised a far greater influence in national affairs than could have been expected, if he recall the early history and understands what sort of people settled the wilderness which has become Vermont and the experiences through which they passed in the latter part of the 18th and early part of the 19th centuries.

The settlement of Vermont had been of New England origin and largely from Connecticut. Their ideas of freedom, crystallized in the "Bill of Rights," had been the expression of principles founded upon sincere convictions; they had struggled to attain statehood through uncles that were heroic because these affected the dearest spot to freemen — the home. The constitution partook of several unique elements, chief of which was that human slavery should never be legal and it was not strange immigration of the right sort poured into the State and its territory rapidly opened up to settlement. The financial situation was attractive to men of means and the commonwealth grew apace in all that tended to influence and the sterling worth for which the Vermont has never been noted. This accounts for its political "one-sidedness" — after the two types of citizenship, indigenous to all civilized peoples, have crystallized into two opposing camps or parties — and the commanding positions in national affairs. The isolation forced upon the people by their early struggles accounts for the insularity of the earlier trade relations, these being with Canada, principally, rather than with the United States. The War of 1812, Vermont ignores this feature, presenting another opportunity for Vermonters to show their mettle. With the north-
THE BENNINGTON BATTLE MONUMENT
ern frontier again threatened by the British, the courage, patriotism and military acumen of the fathers—many of whom were alive—induced a prompt response from the state of the government for help. As in the Revolution, so in the Second War with Great Britain, the Vermont troops were in evidence; and, at the Battle of Plattsburgh, 11 Sept. 1814, where Macomb's forces were vanquished by 14,882 men, 86 guns, defeated the British Captain Downie, whose fleet consisted of 16 vessels, 2,404 tons, 987 men, 92 guns; it was the Vermont volunteers who silenced the shore batteries at the crucial time, and made the victory possible, again stripping the waters of Lake Champlain bare of English vessels of war. This was the last important engagement in the Northern Department and the result was joyously celebrated throughout the United States. Four months later peace was concluded. Official records, although imperfect, credit Vermont with: 4 Sol diers who served 1812-14, 4,170; Plattsburg (Vt.) volunteers, 4,620. Vermont furnished one company of 84 men for Mexican War, 1846-47, term of Chittenden; 12-14 Sept. 1847, two of these soldiers were the first to reach and lower the Mexican flag on the bishop's palace. The Civil War, 1861-65, found Vermont with a nominal brigade composed of federal militia regiments, of less men than the law required, armed with obsolete equipment; not enough superannuated stuff to fit out one regiment. At the first call by President Lincoln for 75,000 volunteers, the legislature was called in extraordinary session, the national proclamation for 200,000, and State warning bearing even date, 15 April 1861. On 25 April the general assembly convened, and, in one day, appropriated $1,000,000 for war expenses; during the session of 42 hours, voted also $7 per month to pay Vermont soldiers in addition to the $13 per month allowed by the general government; laid a war tax of 10 cents on the "grand list dollar"; provided for the equipment of six more regiments for a term of two years, afterward extending the period of enlistment to three-years; and adjourned, after providing that the existing first regiment be recruited to its full quota. This regiment was mustered 8 May 1861 and two days later went to the War Department; the annual day volunteers for five regiments had offered their services, where only two were needed, thus emulating the patriotic ardor of Revolutionary days. The precedent for the $7 per month in 1861 was established by the governor and council 21 June 1794 when an extra allowance was voted to the "minute men"—Vermont's quota of 2,139—under a call of the United States 19 May, ultimo.

In 1861 the number of Vermonters subject to military duty was 60,719. At the close of hostilities Vermont was credited by the War Department with 35,242 men, an excess of its quota of 1,513. One in 10 of the total population and more than one-half of those subject to military service had fought for the Union. The State sent out 17 regiments of infantry; three batteries, one regiment of cavalry and three companies of sharpshooters. The First regiment were three months' men; from the Second to the 11th (the last heavy artillery), inclusive, three months' men; the six were nine months' troops. The First Vermont Brigade consisted of the Second, Third, Fourth, Fifth and Sixth regiments; the Second brigade, of the 12th, 13th, 14th, 15th and 16th regiments. Vermonters enrolled in the regular army and navy are believed to have been in excess of 2,000 in the marine corps, 619; enlisted in Vermont organizations, 28,967; re-enlistments, 1,961; commissioned officers in the navy, 84; in the marine corps, 3. Vermont appropriated for war purposes, $9,887,353, of which $7,382,943, 750,000, of which $5,215,787 was paid by towns. In the Spanish-American War (1898) Vermont promptly responded, but its troops were not called into action. Admirals George Dewey and Chas. E. Clark were the notable Vermont figures of that contest. When trouble with Mexico broke out in 1916 the First Regiment of the Vermont National Guard immediately mobilized and was one of the first to reach the border where it remained until ordered home the end of September. It was officially reported as "The best National Guard Regiment in equipment and general efficiency" on the border. In July 1917 the same regiment, though with somewhat changed personnel, was drafted into the Federal service and increased or ceased to be of the National Guard. At this time the regiment mustered 55 officers and over 2,000 men and soon became the 157th Pioneer Infantry in the famous 20th or Yankee Division. Under Gen. C. R. Edwards the regiment won the highest commendation for its fighting qualities and general morale. It is needless to add that many other Vermonters were in other parts of the army and had active duty abroad in the United States, English and French regiments.

Population.—The percentage of increase in Vermont's population has been quite insignificant since 1850. The surplus of "brain and brawn" has been contributed, with the Civil War exception, to develop the West, and the cities of contiguous States. The younger generations have, since 1837, gone out to improve the country at large; so much so that, in 1890, there were more than 1,000 farms virtually abandoned; others were indifferently cultivated, and, others still, grown up again to primeval forest. Associations of "Native Vermonters" exist in all the larger cities of the East and West; and the annual "Day" voluntary is both for their distinguished personnel and the loyalty expressed for the childhood's home amid the Green Mountains. A small percentage return to occupy the paternal acres; quite large estates are held as summer residences and another transition stage is now in progress which bids fair to build up the Commonwealth and still further augment the financial statements of its later history. As to density the State as a whole is not thickly settled, the average population being 39 in each square mile. The proportion of males and females is nearly equal, but the former are about 5 per cent less numerous in both native and foreign population. During the last 25 years there has been slow, but continuous increase in the population of the smaller towns and an increase in that of the larger towns. Because of this the population of several counties is less than 50 years ago, though, as has been seen, the State as a whole has slowly increased in number of inhabitants.

The population 18 June 1761 was 22—the families of six actual settlers and landowners
in Bennington. The temporary population of Fort Dummer (late in Massachusetts) had not been preserved. These pioneers had been increased, in 1791, to 43,970 on the east side and 41,509 on the west side. In 1800 the population was 154,465; (1810) 217,895; (1820) 235,981; (1830) 291,948; (1840) 314,964; (1850) 310,120; (1860) 315,098; (1870) 320,351; (1880) 332,290; (1890) 332,422; (1900) 343,641; (1910) 355,956; (1915 est.) 362,452.

1910-1912

Foreign Immigration.—For many years after the founding of Vermont it was almost entirely settled by native New Englanders, but there were always French Canadians and a few of more distant origin. As everywhere in the United States, with the coming of various industries, of the (1840) 319,514 of foreign born into the country, the foreign portion of the population increased and now, 1919, not less than 35 per cent of the inhabitants are either wholly foreign or of foreign parentage. Welsh have come to the slate quarries, Italians to the marble and granite mills and quarries, Swedes to the marble, works and Scotch to the granite works, and other nationalities to other industries, so that more than twenty nations are represented in the State. Of these people 14 per cent are foreign born, 24 per cent of foreign parents. Naturally, by far the greatest number of immigrants have come over the border from Canada, nearly 15,000 being French Canadians and 11,400 English Canadians. Of the other nationalities represented by over 1,000 are 5,000 Irish, 4,500 Italians, and less number of English, Swedes, Austrians, Russians, etc. There are only about 1,000 negroes in the State.

GEORGE H. PERKINS,

The University of Vermont.

VERMONT, University of, and State Agricultural College, located at Burlington, Vt. The University of Vermont was chartered in 1791, and first opened to students in 1800, the first class being graduated in 1804. The State made a grant of land of 29,000 acres for the use of the university, and the governor of the State and speaker of the house were made members ex officio of the board of trustees. In 1862 the Vermont Agricultural College was chartered, but it did not receive the support necessary to put it into operation, it was incorporated in 1865 with the university under the title of the University of Vermont and State Agricultural College. Under this new charter the board of trustees consists of the governor,
VERNE — VERNER

the president of the university, members ex officio; nine members elected by the State legislature, three every two years, for a term of six years, and nine other members having the power to fill vacancies in the number. The College of Medicine, which prior to 1899 was a partially independent affiliated school, is one of the oldest medical schools in the United States, having been opened to students as early as 1809. It was suspended from 1836 to 1854, but after the latter date its worth was continuous, and in 1899 it became an integral part of the university under the entire control of the board of trustees. The university has maintained a steady growth from the first, except during the War of 1812 and the Civil War. In 1814-18 the college buildings were used as barracks, and all exercises were suspended; in the Civil War large numbers of students left the university to join the army. The organization of the university now includes: (1) the College of Arts and Science; (2) the College of Medicine; (3) the College of Engineering; (4) the College of Agriculture. Women are admitted to all colleges except medicine. The College of Arts offers a classical course leading to the degree of A.B.; a literary-scientific course leading to the degree of Ph.B.; a course in general science leading to the degree of B.S.; a technical course in chemistry leading to the degree of B.S. in chemistry and a course in commerce and economics, leading to the degree of B.S. in commerce and economics. The A.B. and Ph.B. and general B.S. courses are largely elective after the freshman year. The College of Engineering offers courses in civil and sanitary, electrical and mechanical engineering, all leading to the degree of B.S. in the College of Agriculture courses in animal and plant industry, teaching of agriculture and home economics are offered. Shorter courses of one or two years are also provided in agriculture. The Colleges of Medicine and engineering offer a four-year course leading to the degree of M.D. Two years of preliminary work are required for admission to the medical college. The university also offers a seven-year combination of medical and academic work leading to the Baccalaureate and M.D. degrees. The university also confers the degrees of A.M., M.S., C.E., M.E. and E.E. for graduate work. There are 56 endowed scholarships, 30 State scholarships and a students' loan fund. The university building on the campus include Old College, a reconstruction of a building erected in 1825, the cornerstone of whose southern part was laid by General Lafayette; Converse Hall, a dormitory; Grassmoot's woman's dormitory, the Billings Library, the Willard Science Hall; the mechanical buildings: the agricultural buildings; and the gymnasium; the medical department occupies buildings in the city. The library in 1918 contained 97,000 volumes. In 1904, in which the centennial of the first graduation was celebrated, a movement was begun by the alumni to raise a centennial endowment fund of $1,000,000. The students in 1918 numbered 599, of whom 313 were in the departments of arts and sciences. Among the graduates have been one vice-president of the United States, one cabinet minister, three United States ministers to foreign nations, four governors of Vermont and 14 college presidents.

VERNE, Jules, French novelist: b. Nantes, 8 Feb. 1828; d. Amiens, 24 March 1905. His early education was obtained in the Nantes Lycea; he then studied law in Paris, but early turned his attention to literary work, at first writing short pieces for the stage, and in 1863 attracted attention by a story, 'Cinq Semaines en Ballon,' or 'Five Weeks in a Balloon,' which instantly met with popular approval. He inaugurated a new school in fiction, basing his stories on the inventions of the day, delineating wildly extravagant voyages and adventures to which he added very cleverly prepared scientific and geographical detail. The interest in his books depends entirely on incident, and though extremely entertaining, his characters are subordinate and merely inserted to sustain the narrative. Among his books, all of which were translated into several languages, are 'Le Desert de Glace' (1867); 'A Journey to the Centre of the Earth' (1870); 'Twenty Thousand Leagues Under the Sea' (1873); 'Merdiana, The Adventures of Three Englishmen and Three Russians in South Africa' (1873); 'From the Earth to the Moon Direct in Ninety-Seven Hours Twenty Minutes' and 'A Trip Round It' (1873); 'The Fur Country, or Seventy Degrees North Latitude' (1874); 'Around the World in Eighty Days' (1874); 'A Floating City' and 'The Blockade Runners' (1874); 'The English at the North Pole' (1874); 'Dr. Ox's Experiment' (1874); 'A Winter Amid the Ice' (1875); 'The Mysterious Island' (1875); 'The Survivors of the Chancellor' (1875); 'Michael Strogoff, the Courier of the Czar' (1876); 'The Child of the Cavern' (1877); 'Hector Servadac, or the Career of a Comet' (1877); 'Dick Sands, the Boy Captain' (1878); 'Le Rayon Vert' (1882); 'Kerabane-le-tete' (1883); 'L'Etoile du Sud' (1884); 'Le Pays de Diamants' (1884); 'Le Chemin de France' (1887); 'Deux Ans de Vacances' (1888); 'Famille Sans N°me' (1889); 'Cesar Cascabel' (1890); 'Mathias Sandor' (1890); 'Nord contre Sud' (1890); 'The Purchase of the North Pole' (1890); 'Claudius Bombacus' (1892); 'Le Château des Carpathes' (1892); 'L'ile d'Hisle' (1892); 'Le Sphinx des Glaces' (1897); 'Le Village Aeron' (1898); 'The Master of the World' (1904); and ("A Drama in Livonia" (1905). His comedy 'Les Failles Rompues' was written in 1848 and produced at the Gymnase in 1850 and his 'Onze Jours de Siège' quickly followed. Several others were dramatized and 'Le Docteur Ox' was changed to an opera. He was made a member of the Legion of Honor and his books were crowned by the French Academy, but to his disappointment his literary work was more fully recognized abroad than in his own country. See TWENTY THOUSAND LEAGUES UNDER THE SEA.

VERNER, ver'-ner, Karl Adolf, Danish philologist: b. Aarhus, Jutland, 7 March 1846; d. 1896. He was educated at the University of Copenhagen; in 1876 he obtained his Ph.D. in the university library at Halle and after 1883 was professor of Slavonic languages at the University of Copenhagen. In 1875 he published in Kultur Zeitschrift an article entitled 'Eine Ausnahme der ersteren' which proved of far-reaching importance not only for Teutonic philosophy, but also for the
methods as well as results of Indo-European comparative grammar. In recognition of this, he was awarded by the Berlin Academy the Bopp prize in 1877, and in 1887 made honorary Ph.D. by the University of Heidelberg. He also published brief articles in linguistic journals. See VERNER'S LAW.

VERNER'S LAW, in philology, a law of sound, so named from the discoverer, Karl Adolf Verner (q.v.) who formulated it in 1875. It embodies an explanation of certain apparent exceptions to the laws for the first shifting of consonants, affecting the representation in Teutonic of the Indo-European voiceless explosives k, t, p, and the voiceless sibilant s. According to Grimm's Law p of the material language always equaled English f; t = th; k = English h; b = English l; d = English t; g = English c(k); bh = b; dh = d; gh = g. Verner pointed out that these laws or rules did not apply to all instances; he saw that t = th at the beginning of a word and under certain conditions (cp. the father), but ektos and centum, from -tom, gave not hunth(red) but hundred. So he made, that at the beginning of a word, or when the Mater-Language showed an Accent following the t, then t' = d, not th: cp. Detroit and deed. Greek shows this Early Accent very clearly. In order to remember Grimm's Law and Verner's Law, it is best to start with instances, which can be collected in a Hexameter: under each word write the Greek word, then the Mater-Language consonants, then the English word with the consonant in capitals or thick type. The Laws can easily be gathered from the instances, and can then be applied to other instances. Latin: turba pedes in aces grum fert festa et in hortis. Greek: πεποιθε μαχη επ (t) αρχιε (t) κατα (t) θερη (t) τερι (t) ξωριγο (t). English: THorpe FeeT (in) aCres HunD(red) BeareTH DecD GarTH (O.E).

To sum up Grimm's Law and Verner's Law for English:

1. The Hard Consonants or 'Tenues' of the Mater-Language = Aspirates, etc., in English q and k (Guttural) = h
   I and g = c (k)
   d = t
   b (rare) = p

2. The Soft Consonants or 'Mediae' = Hard:
   I and g = c (k)
   d = t
   b (rare) = p

3. The Aspirated Consonants = Soft:
   Ih and gh = g
   dh = d
   bh = b

From the above it is seen that Verner's Law is a modification and extension of Grimm's Law; its essential point consisting in the recognition that the diversity was connected with the original word-accents of Indo-European. Consuk Brugmann, K., 'Comparative Grammar of the Indo-Germanic Languages'; Senn, W., 'The element of English Etymology' (1887); and King and Cookson, 'Sounds and Inflexions.'

VERNET, vêr-nã, Antoine Charles Horace, known as CARLE VERNET, French painter: b. Bordeaux, 14 Aug. 1758; d. Paris, 17 Nov. 1835. He was the son of Joseph Vernet and distinguished as a painter of the Napoleonic battles, who ever aimed at the glorification of the victor of Friedland and Fontenoy. He also painted portraits and hunting scenes. His comic pictures are interesting and valuable as records of contemporaneous events.

VERNET, Claude Joseph, French painter: b. Avignon, 14 Aug. 1714; d. Paris, 3 Dec. 1789. Going to Rome in 1734, he received his art-training from A. Manglard and returned to France (1753) to become member of the Academy and to paint for Louis XV a series of views of French seaports (now in the Louvre). His landscapes and marines are well set-off with figures. He evidently imitated the manner of Claude Lorrain, but his pictures are finished with a certain conventional monotone which detracts from their reality.

VERNET, Jean Emile Horace, commonly called HORACE VERNET, French painter: b. Paris, 30 June 1789; d. there, 17 Jan. 1863. He was the grandson of Claude Joseph Vernet (q.v.), and son of Antoine Charles Horace Vernet, brother of Carle Vernet. His first master in art was his father and even at 13 he could support himself by the payments received for his drawings. He studied also under designer Moreau, the architect Chalgrin, and the painter Vincent. His 'Capture of a Redoubt' (1799) took the public by storm; it was a new departure from the frigid classicism of David and was alive with modern feeling and realistic life. On the hopes kindled by this success he married, opened a studio, and established a manner of his own. He became the first representative in art of the Napoleonic war spirit with all its swagger and chauvinism, and offended the government of the Restoration by his anti-monarchical caricatures, so that in 1822 his works were excluded from the exhibition; this induced him to open a picture-gallery of his own which was very successful. His increasing popularity at last induced Charles X to appoint him to the directorship of the French Academy, his modern gallery being a post which he ably filled till the end of 1834. On his return to Paris, Louis Philippe commissioned him to paint the historical galleries of the museum of Versailles, a task which occupied him five years. Among the remarkable of the pictures are 'The Occupation of Ancona'; 'The Assault of the Town of Constantine in Africa'; 'The Attack of the Citadel of Antwerp'; 'The Fleet Forcing the Tagus'; 'The Dog of the Regiment'; 'The Soldier of Waterloo'; 'The Battles of Jemappes'; 'Montmirail'; 'Fontenoy'; 'Wagram'; 'The Capture of La-Smal'; 'The Prayer in the Desert'; 'The Council of Arabs.' His last great picture was 'The Battle of the Alma.'

VERNIER, vér-niér, Pierre, French mathematician: b. Ornans (Doubs), 1580; d. Ornans, 14 Sept. 1637. He was captain commanding the chateau d'Ornans, counselor of the king of Spain, and member of the Comité de Franche-Comté. He devoted his leisure to mathematics, and is known as the inventor of the vernier (q.v.), which was formerly attributed to Nunez. He described this instrument in 'La construction, l'usage et des propriétés
du quadrant nouveaux de mathematiques" (Brussels 1631). He also wrote a manuscript 'Traite d'artillerie.'

**VERNIER**, a device for reading scales, invented by Pierre Vernier (q.v.). It consists of an auxiliary scale of $n$ intervals sliding in contact with the scale to be read, and occupying therein a space of $n \pm 1$ intervals. Each interval of the vernier scale will then occupy $1 - \frac{1}{n}$ intervals on the main scale. Let us assume that the main scale reads from right to left, and the vernier scale from left to right, and that 10 intervals in the vernier scale occupy the place of 11 intervals on the main scale. Let the 0 of the vernier scale be 1.28 intervals to the left of the 0 of the main scale. It will then be situated between 12 and 13 of the main scale. The one of the vernier scale will be at 12.8 - 1.1 on the main scale, the two at 12.8 - 2.2, and finally the 8 at 12.8 - 8.8 - 4 on the main scale. That is, the figure 8 on the vernier will coincide with a graduation on the main scale. We thus see how to read to tenths of an interval; the integral part of the number of units by which the 0s differ is read in the usual manner from the main scale, while the number of tenths is read by determining which index on the vernier scale most nearly coincides with an index on the main scale. This type of vernier is known as the retrograde or reverse vernier. In the direct vernier, vernier and main scale read in the same direction, and the vernier intervals are $1 - \frac{1}{n}$ on the main scale.

If the distance between the 0s is $a + \frac{b}{n}$ the distance between the 0 of the main scale and $c$ on the vernier scale is $a + \frac{b}{n} + c \left(1 - \frac{1}{n}\right)$.

$= a + c + \frac{b - c}{n}$.

When $b = c$, this is integral, and the reading $b$ on the vernier scale coincides with a reading on the main scale. Verniers are used for reading distances and angles, and it has been applied to a form of chronoscope used in psychological experiments concerning the reaction-time. Here the main scale is represented by a pendulum making $n$ oscillations per minute, the vernier by a pendulum making $n + 1$ oscillations per minute, and the interval between the times at which the two pendulums are released is measured by the number of oscillations it takes for them to swing in unison. See **DIAGONAL SCALE**; **PSYCHOLOGICAL APPARATUS**. Consult Ludlow, "Subscales, Including Verniers" (Von Noorden's Engineering Magazine, New York 1882).

**Vernon, vér'nən, Edward**, English naval officer: b. Westminster, England, 12 Nov. 1684; d. Nacton, Suffolk, 30 Oct. 1757. He was educated at Westminster and Oxford and in 1700 entered the royal navy. In 1702 he was promoted lieutenant, and in 1704 was engaged under Sir George Rooke at Malaga, continuing in the navy until 1721, when he retired on half-pay. In 1722 he was returned to Parliament for Kent. In 1726 he assumed command of the Grafton in the Baltic Fleet, and later joined the forces at Gibraltar. He returned to England on the conclusion of peace with Spain in 1728, and resumed his seat in Parliament. He vehemently insisted in the House on the weakness of the Spanish colonies, and upon declaring that he could take Porto Bello, on the Isthmus of Panama, with six ships, he was in 1739 appointed vice-admiral and commander of the West Indian expedition. He succeeded in capturing Porto Bello in November of that year, but his attack upon Cartagena in 1741 was unsuccessful. In 1742 he returned to England, and having in his absence been elected to Parliament for both Penrryn and Ipswich, he chose to sit for the latter. He was promoted admiral in 1745, but in 1746 was removed from his office by reason of a quarrel with the admiral. He continued to sit in Parliament until his death. His second attack on Cartagena is introduced in Smollett's novel 'Roderick Random,' the author, together with Laurence Washington (brother of George), having participated in the expedition. The latter named his estate in honor of the admiral Count Vernon. Vernon wrote 'A New History of Jamaica' (1740); 'Original Papers Relating to the Expedition of Panama' (1744), etc.

**Vernon, George John Warren, 5th Baron**, English scholar and philanthropist: b. Stapleford, Nottinghamshire, 22 June 1803; d. near Derby, England, 31 May 1866. He was one of the wealthiest men in England, and devoted his life to the service of letters, philanthropy and reform. He entered public life in 1831 as member of Parliament for Derby and was an active supporter of the Reform Bill. In 1835 he succeeded to the title of his father and his seat in the House of Lords, honors which hampered in some degree his political career, although he remained liberal in sentiment and a progressive and public-spirited citizen to the last. His labors as a philanthropist during the cotton famine in Lancashire in 1862-63 made him much beloved, his generosity and personal exertions doing much to alleviate the widespread distress of that period.

**Vernon-Harcourt, Joseph Francis**, English civil engineer: b. London, 25 Jan. 1839. He was educated at Oxford, and studied under Sir John Hawkshaw in 1862-65, later becoming his assistant. He engaged in engineering on various waterworks and railways, went to London in 1875, where he established himself as a hydraulic engineer, and is generally recognized as an expert in his profession. He visited India in 1890 to make an inspection of the river Hugli, was British member of the jury for civil engineering at the Paris exposition in 1900, and since 1892 has occupied the chair of civil engineering at University College, London. He has published 'Rivers and Canals' (1882); 'Achievements in Engineering' (1891); 'Civil Engineering as Applied in Construction' (1902).

**Vernon**, Conn., town in Tolland County, on the New York, New Haven and Hartford Railroad, about 12 miles east by north of Hartford. There are three villages and one city included in the town. It is in an agricultural region, and has considerable manufacturing interests, producing annually about $7,000,000 worth of goods. The chief manufactures are silk, cotton and woollen goods. The dairy and
VERONA—VERONESE

farm products shipped from the town are quite extensive. Pop. about 9,087.

VERONA, vā-rōˈnə, Northern Italy, (1) A city, capital of the province of the same name, 68 miles west of Venice, beautifully situated on the Adige River where the last slopes of the Alps merge into the plains of Lombardy, on both sides of the Adige, which traverses the city in a wild and rapid torrent, and is crossed here by six bridges. The town is surrounded by lofty walls flanked with towers and bastions and is entered by five gates remarkable alike for solidity and beauty. Many of the streets, though narrow and crooked, are lined by splendid mansions, particularly rich in marble decorations, and there are several elegant squares. New embankments and buildings along the Adige, numerous industrial establishments, electric lighting, and street railroads are modern features. Among the more interesting buildings is the Roman amphitheatre, occupying one side of the Piazza-Braz; it is supposed to have been built in the 2d or 3d century A.D. The interior is nearly perfect; it is in the form of an ellipse, the transverse axis of which is 510 feet, and the conjugate minor axis is 106 feet high, and on the 45 tiers of steps 27,000 spectators could be accommodated. There are about 50 churches, many of them having the magnificent specimens of Gothic architecture, rich in paintings and other art treasures. The cathedral is an imposing Gothic structure of the 14th century, with a choir and Romanesque façade of the 12th; the church of Saint Zeno is a Romanesque basilica of noble proportions, with some interesting old statues and relics; those of Saint Anastasia, Saint Giorgio and Saint Fermo Maggiore, should also be mentioned. The Palazzo del Consiglio, in the Piazza dei Signori, dates from the beginning of the 16th century; it is adorned with statues of celebrated natives of the town, among whom are Cornelius Nepos, Catullus, Pliny the Younger and Vitruvius. Close by are the imposing Gothic tombs of the Della Scala family (known also as the Scaligeri), who for upward of a century (1322-1389), were the lords of Verona. There are several theatres, a museum with a valuable collection of antiquities, a public library, hospitals and numerous literary and artistic institutions. The town carries on manufactures of silks, woolens, hats, etc., and has an important trade. Verona is supposed to have been founded in the 4th, and to have been subjected to the Romans in the 2d century B.C.

On the decline of the Roman Empire it was taken by the Goths, and made by Theodoric the capital of his empire. In 774 it was captured by Charlemagne, and took a lead among the Italian cities while the power of the emperors in Italy lasted. It afterward became an independent republic, but suffered much from the divisions of its internal state, and a state of affairs depicted by Shakespeare in "Romeo and Juliet." Weary of the vicissitudes to which it had been subjected, it voluntarily ceded itself to Venice, under which it remained from 1405 to 1797. It then passed, first, to the hands of the French, afterward into those of the Austrians, under whom it possessed great strategic importance, as it formed a member of the celebrated "Quadrilateral," or four mutually supporting fortresses (Mantua, Verona, Peschiera and Legnago) which secured the Austrian position in northern Italy, and formed the key to the Tyrol from the south. Here in 1822 the Congress of Verona, consisting of European monarchs and diplomats, under the leadership of Metternich, decided upon the suppression of the Spanish revolution by the intervention of the Holy Alliance (q.v.). With the rest of Venetia, Verona was incorporated with Italy in 1866. Pop., about 85,000. (2) The province of Verona in the compartimento of Venice has an area of 1,185 square miles. It adjoins Austria on the north, Vicenza and Padua on the east, Ferrara in the south, and Mantua and Garda on the west. This section was subject to air raids by the Austrians during the World War. Pop. (1918 est.) 475,000. Consult Allen, M. A., "History of Verona" (New York 1910).

VERONESE, və-rōˈnēz, Paul (his real name was PAOLO CALIARI), Italian painter: b. Verona, 1528; d. Venice, 19 April 1588. He studied under his uncle Antonio Badile, a painter, and copied the style of Caravaggio and the Veronese school, as appears from the many altar-pieces and frescoes which he executed at Verona. He went in 1548 to Mantua where he executed frescoes for the cathedral and afterward to Venice. He painted the "Tintoretto, but at the same time appeared desirous of surpassing them by a more studied elegance and a richer variety of ornament. It soon became evident from his works that he had studied the ancient statues, and the etchings of Parmesan and Albert Dürer. His first works are frescoes on the ceiling of the sacristy in the Church of Saint Sebastian in Venice, now known to the Italians as "Teatro di Gloria," that is, the Greco-Veronese. The "History of Esther," in fresco, which he afterward painted in this church, excited general admiration. Among other works by him at Venice are "The Coronation of the Virgin," altar-piece; the "Martyrdom of Saint Sebastian"; "The Feast at Simon's House" (now in the Brera, Milan). It was during this time that he formed his style as a master of the Venetian school. He had already acquired the Veronese spirit of color, with its clear pale tone and soft harmoniousness. He was now under the influence of Titian, but he never surrendered his own individuality so far as to become an imitator. After accompanying the Venetian Ambassador, Grimani, to Rome he saw with enthusiasm the beautiful models of Raphael and Michelangelo, and painted after his return his fine "Apophis of Venice." His numerous banquetting pieces are also excellent. Six at least of these are found at Venice in the refectories of the monasteries, among the best of which is the "Banquet at Cana," comprising 120 figures, many of which are portraits. In this piece the extravagant display of almost Asiatic pomp, and the confusion of different persons and dresses have been justly censured. The air of pride in

Corner of the Palace and Gardens. In this Palace the World Peace Conferences were held, 1918-1919
the aspect of Christ instead of a simple expression of dignity, the placing of the principal personage in a corner of the picture and the confused blending of the white textile and the atmosphere background have also been considered blemishes. In his 'Pilgrims of Emmaus' Veronese violated all the unities of time, place and action. But with all these faults he displays talent and fruitfulness of conception. In his later works are rather to be considered as contributions to decorative effect rather than either religious paintings or representations of life in the past. They are neither historic nor devotional, but merely magnificent combinations of form and color intended to add life, warmth and variety to vast architectural spaces and to interest the spectator by their expressive faces, their gorgeous costumes and the movement and dramatic action of the scene. Veronese died in 1588. His scholars were Charles and Gabriel, his sons, and Benedetto, his brother, besides Michael Pannasio, Naudi, Maffei, Verona, Francesco Montemezzano. Consult Weigisrer, 'Veronese' (1897).

VERonica, vë-rôn'ka, Saint, a woman who, when Christ was carrying his cross, lent him her veil to wipe the sweat from his face, and on receiving it back found his likeness imprinted on the cloth. This veil is said to be still preserved at Rome, where it is shown to only a few persons of special rank. It is commonly supposed that the Saint Veronica of the legend received this name in mistake, and that it arose from a misunderstanding and corruption of the term vera icon, true image, originally applied to the likeness itself. Various ancient witnesses, however, have identified Veronica with different persons mentioned in the Gospels. In the legend of the Clementine Veronica is another form for Vernica, the daughter of the Canaanitish woman who won from Jesus the recovery of her child. According to the 'Acts of Pilatus' and in the writings of Cassiodorus, Reginus, Cedrenus, etc., she was the woman healed by Christ of her issue, who afterward raised to Jesus a statue in bronze at Panes; Consult Grimm, 'Die Sage von den Christusbildern' (1842) and Thurneysen, H., 'Stations of the Cross' (London 1906).

VERPLANCK, vër-plânk', Guliam Crommelin, American Shakespearean scholar and legislator: b. New York, 6 Aug. 1786; d. there, 18 March 1870. He was graduated from Columbia in 1801, admitted to the bar in 1807 and afterward traveled in Europe. In 1820 he was elected to the New York legislature, was professor of the evidences of revealed religion and moral science at the General Protestant Episcopal Seminary, New York, in 1822-23; served in Congress in 1825-33 and was a member of the New York senate in 1838-41. He was a governor of the New York City Hospital in 1823-65; president of the New York Board of Emigration Commissioners in 1840-61, and from 1865 until his death was vice-chancellor of the State University. He edited 'Shakespeare's Plays, with his Life' (3 vols., 1844-47) and wrote 'The Bucktail Bards and the Epistles of Pindar Piff'; his critical satires were directed at De Witt Clinton (1818); 'Evidences of Revealed Religion' (1824); 'Discourses and Addresses' (1833); nearly half of the Talisman, an annual conducted jointly with Robert C. Sands and William C. Bryant (3 vols., 1827-30), etc. His most enduring work was that performed in connection with his Shakespearean studies.

VERRIALL, vër'ål, Arthur Woolfgar, English classical scholar: b. Brighton, Sussex, 5 Feb. 1851; d. 1912. He was educated at Wellington College and Cambridge University; was called to the bar in 1877, and from 1874 was a Fellow of Trinity College, Cambridge. He edited 'Euripides' Medea' (1881); edited and translated 'Euripides' Seven' (1897); 'Agamemnon' (1889, 1903); and wrote 'Studies in Horace' (1883); 'Euripides, the Rationalist' (1895), etc. His 'Collected Literary Essays,' with a memoir by M. A. Bayfield, appeared in 1913.

VERRES, vë-rëz, Gaius, Roman governor of Sicily: d. 43 B.C. He was the son of a Roman senator and in his earlier career a supporter of the Marian faction which he afterward deserted to join the following of Sulla. He was recompensed for his conduct by a share in the confiscated estates of the defeated party, and was proconsul to Dodebia, praetor of Cilicia in 80-79. He became governor of Sicily in 73, but fairly impoverished the island by his mismanagement. The inhabitants gained the support of Cicero in 71 and Verres was brought to trial, with Cicero as prosecutor. He was acquitted in 71 and 66, and was appointed to Syria as defender. While the trial was still in progress Verres gathered a large share of his wealth together and fled to Massilia, where he lived in luxury for 27 years, when he was put to death by the proscription of Antony, whose greed he had excited.

VERROCCHIO, vër-rôk'ë-o, Andrea del, Italian artist: b. Florence, 1435; d. Venice, 1488. He began as a goldsmith; was also a follower of Donatello in the practice of sculpture and eventually devoted himself to painting. He was as skilful in marble as in bronze work, and his sculptures at Florence are distinguished for lifelike expression and strong, truthful individuality. His best works are 'The Boy and the Dolphin,' a group on the fountain in the court of the Palazzo Vecchio; 'Madonna and Child,' a relief; 'David,' a life-size bronze; 'Death of the Wife of Francesco Tornabouoni,' in the Bargello; and 'Doubting Thomas.' Going to Venice in 1480 he began the colossal statue of Bartolommeo Colleoni, which was completed by Leonardo. In the Academy at Florence is his 'Baptism of Christ,' in which one of the angels is said to have been painted by Leonardo da Vinci. There are two other pictures, Madonnas, ascribed to him, none of which is in the Museum at Berlin.

VERRUGAS, vër-roo'gäs, Peru, a streamlet and ravine in the mountains of central Peru, spanned by a lofty viaduct of the Lima and Oroya Railway. The viaduct, with two piers, is 575 feet long and 252 feet high; it was completed in 1891 and replaced a similar construction with three piers opened in 1873 and destroyed by a flood in 1889.

VERSAILLES, vër-säly', (Fr. vër-sâ-y'), France, capital of the department of Seine-et-Oise, 11 miles southwest of Paris, is a town of royal construction, having risen up rapidly, regularly and with great magnificence under the
directions of the sovereigns of France, particularly Louis XIV, who made it the seat of his court, and lavished immense sums on its embellishment. It is justly regarded as one of the handsomest towns in Europe, and, having many conspicuous objects for attack by air, was extensively camouflaged during the World War. The palace is the most conspicuous edifice, though somewhat monotonous in appearance, the buildings being more than 2,000 feet in length. It was built by Louis XIV, but ceased to be a royal palace at the revolution of 1793, and Louis Philippe converted it into a national museum. It is filled with an immense collection of statues and paintings intended to represent all the principal personages and events connected with French history from Clovis downward. The principal façade bears the inscription, *A toutes les Gloires de la France* ("To all the Glories of France"), and fronting the gardens and park, is over 400 yards long. A conspicuous feature is the Battle Gallery, 400 feet long, lined with paintings representing French victories. The window spaces are filled with the names and titles of the military heroes of France, with the dates when they gave up their lives for their country, and names of the battles where they fell. The fountains are famed for their beauty; the water to supply them was brought 100 miles. The Orangery was planned in 1685 by Mansart, and is still one of the most delightful features of the grounds, being surrounded by observation galleries. Innumerable statues and vases grace the grass plots and the shrubbery is highly cultivated. The palaces of the Grand and Petit Trianon are in the north of the park. There is also in the town a fine hippodrome, military hospital, public library and there are excellent technical and private schools. The industries are unimportant, shoe manufacture and market gardening being the largest. The treaty of peace between the United States and Great Britain was signed at Versailles in 1783. The city was also the German headquarters during the Franco-German War (q.v.) from September to March 1870-71, and here Wilhelm I was declared emperor of Germany. It was also the seat of the French government from the peace until 1879. Therefore it was especially appropriate that Versailles was selected for the peace conference in 1918. The permanent population is about 65,000. Consult the English translation of Nolhac's *Versailles and the Trianon* (New York 1912).

**VERSAILLES**, Ky., town, county-seat of Woodford County, on the Louisville and Nashville and the Southern railroads, 14 miles southeast of Frankfort. It is in an agricultural region in which considerable attention is given chiefly to stock-raising. The industries are connected chiefly with the farm products. The educational institutions are Ashland Seminary (Protestant Episcopal), Rose Hill Seminary (Christian), opened in 1875, and public elementary schools. There are three banks. Pop. about 2,100.

**VERSAILLES**, Mo., town, county-seat of Morgan County, on the Missouri Railroad, about 38 miles southwest of Jefferson City. It is an agricultural region and in the vicinity are valuable deposits of iron, kaolin, copper and lead. There are nearby large fields of bituminous coal. The products of the mines contribute largely to the prosperity of the town.

There are two banks and a high school, established in 1894. Pop. about 1,508.

**VERSAILLES**, Ohio, village in Darke County, on the Cincinnati, Hamilton and Dayton and the Cleveland, Cincinnati, Chicago and Saint Louis railroads, about 40 miles northwest of Dayton. It is in a farming section in which considerable attention is given to stock-raising. The chief manufacturing establishments are a flour mill, machine shop and creameries. The educational institutions are Saint Dennis Academy (Roman Catholic), a public high school, founded in 1884, public and parish schools and a public library. Pop. about 1,580.

**VERSE**, a line of poetry, consisting of a certain number of metrical feet, disposed according to the rules of the particular species of poetry which the author intends to compose. Also more commonly used as meaning a stanza, or combination of lines regularly recurring, whether long or short in measure. It may be either dactylic, iambic or trochaic, according to the foot that dominates. If the lines exhibit two, three or more measures, it is styled dimetre, trimetre, etc. In the broader sense verse means anything expressed in measured cadence, either oral or written. The origin of verse is lost in antiquity. Its cultivation indicates progress from the savage state, and it was probably an evolution from unconsciously poetic utterances of men at the dawn of human intelligence. It is doubtful if the verses of Hebrew poetry were measured, or had more of the mechanical form of poetry than an irregularly recurring cadence. The use of rhymed cadences is comparatively modern. The multiplication of poetry and the growing fastidiousness of taste have constantly tended to increase the varieties of verse. Grammarians have elaborately classified these, and analytically distinguished the possible divisions of words into bars of accented and unaccented syllables. A mechanical adherence to a uniform measure is, however, irksome in poetry as well as in music; and poets who are gifted with any command of language vary their verse as their feelings dictate. Their task is to go on measuring, to classify. Modern French and Italian verse is almost always rhymed. In America, England and Germany there are the varieties of blank verse and rhyme. See **METRE**; **POETRY**; **RHYTHM**.

**VERSÉCZ**, vér'séch, Hungary, a town in the county of Temesvar, 42 miles by rail south of the town of Temesvar. It is the see of a Greek bishop, and has silk-mills, and a large trade in silk and wine. There are remains of an old castle. Pop. 31,000.

**VERSIFICATION.** The derivation of this word from Latin versificatio, versifi*ciation*, from versific*are*, to versify, from versus, line, verse. + facere, to make, shows that it means the act or practice, and therefore the art, of composing poetic verse. By extension, it also means the science of analyzing the principles on which this art depends, especially rhythm, metre, rhyme, assonance, and alliteration. Verse is the name given to an assemblage of words placed in measured and cadenced formation so as to produce a metrical effect. In poetry, rhythm signifies that measured movement of language which is produced by

the regularly repeated occurrence of metrical units called feet. Metre is the measurement of verse by means of feet. Rhyme is either the correspondence of sounds in the terminating words or syllables of different verses (end-rhyme) or the correspondence of sounds at the middle and the end of the same verse (internal rhyme). Perfect rhyme requires not only that the vowel sounds be the same, but also that the consonants preceding the vowel sounds be different and that the consonants (if any) following the vowel sounds be the same. If the rhyme is only in the last syllable, as day, way, forgive, behave, relent, misspent, it is called a male rhyme; if in the last two syllables, as bitter, glitter, tending, mending, it is called a female, or double, rhyme. Sometimes the last three syllables rhyme, as callosity, reciprocity, sundering, thundering, in English; tavoia, favola, in Italian, and then the rhyme is called triple (Italian verso strucciola). Rhymes extending to more than three syllables are almost confined to the short odes (gazelles) in Arabian and Persian, in which the same rhyme, carried through the whole poem, extends sometimes to five syllables. The origin of this rhyme is lost in antiquity. It is found, at least sporadically, in the early poetry of most countries, including even that of Greece and Rome. Assonance is a sort of substitute for rhyme, consisting in using the same, or similar, vowel sounds, with the following consonants different, as man, hat, penitent, reticence. It is especially common in Spanish poetry. Alliteration, sometimes called head-rhyme, means that all or some of the accented syllables in a verse begin either with a vowel or with the same consonants, as:

1. Apt alliteration artful aid
2. He through the thickets of the thorn gan thrust
3. Here roeb was ful riche of red scarlet engrossed

In all languages known to us, poetry appears to have been the first form assumed by literature. The earliest poets fashioned for themselves the metrical plan in which their works were presented. Using these poems as examples, later critics and grammarians formulated the rules and principles of verse-making for the guidance of future poets. From time to time as poetry multiplied and taste grew more fastidious, new varieties of verse were invented, and, if found to be of merit, were adopted and took their recognized place in the repertory of letters. It is the function of the present article to give a short explanation of the poetical forms occurring in some of the principal literatures of the world. Sanskrit, Greek, and Latin poetry is regulated by the principle of quantity, plus syllabic count. The ancient Greeks regarded the art of verse as a branch of music. According to Suidas, Lasus of Hermione, Pindar’s master in music, wrote an ‘Art of Poetry,’ but nothing of this work has come down to us. In the 3d century a.c., Aristoxenus of Tarcentum, a disciple of Aristotle, wrote ‘Elements of Rhythm’ (Ρηματικά στοιχεῖα). Of this work only brief fragments have been preserved, but they are of great importance as showing the view of the time for the iamb, especially its relation to verse and music. It is, however, from Hephastion, a scholar of the 2d century a.d., author of a work on Greek metres, entitled Ἰχνίον περὶ μετρῶν, that most of our information regarding classical prosody is derived. The publication, in 1868, of the works of J. H. Schmidt, based on a close study of the surviving remains of Greek and Latin poetry, and disregarding to a large extent the views expressed by the ancient metricians, resulted for a time in setting up a different theory as to classical versification. In more recent years the tendency has been rather to revert to the teachings of the ancients. According to Schmidt, the unit of measure for the foot is the mora, or short syllable (\( \ddot{\text{\textmu}} \)), which has the musical value of an eighth note; a long syllable (\( \text{\textmu} \)) is roughly equivalent to two morae. A long syllable may be protracted in certain measures to the length of three (\( \text{\textmu}-\)) or four (\( \dddot{\text{\textmu}} \)) morae. Conversely, a syllable may be so shortened, or hastened in sound, as to take up less than its normal time. These variations are best observed in logaedic verse (q.v.). Every foot has one part accented, the other part unaccented. Thesis was the name given by the Greeks to part on which the stress (metrical accent) falls; Greek metres (prosody) was the name given by them to the unaccented part. In later times, the use of these two terms was exactly reversed; but most modern metricians now employ them in their original sense. The Principal feet of prosody are (1) Trochee (\( \text{\textmu}\ddot{\text{\textmu}} \)), Tribrach (\( \dddot{\text{\textmu}}\text{\textmu}\text{\textmu} \)), all of three morae or \( \frac{3}{4} \) time; Anapest (\( \text{\textmu}\dddot{\text{\textmu}} \)), Dactyl (\( \dddot{\text{\textmu}}\text{\textmu} \)), Spondeon (\( \dddot{\text{\textmu}}\text{\textmu} \)), Proceleusmatic (\( \dddot{\text{\textmu}}\text{\textmu}\ddot{\text{\textmu}} \)), all of four morae or \( \frac{4}{4} \) or \( \frac{1}{4} \) time; Cretic (\( \text{\textmu}\text{\textmu}\ddot{\text{\textmu}} \)), First Paeon (\( \dddot{\text{\textmu}}\text{\textmu}\text{\textmu} \)), Bacchius (\( \dddot{\text{\textmu}}\text{\textmu}\ddot{\text{\textmu}} \)), Antichus (\( \dddot{\text{\textmu}}\text{\textmu}\text{\textmu} \)), all of five morae or \( \frac{5}{4} \) time; and Choriambus (\( \dddot{\text{\textmu}}\text{\textmu}\text{\textmu} \)), Ionic a maleo (\( \dddot{\text{\textmu}}\text{\textmu}\text{\textmu} \)), Ionic a minore (\( \dddot{\text{\textmu}}\text{\textmu}\text{\textmu} \)), all of six morae or \( \frac{6}{4} \) or \( \frac{3}{4} \) time. Besides these, there are also Pyrrhic (\( \text{\textmu}\text{\textmu} \)), Irrational Trochee (\( \dddot{\text{\textmu}}\text{\textmu} \)), Irrational Spondeon (\( \dddot{\text{\textmu}}\text{\textmu} \)), Irrational Dactyl (\( \dddot{\text{\textmu}}\text{\textmu} \)), Cyclic Dactyl (\( \dddot{\text{\textmu}}\text{\textmu} \)), Irrational Anapest (\( \text{\textmu}\dddot{\text{\textmu}} \)), Anaphe (\( \text{\textmu}\dddot{\text{\textmu}} \)), Molossus (\( \text{\textmu}\text{\textmu}\text{\textmu} \)), Amphibrachys (\( \text{\textmu}\dddot{\text{\textmu}} \)), Dispondaus (\( \text{\textmu}\text{\textmu}\text{\textmu} \)), Ditrochus (\( \text{\textmu}\text{\textmu}\text{\textmu} \)), Diambus (\( \text{\textmu}\text{\textmu}\text{\textmu} \)), Antispastus (\( \text{\textmu}\text{\textmu}\text{\textmu} \)), Second Paeon (\( \text{\textmu}\text{\textmu}\dddot{\text{\textmu}} \)), Third Paeon (\( \text{\textmu}\text{\textmu}\text{\textmu} \)), Epitrus Primus (\( \text{\textmu}\text{\textmu}\text{\textmu} \)), Epitrus Secundus (\( \text{\textmu}\text{\textmu}\text{\textmu} \)), Epitrus Tertiaus (\( \text{\textmu}\text{\textmu}\text{\textmu} \)), Epitrus Quartus (\( \text{\textmu}\text{\textmu}\text{\textmu} \)), and Dochiomus (\( \text{\textmu}\text{\textmu}\text{\textmu} \)).

The combinations of these various feet produce verse. According to the nature of the fundamental foot, the verse is named iambic, dactylic, trochaic, etc. When the last foot of a line is incomplete, i.e., lacking one or more syllables, the line or verse is called catalectic; if the number of syllables is complete, the verse is said to be acatalectic. When a word ends within a foot, there is a break, to which the term cæsusura is applied; when the end of a word and the end of a foot coincide, there is a different sort of break, which is known as diacrisis. The iambic trimeter acatalectic line, having the iamb arranged in dipodies, was used for the dialogue of the drama, tragic and comic, with much freedom of substitution of other verse for the iamb. When the iamb is inverted, one long iamb followed by a short, the line was called by Roman grammarians the senarius. The iambic tetrameter catalectic, or
septenarius, was of frequent occurrence in comedy, with again great freedom of substitution. Iambic metre was also used extensively by the lyric poets. The trochaic tetrameter catalectic line (seven feet and one syllable), having the trochees arranged in dactyls, was written by Solon, Archilochus, and Epicharmus, and is often found in old Attic comedy. Under the designation of trochaicus septenarius it was frequent in Latin comedy and in the writings of Seneca, Varro, and later Latin poets. The anapaestic line, allowing metrical equivalents in certain positions for the anapest proper, is more common in Greek than in Latin. It is found in Æschylus, Sophocles, and Aristophanes among the Greeks, and among the Romans in Plautus, Seneca, Varro, Prudentius, and later writers. The hexameter dactylic line, with substitution of spondee and trochee in certain positions for the dactyl proper, was the measure used in the great epic poems like the 'Iliad,' the 'Odyssey,' and the 'Æneid.' It is also the principal metre of didactic, bucolic, and satiric poetry. Joined to the dactylic pentameter, it formed the elegiac distich so well known from the poems of Ovid and some of the epigrams of Martial. Cretic and Bacchic lines were used to voice intense emotion. Verses formerly known as Choriambic are now generally classed as Logaeic; the true Choriambus is very rare. Iambic verse is used largely by Catullus. In mediaeval Latin, rhyme came into use and quantity gave place to accent. Already in the 1st century A.D. there are poems containing rhymes, and even somewhat earlier than that, e.g., in the poems of Ovid, rhymes occur; but the first fully rhymed Latin poem was written by St. Augustine against the Donatists c. 393. Church hymns, like 'Pange, lingua' and 'O salutaris hostia,' afford an excellent illustration of the change, both as to the employment of rhyme and the subordination of quantity to accent.

From the mediaeval Latin, metrical system was developed by slow and almost imperceptible degrees the versification of the Romance languages (i.e. Italian, French, Provençal, Spanish, Portuguese, Wallachian, Romance, and Rhaeto Romanic) with accent, syllabic count, and rhyme as its characteristic elements. New species of rhythms, depending on the varieties of mood, were introduced. At first assonance was used instead of rhyme, a form found in Provençal 'Boecis' (10th century) and the French 'Chanson de Roland' (11th century); after the 12th century the assonance was gradually displaced by full rhyme. The lines were joined together by similarity of assonance or rhyme in groups or strophes of varying length known as lasses or tirades, corresponding roughly to the modern stanza. Finally, elaborate stanzaic forms of great beauty were invented. In Italian in the 10th century, under the influence of classical Latin, there were developed rhymeless verses (versi sciolti). These are found in Ariosto's comedies and in such works as Trissino's 'Sofonisba.' In Spain, versos sueltos; in France, vers blancs; and in England, blank verse were written on the Italian model. Lines of various length are used in Romance poetry — six-syllable, seven-syllable or septenario, octosyllabic, nine-syllable, decasyllabic, hendecasyllabic, twelve-syllable or Alexandrine, and fourteen-syllable. The earliest of these to occur is the decasyllabic, which has been doubt-

fully traced to the 'Vita Sancti Faronis' in the 9th century, but is certainly found in the 'Boecis' and the 'Chanson de Roland,' mentioned above, as well as in the 'Vie de Saint Alexis' (11th century). To secure uniformity of count, hiatus, elision, and contraction of syllables are permitted. The principal Italian verse is the hendecasyllabic, and next to it in order of frequency of occurrence is the tetrameter. From Provence first and later from Italy the decasyllabic line found its way into Spain. Fourteen-syllable, eleven-syllable, nine-syllable, seven-syllable, and five-syllable verses are common in Spanish poetry. The octosyllabic line did not find favor in Italy, Portugal, or Spain, but it had a great vogue at an early period in France and Provence. It is found in the French and Provençal mediaeval narrative poetry, as well as in the so-called courtly epics and the older drama. It fell more or less into disuse about the middle of the 16th century, and is now confined to lyric poetry. The great French line is, however, the Alexandrine or twelve-syllable iambic measure. Taking the place of the verses of ten and eight syllables, it is found in the 'Chansons de geste' and also in the drama. It reached its climax in the 16th century, and has never since quite lost its importance. It is the metre of the tragedies of Corneille and Racine, the comedies of Molière and Regnard, the epic poem 'La Hebre' by Voltaire, the romantic drama 'Hernani' by Victor Hugo, and of numerous other plays and poems. Trochaic verse was much cultivated in Spain and Portugal, but not nearly to the same extent in Italy, France, or Provence.

English and the other Germanic languages use an accentual rhythm in their verse system. This accentual rhythm, together with alliteration, but with scarcely any perceptible attempt at foot-division, is found in the earliest known Germanic poetry. It is fully illustrated in what has come down to us of Old Saxon, Old Norse, and Anglo-Saxon, as, for example, in the 'Heliand' and the 'Lay of Hildebrand' (both Old-Saxon), in the 'Ael' and 'Harbard' lays (Icelandic), and Rhaeto Romanic verse of Caedmon and Cynnewulf (All Anglo-Saxon). In this early poetry the accented syllables are limited in number, but there is considerable latitude as to the number of unaccented syllables. The regular line consists of two half lines fused together by the alliteration. The following two verses from 'Beowulf' may be taken as characteristic:

Oft Scyld Scytingo sceateman, mores mimung maegnum, mouco-seta ofthen.

("Oft Scyld Scyting goeth away their mood-benches from the throngs of his foes, from many a people.")

End-rhyme is practically unknown. The earliest deliberate use of it in a Germanic dialect is in Otfrid's 'Evangeli,' written in Frankish in the latter part of the 9th century. Under the influence of Romance versification, the old native alliterative unrhyming system gradually disappeared in favor of the full and regular syllabic count and end-rhyme. We have a good example of the transition stage in the combination of the two forms in Layamon's 'Brut' (c. 1200). In this long poem both rhyme and alliteration are employed and, while there is some attempt at foot-division, this is still much in alliteration, a freedom which, like the use of alliteration,
has never totally disappeared from English versification. By the 14th century the innovation had made such headway in England that it is by now almost impossible to decide which resulted in the production of the very characteristic alliterative and rhymeless poem, Langland's 'Piers Plowman'. 'Sir Gawayne and the Grene Knigh't, by an unknown author, shows a compromise, for in its main body it is a rhymeless alliterative poem, but has short rhyming lines at the end of each stanza. The beautiful lyric, 'Pearl,' has a combination of elaborate alliteration and elaborate rhyme. The genius of Chaucer, however, decided the contest between the old and the new forms, and from his time the principles generally recognized in English verse are accentual rhythm and syllabic count, with free use of rhyme and occasional use of alliteration as an ornament. Freedom in the number of unstressed syllables persisted in many poems during the Middle English period, and at later times in popular ballads and in the 'tumbling verse' of early modern English poets. This same freedom was revived by Swift in some of his humorous pieces, by Copley in 'Christabel,' by Scott in several of his narrative poems, and by numerous imitators down to the present day. The writers of vers libre, who are at revolt against all metre, have naturally been more given to dismantling the hexameter, the anapestic, and the dactylic. There are lines of one foot, monometer; two feet, dimeter; three feet, trimeter; four feet, tetrameter; five feet, pentameter; six feet, hexameter or Alexandrine; seven feet, heptameter or septennarius; and eight feet, octameter. The combination of the hexameter with the heptameter formed the celebrated 'poulters measure,' which had considerable vogue among 16th century writers. Perhaps it may be said that since Chaucer's time the central English line is the iambic pentameter, which, when written with every line rhyming together but not rhyming with what precedes or follows, forms what is known as the heroic couplet, and when rhyming within itself, is specially called blank verse. The iambic pentameter is also a highly important line in German poetry, while in Dutch the most characteristic of verse forms is the Alexandrine. Iambic pentameter is used in English to form several distinctive stanzas, like Rime Royal, the Spenserian stanza, and the Ottawa Rima. It is also used almost but not quite exclusively in the Sonnet. Rime Royal, a stanza of seven lines, is found in Chaucer's 'Troilus and Cressida,' in 'The King's Quair' by James I of Scotland, in Sackville's 'Induction' to the 'Mirror of Magistrates,' and in Shakespeare's 'Lucrece.' The Spenserian stanza of nine lines, the last of which is an Alexandrine, was invented by Spenser for 'The Faerie Queene.' It is used in Thomson's 'Castle of Indolence,' in Beattie's 'Minstrel,' in Byron's 'Childe Harold,' and in Shelley's 'Adonais.' The Ottawa Rima, of eight lines, is handled to great perfection in the romances of Sir Walter Scott, and perhaps most humorously satirical by Byron in 'Beppo' and 'Don Juan.' The sonnet, a complete poem in 14 lines with an intricate rhyme-scheme, has been written by some of the greatest English poets—Spenser, Sidney, Shakespeare, Milton, Wordsworth, Rossetti, and Mrs. Browning. Blank verse proper, that is, unrhymed iambic pentameter measure, has held its ground in English versification since its introduction in the 16th century by Henry Howard, earl of Surrey (c. 1516-47) in his translation (1557) of the second and fourth books of Virgil's 'Aeneid.' Some blank verse occurs it is true, in Chaucer's 'Tale of Melibe,' but it was Surrey who established it in English poetry. It was applied to tragedy by Sackville and Norton in 'Gorboduc' (1565), was highly developed by Marlowe in 'Tamburlaine the Great' and other dramas, was brought to perfection by Shakespeare, and since his time has been the generally accepted medium for English dramatic poetry. It is used for the same purpose in German. It has also been extensively employed for epic and reflective poetry. Such representative English works as Milton's 'Paradise Lost,' Thomson's 'Seasons,' Young's 'Night Thoughts,' Keats' 'Hyperion,' Browning's 'Parricide,' and Tennyson's 'Idylls of the King' are in blank verse. An attempt was made in the reign of Elizabeth by Gabriel Harvey and some of his literary friends to naturalize English the quantitative dactylic hexameter and other classic metres, but this met with failure. The dactylic hexameter based upon accent instead of quantity has been used sparingly in English verse, but it attained some success as produced by Southey, Clough, Kingsley, and, especially, Longfellow. It has also been successfully cultivated in German poetry, as, for example, by Schiller. Numerous lyric forms, such as the Ode, Ballade, Rondeau, Rondelet, Sestina, Triolet, Villanelle, and Chant Royal, made their appearance at an early stage in different European literatures, and have been revived with varying degrees of success by some modern writers. They can be no more than mentioned in the present article, for they present a complicated technique, which may best be studied in some good book on versification. Writers of what has come to be known in quite recent years as vers libre are, as already stated, in revolt against hitherto accepted metrical conventions. They maintain that expression is the first, and that rhyme and metre hamper the poet's full and free expression. Their definition of vers libre is 'a verse-form based upon cadence.' Its unit is neither the foot nor the line, but the strophe. Its rhythm is therefore not the rhythm of foot or line, but of the strophe only, and within the strophe it must have perfect freedom of swing as determined by, and consistently with, the demands of the speaking voice and the necessity for breathing spaces. Among the vers libres there are extremists, known as the Paroxysmist in France and the Vorticists in England, and there are many other graduations in their ranks, but there is also a comparatively conservative and well-balanced Centre party. The movement is too new and its ramifications too extensive and manifold to be adequately discussed here. It may be said, however, that, whether its theory will eventually establish itself or not, much genuine, thoughtful, and sincere poetry has already appeared under the ægis of vers libre. In the poetry of the various Celtic languages, ancient and modern, there is an intricate and, in many respects, a beautiful system of versification,
which may, with great profit, be intensively studied by those who are interested in the general subject.

In outgrowth from the brain, whereas the eye of vertebrates develops as a direct insinking of the skin. (5) In vertebrates the heart is formed on the ventral side of the embryo, whereas in insects it is dorsal. (6) Finally, vertebrates agree with annelids and arthropods among the invertebrates in being bilaterally symmetrical segmented animals. The segmentation is shown by the distribution of nerves and ganglia, by the gill-clefts by the series of vertebrae, by the muscle-segments and nephridia (kidney-tubes) in embryonic life at least.

But, while our knowledge of these characteristics has become more precise, it is no longer possible to draw a boundary line between vertebrates and invertebrates with a firm hand. It can no longer be said that fishes form the base of the vertebrate series, for hag and lamprey (*Cyclostoma*), though in many ways more primitive, are certainly vertebrates; the lancelet (*Amphioxus*), though perhaps degenerate, cannot be excluded from the alliance; the *Tunicata* (q.v.), though almost always degenerate in adult life, are all vertebrates in their youth, and the worm-like *Balanoglossus* and the flatworm also certain hardly disputable vertebrate characters. The possession of a backbone is, therefore, no longer so exclusively definite a mark of the group, as it once was, but instead, the presence of a notochord. The term vertebrate has, therefore, ceased to have scientific significance although it remains convenient for popular use to designate the groups more properly styled CHORDATA.

**VERTEBRATE, a** segment of the backbone. See ANATOMY; BONE; OSTEOLGY.

**VERTEBRATES, a** group name, no longer significant in classification, for all those animals (the vertebrates) considered collectively which possess a backbone, composed of vertebrae. (See ANATOMY; OSTEOLGY). This category would include mammals, birds, reptiles, amphibians and fishes. These have important characteristics in common that distinguish them from mollusks, insects, crustaceans, worms and other animals of simpler type. Yet it was not until 1797 that the distinctive characteristic was stated by Lamarck, who drew a fine line between "back-boned," or vertebrate and "backbonelss," or invertebrate, forms. Anatomists and embryologists have since made the distinction more precise, and the more important characteristics may be summed up as follows: (1) In vertebrates the central nervous system, namely, the brain and the spinal cord, lies on the dorsal surface of the body, and is tubular in structure. (2) In all young vertebrates there is formed along the dorsal surface of the gut, and, therefore, of hypoblastic origin, a supporting rod or notochord, which in the simpler forms may persist throughout life, but in higher forms is more or less completely replaced by the backbone—a axis developed from the mesoblastic sheath of the notochord. (3) In almost all young vertebrates several pairs of slits or clefs open from the pharynx to the exterior; in some amphibia, all fishes and simpler forms they persist throughout life as respiratory organs, and are usually associated with feathery gills; in most amphibia they disappear during adolescence; in reptiles, birds and mammals they are practically functionless vestigial organs, which in a few cases do not even open. (4) A great part—for example, the retina—of the vertebrate eye arises as an outgrowth from the brain, whereas the eye of invertebrates develops as a direct insinking of the skin. (5) In vertebrates the heart is formed on the ventral side of the embryo, whereas in insects it is dorsal. (6) Finally, vertebrates agree with annelids and arthropods among the invertebrates in being bilaterally symmetrical segmented animals. The segmentation is shown by the distribution of nerves and ganglia, by the gill-clefts by the series of vertebrae, by the muscle-segments and nephridia (kidney-tubes) in embryonic life at least.

**VERTICAL TRANSPORTATION.** See ELEVATOR.

**VERTIGO,** dizziness, giddiness, or swimming of the head; a defect, real or seeming, in the equilibration of the body. Though the condition is sometimes so distressing as to be considered by the patient a disease, it is essentially only a symptom. It is believed that the cerebellum is the center for the co-ordination of muscular movements, and that impressions from the semi-circular canals of the internal ear also influence the movements necessary for maintaining the equilibrium of the body. But the essential nature of vertigo is not yet clearly determined; it is believed to be due to disorder cerebral circulation; but others, to result from a disturbance of the central nervec-
VERTUE.—VESICA PISCIS

ganglia. The sense of instability and of apparent rotary movement of the body or of other objects in the immediate environment, mental confusion or loss of consciousness, or by anguish or terror. There may or may not be present also buzzing in the ears, mist or flashes of light before the eyes, nausea and vomiting, looseness of the bowels and a flow of pale urine. Vertigo may result from functional disorders of the heart or stomach, from defects in vision, from diseases of the middle ear, from some peripheral irritations (as laryngeal vertigo), from toxemias, as in Bright's disease, from organic brain disease and from unrecognized causes. Grasset classifies vertigo under two heads, acute or accidental and chronic or habitual. Under the first head he places forms of it which attend the onset of acute infectious diseases, inflammations, influenzas and the vertigo which accompanies the stage of excretion in cerebro-spinal meningitis, that which appears with attacks of indigestion, the vertigo of acute alcoholism and of the first cigar, and the dizziness caused by swimming, seasickness or by looking down from a great height. Then there are acute toxic vertigos caused by digitalis, hemp, opium, belladonna, gelsemium, nicotine, etc., also others caused by heat, the introduction of a bougie, the suppression of habitual discharges, the pressure of wax or other accumulations on the drumhead, nasal obstruction and post-nasal catarrh, mental strain, emotional disturbances, etc. Under the head of chronic or epileptic vertigo, vertigo dependent upon disturbances in the sensory nerve-centres, especially auricular vertigo, stomachic and cardiovascular vertigo.

In the treatment of vertigo the main thing is to remove the cause. Vertigo caused by indigestion frequently demands a prompt emetic or purgative. The tone of the stomach may be restored by tincture of nux vomica or by dilute hydrochloric acid. Smokers' vertigo requires for relief a complete cessation from smoking, a slight laxative and bitters. For the vertigo of seasickness bromide of sodium or amyl nitrite and kola-seeds, diminishing as much as possible the drinking of liquids and the use of a well-drawn handkerchief seem to be of most service. Ocular vertigo, dependent upon astigmatism, hypermetropia, paralysis of certain of the ocular muscles and various eye-strains may often be relieved by the oculist. See Brain, Diseases of; Cerebellum; Ear.

VERTUE, vêr'too, George, English engraver and antiquary. b. London, 1654; d. there, 24 July 1756. He gained the favor of Sir Godfrey Kneller, Lord Somers and others, and upon the institution of the Academy of Painting in 1711 became one of the original members. When the Society of Antiquaries was revived in 1717 he was appointed its official engraver, nearly all the plates published in *Vetusta Monumenta* down to 1756 being his work. He was engaged in making journeys through England for 40 years collecting medals and making drawings for a projected history of the fine arts in England. His collection came into the hands of Horace Walpole, who published a portion of them under the title 'Anecdotes of Painting in England' (1762-71). To his own 'Catalogue of Engravers' (1763) he appended a biographical sketch of Vertue's life. Others of Vertue's best-known works are 12 Portraits of Poets (1730); 10 Etchings of Charles I and his Friends; and the series of English kings published in Rapin's 'History."

VERULAM, Lord. See BACON, Sir Francis.

VERVAIN. See VERBENA.

VERVIERS, vér-vé-à, Belgium, a town in the province of Liège, on the Vesdre, 14 miles southeast of Liège, and on the railway between Liège and Aix la Chapelle. For shipwrights' fortified town, its fortifications were destroyed by Louis XIV. It suffered severely in the German occupation 1914-18. It is celebrated for its manufacture of woolen goods and dyes. There is also cotton, leather and other manufactures. Pop. about 50,000.

VERY, Jones, American poet: b. Salem, Mass., 28 Aug. 1813; d. there, 8 May 1880. He was graduated at Harvard in 1836, and was Greek tutor there 1836-38. He became a Unitarian minister in 1843, but never held a pastoral charge although he preaching. In 1839 he published a small volume of 'Essays and Poems'; the latter, among which 'The Painted Columbine,' is perhaps the best known, indicating an appreciative love of nature, and a deep religious feeling made with a tendency toward mysticism, and these qualities are especially marked in his sonnets, which follow the Shakespearean model. His life was mainly spent in retirement at Salem. Consult 'Poems and Essays' (1880), with memoir by J. F. Clarke.

VESALIUS, vê-sâ'li-os, Andreas, Flemish physician, founder of the modern system of anatomy: b. Brussels, 31 Dec. 1514; d. island of Zante, 15 Oct. 1564. He was educated at Louvain, Cologne, Montpellier and Paris, and was early distinguished by his knowledge of physics and his devotion to anatomical studies. The pursuit of practical anatomy was attended with so much difficulty and danger in France, that after returning to Louvain he joined the army of the emperor of Germany, and went to Italy, where in 1540 he was made professor of anatomy in the University of Pavia, in 1543 in that of Bologna, and not long afterward in that of Pisa. In 1543 he published his great work on anatomy, 'De Corporis Humani Fabrica' (enlarged edition 1555). See also discovery of a new world, and Haller speaks of it as 'an immortal work, by which all that had been written before was almost superseded.' In it Vesalius exposed the errors of the Galenian school, who relied for their knowledge of the anatomy of the human body upon the observations made in the dissection of the bodies of the lower animals. The work met with the fiercest opposition, but the author's reputation constantly increased. About 1554 he was made chief physician to the emperor Charles V, and afterward to his son Philip II. He was accused of heresy and condemned to death by the Inquisition, but his sentence was commuted by the emperor to a pilgrimage to the Holy Sepulchre. On his return he resided at Zante. His collected works were published in 1725. Consult the study by Roth (1886).

VESICA PISCIS (literally, a fish's sound or swimming-bladder), the ovoid aureole or glory, formed by the intersection of two circles having a common radius, which, in the religious
symbolism of the early Middle Ages, is often represented encircling the whole body of the Lord Jesus. This form is supposed to have been gradually evolved out of the figure of the fish, a symbol of the early Christians on sarcophagi and elsewhere, and whose use arose out of an anagram on the initial letters of Ιησούς χριστός, θεόν, θεόν, Σάβατον, Jesus Christ, Son of God, Savior: these initials formed the Greek word ἵππος (fish).

VEISCANTS, or BLISTERING AGENTS, substances which, if kept in contact for some time with the surface of the body, excite such irritation as to cause effusion of serum from the true skin, leading to separation and elevation of the cuticle, and formation of a vesicle or blister. Vesicants are employed: (1) for relieving or removing the diseased condition of some internal part, by producing a determination of blood from the interior to the surface over the seat of the affection; (2) as general stimulants to the system, often beneficial in cases of low continued fever; (3) for the direct purpose of withdrawing serum from the vascular system, for which they are prescribed with advantage in cases of sudden effusion into the pericardium or the pleura; blisters from this purpose should be of large size, and should be kept in contact with the skin sufficiently long to produce their full effect (24 hours being necessary in the case of some persons); (4) For removing the cuticle, to permit the direct application of various medicated agents, especially mercury and morphia, to the absorbing surface of the true skin. In infancy and childhood, these agents must be used with extreme caution.

To produce vesication, Cantharidine, the active principle of Cantharides, or Spanish Flies, in one of its various forms, is generally employed, though other substances also are used. Cantharidine is a white crystalline substance, extracted from the powdered insects by rectified spirits, and whose composition is represented by the formula C, H, O,. It is a very active poison, and produces immediate inflammation of the skin wherever it comes in contact with it, is very volatile even at ordinary temperatures, and not soluble in alcohol, but also in chloroform, ether, strong acetic acid and many oils. In preparing a blister, it is expedient to sketch the desired shape and size, and before applying it the skin should be well washed with warm water. If the patient's skin is not easily acted upon, the part should be sponged with vinegar; but if it is very susceptible a piece of tissue-paper should be placed between the skin and the plaster. To insure close contact with the skin, the blister should be gently warmed, carefully applied, avoiding creases, and kept in its place by a bandage; and to produce its full action, it should be kept on for 10 to 12 hours. If, on removal after that time, full vesication has not been produced, a hot poultice will be of the desired effect. The raised cuticle should be punctured, to allow the escape of the serum, except in the case of children and persons of very irritable skin, when the vesications should be left unopened, and a dressing of simple ointment or spermaceti ointment on soft rags applied and repeated in 24 hours; or the part may be at once covered with cotton-wool. The troublesome itching which often follows application of a blister is best relieved by a bread-and-water poultice, moistened with the dilute solution of acetate of lead. Collodium Vesicans is prepared by mixing equal parts of cantharidal ether. It possesses the advantage that its strength can be readily increased or diminished.

When a blistering agent with very rapid action is required, as in the state of collapse in cholera, recourse may be had to the application of boiling or nearly boiling water to a portion of the abdomen, the surrounding surface being protected by a wall of damp cloths. Cold water may be used as efficiently as boiling water: a piece of birelous paper, such as common blotting-paper, should be soaked in cold water, applied to the part to be vesicated, and covered with three or four folds of dry paper. A common smoothing-iron heated to 212° F. is then pressed three or four times over all; and on removing the paper, the part will be found vesicated. In less urgent cases an almost immediate blister may be produced by saturating a piece of lint in a strong solution of ammonia, and applying it to the skin with moderate pressure. By the time the ammonia has evaporated, the result is usually obtained. When it is desired to keep up a discharge from a blistered surface, instead of healing it as is commonly required, or to produce a perpetual blister, the raw surface is dressed with irritants of all kinds, such as savine ointment. At each fresh dressing (in summer twice a day), the part should be cleansed in warm water.

VESPAVIN, vēs-pā′zhi-an (Titus Flavius Sabinius Vespasianus), emperor of Rome; b. Reate, in the country of the Sabines, 17 Nov. 9 A.D.; d. June 79. Being appointed commander of a legion in the reign of Claudius he acquired great reputation in Germany and in Britain, and on his return to Rome was made consul. Subsequently he was appointed pro-consul of Africa; and on the rebellion of the Jews was sent with an army into Judea (66). After subduing almost the whole of Galilee he was about to attack Jerusalem, when he received the news of the death of Nero (68 A.D.). After the transient reigns of Galba and Otho, Vitellius, he was elevated to the Imperial power, and reaching Rome about the middle of the year 70, was received with great rejoicing. He reformed the army discipline, and appointed a commission to settle the vast multitude of suits which had accumulated during the late troubles, besides presiding on the bench frequently himself, that justice might be administered with impartiality. Vespasian favored arts, letters and learned men, particularly Quintilian, Pliny and Josephus. He rebuilt a part of the city, restored the Capitol with increased splendor, and erected the gigantic amphitheater, the ruins of which are known as the Coliseum. Among important public events of his reign are the termination of the dangerous rebellion of the Gauls under Civilis, and the capture of Jerusalem by his son Titus, whom the emperor had made his lieutenant in Judea.

VESPER SPARROW, GRASS FINCH, or BAYWINGED BUNTING, a well-known and abundant bird (Pooecetes gramineus) of the family Fringillidae, found throughout the eastern United States and Canada, and represented in other parts of temperate North
America by distinct sub-species. It is about six inches long and may be recognized by its streaked plumage, the bay or chestnut wing-patch and the white outer tail-feathers which are a very noticeable feature of which are more or less prominent. The three common names of this bird show the interchangeability in ordinary usage of the appellations applied to the species of *Fringilla* and illustrate three peculiarities of this bird: the first, its habit of singing at sundown; second, its abundance in grassy fields; and the third, the rather characteristic wing markings. No bird is more familiar to the stroller along country roads and byways in the New England and Middle States than the grass finch. It spends much of its time on the ground, but often perches on fences, telegraph wires and trees. Except during the breeding season it is gregarious and consorts with other ground-loving sparrows, like which it feeds upon seeds, grains and insects for which it often searches by the roadside. When approached, the grass finch runs rapidly and seldom flies more than a few yards before alighting. It is a bold and confiding bird. Its migrations are not extensive and it leaves late and returns early, and in our seasons a few may even remain throughout the winter in the Middle States. From the latitude of Virginia and Missouri northward is its breeding ground. The nest is placed on or near the ground and is a bulky structure of weed stems, leaves and grasses, with a lining of fine grasses or hairs. The eggs are usually four or five, dull white, variously tinted and blotched at the larger end, especially with lilac and brown. Two or even three broods may be raised. As mentioned above the soft and sweet, but clear song is heard most frequently toward evening, but is by no means confined to that time. Consult Wilson, *American Ornithology*.

**VESPER S** (late Lat. *vespera*, vespers; plur. of *vespera*, evening), in the breviary (q.v.) of the Roman Catholic Church, the canonical hours following the *nones* and preceding compline, and thus the next to the last of the seven canonical hours. Also a religious service at evening.

**VESPERTILLIONIDÆ**, vêspér-tîl-î-ôn'-tê, a family of bats including the great majority of small insectivorous species, and especially characteristic of temperate regions. In this family the muzzle has no nose-leaf, the pre-maxillary bones are defective and separated by a wide median vacuity, the number of incisor teeth is usually two on each side above and three below, and the tail is nearly or quite included in the interfemoral extension of the wing-membrane. With the exception of a few found along the southern borders all of the bats of the United States belong to this family, nine genera and about 25 well-marked species being included among them. Among them are the long-eared bat (*Corynorhinus macros),* typifying the subfamily Plecotinae, in which the bases of the ears are joined across the top of the head, and which is found in the Southern States north to Virginia, the well known and variable little brown bat (*Myotis lucifugus*), so abundant everywhere in the east, and represented by closely related species westward, the pretty and equally abundant red bat (*Tamia borealis*), the larger and much rarer hoary bat (*T. cine-

**VESPUCCI**, vês-poo'chê, Amerigo (Latinized *Amerigo Vespucci*), Italian navigator: b. Florence, 18 March 1452; d. Seville, 2 Feb. 1512. He acquired in some fashion *an excellent practical knowledge of astronomy,* and was the greatest expert of his day in the calculation of latitude and longitude. A clerk in the commercial office of the Medici at Florence, he made an avocation of the study of cosmography and the collection of globes, charts and maps. He became, too, a skilled map draughtsman. Some time between the middle of 1489 and the end of 1491 he was sent to Barcelona as representative of the Medici in connection with Spanish business interests of importance; and in 1493 he became connected with the commercial house of Juanato Berardi at Seville. Berardi was in the employ of the Spanish Crown, and fitted out vessels for expeditions across the Atlantic. In 1495 he signed a contract for supplying 12 vessels of 900 tons burden in aggregate; and when he died in December, Vespucci settled the remainder of the contract and the various obligations in connection therewith. It is thus probable that Vespucci participated in the fitting out of Columbus' second voyage. Knowledge of Vespucci's career between early in 1496 and late in 1504 is based on two letters written by him, one (March or April 1503) to Lorenzo di Pier Francesco de' Medici, the other (4 Sept. 1504) to Piero Soderini, gonfaloniere of Florence. The latter gives an account of four voyages in which the writer took a part, the earlier two in the service of Spain, the latter two in that of Portugal. The first expedition started from Cadiz port 10 May 1497 and returned 15 Oct. 1498, and Vespucci accompanied it as *astronomer.* Hence, to all intents and purposes the voyage was his. As an officer of such importance, then Vespucci sailed. His account above mentioned is a cursory epistle, not an official report, and, therefore, of course—but unfortunately—fails to supply many details that would now be of great value. He does, however, tell something of the flora and fauna of the regions visited, the natives and their customs. The letter to Soderini got into print in two editions, so improbable it is indeed to suppose that Vespucci had any part in their appearance. The letter says that the expedition, after running to the Canaries, made land 1,000 leagues about west-southwest from those islands, coasted for 870 leagues, so extensive as it was thought that of a continent, passed 37 days in a fine harbor and then returned to Spain. Vespucci, then, probably sailed from Cape Honduras to a point not far
from Cape Cañaveral, Fla. Thus he visited what he thought was the continent of Asia, but was really that of America, a year before Columbus. Owing either to a typographical error or the arbitrary alteration of an editor, a proper name Lariab, in the Italian version, has become Parias in the Latin. Lariab was apparently a name belonging to the country of the Huastecas around the river Panuco, while Parias was a name of a region 2,400 miles distant, on the South American east coast. This confusion of Lariab and Parias occurred despite the fact that Vespucci scrupulously gives latitudes and longitudes. As a matter of fact, at the time of the writing of the letter (1504), Columbus was supposed to have discovered Asia by a new route in 1492; and Vespucci, had he wished to anate Columbus, must have placed his first voyage before that date. In the letter to Lorenzo de Medici, regarding his third voyage only (14 May 1501–7 Sept. 1502), Vespucci refers to the regions visited (The Brazil coast to lat. 34° S., running thence southward to South America Island as "a new world," because unknown to the ancients. One Giocondo, who prepared a Latin version, apparently from the Italian manuscript original, gave his rendering (1504) the title "Mundus Novus." This was put down as equivalent to what is now known as Brazil. Then the suggestion was given that Mundus Novus was the so-called Fourth Part of the earth, and ought to be called America, from its supposed discoverer, though as we now know Columbus had already reached it. Thus the name came to be equivalent to South America, and finally to the two continents. Consult the critical and biographical notes by Winsor in his 'History,' Vol. II (1886); Fiske, 'The Discovery of America' (1892); Harrisse, 'Discovery of North America' (1892).

VESELS. See SAILING VESSELS; STEAM VESSELS.

VESELS, Entry and Clearance of. According to the provisions of the clearance law of 1902, the master of a vessel engaged in international commerce is required to deliver to the collector of the port of departure, prior to sailing, a sworn manifest. Shippers' manifests are also required from the consignors. When all requirements as to inspection, fees, etc., have been satisfied, the collector issues clearance papers for the ship and its cargo. Coastwise vessels must take out clearance papers if they clear from one customs district to another. The masters of vessels of American registry are required, when entering from foreign ports, to deposit with the port collector their register and clearance papers and these are retained until the vessel clears. Masters of vessels of foreign registry are required to show similar papers and then deposit them with their consul until time for their clearance. The names of the vessel owners appear on the papers of American vessels. Entering vessels give copies of their original manifests to the customs officers who are also empowered to inspect the originals. Entry and clearance fees are fixed by law. Consult United States Treasury Department, 'Norton Laws of the United States' (1911), and Johnson, E. R., 'Ocean and Water Transportation' (1905).

VEST, George Graham, American lawyer: b. Frankfort, Ky., 6 Dec. 1830; d. Sweet Springs, Mo., 9 Aug. 1904. He was graduated from Centre College, Danville, Ky., in 1848 and from the law department of Transylvania College in 1853. In the last-mentioned year he removed to Georgia, where he was admitted to the bar in 1854 and for some time practiced law, removing thence to Booneville, Mo., in 1856. He was a member of the Missouri legislature in 1860-61, and at the outbreak of the Civil War he espoused the cause of the Confederacy. He served in the Confederate army in the summer of 1861, and was elected in that fall to the Confederate Congress, in which he served for three years. After the War he resumed his law practice, settling at Sedalia, Mo. He was elected to the United States Senate in 1879, and was re-elected in 1885, 1890 and 1897. He was prominent as a committee-man in the Senate; earned a national reputation as a debater; and was an acknowledged leader in national affairs. He was the last member of Congress to return to his seat, following the death of a member of Congress. In 1903 physical disability necessitated his retirement from office.

VESTA, the Roman goddess of the hearth identified with the Greek Hestia. The worship of Vesta arose from the necessity and difficulty in primitive times of obtaining fire. The custom came about of maintaining at some point a perpetual fire for general use, and this was continued after the necessity had ceased. The flame was personified, and associated with the Penates (q.v.) as a deity of the state. Vesta was not represented by any statue in the temple devoted to her honor, but by the symbolic fire kept perpetually burning on the hearth or altar by the vestals, her virgin priestesses. In Rome, on 1 March of every year, the sacred fire and the laurel tree shading her hearth were renewed; on 9 June, the festival called Vestalia was celebrated; and on 15 June her temple was cleansed and purified. Praetors, consuls and dictators, before entering upon their functions, sacrificed at Lanuvium, where the cult was believed to have been established.

VESTA, in astronomy, the name of the fourth asteroid, discovered by Olbers at Bremen 29 March 1807.

VESTAL VIRGINS, women dedicated to the service of the goddess Vesta, and bound by vows of chastity for the limited period of 30 years. They were also termed vestals. The worship of this goddess is supposed to have originated in the guardianship of a central or village fire by the earliest communities of men. The difficulty of kindling fire before the invention of the lucifer match was general and in prehistoric times the care of a fire for the common use must have been a most important duty. It would naturally be entrusted to women, and preferably to those who were not distracted from it by family ties. The duty of maintaining this fire became a sacred function connected with the worship of a presiding goddess, after its original significance had been lost. Annually, on 1 March, the Latin New Year's Day, the fire was extinguished, and rekindled either by the friction of dry sticks, or, in later times, by the sun's rays being brought to a focus by a concave mirror. The vestal virgins who had charge of the
ERUPTION OF MOUNT VESUVIUS
sacred fire were chosen by the king in the early days of Rome, and by the pontifex maximus under the republic and the empire. There were originally four and later six vestal virgins. The candidate was to be over six and under 10 years of age, free from defects, with father and mother living, and daughter of a free-born resident of Italy. Her hair was cut, and she was formally initiated by the pontifex maximus, who thenceforth held toward her the relation of a religious father. The vestals had many privileges, and the honor was eagerly sought. After 30 years they could return to private life, and marry, if they chose. Violation of the vow of chastity during their years of service as vestals was punished by burial alive, and as the conviction was usually obtained on the evidence of slaves under torture, it is considered probable that some suffered who were innocent. The worship of Vesta disappeared with other pagan practices when Christianity became the religion of the empire.

VESTED RIGHTS, in law, a technical phrase, denoting a present fixed interest resting in a particular person or particular persons. They are opposed to contingent rights, which depend on some event or condition which may not come about before some other event or condition prevents their vesting. It is the general policy of lawmakers and the courts to uphold what are known as vested rights and not to allow interference with them without due compensation. The 5th and 14th amendments of the Constitution of the United States are aimed to protect such rights from infringement by new legislation. See Feudery.

VESTMENTS, Ecclesiastical, the garments worn at religious services by priests and prelates of the Protestant Episcopal, Roman Catholic and other churches. Nearly all denominations, even those that repudiate vestments, expect their ministers to wear attire indicative of their vocation, and this custom is not confined to Christian ministers, but prevails in the Jewish hierarchy, and is still maintained in the religious system of modern Jews. In the Buddhist and Hindu religions, and in pagan creeds so far as known, the priests wear some garment or symbol to distinguish their order. For vestments worn in Roman Catholic and Protestant Episcopal churches, see CHASUBLE; COSTUME, ECCLESIASTICAL; STOLE, etc.

VESTRIS, Lucia Elizabeth Bartolozzi, English actress, granddaughter of Francesco Bartolozzi (q.v.) : b. London, January 1797; d. Middlesex, 8 Aug. 1856. She was carefully educated, and at 16 was married to Armand Vestris, a member of the famous family of dancers. In 1813 she separated from him and made her début on the Parisian stage with moderate success. Her appearance in London in 1820, however, was a marked triumph; she became famous in 'The Haunted Tower' playing at the Haymarket, and subsequently added to her reputation in the part of "Phebe" in 'Paul Pry.' While lessee of the Olympic in 1838 she was married to Charles James Mathews. She was afterward manager of the Lyceum and of Covent Garden.

VESTRY, a room adjoining a church where the vestments of the clergy are kept.

Hence the place of meeting of those who had the charge of parochial affairs, and subsequently the persons themselves these affairs were entrusted. This is the present meaning in American churches. Vestries, under church establishment in England, were originally entrusted with the secular affairs of the church, as the maintenance and repair of the building, and the levying of church rates for this and other purposes. They latterly acquired a general control of the affairs of the parish, but by the Local Government Act of 1894 the vestries in rural parishes were superseded as regards their civil powers by the parish council or parish meeting. The vestries which formerly managed the affairs of the populous parishes of London were done away with by the London Government Act of 1899, under which a number of metropolitan boroughs, each with its own mayor, alderman and council, were established in their place and in the place of other anomalous authorities. In the United States, where no connection between Church and State is recognized by law, the vestry is typically charged to its duties as a body chosen from the congregation to attend to the interests of the church. In the Protestant Episcopal Church the vestry usually consists of 10 men, of whom two are wardens. They are elected by the members, and they in turn elect the rector, as well as manage the business affairs of the church.

VESUNNA, the ancient name of Périgueux (q.v.).

VESUVIANITE, or IDOCRASE, one of the commonest minerals which occur in tetragonal crystals. It is essentially a basic calcium and aluminum silicate, but all analyses show some iron and magnesium and occasionally titanium and manganese. The crystals are generally prismatic, terminated by the base often combined with the unit pyramid. Highly modified crystals are not infrequent. It also occurs massive and columnar. It has a hardness of 6.5 and a specific gravity of about 3.4. Its lustre is vitreous to resinous and sometimes splintery, while its colors are usually brown to yellow and green. A blue variety from Norway called "cyanite," owes its color to a trace of copper. Vesuvianite was so named in 1795 by Werner, who described the brilliant, brown crystals which are found in the ejected blocks of Vesuvius. The mineral has since been discovered in scores of localities, among the most noteworthy of which are the Vilui River in Siberia, Achmatovsk in the Urals, Ala in the Piedmont, Monzoni in the Tyrol, Wakefield in Quebec, near Helena, Mont., and Magnet Cove, Ark. It usually occurs in metamorphic limestone and the crystalline schists, or as a contact mineral.

VESUVIUS, vē-sū’vi-ū’s, Italy, a volcanic mountain, 10 miles southeast of Naples. With a basal circumferenece of about 30 miles, it rises from the centre of a plain 2,300 feet above the sea in a pyramidal truncated cone 1,500 feet high and about 2,900 feet in vertical height, 3,800 feet. In 1880 a funicular railroad was laid to the summit, which was reconstructed and equipped for electrical working 1903-04, and supplemented by a new electric railway four and three-quarter miles long, from Pugliano, the
VESZPREM — VETCH

northern quarter of Resina, thus enabling visitors to travel by electricity from Naples to within 250 yards of the crater. Previous to an eruption about 1838, the top was an uneven plane, but was then converted into a hollow cup, with a rim 400 feet to 500 feet broad on its west side, and not more than 50 feet on the others, with an internal sloping surface to a depth of 500 feet. A precipitous rocky ridge, forming an arc of a circle, and 1,400 feet in height, called the Monte Somma, is situated at a short distance from the cone on the north, from which it is separated by a deep valley, called the Atrio del Cavallino. Near the western extremity of this valley is the observatory established expressly for watching the volcanic phenomena. The lower part of the sloping plain, which rises gradually from the sea to the foot of the cone, forms a belt about two miles broad along the shore, laid out in vineyards and well cultivated, though intersected at intervals by terraces of black calcined matter. Beyond the cultivated belt the plain is rugged and covered with scorice of all forms and thickness, and this scoriaceous matter is covered with loose gravelly material composed of scorice, blocks of lava and volcanic sand, arranged in successive layers by the natural force of gravitation. The form of the pyramids has been modified by side eruptions and by the internal force acting upon the external matter before it has cooled. An internal movement of elevation has been proved by the angle at which continuous streams of lava are now found, being much greater than that at which they are known to have originally flowed. A stream of lava ceases to be continuous, and breaks into masses of scorice at an angle of more than 3°. Monte Somma is supposed to have formed at one time a complete cone of much larger dimensions and probably of greater height than the present cone, being subsequently thrown down by volcanic forces, in the same manner as 800 feet of the present cone was carried away by an eruption of 1822. From a difference of structure implying greater pressure, geologists have concluded that this somma was a bigger cone, which in the present is a subaerial one. Till 63 A.D., when many of the surrounding cities were damaged by an earthquake, no symptoms of activity are known to have been given forth by Vesuvius. In 79 occurred the great eruption described in the well-known letters by the younger Pliny, which buried Herculaneum and Pompeii, and during which the elder Pliny perished while hastening with part of the Roman fleet to the relief of the inhabitants. Since that time there have been continuous symptoms of activity and numerous eruptions have taken place. The first recorded discharge of liquid lava after that of 79 was in 1036. Since then there have been many violent eruptions; the most noted were those of 1775, 1793, 1754, 1787, 1850, 1855, 1867, 1872, 1878, 1880 and 1895. The eruption of 1779 was particularly magnificent flames of fire rising to three times the height of the mountain, and stones, scorie, etc., being projected as high as 3,000 feet, while a small stream of lava 1,500 feet wide flowed for three and a half miles and extended 600 feet into the sea. In 1872 14 different orifices opened in the mountain sending forth rivers of lava that threatened to carry devastation far and wide. The villages of San Sebastiano and Massa di Somma were almost entirely destroyed. Early in April 1906 eruptions destroyed several small towns and villages in the vicinity and created wide devastation throughout the surrounding territory. See Herculaneum; Pompeii; Volcano.

VESZPREM, Hungary, town in the western part of the country about 63 miles southwest of Budapest. It contains a hanomne episcopal palace, a fine cathedral, a Piarist college, and a gymnasium. Cloth and flannel-weaving, silk-spinning, cultivation of wine, fruits and tobacco are the principal industries. The town on several occasions was in the pot, session of the Turks; and an interesting memorial of them is a slender minaret rising from an old Gothic tower, and which long served as a watch-tower against fire. Pop. about 26,000.

VETANCURT, vé-tán-kört', or VETANCOUR, Augustin, Mexico City, 1620; d. Mexico, 1700. He was a member of the Franciscan order at Puebla, in which he was held in high regard as a teacher and as a linguist. He was commissary of the Indies, a member of the provincial council and was actively engaged in missionary work. His writings include various biographies and theological essays, in addition to his great works 'Arte de Lengua Mexicana' (1673); and 'Teatro Mexicano' (2 vols., 1697-98).

VETCH, a name applied to many species of leguminous herbs, in the genera Vicia, Astra
galus, Phaca, etc. They resemble pea-vines, and have pinnate, stipulate leaves and often climb over other plants by means of tendrils. The flowers are papilionaceous, of various colors, and the fruits are legumes, containing the seeds. The broad or Windsor bean of Europe is one of the vetch tribe (Vicia faba). The vetches are numerous, and many of them, especially the common tares (Vicia sativa and V. harenula), are plants valuable either for grazing livestock, to cut for green fodder or for ensilage with corn. They are rich in nitrogen, and are important not only for green manuring, or plowing under the soil, so that by decomposition nitrogen is given back to the soil, but because the roots are covered with tubercles that are the home of bacteria which have the power of assimilating free nitrogen from the soil, and converting it into such a form that it may be used by the host-plant. If the roots are left to rot in the soil, the ground is enriched by this store of nitrogen, rendered available for other crops. Vetches, therefore, like other Leguminosae, are valuable for poor lands, where they grow readily, and for restoring nitrogen exhausted by grass-teen.

The American vetch (Vicia americana), with bluish flowers, grows in the moist soil of prairies and woodlands and is a valuable forage-plant for the West. Vicia caroliniana was highly regarded as a medicine by the Cherokee Indians, who used it for dyspepsia, cramp and rheumatic pains. Members of Astra
galus, Phaca and allied genera, the American species of which are chiefly western or sub-arctic, are called milk of lava 1,500 trees, from the notion that feeding upon them would increase the milk of goats.

Other leguminous plants known as vetches are the chickling vetch (Lathyrus salicinus) grown in southern Europe for a forage-plant
and for its edible seeds, which are said, however to produce paralysis of the lower limbs in men and animals. Some of the bitter vetches are included in the genus *Vicia*, but one is *Enemus aerius*. The vetchlings are also included in *Lathyrus* (q.v.). The bastard hatchet-vetch is *Bistorta pelecinus*, with linear pods flattened transversely to the valve-edges, thus resembling our native *Vicia sativa* pods. The sensitive joint-vetch, *Echsynome nana*, has sensitive leaves, yellow flowers in axillary clusters and jointed pods. The kidney-vetch (*Anthyllis vulneraria*) has heads of flowers with permanent inflated calyces, in pairs at the ends of the branches; it was formerly supposed to have medicinal properties. The horse-shoe vetch (*Hippocrepis comosa*) has horse-shoe-shaped pods and is also called *unshoe the horse* from the magic property ascribed to it of taking the shoes off any nag that stepped upon it. Consult Farmers' Bulletins (United States Department of Agriculture).

**VETERANS OF INDIAN WARS OF THE UNITED STATES, Society of,** an organization formed at Philadelphia, 23 April 1881, by the Union army, to keep in memory the hardships and heroism of the men who served in the Indian wars, which may now be regarded as of the past, and which had such an important and essential part in building up the States and Territories of the west. The society consists of three classes: first, the composed of commissioned officers, active, retired or honorably discharged, of the United States army, or of any State National Guard or militia, who have served in the service of the United States in a military capacity in a section occupied by hostile Indians. The second class consists of lineal male descendants of officers who were either members of or eligible to the first class. The third class is composed of non-commissioned officers and soldiers who have received a medal of honor or certificate of merit from the United States government for services in Indian wars, or who have been recommended for a commission or minor by their immediate commanding officer for such services. The society is of course steadily diminishing.

**VETERINARY MEDICINE.** Veterinary medicine is the science and art that deals with the prevention, cure, alleviation and extermination of disease among domestic animals. It includes the appropriate management of domestic animals, as well as the nature, causes and treatment of the disorders to which they are subject.

**History.** In Europe the first veterinary school was established in 1761 at Lyons; in 1776, that at Alfort, near Paris, was opened. Other veterinary schools were established in Europe as follows: Turin, 1769; Copenhagen, 1773; Vienna, 1775; Dresden, 1776; Hanover, 1778; Budapest, 1787; Berlin and Munich each one in 1792. London, 1793; and London, besides the older institution, now called the Royal Veterinary College, Camden-town, there was a second established at Bayswater in 1865. In 1844 the veterinary surgeons of Great Britain obtained a charter constituting them a corporation under the title of the Royal College of Veterinary Surgeons, and empowering them to appoint examiners and grant licenses or diplomas, the holders of which are members of this body (M.R.C.V.S.).

In the United States the first step toward systematic veterinary education was the granting of a charter in 1852 by the legislature of Pennsylvania and the securing of a subscription of $40,000 to serve in the organization of a veterinary school in Philadelphia. No students responded until 1859-60, when seven were enrolled, one of whom was a graduate of the Boston Veterinary College which had been chartered in 1855. Both of these schools had a short life. Philadelphia, however, now has its veterinary school in connection with the University of Pennsylvania. In 1857 the New York College of Veterinary Surgeons was chartered and in 1875 the American Veterinary College was opened. These two New York City schools were maintained as proprietary institutions till 1899 when they were placed on a strictly university footing by consolidation under New York University. Their doors did not remain open long. In the succeeding years veterinary schools sprang into existence in many of the large cities, Chicago, Kansas City, Saint Joseph, Cincinnati, Baltimore, Washington, Grand Rapids, Detroit, etc. All of them were private institutions, dependent on their financial returns, with a curriculum of 10 to 12 months, representing two years of five or six months each.

On 7 Oct. 1868 Cornell University opened with a chair of veterinary medicine. Special courses of purely veterinary subjects were offered, and in the succeeding years four students received the Cornell degree of B.V.S. One of these organized the Bureau of Animal Industry in 1884 and for many years served as its head; another became director of United States Meat Inspection Service; another in conjunction with a later Cornell graduate demonstrated that the Southern cattle tick (*Margaretus annulatus*) was the carrier from beast to beast of the microbe cause (*Piroplasma bigeminum*) of Texas cattle fever — thus laying the foundation of the later discovery that one mosquito (*Anopheles*) carries the microbe of malaria, a second (*Steegomyia*) that of yellow fever, and a third (*Culex*) the blood parasite (*filaria*).

In 1894 by enactment of the New York State legislature the Cornell chair of veterinary medicine became the first State veterinary college in America. Other State veterinary colleges later were established in connection with State agricultural colleges in Ohio, Iowa, Washington, Kansas, Alabama, Colorado and Pennsylvania. A second New York State veterinary college was established at New York University in 1913.

The American Veterinary Medical Association in 1891 adopted an article providing that all applicants for membership should be graduates of a recognized veterinary school with a curriculum of at least three years of six months each and a corporately certifying at least four veterinarians. Nearly all the schools which had not already done so soon placed themselves in harmony with these requirements. The next step in advance came in 1895 when the New York State legislature enacted that at least a high school diploma representing four years of high school work should be offered for admission to a veterinary school,
that the veterinary curriculum should embrace three full years of nine months each, and that only those who had met both requirements could be admitted to the regents’ veterinary examination for license to practice in the State. Veterinary colleges now require that a matriculant must be a graduate of an accredited high school having a four-year course of study. The American Veterinary Medical Association now requires that all applicants for membership must be graduates of a recognized veterinary school with a curriculum of four years of nine months each.

Army Service.—The United States army has long had its nominal veterinarians, but many of these were uneducated men, appointed by political influence or advanced from the position of farrier-major, and there was little to tempt professional men of character and ability into the service. The army veterinarian had practically no army status, no rights, no prospects. He was not even enlisted, there was no special provision for him during service, and no pension if he had to retire disabled. In the session of Congress for 1900 the first step was taken for the improvement of the army veterinary service by enacting that the army veterinarian of the first grade must enter on the basis of an examination to be prescribed by the Secretary of War, and that he shall have the pay and allowances of a second lieutenant of cavalry, while those of the second grade shall have $75 a month and the allowances of a sergeant-major. To-day the military veterinarian, under the Military Defense Act of 3 June 1916 has an opening to advanced rank and nominal authority, a transfer from the Quartermaster’s to the Medical Department with supervision and access at least to the medical mind in the military body. The requirements for the United States army veterinary service are that the applicant must be an American citizen between 21 and 35 years of age, a graduate of a recognized veterinary college, a person of good moral character, free from mental and physical defects, and satisfactorily pass an examination prescribed by the surgeon-general.

State Regulations restricting the practice of veterinary medicine was enacted in New York in 1886. In 1901 12 States had veterinary medical laws. To-day each State has its Veterinary Examination Board which offers semi-annually an examination to graduates of recognized veterinary schools and issues a certificate of “veterinary surgeon” to those who pass the examination satisfactorily which permits the successful applicant to practice veterinary medicine legally within the State. Some States, especially in which there is no recognized veterinary college, may recognize the license to practise granted by the Veterinary Examination Board of another State depending upon the need of veterinarians within the State and the opinion of the examining board.

Bureau of Animal Industry.—The Bureau of Animal Industry was established in 1884 in connection with the Department of Agriculture at Washington. The immediate cause of the formation of the Bureau was the urgent need by the Federal government of official information concerning the nature and prevalence of animal diseases, and of means required to control and eradicate them, and also the necessity of having an executive agency to carry out the measures necessary to stop the spread of disease and to prevent the importation of contagion into the country, as well as to conduct investigations through which further knowledge might be obtained. The Bureau deals with the investigation, control and eradication of contagious diseases of animals, the inspection and quarantine of livestock, horse breeding, experiments in feeding, diseases of poultry and the inspection of meat and dairy produce. It makes original investigations as to the nature, cause and prevention of communicable diseases of livestock, and takes measures for their repression, frequently in conjunction with State and Territorial authorities. It prepares tuberculin and mallein and supplies these substances free of charge to public health officers, conducts experiments with immunizing agents, and prepares vaccines, sera and antitoxins for the protection of animals against disease. It prepares and publishes reports of scientific investigations and treatises on various subjects relating to livestock. The effect of the work of the Bureau on the health and value of farm animals and their products is well known, and the people of the United States realize the immense importance of veterinary medicine.

Since 1884 veterinary medicine has made far more progress than during any previous period in its history. Every branch of veterinary science has shared in this advance. Pathology has made the most marked progress. Bacteriological study has discovered new diseases, changed the views held regarding many others, and has pointed the way to new methods of prevention and cure through the use of bacterins, vaccines, antiseraums and bacterial toxins. Many diseases have been proved beyond a doubt to be due to infection by specific bacteria or germs. Some that may be mentioned are tuberculosis, anthrax, blackleg, glanders, tetanus, hog-cholera and rabies. In the United States veterinary medicine has gained distinction by the assistance and protection it affords to the livestock industry of the country. Contagious pleuropneumonia of cattle was first discovered in the State of Louisiana at the age of 49 years and was finally exterminated in 1887 and has not appeared here since. Foot and mouth disease has invaded the herds of this country four times (1870, 1902, 1908 and 1914), and each time it has been successfully exterminated. Texas fever is rapidly disappearing from the South under the eradication of the Texas fever cattle tick. Hog-cholera, anthrax and blackleg are being successfully prevented by immunization of susceptible animals. Tuberculosis is being slowly eradicated through the operation of the Tuberculous-Free Accredited Herd Plan of the Federal government and legislative measures regarding cattle reacting to the tuberculin test. The annual physical examination of dairy cattle is also accomplishing much toward its eradication.

Veterinary medicine can offer much assistance in the study and prevention of the diseases to which the human family is susceptible. Some grave human maladies are certainly derived from diseased animals such as rabies, glanders and anthrax. Food products derived from animals often serve as a medium by which serious maladies may gain wide distribution in the human family. Raw milk may
VETERINARY OBSTETRICS

carry and distribute typhoid, septic sore-throat, diphtheria, smallpox and tuberculosis, fork, if the process of fertilization occurs through the vagina and the tapeworm of man. Others may yet be added to the list. See CATTLE, DISEASES OF; HORSE, CARE AND DISEASES OF; VETERINARY OBSTETRICS; VETERINARY SURGERY; and consult bibliography under the last named.

R. RAY BOLTON,
Formerly Assistant Professor of Veterinary Medicine, Iowa State College.

VETERINARY OBSTETRICS. Obstetrics is the art of assisting in parturition, or in the troubles incident to birth. The giving of birth to young is the culminating act of a series of complex physiological processes, the perversion or interruption of any one of which may lead to the defeat of reproduction. Some knowledge of each process is necessary in order to grasp the significance of parturition itself. Successful parturition occurs only when the prospective mother is normal in the structure and physiological development of all her organs of reproduction, and of others which may have any connection with the act of parturition. She must undergo a normal development before it can be born in a viable state. In veterinary obstetrics, therefore, is included all factors which necessarily precede and lead directly to parturition and all immediate consequences of birth which affect the health of the mother or the young. The reproductive organs of the female consist of the ovaries, uterus or womb, vagina, vulva and the mammary glands. Of the male they are the testicles and the penis. Their specific function is the procreation of the species, including impregnation, conception, the intra-uterine nutrition and development of the fetus, its expulsion after a certain degree of development and its further nutrition for a time after birth by milk from the mammary glands until the young has acquired sufficient development to enable it to lead a wholly independent existence. Before reproduction becomes possible the breeding animal must have reached the age of puberty or sexual maturity, the mare and spavined mares become mature and are discharged and sexual desire is established. Up to this age the reproductive organs are dormant in so far as their specific functions are concerned and no sexual desire is manifested.

The different species of domestic animals arrive at puberty or sexual maturity at various ages. The horse breeds at the age of two years, cattle at one to one and one-half years, sheep at 10 months to one year and the pig at seven to eight months of age. The rabbit breeds at six months of age.

Reproduction is a complex physiological process accompanied by or associated with phenomena which bear an important relation to each other. In the following order we may observe some of the processes: (1) estrum; (2) impregnation; (3) pregnancy; and (4) parturition.

Estrum or "heat" is that period of irresistible sexual desire which occurs in non-pregnant females at regular intervals. It is closely associated with a physiological process taking place in the ovary called ovulation, in which an ovum or egg cell is shed from the ovary to traverse the oviducts and then the uterus where, if copulation has taken place, the male cell (spermatozoan) and the female cell (ovum) unite, and the process of ovulation occurs. The estrual period and its interval in non-pregnant animals varies with the different species. In the mare the estrual period is 48 hours occurring at intervals of four weeks during the spring and early summer, becoming less frequent and more irregular during the summer and may be absent during the winter. Estrum in the cow is 24 to 36 hours and occurs every three weeks with considerable regularity. In the ewe the period of heat is 24 hours and recurs in from 13 to 18 (usually 16) days. The pig remains in a state of estrum for about three days and if not impregnated comes in heat again in three weeks. In carnivora estrum ordinarily occurs semi-annually in late winter and early autumn. The rabbit breeds from four to eight times a year. In all animals estrum is normally suspended during pregnancy, but exceptions to this rule may occur.

Impregnation.—Natural reproduction in animals can only occur as a result of copulation, which is brought about by the seminal fluid or semen of the male entering the vagina of the female and the corresponding sexual excitement of the male. During copulation the semen from the male is injected into the vagina of the female, possibly in part into the uterus. The essential condition to fertilization or impregnation, so far as the male is concerned, is that physiologically perfect spermatozoa shall gain the cervical canal, traverse the uterine and oviducts and meet the ovum. From among the myriads of spermatozoa in one discharge of semen, but one sperm cell is essential to the fertilization of an ovum. Fertilization or conception is the successful union of the male generative cell (spermatozoan) with the female generative cell (ovum), by which the resulting cell acquires the power of segmentation and is enabled to develop into an embryo.

Pregnancy or gestation is that period of time during which the fetus is undergoing development in the uterus of the mother; a period extending from the time of fertilization of the ovum until the birth of the young. The modifications which necessarily take place during this period are of a very profound character, and exert an important influence upon the life and nutritive powers of the mother. The volume of the uterus becomes greatly increased in order to accommodate the fetus and its membranes. Pregnancy is manifested in several ways by the female. However, no single sign observed should be considered diagnostic but when several of the indications are manifested and noted in conjunction the diagnosis of pregnancy may be made with certainty. The signs of pregnancy are: the cessation of estrum; a more quiet and peaceful disposition; a tendency to take on fat more rapidly; and the enlargement of the abdomen so that it bulges below and to each side. Further and more positive signs are: movements of the living fetus which may be observed in the flank and along the sides of the abdomen; touching or feeling the fetus through the walls of the uterus, and auscultation of the fetal heart-beat. The earliest positive diagnosis of pregnancy may be made in the larger animals by palpation of the uterus through the rectum.
The duration of pregnancy or what is known as the period of gestation in domestic animals varies with the species. In the mare gestation is 330 to 340 days, in the cow 280 to 285 days, in the sheep and goat 21 to 22 weeks, in the pig 11 to 12 weeks, in the dog about 60 days, and in the rabbit 30 days.

**Parturition** is the birth or expulsion of the living fetus at the natural time in a state of development which enables it to live. Although parturition is a physiological process it is accompanied by pain and severe exertion on the part of the mother and brings about sudden changes in the life of both mother and fetus which in a measure imperil the well-being of each. The causes of parturition are not definitely known. On nearing the completion of pregnancy there appear certain signs in animals which indicate the approach of birth. One of these is the increased functional activity of the milk glands; another is the relaxation of the sacro-sciatic ligaments which allows the muscles passing over them to drop inward; this causes deep hollows to appear on either side of the base of the tail; the vulvar lips become swollen and tend to stand apart more loosely than ordinarily. As the time for birth draws nearer the animal appears to be somewhat uneasy and anxious, and, if at liberty, she will withdraw from other animals of her kind or of other species and seek a quiet and secluded place. In parturition there are certain attitudes of the fetus which make its passage possible while others render it virtually impossible. The possibility of a fetus being born alive and without assistance depends fundamentally upon which parts of the fetal body present at the outlet, and secondarily upon the relations of the parts which present to the circumference of the pelvis. The natural and normal presentation is that of the two fore-feet with the front side of the feet and knees upward or next to the tail of the dam and the nose lying between the knees. With a well-formed dam and fetus and a normal presentation parturition in animals is usually prompt and easy. Whenever birth becomes difficult or impossible without artificial aid the condition is known as dystocia. It has been found that dystocia runs parallel in frequency to the confinement of the animal. Consequently those females which are most closely housed and least exercised are the ones which suffer most frequently and seriously from dystocia. The immediate causes of the dystocia are many and varied. It may be dependent upon some defect, disease, or displacement of the maternal organs such as: failure of the mouth of the uterus to dilate; twisting or torsion of the uterus; tumors in the vagina; disease in the pubis, ilium, or abdomen; undue narrowing of the passages; the disturbance of the animal by the presence of persons; or by unaccustomed and unnatural noises. Or it may be due to some disease or abnormality in the size, form, presentation or position of the fetus such as its back being turned downward or to one side in place of upward toward the spine of the dam; the bending backwards of one or more limbs or of the head into the body of the uterus; the presentation of the back, shoulder, or neck of the fetus; the presentation of all four feet once; dropy or other disease of the fetus; or excessive or imperfect development of the fetus.

In overcoming dystocia in animals a number of operations may be demanded. Depending upon the animal in dystocia and the kind of dystocia present the operation for relief is selected to suit the case. The chief obstetric operations are: (1) Manual, or changing the position of the fetus; (2) forced extraction; (3) embotomy; (4) Cesarian section. Mutation, forced extraction and embotomy are most commonly performed in dystocia of the larger animals (mare, cow, sheep and goats). In the smaller animals (pig, dog and cat) Cesarian section is performed. Pregnant animals are subject to an infectious disease which frequently destroys pregnancy. The disease is infectious abortion and consists in an infection of the fetus and its membranes which causes the death and expulsion of the fetus, or its expulsion in a living and enfeebled state at any time in the pregnancy period without directly inducing material evidence of disease in the mother.

There are also a few accidents and diseases grouped about the act of parturition which require great care and attention. They occur in all animals, although one or another accident or disease is more frequent in one species than in another. Retention of the afterbirth is one of the most common and at the same time one of the most serious diseases of the puerperal state. It is observed most frequently in the cow. Rupture of the uterus may occur but is not frequent. Eversion or prolapse of the uterus is a common and formidable accident, especially liable to occur in cows. Metritis or inflammation of the uterus is common and occurs in all species. Parturient paresis or milk fever is a very common malady of the parturient state, but is observed only in cows. Present methods of treatment have made milk fever a disease not to be feared if attended early, where it was once a highly fatal malady. For bibliography consult works referred to under article Veterinary Surgery.

R. Ray Bolton,  
Formerly Assistant Professor of Veterinary Medicine, Iowa State College.

**Veterinary Surgery.** Veterinary surgery is the art of healing local injuries and certain diseases of domestic animals by operative procedure and instrumental treatment. It includes also certain operations, that when performed render animals more submissive and more serviceable to man. Surgery in all countries is as old as human needs. A certain skill in arresting hemorrhage, the binding up of wounds, the supporting of broken limbs by splints, and the like, together with an instinctive reliance on the healing power of tissues, has been common to men everywhere. Veterinary surgery began in all probability with the domestication of the horse which occurred in Europe before the dawn of history. There is evidence that the Egyptians practised veterinary surgery in very remote times, and that the ancient Egyptians. To the Greeks do we obtain any very definite information regarding the state of veterinary surgical practice in antiquity. The writings of Hippocrates (460-377 B.C.) afford evidence of investigations in comparative anatomy. The works of Aristotle were one of the first to occupy himself with anatomy, which he studied in animals and wrote on physiology and com-
VETERINARY SURGERY

parative anatomy, and on the maladies of animals, while many other Greek writers on veterinary medicine are cited or copied from by Varro, Columella and Galen. Mago of Carthage (200 B.C.) wrote a work of 20 books which was translated into Greek and largely used by Varro and Columella. Veterinary surgery in its progress has kept pace with human surgery because the principles of surgery wherever practised are applicable to surgery in animals. Veterinary surgery affects likewise the progress of veterinary science, and the invaluable investigations of Davaine, Pasteur, Chauveau, Lister and Koch have created as great a revolution in veterinary practice as in human practice. Veterinary surgery is limited somewhat in its application in practice as compared with the practical application of human surgery. This is due to the sub servient purposes for which the domestic animals are reared and used, and to the insurmountable difficulties of diagnosis and post-operative control. The amount of care and attention given to the improvement of the physical condition and general health of domestic animals is measured by the knowledge the owner possesses as to how the animals may be best fitted to serve his purpose. The amount of medical or surgical attention given an animal is measured by the cost in comparison with the results obtained. Perfect restoration of function being usually demanded in veterinary surgery, many operations common in human practice must either be renounced or very seldom performed. It is, therefore, often necessary to consider whether operation is justified or whether slaughter is not preferable.

Owners as a class have quite erroneous impressions of the results to be expected. Many are not satisfied even when the animal's usefulness is completely restored because perhaps a trifling blemish remains. Some seem incapable of understanding that a certain time is necessary for recovery. They imagine that healing can be forced, become impatient and in a few moments destroy by clumsy interference or too early use of the animal the results of weeks of skill, afterward seeking to hold the operation in question. In far too many instances the conditions for rapid healing are much less favorable than in human practice. The veterinary surgeon is handicapped in his operative work by the active opposition of the animal, the natural uncouthness of the patient's body, the unsatisfactory surroundings in which the operation must oftentimes be performed and the hazards of anaesthesia. And he is finally hampered in his post-operative management of the case by the lack of any instinct of self-care or self-protection on the part of the patient, the difficulties of post-operative control, and frequently, the impossibility of shielding the wound from injurious external influences and the great cost of sustenance and proper care during long periods of convalescence. These limitations to veterinary surgery often render success imperfect even with the greatest care and attention to detail and are so harmful against the enlargement of the scope of veterinary surgery that there has been a demand for the specialization from which an elaboration of veterinary surgical knowledge should come. On the contrary, every veterinary practitioner must be more or less of a surgeon himself in order to meet the demands of his daily work, and since his mind is occupied in so many different directions he finds little time to enrich the fund of surgical knowledge by fruitful investigation and research. He finds little opportunity to acquire that knowledge of detail, that degree of skill, that practical experience upon which a successful surgical career actually depends. And unlike the human physician he is denied the opportunity of consultation with the competent specialist who by reason of a broad experience is capable of performing complicated and intricate operations against diseases which the general practitioner cannot hope even to diagnose, to prognosticate or meddle with because such specialists do not exist in the veterinary profession.

There are a few men who stand out rather conspicuously as veterinary surgeons and there are a few teachers in the various veterinary colleges who profess to be endowed with an inferior variety of surgical skill but still it cannot be said that the ranks are richly embellished with real surgeons.

Although many of the domestic animals undergo necessary surgical operations, the horse has furnished by far the largest field for the development and application of veterinary surgery because up to the beginning of the 20th century all agricultural pursuits and the local transportation of people, manufactured articles and farm products were done by means of horses. This necessitated great numbers of horses in every occupation. To-day the tractor and the automobile have made such enormous inroads into our commercial and agricultural transactions that the work for the horse has all but gone, and consequently the horse has disappeared in great numbers from the cities and farms, thus very greatly diminishing the opportunities and the field for the practice of veterinary surgery in the future. Nevertheless, a high degree of skill has been attained in the application of veterinary surgery when judged by the various operations that may be performed upon the horse for the restoration of his usefulness. In surgical practice the indications and contra-indications for the operation must be carefully studied. Except in case of urgent operations like tracheotomy for threatening suffocation, operation for strangulated hernia, removal of a foreign body, arrest of severe hemorrhage, dressing of a wound, etc., it is first necessary carefully to consider whether the animal's value, its chance of perfect recovery and the probable duration of its convalescence justify operation at all. When surgical treatment can only have a temporary good effect and the disease is likely to return, when improvement is only to be obtained by sacrificing the animal's usefulness, or when the patient is old or its strength too greatly reduced the operation should not be performed except on the insistence of the owner.

Surgical Procedure.—This includes (1) the restraint of the animal; (2) anaesthesia; (3) obtaining surgical cleanliness, and (4) the dressing and care of wounds. Restraint.—Efficient restraint is a prerequisite to good animal surgery. Operation, or even local examination, is often impossible without recourse to methods of restraint of which an exceedingly numerous choice is available. Each species of the
domestic animals is endowed with one or more means or weapons of defense. These must be reckoned with and overcome by effectual means. The animals that are to be operated on must be rendered harmless at the same time the operative area must be made immovable and secure. Surgical restraint methods begin with subjection by means of blinds, twitches, gags, war briddles and barnacles. These appliances are used to divert the animal's attention while injures on the diseased areas of the wounds are being examined, operated or dressed. They are also used while the hobbles or casting harnesses are being applied. The method of restraint used depends upon the size and strength of the patient, the part to be operated upon and the operation to be performed. Large animals are cast and secured in the recumbent position by means of harnesses with hobbles and ropes for serious operations and preparation for administering an anesthetic. Veterinary colleges and veterinary hospitals are usually equipped with stocks and operating tables where large animals may be securely confined for operation in the standing or in the recumbent position as desired. Small animals (hogs, foals, dogs and cats) are restrained for operation by tying all four limbs together or by securing them to an improvised operating table. If not too large and strong they may be held firmly by a powerful assistant.

Anesthesia.—According to its nature and extent anesthesia may be general or local. In general anesthesia the patient is thrown into a more or less profound artificial sleep. It is not always necessary, however, to act on the entire individual. Sometimes the operation affects only a very limited area and local anesthesia suffices. Local anesthesia may be produced by the application of ice or freezing mixtures, by spraying the part with certain liquids like ether or ethyl chloride, or by the subcutaneous injection of a solution of cocaine, eucaine, novocaine, quinine and urea hydrochloride or procaine. Anesthetics are quite as useful in animals as in man, and few important operations are performed on veterinary patients without anesthesia, either local or general. For most minor operations the methods of restraint are sufficient, but certain operations cannot be well performed without general anesthesia. In reduction of hernia, delivery in cases of dystocia, in laparotomy and in all cases where one works in dangerous proximity to important organs, the animal's struggles render general anesthesia indispensable. It is also necessary for delicate operations on or near the eye, and for all serious operations on horses. In ruminants, anesthetics are seldom used except in case of difficult parturition because the ruminant does not withstand anesthesia well. In carnivora, especially the dog, its principal indications are in laparotomy, dystocia, amputation and certain operations on the head. General anesthesia is the result of a special action exerted directly on nerve centres by the anesthetic agent. General anesthetics may be administered by the respiratory tract through inhalation of their vapors or by injection intravenously or subcutaneously or by administration through the mouth and digestive tract. Anesthetics administered by the respiratory tract produce a series of phenomena in the following order: (1) A period of excitation; (2) a period of anesthesia, or surgical period; (3) a period of collapse or intoxication. For horses, the best anesthetic is chloroform inhaled by a mixture of ether or chloroform and brandy or rum administered by the mouth is the best. For sheep, goats and swine chloroform is best, and for dogs and cats morphine injected subcutaneously followed by inhalations of a mixture of ether and chloroform should be used.

Local anesthesia is the result of the action exerted upon the nerves in the area in which the agent is injected. Areas or parts may be anesthetized for operation by the injection of a local anesthetic into the area to be operated upon or by injecting the agent along the tract of the nerve supplying the part. Local anesthesia may also be produced by infiltration or by producing an artificial edema in the region of the operation.

Surgical Cleanliness.—The surgeon's most formidable adversary is wound infection caused by the invasion of wounds with pathogenic bacteria which sooner or later develop and multiply, and by their activity or their products cause inflammation, suppuration and, in certain cases, general infection of the body. Antiseptis and asepsis are two terms used to describe the method of treatment and care of wounds, accidental or operative, as regards the bringing about of that condition known as surgical cleanliness or freedom from any of the pathogenic or wound-infecting germs. Antiseptis is that process by which infective germs are carried away and excluded from the wound, while asepsis is freedom from infective germs. In veterinary surgery asepsis will probably never obtain the same favor as antiseptis on account of the natural uncleanness of the skin of animals, the condition of their environments and the difficulties of post-operative control. Strictly considered, however, antiseptis and asepsis do not stand in opposition, but rather form mutual complements of each other; aseptic methods being preventive, antiseptic curative, their association is often advantageous. Antiseptis is resorted to when the region of operation includes a suppurating wound, a fistula or an ulcer or an infected wound. Antiseptics are then employed to disinfect the seat of operation, the hands, the instruments and the dressing materials.

The aseptic method is applicable to operations upon healthy or infection-free tissues. Antiseptis is preferable in veterinary surgery on account of the chances of the wound, the hands and the instruments becoming infected during the operation. For disinfecting the seat of operation and the hands, chemical antiseptics are employed. Instruments, ligatures, drainage tubes and other materials used for dressing wounds are sterilized by being subjected to the action of boiling water, glycerine, heated oil or to a high degree of dry heat.

Some of the antiseptics most used are iodine, iodoform, potassium permanganate, carbolic acid, lysol, bichloride and bimiodide of mercury, boric acid, chlorazine and dichloraine-T.

The operator's hands are not infrequently the means of infecting wounds, and the surgeon who desires to avoid after-complications will take especial care in the disinfection of his
hands. The spaces beneath the nails, the folds of skin at their base, the folds of the skin itself and the clefts of the fingers are all refuges for microbes, to destroy which demands the most minute precaution. In veterinary surgery the precautions taken extend to thoroughly cleansing the nails, washing the hands with hot water and soap application of disinfecting them with 1 in 1,000 sublimate solution. The hands should be rendered aseptic and kept aseptic throughout the operation. For this reason the operator should avoid touching the skin surrounding the point of operation, the table, the straw or any object which has not been disinfected.

The field of operation and surrounding parts should be most carefully cleansed. In all animals the skin is covered with extremely numerous and varied micro-organisms among which staphylococci are particularly abundant. It is, therefore, always important to disinfect the parts. If the skin is healthy, the hair is removed with scissors or a clipper, the parts thoroughly soapod, shaved, scrubbed and washed with clean water. If dried, the parts are rubbed with ether or gasoline to remove fatty materials from the surface and are finally drenched or painted with tincture of iodine. This method, however, is not applicable to all surfaces. The mucous membranes require the application of mild antiseptics and irrigation, while the foot requires paring and continued soaking in a strong antiseptic for several hours.

Surgical Dressing of Wounds.—Wounds, operative or accidental, require in dressing and treatment (1) the control of hemorrhage; (2) to be placed in a position of rest; and (3) adequate provision against infection. Hemorrhage is controlled by the application of thermic agents (heat or cold), chemical agents (stypic) and surgical methods. The surgical methods of controlling or arresting hemorrhage are represented by the tourniquet, Esmarch's bandage and the rubber cord, by compression, ligation, torsion, forcipressure and acupressure. Placing the wound in a position of rest in domestic animals is oftentimes a difficult task. It signifies the fixation of the margins of the wound in apposition, or the fixation of the part in which the wound has occurred. The margins of the wound are fixed by means of sutures and bandages, and the fixation of the part is accomplished by the confinement of the animal to as little freedom of movement as possible.

All wounds must be scrupulously guarded against infection. Aseptic wounds should be closed by suturing and protected with a dressing of sterile cotton applied and kept in place by bandages. If bandages cannot be applied the wound must be protected by the confinement of the animal in a clean and sanitary environment, and the application of antiseptics in the form of dusting powders, healing oils or irrigation. Infected wounds must be thoroughly cleansed of all foreign material and necrotic tissue, provided with free drainage and frequent irrigation with antiseptics.

RAY BOLTON,
Formerly Assistant Professor of Veterinary Medicine, Iowa State College.

VETHAKE, Henry, American educator: b. Demerara, 1792; d. 17 Dec. 1866. Coming to the United States with his states he entered Columbia College, New York, where he was graduated in 1806, and studied law. In 1813 he became teacher of mathematics at Columbia and the same year was made professor of mathematics and natural philosophy in Rutgers (then Queen's) College. From 1817 to 1821 he held a similar chair at Princeton; from 1821 to 1829 at Dickinson College; and from 1833-34 at the University of the City of New York. He then was for a year president of Washington College, Lexington, Va. He was professor of mathematics from 1836 to 1855 and in 1855-59 was professor of intellectual and moral philosophy in the University of Pennsylvania; and was chosen vice-professor in 1846 and provost in 1854. From 1859 until his death he was professor of higher mathematics in the Philadelphia Polytechnic College. He published 'Principles of

VETILLART, vay-tyaart, Marie Michel Henri, French civil engineer: b. Le Mans, France, 5 Sept. 1848. He was educated at the Ecole Polytechnique and the Ecole de Ponts et Chaussées, Paris, and in 1875-86 was resident engineer of the port and canals of Calais. In 1868 he was named Engineer-in-chief of the ports of Boulogne and Calais and has since occupied that position at Havre and the ports on the Seine. The new port of Calais, the improvement of the Calais Canal and the completion of the Boulogne breakwater are among his more notable works, while to him may also be credited the first use of the water-jet for sinking the foundations of large piers and lock walls. He was a delegate to the International Maritime Congress at Washington in 1889. His writings include "Foncage des Pieux par Injection d'Eau" (1877); "Fondations en Terrain de Sable des quais et Ecluses du Port de Calais" (1889); "La Navigation aux Etats-Unis" (1892); in collaboration with Quinette de Rochmont, "Les Ports Maritimes de l'Amérique du Nord sur l'Atlantique" (1902), etc.

VETIVER, the rhizome and rootlets of the cuscus-grass (Andropogon squarroso), of India, which, when dried, is light yellowish-brown in color, aromatic, balsamic and persistent in odor, suggesting sandalwood or myrrh. It is a tonic and stimulant drug, but is chiefly used as a source of vetiver oil, an ingredient in perfumery. The fibre of the grass is woven into fragrant baskets and matting, which curtains house-openings, during the hot season of India, and is always kept wet.

VETO, in political science, the right of the executive to disapprove an act or resolution of the legislature. It may be absolute as in England, or qualified as in the United States, where the disapproval of the executive may be overridden by an extraordinary majority of the legislature, or suspensive as in France, where the veto merely works a suspension of the law until repassed by the legislature by an ordinary majority. In England the veto is a remnant of the more extensive legislative power formerly exercised by the sovereign, but which has been gradually cut down until only the negative power of disapproval is left. Since 1708 the right has never been exercised and the commentator Baghot goes so far as to say that the sovereign would be bound to sign his own death warrant if the two houses of Parliament should send it to him. But the better opinion is that a royal prerogative is never lost by non-user and, therefore, the royal veto power still exists unimpaired, although the system of responsible cabinet government makes its use out of place. In the English colonies of America, except Maryland, Rhode Island and Connecticut, the royal veto was frequently employed in a manner to call out the strong protests of the colonies, and this abuse was one of theowell-known contents in the indictment against the British king contained in the Declaration of Independence. None of the revolutionary State constitutions except Massachusetts gave the executive even a qualified veto, nor was any provision for such a power made in the Articles of Confederation. The advantages of a qualified veto, as a check on hasty and ill-considered legislation, however, appealed to the framers of the Federal Constitution, and it was provided in Article I, Section 7, that every bill which shall have passed both House of Congress shall be presented to the President for his approval, but if disapproved by him it shall be returned with his objections to the House in which it shall have originated. It is made obligatory upon the House to enter the objections upon the journal and proceed to reconsider the bill. If repassed by two-thirds of both houses by a yea and nay vote it becomes law in spite of the executive disapproval. If the bill is retained by the President for a period of 10 days (Sundays excepted), it becomes law without his signature unless the adjournment of Congress in the meantime prevents its return. This last proviso in effect gives the President an absolute veto on all bills passed during the last 10 days of the session since he has only to retain them in order to kill them. This potent weapon is known as the "pocket veto" and was first extensively employed by President Jackson, who defeated in this way Clay's bill for the distribution among the States of the proceeds from the sale of the public lands. The veto power was used rather sparingly by the earlier Presidents. Washington vetoed two, Jefferson and the two Adamses none, Madison six and Monroe one. The most extensive use of the veto was made by Jackson, who vetoed 12 bills, by Tyler and Pierce who vetoed nine each, by Grant who vetoed 43, by Johnson who vetoed 21 and by Cleveland who vetoed 301 during his first term. Most of those vetoed by Cleveland, however, were private pension bills of little importance. Among the more important measures which have been killed by the executive disapproval were the bank bill and the internal improvement bill vetoed by Jackson, the two bank bills vetoed by Tyler, the Freedmen's Bureau, Civil Rights and Reconstruction bills vetoed by Johnson, the Inflation bill and the bill to reduce the President's salary from $50,000 to $25,000 vetoed by Grant, the silver coinage bill vetoed by Hayes and the Immigration bill vetoed by Cleveland. Until Pierce's administration but one bill was vetoed by the executive veto, the exception being a tariff bill vetoed by Tyler. Five were passed over Pierce's veto, 4 over Grant's and 15 over Johnson's. No bills became law by the operation of the 10-day rule until Buchanan's administration. During Grant's two terms 136 bills became law by this rule, 18 during Johnson's term, 13 during Arthur's and 283 during Cleveland's first term.

Among the precedents which have grown up in connection with the exercise of the veto power are: that the President has no power to veto a resolution proposing an amendment to the Constitution; that he cannot veto a bill without stating his objections thereto; that he cannot recall a veto, although this was done on one occasion by Grant; and that the two-thirds of both Houses required to override the veto means two-thirds of those present, and not two-thirds of all members composing the two Houses. An oft-suggested amendment to the Constitution is that the President be empowered to veto particular items in appropria-
tion bills. This would enable the executive to eliminate objectionable *riders* from important appropriation bills. At the present time all the State executives except that of Rhode Island are allowed a qualified veto over the acts of the legislature. In 1902 were the executives of North Carolina and Ohio given this power. In four States (Vermont, Connecticut, New Jersey, and Indiana) it includes only the right to demand reconsideration. In 27 States the veto may be overridden by two-thirds of the members present or elected; in three States, by three-fifths; and in the others, by a majority of those elected. In a considerable number the executive is empowered to veto any item of an appropriation bill, and in a few, any section of other bills. See Acts of Congress; Bills, Course of; Executive. Consult Mason, *The Veto Power* (1890); Wyman and Sherwood, *Veto Power in the several States* (1907).

JAMES WILFORD GARVER,
Professor of Political Science, University of Illinois.

VEUILLOT, vë-yô, Louis, French author; b. Boynes, France, 11 Oct. 1813; d. Paris, 7 April 1883. He was of humble origin and began his journalistic career in 1832, having obtained a position on one of the ministerial provincial papers. He rose from one position to another until in 1843 he became editor of *L'Univers Religieux*. He visited Rome in 1838 and, influenced by the impressive religious services of Holy Week, became an ultramontanist in his views, his conversion resulting in a series of religious romances, among which are *Pierre Saintine* (1840); *L'Honnette Femme* (1844), etc. Among his other writings are *Les Pélerinages de Suisse* (1838); *Les Libres penseurs* (1845); *Les Oeuvres de Paris* (1866); *Poetic Works* (1878), etc. He was the most uncompromising French ultramontanist of his day. Consult biographies by E. Veuillot (1883), and Cornut (1891).

VEVAY, vë-va', Ind., county, county-seat of Switzerland, County, on the Ohio River, about midway, following the course of the river, between Louisville, Ky., and Cincinnati, Ohio. It has steamboat connections with all the Ohio River ports. It is in a fertile agricultural region in which the chief products are fruit, tobacco and grain. The manufactures are flour, furniture, brick, tobacco and lumber and dairy products. The place was settled in 1805 by a colony from near Vevay, Switzerland; in 1813 it was laid out and in 1877 was chartered as a city. Pop. 1,286.

VEVEY, or VEVAY, Switzerland, a town in the canton Vaud, beautifully situated at the northeast margin of the Lake of Geneva, 11 miles east-southeast of Lausanne. The beauty of the town and neighborhood attracts many foreign residents and it has interesting literary associations in connection with Rousseau's *Nouvelle Héloïse*. Pop. 17,500.

VEXILLA REGIS PRODEUNT (*Be hold the banners of the King*), the first line of a *world-famous hymn,* written by Vanantius Fortunatus at the time when he was living at Poitiers. Radaegunda, queen of the Franks, who was living in the monastery which she had founded at that place, had obtained from Emperor Justin I a fragment of the True Cross for her monastery, and the relic was forwarded to her by way of Tours in charge of the bishop of that place. Fortunatus headed Radaegunda's deputation to meet the bishop's procession and chanted this hymn to salute the relic's arrival (19 Nov. 569). The word *vexilla* has received many symbolical interpretations, the best of which is perhaps that of Kaysor, namely, that the eagle of the old Roman cavalry standard has been supplanted by the cross and corresponding changes made in the banner. The hymn originally contained eight stanzas, but the correctors of the Breviary under Urban VIII revised it entirely, making changes and substitutions which in general are not liked by hymnologists. The Vatican Graduale (1908), however, preserves the original text, although the Antiphonary (1912) gives only the revised text. The hymn is sung in the procession on Good Friday when the Blessed Sacrament is carried from the Repository to the High Altar, but its principal use is in the Divine Office, the Roman Breviary assigning it to Vespers from Saturday before Passion Sunday daily to Maundy Thursday, and to Vespers on the feasts of the Holy Cross. There are several English translations (consult the *Dictionary of Hymnology*) of the *Vexilla Regis,* notably by Blount, by Bagshawe, by Donahoe and by Neale, the latter's being one of the best known. A fine translation, preserving the metre of the original, was published with the Latin text and historical and exegetical comments by Hugh T. Henry in the *American Ecclesiastical Review* (March 1881). The text with critical and theological notes is also to be found in S. G. Pimont, *Les Hymnes du Breviaire Romain* (Paris 1884).

HERBERT F. WRIGHT.

VIA DOLOROSA (Latin, *sorrowful way*), the name of a narrow tortuous street of Jerusalem, supposed to be part of the route on which Jesus carried his cross to Calvary. There are 14 stations marked by tablets. The name appears to have been bestowed in the Middle Ages and is founded on a rather doubtful tradition. The Way of the Cross, a form of devotion in the Catholic Church, commemorates that dolorous journey of the Savior. It consists in prayer and meditation successively before each of the 14 tablets ("Sta tions") familiar in all Catholic churches, and which represent incidents in the journey of Jesus from the place of judgment to the Hill of Calvary.

VIA MALA, a remarkable defile or crevasse in the canton of Grisons, Switzerland, a portion of the Hinterenthal between Thusis and Zillis. The sides of the cleft, which is about two miles in length, are immense walls of rock, almost parallel, and so hard that the dissol vent influence of the elements appears to have little effect on them, each projection on one side corresponding to an indentation on the other, almost as perfectly as at the time they were separated. The walls rise to a height of about 1,600 feet, and at various parts of the defile are not more than 30 feet apart at the top. The first part of this defile was long deemed inaccessible, and had received the name of the Lost Gulf, but in the early part of the 19th century a magnificent road was constructed
through the Via Mala, 400 to 600 feet above the river, by blasting and cutting a notch in the side of the rock. The road is necessarily steep and narrow, crosses from side to side by three bridges, and is protected from falling stones and trees by a cordon of rocks overhead here, and by a wooden roofing there. So narrow is the crevasse in some places that fallen trunks and stones are sometimes wedged in between its sides above the ordinary water-level; and on the occasion of the great flood of 1834, the river, generally 400 feet below the second bridge, rose to within a few feet of it, and carried off the upper bridge.

VIADUCT. See Bridge.

VIARDOT, Louise, loo-zh vair-doh, French art critic: b. Dijon, 31 July 1800; d. Paris, 5 May 1883. He studied law in Paris, entered journalism and was manager of the Theatre Italien, 1831–41. In the last-named year he founded with George Sand and Pierre Leroux the Revue Indépendante. He wrote 'History of the Masters of Spain' (1851); 'The Traditional Rise of Modern Painting in Italy' (1840); 'The Museums of France' (1855); 'Spain and the Fine Arts' (1866); 'Wonders of Painting' (1868–69).

VIARDOT-GARCIA, vair-doh gar-theh-sah, Michelle Pauline, French opera singer, daughter of Manuel Garcia (q.v.) and sister of Maria Félicité Malibran (q.v.): b. Paris, 18 July 1821; d. 1910. She traveled extensively with her parents and in 1839 made her début at London, playing in 'Otello' and in 'La Cenerentola.' She was married to Louis Viardot (q.v.) in 1840, but continued her operatic career until 1862 when she retired. She appeared in the great European cities with continued success throughout her stage life; created the parts of 'Valentine' in 'Les Huguenots' and of 'Fidès' in 'Le Prophète,' her voice, a mezzo-soprano of three octaves, enabling her to make an artistic triumph presentation of the rôles; and after her retirement from the stage she engaged as a vocal teacher and in composition, in which her work is of importance. It includes the operettas 'Le Dernier Sorcier' (1867); 'Trop de Femmes' (1869), etc., in addition to about 60 vocal melodies and other compositions.

VIAVICUM, a Latin word originally meaning provision for a journey of some distinguished person traveling on business for the state. The usage has been extended in the Roman Catholic Church to signify the Eucharist administered to patients beyond hope of recovery.

VIATKA, vee-ah-tkah, Russia. See Viatka.

VIAUD, Louis Marie Julien. See LOTI, Pierre.

VIBERT, Jean Georges, zhahn shrur vee-bairt, French painter: b. Paris, 30 Sept. 1840; d. there, 28 July 1902. He studied under Barrias and Picot and exhibited at the Salon for the first time in 1862. His work was chiefly in oils, but he also possessed great skill in water-colors. His drawing was carefully accurate and he excelled as a technician, but his work is frequently marred by crude coloring. He founded the Société des Aquarellistes Français, was awarded a medal at the Salon in 1862, and in 1882 became an officer of the Legion of Honor. Among his best-known works are 'Gulliver' (1870); 'The Grasshopper and the Ant' (1875); Monseigneur's 'Antechamber' (1876); 'Apologie of M. Thiers' (1878), etc. He wrote 'La Science de la peinture' (1891). There are four good examples of this artist in the New York Metropolitan Museum of Art.

VIBORG, vee-borh, Finland. See Viborg.

VIBRATION, the limited reciprocal or oscillatory motion of the particles of an elastic body or medium, in alternately opposite directions from their positions of rest or equilibrium. A complete vibration comprises a motion to and fro, but some French physicists measure it as a motion to or fro; hence the latter is one-half of the former. When vibrations are comparatively slow they are known as oscillations, the term vibration being reserved for all the rapid reciprocal motions beyond the ability of the eye to follow. In rods or strings vibrations are distinguished as transverse, or longitudinal. The rate of transverse vibrations in rods is inversely proportional to the square of the length of the rod. When fixed at both ends, a rod vibrates in the form of a stretched string. When fixed at one end only it vibrates either as a whole or in segments. When bent into a U-shape, as is the case in the tuning fork, the rod divides into three vibrating parts near the two ends. The vibration of plates and discs has been extensively investigated, as in the manufacture of diaphragms for telephones, phonographs, etc. For the laws governing these vibrations see textbooks in physics (sound). A vibrating bell follows the same law as a disc. The rate of vibration is directly proportional to the thickness and inversely proportional to the square of the diameter. Rods vibrate longitudinally, either as a whole or in proportion to the numbers, 2, 3, 4, etc. At the points of maximum vibration a rod suffers no change of density. Enclosed columns of air vibrate longitudinally; by alternate condensations and rarefactions. Free vibrations in air or gases proceed in straight lines from the point of disturbance. Forced vibrations, or vibrations modified by one another, or some other influence, produce circular or elliptical revolutions of the particles of the liquid or medium disturbed. The eye does not note vibrations more rapid than about 20 to 40 per second, and the moving picture photographers take advantage of this, showing usually about 20 pictures per second, which appear as one picture, with moving figures. In music, 16 per second is the lowest vibration the ear can note and 40,000 per second the highest. Our senses do not appreciate the vibrations above this until we come to a frequency of 370 million million when we begin to see rays of ultra red light. Beyond 833 million million vibrations the highest light, the ultra violet, begins to disappear. Another class of vibrations we recognize as electricity, another class as X-rays, another as N-rays, another as the medium through which wireless telegraphy takes place, and so on. Everything in nature vibrates; everything has its rate of vibration. Heat is a matter of vibration; where there is utter lack of vibration there is no heat, no vibration for with all absence of motion there can be no heat. What limit there may be to
higher vibrations is not known, but it is claimed by occultists that the phenomena of Spiritualism, of telepathy and everything pertaining to a higher take place are immensely higher than those we commonly experience and know about. The amplitude of a vibration is the maximum displacement of the vibrating particle. The phase of a vibration is a point or position of a wave displacement. The laws of vibration are the basis of modern theories regarding sound, heat, light and electricity. See these subjects as well as Waves and Wave Motion.

VIBROSCOPE, an instrument invented by Duhamel for recording the vibrations of a tuning fork, by means of an attached style on a piece of smoked paper gummed around a cylinder. The fork is made to vibrate and the cylinder turned, the style marking a mark whose waves correspond to the number of vibrations in a second.

VIBURNUM, a large genus of shrubs, or small trees, of the honeysuckle family, indigenous to the north temperate zone. Many species are cultivated for their ornamental flowers and fruits. The branches and leaves are usually opposite, the latter never being compound, but are diversely toothed and lobed, and generally assume brilliant hues in autumn. Viburnums are easily grown, but generally prefer a moist soil and sunny position, most of the American species living at the edges of open woodland. The most conspicuous of the genus both in flower and fruit are V. opulus, V. tomentosum and V. alnifolium. The two former are the source of the garden snowballs (q.v.). Among the American viburnums is the oval-leaved, V. dentatum, or arrow-wood, so called because the Indians made arrow-shafts out of its soft, light wood, as well as from that of several other species, such as V. molle. V. dentatum is the sweet viburnum, sheep-berry or nanny-berry, an arboreal shrub keeping its oval, bluish-black drupes over winter. These fruits have a thin pulp and are edible, and although somewhat insipid are said to be palatable after having been frozen. V. cassinoides is the early-flowering white-rod, with gray ascending branches. Its leathery, rather dull-green, ovate leaves are sometimes used for what is called Appalachian tea. One of the commonest northeastern viburnums is the maple-leaved, or dock-mackie (V. acerifolium), a pretty, spreading shrub growing under trees, with creamy plate-like cymes of flowers, fruits changing from red to dark blue, three-lobed maple-like leaves, which are downy beneath and assume dark purple shades in the fall. The thin bark of root and stem of the black haw (V. prunifolium) yields a diuretic and tonic drug. This shrub forms thickets with dense foliage, composed of flat, hairy, ovulate, small, oval, much-leaved, and bears numerous clusters of flowers, succeeded by blue-black and glaucous drupes.

The small *wayfaring tree* of Europe (V. lantana) is often cultivated and has elliptic foliage and bright-blue fruits, darkening to black. They are sweetish, mealy and mucilaginous, and are said to have been used as a remedy for diarrhoea and catarrh, and also for an ink. An inferior birdlime is extracted from the roots, and the acrid inner bark was used as a vesicant. The young shoots furnish stems for tobacco-pipes. The American wayfaring tree is the hobble-bush (V. americana), with leaves that are nearly orbicular and turn to deep wine-red in autumn, and handsome flowers having large, sterile ray-florets. It has long, flexuous, reddish branches, which are decumbent and are constantly tripping up pedestrians in the shady woods where it frequents. This fact explains the popular name. The American wayfaring tree is a companion of the white-rod except in its northern quarters.

VICAR (from Latin vicarius, substituted, delegated), a representative, a viceregent. The Pope of Rome is called by Roman Catholics the *vicar of Christ on earth.* A vicar-apostolic was formerly a bishop or archbishop of the Roman Catholic Church to whom the Pope delegated some of his jurisdiction, but the term now denotes a titular bishop in a country where episcopal sees have not yet been established, or where the succession has been interrupted. A vicar-forane is a priest appointed by a bishop to exercise a limited jurisdiction in a particular town or district. A bishop may appoint one or more vicars-forane to assist him in the work of his diocese. A vicar-capitular is elected by the chapter of a diocese during the vacancy of the see, to hold the place of the bishop.

The term *vicar* as applied to a clergyman in charge of a parish originated in the appointment by religious corporations of a priest to perform the pastoral duties of some benefice which had become their property. When the properties of the religious houses were transferred to lay possession under Henry VIII the vicar became the deputy or religious representative of the lay proprietor of the benefice, and his stipend was at the discretion of such proprietor. The vicar was and is inferior to the rector who has both the patronage and the tithes. Parochial vicars are either perpetual, as in parishes, or temporary, the appointment of the latter being recalled at pleasure, or after a fixed time. In the Roman Catholic Church the designation is sometimes given in Europe to the assistant priest of a parish.

VICAR OF WAKEFIELD, The. 'The Vicar of Wakefield; a Tale' by Oliver Goldsmith seems to have been begun during the year 1761 and was sold to a publisher in October of the following year, but it remained in manuscript nearly four years, finally coming out in March 1766, when its author, thanks to 'The Traveler' (1764), was a more famous man than he had been in 1762. The 'Vicar' promptly became an English—and then a European—classic. Goethe thought it one of the best novels ever written. A similar opinion has been agreed in by a long line of notable critics, even when so diverse as Henry James and Joel Chandler Harris. For the most part the book's charm resists analysis, but much can be ascribed to the mingled gayety and tenderness with which Goldsmith therein recounts his own experiences. It is not merely that in the 20th chapter George Primrose, the 'philosophic vagabond,' on the Continent which Goldsmith himself had had during his travels; nor that the Vicar is studied in many respects from Goldsmith's father. It is rather that the characters so
often give utterance to Goldsmith's own mellow
doctrines, and that the incidents so often re-
fect his fresh and benign observations of life.
Many passages fail to rise above conventional
18th-century prejudices: pretty notions about
the state of nature and the natural man abound;
the political ideas advanced are as often as not
simply incredible, while the attitude of the
Primrose family toward Sir William Thornhill
is of a snobbishness at which one cannot help
wincing. Such matters must be classed with the
‘hundred faults’ which Goldsmith admitted
are in this Thing. Doubtless he meant by his
remarks on different matters, such as a certain aimlessness of structure and the
absence of a high decorum, but these, if not
now held to be actually the book's virtues, are
yet understood to contribute to its principal
charm — its easy movement of idyllic events
recorded in language felicitously naïve. The
scene has, indeed, almost no ‘locality’; the
purpose obtrudes itself everywhere; the plot
skirts melodrama at a dozen places; not a few
of the characters hint of the stage. The total
effect, however, is of a reality which will not
fade. Who that has read the story can possi-
ably forget Moses’ purchase of the green
spectacles or the family portrait which was too
large to be hung? The tale is full of such
episodes, as memorable as proverbs. Few
books of the length present such a variety of
life and such a sum of unsoured human wisdom.
Perhaps its greatest triumph is that it reveals
the most artless simplicity and virtue without
either making fun of them or forgetting that
they are on a large scale less apostolic than the
Vice, as a community. They are rarely, in the
service of kindness, is here a mere method
employed by the gentlest, best and
quietest of men in a novel which is as sincere
and touching as a lyric.

CARL VAN DOREN.

VICE, Regulation of. The "social evil," as
prostitution is euphemistically termed, consti-
tutes one of the chief of the so-called vice
of modern life. Prostitution is defined as pro-
nomous unchastity for gain. It is not an evil
peculiar to any age or country. It existed in
ancient Babylon to a degree and kind almost
beyond belief and in terrible forms was a part
of the religious cults of the Syrians, Phrygians,
Egyptians, etc. Similar rites were part of the
idolatrous practices for which the Israelites
rebuked. In ancient Greece it was a
matter of civic glory and prostitution was there
taught as an art. Orgies took place in the
baths and in the temples while the stage reeked
with obscenity. In the modern world we find
the evil in every portion of the globe, in India,
in Japan, in Hawaii and everywhere in pro-
portion to our knowledge of the social life of
a country's population. Although publicly con-
demned to-day and with an ever-increasing
number of the pure it is believed to be eating
under the surface to a degree that comes nigh
imperiling our modern civilization. It is con-
sequently estimated that there are in the
United States alone 600,000 public prostitutes
and about an equal number who have sacrificed
their chastity but continue to have other means
of livelihood. Great cities and often the lesser
cities are the homes of the prostitute, while
their male companions not only come from the
cities but also from the towns and villages.
The social evil wears a specially sinister aspect in Great Britain because in no country
do so many children become its victims as in
England; in no country does traffic in girls,
especially that of minors, flourish as in
England. On the Continent the vice is also especially prev-
alent. German cities regulate vice as do also
the Scandinavian cities. France also regulates
the vice by means of registration. That country
is a den of vice as can be attested by very many
men of the American Expeditionary Forces.
Of the evils connected with prostitution there
is scarcely need to speak. Many sociologists
are coming to believe that the sexual evil, in
its various forms, is greater even than that of
intemperance. It is considered a more constant
and fundamental cause of degeneration than
drunkenness. It certainly effects degeneration
of a more or less pronounced type in a much
larger number of persons. It persists almost to
the end in the most degenerate stock, while it is
at the same time operative among the healthier
classes. Intemperance, however, is all but uni-
versally the companion of prostitution. Many
observers state that girls rarely can, and men
rarely do, continue a fast life in the brothel.
The saloon is often the entrance of the brothel,
while the brothel as frequently leads to the
saloon. An eminent authority has stated that
more boys are converted to drinking habits in
houses of ill fame than in all of the great benefits of Prohibition in the United
States will be the dissolution of this sinister
partnership. The physical evils attendant
on prostitution it is impossible to describe too
strongly. These reduce youth to premature,
helpless old age, transform the body into a
rotten shell and affect not only the sinner but
his posterity. One of the abominations of this
evil is child prostitution, of the extent of which
few have the remotest idea. If one is to credit
the sad whispers of grave officials of the
Church as to the morals in boy choirs, or in
private and public schools, one finds fearful
evidence of the existence, in all ranks of society,
in various forms of unnaturalness. One aspect of this evil is that of the organized traffic in
girls, which is declared to be world-wide. It
has been publicly stated that "syndicates exist
in New York and Boston for the purpose of
supplying fresh young girls from immigrants
arriving in the United States, for houses of ill
fame; agents of the business go abroad and
assist in this nefarious traffic. Immigrants
arriving in New York furnish 20,000 victims
annually." Much has been done by the Church
and societies to protect these immigrants but
the evil is still very real. When it is realized
that the life of a prostitute is but five years,
one can understand what a traffic there must
be to recruit the 600,000 in the United States
alone, not to speak of the other countries of
the world in some of which the traffic is even
greater.

Causes. — Destitution, inclination, seduction
and drink are given as the causes of this evil
in the order named. Economic necessity drives
many to the haunts of vice. Stores, where girls
work long hours for small pay; the homes that
have few comforts, and practically no pleasures;
the streets, where girls are often cast, still
unknown to sin, but in want and without
shelter; in a word, where distress and temptation stand present as a matter of purity and reverence. It is a most satisfactory fact; in the case of prostitution, the real cause lies not in the girls who fall, but in the social conditions that make the fall easy, and the men who tempt to the step and furnish the money to support degradation after the step has been taken. The money returns from vice furnish a very great temptation to girls to part with their virtue. Some fall because they cannot find work; some because they do not wish to work. Prostitution costs a man money; to a woman it yields money and many a girl of indolent or lazy disposition, comely and healthy withal, soon learns that there is a market for such as she; that she can earn more in a night by sin than she can in a week or a month by work. The stage, the concert hall, and the ball bear a large responsibility. The supreme social cause of prostitution to-day, however, is the crowded tenement, where boys and girls have no attractive home, no healthy playground and must play on the streets. There bad company captures more girls than in any other one way. The supreme cause then of the evil is the bad housing of the poor, resulting from low wages, and the poverty of the great masses in our cities—a terrible price to pay that a few may roll in wealth.

Regulation.—In the early ages of the race prostitution, not being considered an evil, was no concern of the state. Great public decency being adultery on the part of the wife, who might thus foist an illegitimate heir on the property of her lord. The early Christian emperors were among the first to attempt repression of this social scourge. In the course of time the state took cognizance of the evil and set about its control. Licensing and regulation of brothels were among the earliest methods tried to control prostitution. It is well to remember that its elimination was never contemplated, but it was desired to make of prostitution a distinct class in the community and also to prevent disorder in the brothel. From these medieval regulations have come the "systems of control" which obtain in Europe to-day. In France the poorest districts are divided into recognized brothels of two classes—maisons de tolérance and maisons de passe. At the first-named class there is a weekly medical examination of the inmates, while all other registered prostitutes are required to present themselves for examination every two weeks at the public dispensaries. Those found diseased receive hospital treatment. There are also certain rules in regard to solicitation, etc., the infraction of which incurs a penalty of imprisonment of from 14 days to one year. No cognizance of prostitution is taken in the French criminal code. The penalties above stated being inflicted solely for breach of the rules or regulations, the major evil being ignored. The whole French procedure is of doubtful legality.

In Germany the legal regulations are more explicit. While prostitution is not forbidden, women who practise it are liable to arrest unless they are licensed. The latter procedure is that is, unless they have registered and have complied with the regulations of paragraph 361 of the code. In this way the police regulation of prostitution obtains legal sanction and the traffic is completely under the police power. While these regulations vary according to locality, they all include compulsory registration and weekly or bi-weekly examination. Brothels are absolutely illegal throughout the German Republic.

In Austria prostitution is forbidden, yet the police are allowed to tolerate it under conditions and to regulate it and punish violation of these regulations. Procurement is a penal offense.

In Great Britain prostitution is regarded by the law in the light of a public nuisance. Various acts from 1755 on make it possible to deal with public brothels but it is generally left to the public to institute proceedings. Several cities have secured passage of special legislation for the prevention of "loitering for the purpose of prostitution or solicitation." Fines and imprisonment for short terms are the penalties imposed. The defilement of girls under 13 is felony; the defilement of those from 13 to 16 is a misdemeanor punishable by two years' imprisonment. The procurement or attempted procurement of any girl or woman is also a misdemeanor and subject to a similar penalty.

The French system has been copied in Belgium, Russia, Hungary, Portugal and Spain. Norway and Sweden follow in the German plan, while Switzerland is divided between the two. Throughout the English-speaking world the English system of moderate repression and comparative freedom obtains. All systems fail of their object. Prostitution to a greater or less extent prevails in all countries despite regulations. In the United States attempts have been made at one time or another to introduce the registration system, but Saint Louis was the only large city which gave the system an extended trial. It was abandoned after four years of effort. The results proved an increase of 34 per cent in the number of brothels and of over 35 per cent in the number of registered women during the progress of the experiment. There was also an unsubstituted increase of clandestine prostitution. The percentage of diseased women rose from 3.75 per cent in the first year of registration to over 6 per cent in the third year under the system. After a prolonged and painful discussion the plan was abandoned. The efforts to suppress houses of prostitution have also proved futile. In New York City, owing to the agitation conducted by Dr. Parkhurst, hundreds of prostitutes were turned out of their houses and the places closed by the police. The parlor moralists considered this a triumph of morals. But the women were not rescued to virtue, nor were their male partners in virtue so redeemed. Even if the women had been reclaimed, those men remained to seduce other women. The women, ousted from their regular places of abode, invaded the apartments of the upper middle class and the flats and tenements of those less well-to-do. In their former abodes they came little in contact with home life and childhood. Now they were scattered among the homes and children of the city. As well might we say of cases of smallpox that they should not be allowed in that house by themselves, and therefore scatter them round among hundreds. Similar results have followed "moral crusades" in other American cities.

Most students of the problem would not now countenance the licensing or inspection of
houses of ill fame, since this confers the sanction of law upon the barbarous trade in women, but would simply, if they do not become, permit them within certain limits by themselves and meanwhile fight the evil by raising the general moral standard of the community. The segregation system seems impossible even if it were altogether desirable, which it is not. When confined to a specified district, the latter at once becomes notorious; the thieving, lawless and seditious elements make it their rendezvous, and men fear to enter it because of the risk of identification. Since the income of its inhabitants must come from without, resort is had frequently to robbery, intimidation, blackmail, etc.

While all measures have failed, yet there is little hope in leaving the evil alone. Lack of restriction works no cure, as the experience of the London authorities amply testifies. Many believe that the evil is best reached through personal religious or ethical work, by raising the level of the standards of personal purity, and all striving for an equal standard of morality for both men and women. On all sides it seems to be agreed that the existing dual standard of morality is, or will be, doomed, now that society, and especially the female portion of it, is becoming so keenly alive to its evils. Woman's increasing influence in political and economic fields is bound to be felt and her influence is assuredly for good. It is also felt that unless masculine morality is raised to a higher level, feminine morality may fall from the exalted position it has held so long, as it awakes to the full value of the fact that its purity is only playing into the hands of the impurity of the other sex. Many paths of reform have been mapped out, the chief of which are: (1) The movement started by those who believe that the purification of our social morals can only be attained by setting up for men the same high standard of chastity and purity of life as that which has been hitherto considered a woman's prerogative, by the protected and wife-supplying classes; (2) the course advocated by those who take an exactly opposite view, and who believe that the end is to be reached by some extension of sexual freedom to all classes of women. They regard as an attempt to raise men up to that high level of morality hitherto reserved for women as a natural impossibility or Utopian dream. They would lower the standard for women in order to bridge over the wide gulf which now exists between the average sensual man and the average chaste woman, and still more between the latter and the woman of the streets; (3) the views of those who avoid both these extremes and advocate a middle course, viz., the reform of sexual morality through more liberal divorce laws. They believe that erring humanity ought to have the opportunity of retrieving even its matrimonial mistakes and failures, and that the sacrifice of individuals to an ideal is neither moral nor expedient. To these are opposed a great number of religious bodies opposing divorce, and especially the oldest of the Christian churches, which denies its adherents the right of divorce and urges the teaching of a more practical Christian morality as the best means of raising social standards. In the populous centres of America prostitution, the drink evil, the prohibited drug traffic, and kindred evils have floured because of systematic understandings between the prohibited callings and the forces of law and order. To combat these nefarious agreements investigations by private associations and by public officials have been instituted at frequent intervals. Of these the most sweeping were those made of the white-slave traffic in New York and Chicago.

VICENTE, vē-sän'tā, Gil, Portuguese poet: b. 1470; d. after 1536. After studying jurisprudence at the University of Lisbon, he became connected with the court and there was the official provider of dramatic entertainment. Spanish was then much used at the court, and in that language Vicente composed 10 entirely and 15 partly, of his 42 works. He thus became a figure also in Spanish literature, and many of his dramas were presented in Spain. These are, however, in their material chiefly Portuguese. They have been arranged as autos (miracle-plays), comedies, tragi-comedies and farces. The first class comprises 12 sacred works for performance at church festivals. Vicente's humor and abundant originality won for him the title of the Portuguese Plautus. He has been ranked with Camões and Almeida-Garrett among the poets of the literature. The best collected edition continues to be that of Feio and Monteiro (1834). Consult also Von Faber, Teatro Español anterior a Lope
VICENZA — VICKSBURG.

VICENZA, věščëntˈzà, Duke of. See CAULAINCOURT, ARMAND AUGUSTIN LOUIS DE.

VICENZA, Italy, capital of a northern province of the same name, and an episcopal see, 40 miles west of Venice, beautifully situated at the confluence of the Retrone with the Bacchiglione. It is surrounded by dry moats, now partly under cultivation, and by dilapidated walls. The city is well built, containing numerous fine mansions, many handsome streets and several elegant squares, among which the Piazza dei Signori, with its campanile, not more than 20 feet square and yet more than 300 feet in height, is conspicuous. The public buildings, though numerous, are somewhat monotonous, being almost all the work of Palladio, who was born here, or of scholars who imitated him. The most remarkable edifices are the Duomo, converted by Guglielmelli, but much injured by modern alterations; the Basilica, or Palazzo della Ragione, an ancient Gothic building; the Palazzo Pretiætizio, in a rich and fanciful Corinthian style; the Teatro-Olimpico, regarded as the most curious if not the finest work of Palladio; the Museo Civico, the lyceum, a very large public library, and numerous hospitals. The manufactures are silk, woolen and linen tissues, leather, earthenware, hats, etc. There is a large trade in grain and wine. Vicenza is written Venice in Italian, and in olden times, Vicentia; it was founded about a century before the Christian era, and became a Roman municipal town. The province has an area of 1,056 square miles, with a population of about 618,238, or nearly 500 to the mile. The commercial population of the city is about 57,116.

VICEROY (French vice-roi; Latin, rex, a king), governor of a country or province ruling in the name and by the authority of a king; officer delegated by a sovereign to exercise regal authority in his name in a dependency; e.g., the viceroy of Ireland—who, however, is never officially so styled; the governor-general (or Vicerey) of India; the khedive (q.v.) (or Viceroy) of Egypt. Vicerey was the proper official designation of the governors of Naples, Spain and Peru, under the old Spanish monarchy.

VICH, or VIQUE, věːk, Spain, city of Catalonia, modern province of Gerona; on a hill-girt plain about 38 miles north of Barcelona. Its cathedral, built about 1040, repaired and modernized about the end of the 18th century, is bold and sumptuous in the interior; and the Gothic cloisters are exceedingly rich and elegant. Corn, fruit and a poor wine are the products of the vicinity; and the inhabitants are employed in weaving, and in manufacture of hats and papier-mâché. The village of Auçona was afterward called Ausona and Vicus Ausonensis, of the first part of which its present name is a corruption. Pop. 13,000.

VICHY, věʃˈʃi, France, a town in the department of the Allier, in a beautiful valley of the river of that name, 32 miles southeast of Moulins. It was once a place of strength and has been celebrated since Roman times for its numerous thermal alkaline springs. There are about 40 springs in all, of which 12 in number, belong to the government. The waters are drunk on the spot, are used for baths and about 2,500,000 gallons annually are bottled for export; and the salts obtained from them by evaporation are manufactured into lozenges. The temperature of the springs ranges from 59° to 106°, and the chief constituent is bicarbonate of soda. The Vichy waters are efficacious in urinary and uterine affections, diabetes, rheumatism, gout, and similar disorders. The town is well provided with the usual accessories of a spa, and is a fashionable resort, annually visited by about 60,000 persons; the permanent population (1918) is about 17,500.

VICKERS-MAXIM GUN. See ORDNANCE.

VICKSBURG, viksˈbərk, Miss., city, county-seat of Warren County, on the Mississippi River, a few miles below the mouth of the Yazoo River, and on the line of the Vicksburg, Shreveport and Pacific and the Illinois Central railroads, about 45 miles west of Jackson, the capital and largest city of the State, and 230 miles northwest of New Orleans. The city has regular steamboat connections with all the important Mississippi River ports. It is in an agricultural region in which cotton is one of the principal products. It is on a high bluff overlooking the river, and the streets, though not broad, are regular, well-kept, and have a number of shade trees. The chief manufacturing establishments are cottonseed-oil mills, planing mills, railroad shops, foundries, machine shops and an ice factory. In 1910 (government census) there were 47 manufactories with a combined capital invested in plants of $1,235,743; and employing 1,433 persons, to whom were paid annually $995,000. The cost of raw material was $1,085,127 and the annual value of the product was $2,029,344. The city has an extensive trade in cotton and lumber products and general produce.

The principal public buildings are the government building, the county courthouse, the Charity hospital, the churches and schools. The educational institutions are a public high school, St. Aloysius College, and Cherry Street College (colored), founded in 1852, Saint Francis Xavier's Academy, public and parish schools for both races and school libraries. There is here a National cemetery which contains 16,727 graves, of which 12,723 are of unknown dead. The eight banks have a combined capital of about $1,000,000. There are two daily newspapers. The government is vested in a mayor and board of aldermen, consisting of eight members. Vicksburg was laid out as a city on the plantation of John Lane and William Vick. In 1840 it was incorporated. It soon became a prominent distributing centre for the interior towns and a shipping point for the products of the plantations. It came into great prominence during the Civil War. The city suffered some damages in 1876, when the river cut through a neck of land. The government has since expended about $3,000,000 in efforts to divert the Yazoo River, and also to restore the harbor. Pop. 23,000.

VICKSBURG, Military Operations Against and Siege of. The advisability of
fortifying Vicksburg to aid in the closing of the Mississippi River was apparent to the Confederates early in 1861, but not until after the fall of Fort Donelson on February 16, 1862, were any steps taken to garrison and fortify the place. Then General Bragg sent one regiment to occupy it and in March guns and ammunition were sent from Pensacola. In April General Beauregard recommended that works should be constructed on the bluffs commanding the river for 40 guns and that the place should be garrisoned by 3,000 men. Work was begun late in the month and six batteries had been completed by 18 May, on which day Commander S. P. Lee, commanding the advance of Farragut's fleet from New Orleans, appeared before the place and demanded its surrender, which was refused. Two days later Farragut arrived with additional vessels and transports carrying 1,500 men under Captain M. A. David, while Bragg, with the greater part of his fleet returned to New Orleans and Farragut took his troops back to Baton Rouge. Upon his return to New Orleans, Farragut was met by instructions from the Navy Department to clear the Mississippi, which, at the time, was obstructed only by the batteries of Vicksburg. A mortar flotilla of 15 vessels, each with a mortar, under Commander D. D. Porter, was started and reached Vicksburg 20 June, and on the same day Farragut left Baton Rouge with three vessels of war and seven gunboats, carrying in all 106 guns, and a fleet of transports carrying Williams' brigade of 3,000 men and two batteries. Farragut reached Vicksburg on 25 June, and Williams' brigade was landed on the Louisiana shore, and with the assistance of 1,200 negro laborers began digging a canal across the peninsula opposite the city. With his 106 guns and the 16 mortars of Porter, Farragut attacked the Confederate batteries, but they were so high, more than 200 feet above the river, that little or no damage was done them. At the time the place was held by Gen. Earl Van Dorn with 16,000 men, and 40 heavy guns were in position. Failing to silence the batteries, the mortar flotilla, with one vessel and two gunboats, were left below, and early on the morning of the 28th Farragut, with two vessels and five gunboats, ran the batteries. The firing lasted about two hours and his loss was 15 killed and 42 wounded. The damage to his fleet was not serious and he had inflicted no damage on the Confederate works. Meanwhile a Union fleet, under Admiral Porter, had ascended the Mississippi and on 1 July joined Farragut above Vicksburg. A sudden rise in the river destroyed the canal Williams was digging across the peninsula; he proposed to return to Baton Rouge and Farragut was expecting an order to return with him when, 15 July, a startling incident took place. Early in the morning some light gunboats of Davis' flotilla had been sent up the Yazoo to obtain information of the Arkansas, an iron-plated ram known to be building in the batteries that night and endeavor to destroy the ram in the passage. He passed the batteries with a loss of 20 killed and wounded, but did no damage to the Arkansas. On 20 July, Farragut received orders to return to New Orleans. He waited until Williams embarked his men and on the 27th started down the river, Davis on the same day going up the river to Helena. During the two months since the fleet had appeared before Vicksburg the Confederates had but 22 killed and wounded and no material damage had been done to their batteries.

The next movement against Vicksburg was by General Grant, who, 2 Nov. 1862, moving from Corinth, Miss., and Cairo, Ill., with 30,000 men drove the Confederates from Grand Junction and followed along the line of the Mississippi Central Railroad to attack Vicksburg from the rear. General Pemberton, commanding the Confederate forces, fell back behind the Tallahechee and occupied Holly Springs and made it a depot of supplies. Another advance was made, Pemberton fell back to Grenada and Grant halted south of Oxford until he could repair the railroads in his rear, and while so engaged heard definitely that General McClellan had been given command of an independent expedition to start from Memphis and open the Mississippi, and for which McClellan had already organized and sent some regiments to Memphis. Grant says: 'I doubted McClellan's fitness and I had good reason to believe that in forestalling him I was by no means giving offense to those whose authority to command was above both him and me.' So, to forestall McClellan, General Sherman, 8 December, was sent back to Memphis to take charge of the expedition which had been specially assigned to McClellan by the President and Secretary of War. Grant was about to advance from Oxford on Grenada when the Confederate cavalry under Forrest, broke up the lines of communication in West Tennessee, and on the morning of 20 December Gen. Earl Van Dorn, at the head of 3,500 cavalry, dashed into Holly Springs, captured a greater part of the garrison and burned Grant's accumulated supplies. (See Holly Springs). These two raids compelled Grant to fall back, and Sherman was notified not to sail from Memphis, but he did not receive the notification in time; the day Holly Springs was captured he started from Memphis, with four divisions of 30,000 men, moved down the river, accompanied by Porter's fleet, and on the 29th assaulted Chickasaw Bluffs, on Yazoo River, and was repulsed with a loss of 1,213 killed and wounded and 563 missing. (See Chickasaw Bayou, or Bluffs, Battle of). General McClellan arrived at Memphis, after Sherman's departure, and following down the river assumed command and escorted by gunboats, under Admiral Porter, ascended the Arkansas River was unexpectedly encountered and the Union gunboats steamed back, closely followed by the Arkansas. But one of Farragut's vessels had steam up and the Confederate ram passed directly through his entire fleet, delivering her saucy broadsides, and without injury proceeded to the shelter of the batteries of Vicksburg. Farragut was much aggrieved at the result of the action and the batteries that night and endeavor to destroy the ram in the passage. He passed the batteries with a loss of 20 killed and wounded, but did no damage to the Arkansas. On 20 July, Farragut received orders to return to New Orleans. He waited until Williams embarked his men and on the 27th started down the river, Davis on the same day going up the river to Helena. During the two months since the fleet had appeared before Vicksburg the Confederates had but 22 killed and wounded and no material damage had been done to their batteries.
assigned to that part of the army which was to operate down the Mississippi. This materially interfered with his plans, as he had put Sherman in command of the river expedition, so after falling back to Grand Junction, Grant decided to go down the Mississippi, unite a part of his forces with those under McClernand and assume command of the whole. The army was divided into four corps commanded by Generals McClernand, Sherman, McPherson and Hurlbut, and Grant now planned a new campaign to get below Vicksburg and operate from the south. McClernand’s and Sherman’s two corps were moved from the mouth of the Arkansas to Young’s Point to cut a canal across the peninsula opposite Vicksburg, on very near the line followed by Williams, and by the aid of this canal it was hoped to get below Vicksburg and land on the east bank of the Mississippi. The work was prosecuted from 22 January and 3,000 negroes, were hurried, exhausting labor being expended upon it, when there was a sudden rise in the river, the entire peninsula was flooded and work on the canal abandoned; it was an admitted failure. An attempt was made to reach the Mississippi south of Vicksburg, from Lake Providence, La., 60 miles above the city, through Bayou Macon, the Tensas and Washita rivers into Red River and then up the Mississippi to Vicksburg. This project was abandoned at the end of March. Meanwhile efforts were being made to reach the high ground north of Vicksburg by cutting the levees at Yazoo Pass, nearly opposite Helena, Ark., and by way of the Coldwater and Tallahatchie rivers gain the Yazoo River. A like movement was attempted through Steele’s Bayou into Deer Creek, to reach the Sunflower River and through it the Yazoo above Snyder’s Bluff. (See Yazoo Pass and Steele’s Bayou Expeditions.) All these efforts to flank the position on the right having failed Grant once more turned his attention to getting south of Vicksburg, by a series of bayous running from Milliken’s Bend past Richmond to New Carthage, and on 29 March McClernand was ordered to move his corps toward Richmond and New Carthage, with a view to making his way to the Mississippi. From Vicksburg, the batteries at Warrenton and Grand Gulf. At the same time Grant suggested to Porter that the gunboats run past the Vicksburg batteries to attack those at Grand Gulf and cover a landing in that vicinity. On the night of 16 April, Porter with eight gunboats, three transports with supplies and a number of barges filled with coal ran past the batteries, and although under fire for nearly two hours and struck many times by gunboats, were unhurt, ran the batteries, five getting through more or less disabled, while one was sunk. Some of the barges were lost. By the 27th, McClernand’s corps was all at Hard Times, and after the battle of Champion’s Hill, the enemy’s line was closing up. The plan was to have the navy silence the guns in Grand Gulf and to have as many men as possible ready to land under cover of the fire of the navy and carry the works by storm. At 7 A.M., 29 April, Porter with seven gunboats carrying 81 guns left his anchorage at Hard Times and moved down the river, followed by transports and flat-boats carrying 10,000 men of McClernand’s corps. Porter opened his guns upon the Grand Gulf batteries about 8 A.M. and by 1:30 P.M. the Confederate guns had not been silenced by the 2,500 shot thrown against them, and the fleet withdrew after a loss of 19 killed and 56 wounded. Grant now determined to move still farther down the river and flank Grand Gulf. McClernand landed his men at Hard Times and marched across the point opposite Grand Gulf and three miles down the river during the night, and Porter with his fleet of gunboats and transports dropped down to the same point. Grant had heard of a good landing on the east bank of the river, and at daybreak of the 30th transports and gunboats began ferrying the troops across to Bruinsburg, 10 miles below Grand Gulf and 32 in a straight line below Vicksburg; and at noon McClernand’s four divisions of 18,000 men had been landed. At 4 P.M. McClernand pushed out 12 miles, and the Confederates next morning at Port Gibson (q.v.), defeated them and caused the abandonment of Grand Gulf. While Grant was crossing the river at Bruinsburg, Sherman whose corps had been left at Young’s Point went up the Yazoo River with a division, accompanied by some of Porter’s gunboats, and made a strong demonstration on Snyder’s Bluff, on the Yazoo, 12 miles above Vicksburg. On 3 May Grant rode into Grand Gulf. He says: “I resolved to get below Vicksburg, unite with Banks against Port Hudson, make New Orleans a base and, with that base and Grand Gulf as a starting point move our combined forces against Vicksburg. Upon reaching Grand Gulf after reducing its batteries and fighting a battle, I received a letter from Banks informing me that he could not be at Port Hudson under 10 days and then with only 15,000 men. The time was worth more than the reinforcements. I, therefore, determined to push into the interior of the enemy’s country.” (See Port Hudson.) On 12 May Grant advanced toward the rear of Vicksburg, defeating the Confederates at Raymond (q.v.) 12 May; Jackson (q.v.) 14 May; and then marched westward on Vicksburg. The battle of Champion’s Hill (q.v.) was fought on 16 May, and General Pemberton, after his defeat withdrew his army across Big Black River. Grant followed on the 17th. Pemberton tried to hold the bridge head on the east side of the stream, but his troops became demoralized and fell back across the bridge, losing 1,750 prisoners. Pemberton’s troops on the west bank of the river covered the disorderly flight, enabling most of the troops on the east side to get over, and Pemberton ordered all his command to withdraw within the intrenched lines of Vicksburg. The fortified position at Snyder’s Bluff on the Yazoo was abandoned and the garrison brought into the city, and the outpost at Warrenton, on the south, was drawn in. About 102 pieces of field artillery were also put in place around the place, which was about eight miles in length, and held by 19,000 effective men. On the river front were 40 heavy guns, with about 700 men. On
the 18th Grant closed in and on the right Sherman occupied Haines' and Snyder's bluffs, and Grant established his base on the Yazoo River above Vicksburg. McPherson, on the left of Sherman, held ground on both sides of the Jackson road, and McClernand south of McPherson, extended toward Warren. The movement into position was accompanied by constant skirmishing, which continued during the morning of the 19th. From the fact that the Confederates had been defeated in several engagements and were so demoralized at the affair on the Big Black, Grant concluded that Pemberton's entire force was so demoralized that it would yield to a vigorous attack and at 2 p.m. of the 19th ordered a general assault. Sherman on the right advanced and after hard fighting gained the ditch of the work near the Graveyard road, but could go no farther and was repulsed with a loss of 942 killed and wounded. McPherson and McClernand had over a mile to advance, and made part of it, under a heavy fire when darkness set in and they bivouacked. The next two days were spent in strengthening the position and making roads in rear of the army to connect with its new base on the Yazoo River.

As Gen. J. E. Johnston was but 50 miles in Grant's rear collecting a force to assist Pemberton, it seemed advisable to Grant that he should press matters and he ordered a general assault for the 22d. Early in the morning a furious cannonade was opened on the Confederate lines, in which Porter's fleet joined, and at 10 A.M. Grant's 40,000 lines of battle charged the 20,000 Confederates covered by interrenchments. As the leading columns went forward not a Confederate was to be seen, but when they had come within easy range the Confederates rose up along the more than three miles of assault and delivered volley after volley, striking down the heads of the assaulting columns, and at the same time the reserves advanced and fired over the heads of those in the trenches. Every field gun double shotted with grape and canister joined in the defense. Sherman's part of the line, in some places, reached the ditch of the Confederate works and planted their colors on the parapet, but in general the assault was repulsed and the troops fell back under shelter. On the left McClernand succeeded in carrying a part of the Confederate line, but its defenders from a line 100 yards in rear drove him out; but he maintained his position in the ditch and planted some of his colors on the parapet. At noon McClernand reported to Grant that he held the Confederate works and that support on the right would be followed by complete success, upon which Sherman and McPherson were both ordered to renew the assault. The assault failed. Grant says it only served to increase the casualties without giving any benefit whatever. The firing continued till evening, and then had reached the Confederate works were withdrawn. The Union loss in this assault was 502 killed, 2,550 wounded and 147 missing. The Confederate loss was not over 500.

The result of this assault convinced Grant that Vicksburg could be taken only by siege, which was immediately begun. The investing line was 15 miles long, extending from Haines' Bluff to Vicksburg, thence to Warren on the south. Artillery was put in commanding positions, and rifle-pits and covered ways constructed to connect the entire command by the shortest route. In no place were the opposing lines more than 600 yards apart, and the distance was gradually reduced. The work was pushed forward as rapidly as an advanced position was secured and covered from the fire of the enemy, the batteries were advanced. The work had steadily progressed from 23 May and by 25 June a sap had been run to the Confederate parapet and a mine exploded just north of the Jackson road and a lodgment effected inside the works by two Union regiments, which, however, were driven out next day. Another mine was exploded on 1 July, but no attempt was made to take advantage of it. Three other mines were exploded at other points and by both sides, by which men were covered and killed and buried at the same time. The lines now were very close and the casualties on each side were from 10 to 100 every day. By 30 June received reinforcements raising his force to 71,000 men and he had in position 248 guns—220 of which were field pieces and 28 heavy naval guns. A large part of the army was put under Sherman's command and placed to resist the advance of General Johnston's army from Jackson to relieve Pemberton. By 1 July Grant's approaches were close up to the Confederate works and at many points the approaches had been pushed to within five to 100 yards of the enemy and orders were given to make preparations for a general assault on the 6th. But Pemberton had concluded, after consultation with his division commanders, that it was best to surrender, as an assault was in- evitable and his men too much enfeebled by hunger and constant duty to meet it, and on the 3d displayed white flags on his works and sent a note to Grant proposing an armistice to arrange terms of capitulation. Terms were agreed on and at 10 a.m. 4 July, the Confederate troops marched out, each division in front of its works, stacked arms, laid their colors upon them and then returned toward the town, where they were subsequently paroled. The prisoners surrendered together with 172 pieces of artillery, 67 of which were siege guns, about 60,000 muskets and a large amount of ammunition.

Before the surrender had been completed on the 4th, Sherman, with 48,000 men, had been ordered to march against Johnston, who with over 30,000 men had advanced as far as the Big Black to relieve Pemberton. Johnston heard on the night of the 4th of Pemberton's surrender and next morning retreated to Jackson, closely pursued by Sherman who besieged Jackson and captured it. (See Jackson, Siege of) Grant's losses in his entire campaign from 30 April and, including Sherman's siege of Jackson, were 1,243 killed, 7,095 wounded and 353 missing. The killed and wounded are not known, but in killed, wounded and captured they aggregated full 40,000 men. Consult 'Official Records' (Vols. XV, XVII, XXI, XXII, XXIV, XXV, XXVII); Greene, 'The Mississippi Assault and the Surrender' (Vol. I); Sherman's 'Memoirs' (Vol. I); The Century Company's 'Battles and Leaders of the Civil War' (Vols. II, III).
VICO, Francesco de, Italian astronomer: b. Macerata, 19 May 1603; d. London, 15 Nov. 1657. He studied at Rome, and in 1623, studied and taught at the Roman College, in 1635, was appointed assistant, and in 1639 chief, of the observatory at Rome. A work by which he gained high reputation was a course of observations for the purpose of ascertaining the true uniformity of rotation of the planet Venus upon its own axis. He subsequently turned his attention toward the satellites and inner ring of Saturn, and also toward the nebula, upon which he wrote some detailed reports. When the Jesuits were driven from Rome by the revolution of 1848, he went to England, and afterward came to the United States. He had accepted a proposal to become director of an observatory to be erected under his auspices in the State of New York, went to England to obtain the necessary instruments and died there.

VICO, Giambattista, or Giovanni Battista, Italian jurist, philosopher and critic: b. Naples, 23 June 1668; d. 20 Jan. 1744. The son of a bookseller, he was educated by the Jesuits and afterward studied for the bar. Weak health prevented him from following his profession; and after nine years he obtained the chair of rhetoric in the University of Naples. In 1735 he was appointed historiographer to the king of Naples. As he married early, and had a large family, his life was passed in poverty; and it was, moreover, embittered by family troubles, and by constant ill health. The great work which he made his name illustrious, the 'Principi d'una Scienza nuova d'intorno alla politica', appeared in 1730; but it was completely recast in an edition 1730, with the effect of making it more imposing as a system, at the expense of a great loss of clearness. A third edition, enlarged, was published shortly after the author's death. In the 'Scienza Nuova', Vico brought together, and attempted to fuse into a system, opinions which he had previously advanced in separate treatises. The slowness of the work in gaining its proper place in European literature must be attributed largely to the neglect which it met at first. Much of the obscurity arises from an uncouth terminology, which the author often leaves unexplained, and (in the later and authoritative editions) from rigorous application of the deductive method to subjects which do not always admit of it. The 'Scienza Nuova' was virtually unknown out of Italy as late as 1822, when a German translation of it appeared at Leipzig.

It was a few years later, translated into French (with some curtailment) by Michelet, 'Principes de la Philosophie de l'Histoire, traduits de la 'Scienza Nuova' de G. B. Vico'; (Paris 1827); and Vico has since found his proper rank among the most profound, original, and ingenious of modern thinkers.

The 'Scienza Nuova' ('De' Principi d'una Scienza Nuova d'intorno alla Comune Natura della Nazioni') may be described as a 'Novum Organum' of politico-historical knowledge. Observing amid the infinite variety of thought and action, of language and manners, which the history of nations presents, a constant recurrence of the same characteristics, and, in the political changes which peoples the furthest removed from each other in time and place have passed through, an essential similarity of development, Vico proposed to himself the task of distinguishing amid so many phenomena the regular from the accidental; of finding out the laws which govern the formation, the growth, and the decay of all societies; in fine, of tracing the outlines of the universal, the ideal history of society—the idea of which he himself believed to have existed from eternity in the mind of God. In doing this, he attempted, by historical criticism on the widest basis, to illustrate the interdependence of all the sciences; to show that the progress of each is related to that of all, and the progress of all of them dependent on, while also acting powerfully on, the general condition of society. While holding that the actual state of every society is the result of a free development of the human faculties, he attempted to give a historical demonstration of the existence of a Divine Providence directing the career of nations, overruling the designs which men propose to themselves; operating, however, not by positive laws or arbitrary interferences, but by methods and expeditents to which men freely resort—i.e., God's providential governance of nations is not by continued miracle, but, like His rule over nature, by natural laws. It has been said that the 'Scienza Nuova' includes a system of social (as distinguished from natural) theology—a demonstration of God's government of the world, and of the laws in which that government consists. In Vico, in these inquiries, the individual consciousness as one of the criteria of truth; but he employed another also—the collective consciousness, or the common sense of mankind—the accord of the race, as it may be gathered from history—in a word, authority.

It would be difficult to overrate the ingenuity and originality of many of the inquiries into which Vico was led by the attempt to delineate the ideal history of society; and he has rarely failed to express views and principles compared with those accepted among his contemporaries. With admirable insight, he has not seldom hit on the conclusions to which increased social knowledge and more scientific conceptions have come to us in later generations. Thus, in clearing the ground for the foundation of his system, he was led to precisely those views about Homer and the authorship of the Homeric poems which are popularly associated with the name of Wolf; and to anticipate the general view of the credibility of early Roman history which was elaborated by Niebuhr. (See also Comte, the gams of many of whose speculations are in Vico). The beginnings of religion, the origin of poetry and language, the commencement of society (which he ascribes to the influence of a common religious belief and worship), the foundation of the privileges of the heroic or aristocratic class, are among the earlier subjects of his speculation. He proceeds to trace the origin of jurisprudence, and to show how its development has been dependent on social changes; and he afterward deduces from the history of ancient societies, and in some degree from the history of the governments which spring out of the ruins of the Roman empire, the laws which govern the progress, the conservation, and the decay of nations. A monarchy, with an equality of civil and political rights as between subjects, was
his ideal of good government for advanced societies.

Vico's theory as to the law of cycles in history—the movement being similar in different nations, and the path in successive periods also being similar through recurrence of the same forces—has been misunderstood as a positive denial of actual or possible advance. But he simply does not deal with the problem of the laws governing the advance of the race; and his historic cycles may easily be conceived of as following each a path similar throughout to that of each preceding, yet with one continuous upward movement as with a slow spiral ascent. This law, however, he does not develop.

Though he ascribed to religion a paramount influence in forming and conserving society, and though it was one of his principal objects to demonstrate the divine government of the world, Vico did not escape the suspicion of having written in a spirit of hostility to religion. It was alleged that he had written so obscurely, as he often did, through the fear of incurring ecclesiastical censures. Some critics of another school charged him, with at least equal plausibility, of having striven, both in his particular doctrines and in his consecration of the prince of the Roman Catholic Church. The cavils on either side are little deserving of attention; and it is pleasant to know that Vico, though not unconcerned about the accusations against him, felt in his later years consoled for the many trials and disappointments of his life by the completion of a work whose greatness he knew better than any of his contemporaries. In 1818 the Marquis de Villa Rosa published a collection of the whole of Vico's works, with a biography (2d ed., 1835). Vico's other works are 'De Ratione Studiorum' (1706); 'De Antiquissima Italorum Sapientia' (1710); 'De Universi Juris Uno Principio et Fine Uno' (1720); 'De Constantia Jurisprudentium' (1721). There are also the French edition by Michelet, referred to above, and a German translation. Consult Flint, 'Vico' (Edinburgh 1884); Ferrari, 'Vico et l'Italie' (Paris 1839); Cantoni, 'G. B. Vico' (Turin 1867); Diemöller, 'Gianbattista Vico und seine Zeit' (1877); Kiemel, 'G. B. Vico als Geschichtsphilosoph und Völkerpsychologe' (1906).

**VICTOR, Claude Perrin, Duc de Belluno**, marshal of France: b. La Marche, Vosges, 7 Dec. 1764; d. Paris, 1 March 1841. At 17 he enlisted in a regiment of artillery and served eight years as a common soldier. He re-enlisted in 1792, and for his conduct at the siege of Toulon in 1793 was made general of brigade. He served with distinction in the Italian campaigns, and Napoleon gave him the marshal's baton on the field of Friedland (1807), and later the title of Duke of Belluno. He commanded the first army corps in Spain, 1808–12, and lost the battles of Talavera and Barrosa, and while commanding the Ninth corps in the fatal Russian campaign covered the crossing of the Don—has been a notable man's favor by neglecting to occupy the bridge of Monteoreau-sur-Yonne, and adopted the cause of the Bourbons, Louis XVIII giving him the command of the second division, and the presidency of the military commission; and pointed to try such officers as had deserted to Napoleon during the 'Hundred Days.' He was Minister of War, 1821–23. His 'Mémoires Inédits' was published in 1846.

**VICTOR, Orville James**, American author: b. Sandusky, Ohio, 23 Oct. 1827. He was graduated at the Theological Institute, Norwalk, Ohio, in 1847, was on the editorial staff of the Sandusky Daily Register (1851–52), and of the Cosmopolitan Art Journal (1856–61). He edited several compilations and wrote 'History of the Southern Rebellion'; 'History of American Conspiracies'; and popular biographies of John Paul Jones, Winfield Scott, Garibaldi and others. He died 17 March 1910.

**VICTOR, the name of three popes, as follows:**

**VICTOR I, Saint.** He was of African birth and succeeded Saint Eleutherius as Pope about 190. He threatened to excommunicate all bishops refusing to accept the Roman computation of Easter, but was forced to compromise by Tertullian. He was concerned in the Monachian controversy also, and excommunicated the Monachian leader, Theodotus. He was succeeded by Saint Zephyrinus about 202.

**VICTOR II (Gerhard, geb'hart)**. He was a son of a Count of Tuscany and became bishop of Eichstätt. His election to the pontificate in 1051 was opposed by his friend, the German emperor Henry III, who did not wish to lose his counsels. He was noted for his zeal in suppression of vice and his opposition to simony. He was followed by Stephen X.

**VICTOR III (Desiderius, dèz-l-de'ri-us).** He belonged to the noble family of Benevento and early in life entered a Benedictine monastery in opposition to the wishes of his family. In 1058 he became abbot of Monte Cassino and the next year was made a cardinal. As papal vicar in southern Italy he conducted the negotiations between the Pope and the Normans in Sicily. He was elected to succeed Gregory VII, much against his will, and accepted the pontificate only after the lapse of a year. He lasted through six months of 1086 and 1087, but within this short period he closely followed out the policy of Gregory VII.

The title of Victor IV was assumed by two antipopes, Cardinal Gregorio Conti in 1138, and Cardinal Octavian, 1159–62.

**VICTOR AMADEUS I, am-a-de'us, king of Sardinia. See Savoy, House of.**

**VICTOR AMADEUS II, king of Sardinia:** b. 1726; d. 1796. He succeeded his father, Charles Emmanuel II, on the throne in 1773. He founded the Academy of Sciences at Turin and displayed much zeal in the advancement of his subjects. His hostility to the Revolution in France provoked a contest with that country, in the course of which Nice, Savoy and portions of Piedmont were secured by France.

**VICTOR-AMADEUS II, Duke of Savoy:** b. 14 May 1666; d. 31 Oct. 1732 (ruled 1675–1730); grand Duke of Victor-Amadeus. He was an able prince and an energetic administrator. In 1684, Victor married Anne-Marie of Orleans, niece of Louis XIV, and daughter of Henrietta of England; but the overbearing insolence of the 'Grand Monarque,' who forced him to persecute the Waldenses (q.v.), and arrogantly
ordered him to contribute an auxiliary force to the French army, and give up the citadel of Turin, drove him into a league with Austria and Spain against France. In revenge, a French army under Catinat assaulted Victor's dominions, and though he was reinforced by 4,000 Austrians under his relative, Prince Eugene, the allies were routed at Staffarda (Aug. 1690), and the victorious Catinat completed the reduction of Nice that winter. In the spring of 1691. The duke, aided by considerable reinforcement from Austria and Spain, gallantly maintained the contest; but a second and more disastrous defeat at Marsaglia (4 Oct. 1693), where he lost 10,000 dead on the field, put almost the whole of Piedmont at the mercy of the French. The war, however, continued; the duke's obstinacy and almost romantic daring balancing Catinat's military genius; till in 1695 Victoria Amadeus accepted far less favorable proposals of peace which detached Savoy from the grand alliance. In the war of the Spanish Succession, Victor took part with France (1700) and was appointed commander-in-chief of the combined armies of France and Spain; but though he defeated the enemy at the battle of Turin (4 Oct. 1700), Catinat, the Austrians, under his former ally Prince Eugene, defeated him at Chiaro (November 1701). In 1703 the tempting offers of Austria and Britain induced him to abandon France, and join the alliance against her. The French were routed by the duke and Prince Eugene under the walls at Turin, 7 Sept. 1706. In 1713 by the treaty of Utrecht, Duke Victor Amadeus was rewarded by receiving the rest of Montferrat, Val-Sesia, Lomellino, and the island of Sicily, with the title of king; besides being acknowledged as heir to the Spanish throne, in case of the failure of the Bourbon dynasty. In 1720 Charles VI of Spain persuaded him to surrender Sicily in exchange for Savoy—a transaction which in later times proved most fortunate for the House of Savoy. The latter portion of Victor's long reign was employed in improving the administration, replenishing the exhausted treasury, encouraging agriculture and industry, and advancing education. In 1730, the king abdicated in order to marry the Countess of San Sebastian, but attempting at her instigation in the following year to resume the crown, he was captured and imprisoned, and afterward died.—His grandson Victor Amadeus III (ruled 1773–96) was compelled by Napoleon's victories to cede Savoy and Nice to the French republic.

VICTOR EMMANUEL I, king of Sardinia, son of Victor Amadeus (q.v.): b. 24 July 1759; d. Moncalieri, Italy, 10 Jan. 1824. He succeeded to the throne on the abdication of his brother, Charles Emmanuel IV, 4 June 1802. His territories on the mainland were occupied by the French and he, therefore, resided at Cagliari until 1814, when his possessions were restored to him by the Congress of Vienna and the duchy of Genoa was added to his kingdom. He introduced various reactionary measures which resulted in a revolution and on 13 March 1821 he abdicated in favor of his brother Charles Felix.

VICTOR EMMANUEL II (Vittorio Emanuele, vé-tér-vé-o-él), king of Sardinia, 1849–61 and of Italy 1861–79: b. Turin, 14 March 1820; d. Rome, 9 Jan. 1878. He was the eldest son of Charles Albert (q.v.), king of Sardinia, was trained in military science and in the campaign of 1848–49 against Austria was commander of a brigade. After the battle of Novara, Charles Albert abdicated in favor of his son, Victor Emmanuel, who thereupon became king of Sardinia, 23 March 1849. The new king soon showed himself faithful to the Constitution in his negotiations with Austria and France, and the latter in 1856 finally received the title of King (regnum). With the aid of wise ministers, among whom was the celebrated Cavour, he reorganized the finances, reorganized the army, secularized the Church property, gave a stimulus to trade and commerce and prepared his country to assert its independence in an effort to unite Italy. To this end, and in order that Sardinia might claim to be a power in European politics, he sent 17,000 troops to the Crimea (1855) to fight with France and England against Russia. In the Congress of Paris (1856) Sardinia took part and her demands that Austria should deal more leniently with the Italian provinces which she occupied were supported by France and England. Cavour also entered into an alliance with Napoleon III, who in 1859 secured the Plombières, securing France as an ally against Austria when that power invaded Piedmont 23 April 1859. Several of the Italian states having now declared in favor of Victor Emmanuel as their king, he took command of the army, and entered upon a campaign against Austria with Napoleon III as his ally. After a series of engagements, ending with the victory of Magenta, he entered Milan with Napoleon III. The Austrians were routed and Lombardy annexed to Sardinia after the battle of Solferino, when suddenly Napoleon III closed the war by the Treaty of Villafranca 11 July 1859 which frustrated the hope of making a united Italy. The Italians declared their cause was betrayed by this treaty and Cavour, disheartened, retired for a time into Switzerland. This period of gloom soon passed when Tuscany, Modena, Parma and the Papal States declared for Victor Emmanuel as their king. This was followed by the conquest and annexation of Sicily by Garibaldi; and as the Sardinian king was master of the peninsula, with the exception of Rome and Venetia, it was decreed by the Senate 5 May 1860 that he should receive the title of king of Italy. It had been a great personal loss to Victor Emmanuel when he was required to cede Nice and Savoy, the cradle of his family, to France; and the death of Count Cavour in 1861 was at once a grief to the king and something that seemed, for the time, a national disaster. Yet, although deprived of his favorite minister, Victor Emmanuel gave constant attention to the material interests of Italy, so that roads were constructed, the coinage was recast, tithes suppressed and the ecclesiastical establishments placed under the control of the state. Nor did he slacken his efforts to obtain the complete freedom of Italy from foreign occupation and in this he was greatly favored by circumstances. In the Austro-Prussian War in 1866 the Italian troops took the field in alliance with the latter power, and although they were all defeated at Custozza and Lissa, Victor Emmanuel received the cession of Venetia 7 Nov. 1866 as the result of the Austrian defeat at Sadowa. Rome still remained in the hands of the papal
authorities, supported by France; but when the Franco-Prussian conflict began, in 1870, the French troops were withdrawn and on the 10th of March, Victor Emmanuel entered Rome, which became thenceforward the capital of Italy. The efforts of the king were now directed to the development of Italy and the maintenance of peace through a reconciliation with Austria on an equal footing with Germany. His death produced profound sorrow throughout Italy, for he was beloved not less for his honest manliness of character than for the benefits which his courage and wisdom had conferred upon his country. Consult Rufer, ‘König Victor Emanuel’ (1878); Godkin, ‘Life of Victor Emanuel II’ (1879); Massari, ‘La vita ed il regno di Vittorio Emanuele II’ (1880); Capelletti, ‘Storia di Vittorio Emanuele II e del suo Regno’ (1894); Stillman, ‘The Union of Italy’ (1898).

VICTOR EMANUEII III, king of Italy: b. Naples, 11 Nov. 1829. He succeeded to the throne, 29 July 1900, as a result of the assassination of King Humbert, his father (q.v.). As Prince of Naples he entered the army as sub-lieutenant in 1887, in 1890 became colonel and commander of the First Infantry at Naples, in 1892 major-general, in 1894 lieutenant-general, and in 1897 commanding general at Naples. On 24 Oct. 1896 he was married to the Princess Helena (b. 1873), daughter of Prince Nicholas of Montenegro. They have four daughters, and an heir apparent, Prince Umberto, b. 13 Sept. 1904. The king is a fine numismatist and a ‘Corpus Nummorum Italicerum’ began to appear under his direction in 1903. He was active in the command of Italian troops during the World War. Consult Basletta, ‘Vittorio Emanuele III’ (1901).

VICTORIA, vikt-o-rɪ-a, queen of the United Kingdom of Great Britain and Ireland and empress of India: b. Kensington Palace, London, 24 May 1819; d. Osborne, Isle of Wight, 22 Jan. 1901. She was the only child of Edward, Duke of Kent, fourth son of George III, and Louisa Victoria, younger child of Francis Frederick Antony, Duke of Saxe-Coburg-Saalfeld, and widow of Prince Ernest Charles of Leiningen. On 24 June she was baptized by the names of Alexandrina Victoria. The reigning sovereign was George III, and there stood between her and the throne the Prince Regent, afterward George IV, the Duke of York, the Duke of Clarence, afterward William IV, and her father. On 23 Jan. 1820, her father died, only nine days after the death of George III. The formal education of the princess began in 1824, her first teacher being Fräulein Lehenz, but from 1827 the chief direction of her studies was entrusted to Rev. George Davys, afterward bishop of Peterborough. On the death of George IV in June 1830 she became heir-presumptive to the throne. She was confirmed at the Chapel Royal, Saint James, 30 July 1835, and in May of the following year she first met her future husband. The death of her uncle William IV, 20 June 1837, raised her to the throne, nearly a month after she had attained her majority. She elected to be known by the name of Victoria. The young queen, daughter of a Whig or even Radical father, held Whig principles herself, and soon learned to place implicit confidence in Melbourne, head of the Whig government, and to listen to his political guidance. For many years she was regarded with somewhat unfriendly feelings by the Tories, but her chief favorite among the statesmen with whom she afterward came into contact was a Tory, or at least a Conservative, Benjamin Disraeli. She opposed the Reform Bill’s amendment, 20 Nov. 1837. Her coronation took place in Westminster Abbey, 28 June 1838.

On 15 Oct. 1839, Victoria was engaged to her cousin, Prince Albert, youngest son of the Duke of Saxe-Coburg, and on 10 Feb. 1840 their marriage was solemnized in the chapel of Saint James’s Palace. In July of that year a bill was passed making Prince Albert regent in case the queen should not survive her first confinement, and on 21 November her first child, the Princess Royal, was born at Buckingham Palace. Melbourne was defeated in the House of Commons in 1841 on a vote of no confidence, and Parliament was dissolved. The Tories were triumphant at the polls, and Sir Robert Peel, whom the queen had trusted but soon learned to like, became Premier. On 9 Nov. 1841 a male heir to the throne, afterward Edward VII, was born at Buckingham Palace. Victoria made her first visit to Scotland in September 1842, and in the following year she left Great Britain for the first time, to visit Louis Philippe at Eu and King Leopold at Brussels. When Peel in 1845 determined on the repeal of the corri-laws the queen gave him her whole-hearted support. Lord John Russell formed a ministry, with Lord Palmerston as Foreign Secretary, a position in which he gave her much anxiety. In 1848, the year of revolution, she made her first stay at Balmoral, which was afterward to be her residence during a large part of each year. She had already acquired Osborne, in the Isle of Wight (1844). She visited Ireland for the first time in 1849, and on that occasion the cove of Cork, where she landed, was renamed Queenstown in her honor. In 1848 and the following years her dislike of Palmerston and foreign policy steadily increased, but in December 1851, his wholly unwarranted approval of the coup d’état in France caused Lord John Russell to remove him from office. During the period of the no-popery outcry which followed the re-establishment of Roman Catholic bishoprics in England in 1850, the queen steadily discountenanced Protestant bigotry. Lord John Russell was defeated in 1852, and Lord Derby formed a new ministry with Disraeli as Chancellor of the Exchequer and leader of the lower House. Derby resigned in December, and at the queen’s suggestion Lord Aberdeen formed a coalition ministry, including Palmerston and Russell. During the war with Russia (1853-56) the conduct of the queen won universal commendation. Early in 1855 Aberdeen was defeated on the question of the conduct of the war, and the queen was reluctantly compelled to ask Palmerston to form a ministry. The victory of the Victoria Cross on the death of her uncle William IV, 20 June 1837, raised her to the throne, nearly a month after she had attained her majority. She elected to be known by the name of Victoria. The young queen, daughter of a Whig or even Radical father, held Whig
effect in the matter of the proclamation issued to her Indian subjects in 1858, and she created the new order of the Star of India the year following the Mutiny to reward native loyalty and enterprise in the struggle. The election of 1859 placed Derby in a minority and compelled her to accept another Palmerston-Russell ministry. She at once came into conflict with them on the Italian question, in which her sympathies were with Austria. Distrust of the intentions of Napoleon III, who had declared his adherence to the cause of Italian unity, led, in 1859, to the foundation of the volunteer force, and in 1860 she formally inaugurated the National Rifle Association at Wimbedon.

On 16 March 1861, her mother died, and on 14 December of the same year she suffered her crowning affliction, the death of her husband, a bereavement which altered the whole tenor of her life. For many years she lived in almost uninterrupted seclusion, and only toward the very end did she return to anything like the court system of her married life.

The war between Prussia and Denmark caused her keen anxiety, her sympathies on the whole being with Prussia, while the wife of her eldest son was a Danish princess. The death of Palmerston in 1865 raised Lord John (now Earl) Russell to the premiership, and the consequent rearrangement of portfolios made W. E. Gladstone Chancellor of the Exchequer. This institution of the Albert Medal in 1866 for bravery in rescuing at sea showed at once her devotion to her husband's memory and her quick human sympathy. The war between Prussia and Austria was a severe trial to her, because she had near relatives on both sides, and her satisfaction at theaggrandisement of Prussia was qualified by regret at other results of the war. Earl Russell's defeat on the reform bill led to his resignation in 1866, and a Derby-Disraeli ministry came into power. Disraeli had her active support in carrying his reform bill, which was congenial to her Whig principles. Derby's resignation in 1868 Disraeli became Prime Minister, but his defeat on Gladstone's Irish Church resolution led to a dissolution. The electors gave the Liberals a large majority, and in 1868 he became premier and inaugurated a succession of reforms which she regarded with some alarm. With Gladstone she was never in sympathy. Recognizing, however, that Irish disestablishment was inevitable, she used her influence with Archbishop Tait to secure the passage of the bill through the House of Lords. Cardwell's important army reforms were distasteful to her, for she always tried to retain control of the army as a royal prerogative.

The dissolution of 1867 placed the Conservatives under Disraeli in power, much to the satisfaction of the queen; and in 1876 the Royal Titles Bill, conferring upon her the additional title of empress of India, was passed. The passing of this bill may be taken as marking the formal beginning of the movement known as Imperialism, with which Queen Victoria was from the first in hearty sympathy. Disraeli was rewarded for his services by being raised to the upper House as Earl of Beaconsfield, and the new empire in India was symbolized by the institution in 1877 of the Orders of the Indian Empire and the Crown of India. Gladstone's passionate denunciations of Beaconsfield's Eastern policy and of his aggressive imperialism in other parts of the world during the years 1876-79 were extremely distasteful to the queen, and she was relieved by the rejection of the bill. The Liberal triumph of 1880 was far from welcome to her. She disapproved strongly of the action of her ministers in regard to the Transvaal in 1881, and during the Egyptian and Sudan troubles of 1882-85, which culminated in the unhappy fate of the brave Gordon, she never ceased to urge strong action upon her advisers. The negotiations which led to the passing of the franchise and redistribution acts of 1884 and 1885 were much aided by her influence and tact. Gladstone was defeated in June 1885, and Salisbury came into office; but in the following January she had to recall Gladstone. She was strongly opposed to the Home Rule policy which Gladstone now adopted, and was greatly relieved by its defeat in the Commons and at the polls, and by the return of Salisbury to power (1886).

The completion of the 50th year of Victoria's reign, in 1887, was celebrated throughout all her dominions with appropriate splendor and rejoicing, and her diamond jubilee in 1897 called forth even more striking demonstrations of loyalty and respect. The general election of 1892 placed Gladstone again in power, and once more the queen had to face the question of Home Rule, but she was relieved by the rejection of the 1893 bill in the House of Lords. In 1894, Gladstone resigned, and the queen summoned the Earl of Rosebery to the head of the government. The Liberal government fell in 1895, and the queen again asked Salisbury to form a ministry. He remained in power during the rest of her reign. On 23 Sept. 1896 her reign exceeded in length that of George III, till then the longest in English history. When Gladstone died in 1898, she became regent for her eldest son Edward, Prince of Wales, and for the first time had to pay the expenses of the public finances, but she was most successful in her new duties. She never visited Salisbury's war cabinet, and would always try to avoid strife and allow the war to pass off with the least disturbance to her household. When the Armistice was signed on 11 Nov. 1918, she gave a banquet to theultan, who was then in London, on 20 Nov., and presided at the first meeting of the Imperial Conference. She was present at the Peace Conference at Versailles, where she showed her usual interest in the interests of the British Empire in South Africa and the Middle East. She was present at the opening of the great Peace Congress at Cowes, and in 1919 was appointed the first president of the Women's International League for Peace and Freedom. She never visited the United States or Canada, but frequently visited Ireland, where her popularity was great.

During the last few years of her life she suffered from rheumatism, failing eyesight and a tendency to aphasia. On 15 Jan. 1901 she drove out for the last time, and from that day gradually sank till the 22d, when she peacefully passed away at 6.30 p.m. in the presence of all her surviving children except her eldest daughter, who was slowly dying in Germany. Her reign of 63 years, seven months and two days is the longest in English history, and she outlived all previous British sovereigns, being at her death three years older than George III. Her remains rest in a sarcophagus in Frogmore mausoleum, besides that of her husband. During the later years of her life she spent much of her time abroad and at Balmoral and
Osborne, and never remained in London for any length of time. Several attempts were made upon her life at various times, but none of them was of any significance. In 1868 she issued 'Leaves from the Journal of our Life in the Highlands,' and in 1883 'More Leaves'—both being very unpretentious little works corresponding with their titles. She also supervised the publication (1868) of 'The Early Years of His Royal Highness, the Prince Consort,' and in 1874-80 supervised another life of her later husband.

To Queen Victoria and Prince Albert were born four sons and five daughters: Victoria Adelaide Maria Louisa, Princess Royal, born 21 Nov. 1840, married 25 Jan. 1858, Frederick, afterward king of Prussia and German emperor, died 5 Aug. 1901; Albert Edward, afterward Edward VII, born 9 Nov. 1841, married 10 March 1863, Princess Alexandrine Caroline Marie Charlotte Louisa Julia, eldest daughter of King Christian IX of Denmark, died 6 May 1910; Alice Maud Mary, born 25 April 1845, married 1 July 1862, the Grand Duke of Hesse, died 14 Feb. 1876; Alfred Ernest, Duke of Edinburgh, born 6 Aug. 1844, married 23 Jan. 1874, the Grand Duchess Marie of Russia, became Duke of Saxe-Coburg 22 Aug. 1893, died 30 July 1900; Helen Augusta Victoria, born 25 May 1846, married 5 July 1866, Prince Frederick Christian of Schleswig-Holstein, died 28 Oct. 1917; Louise Caroline Albert, born 18 March 1848, married 21 March 1871, the Marquis of Lorne, afterward Duke of Argyll; Arthur William Patrick Albert, Duke of Connaught, born 1 May 1853, married 13 March 1879, Princess Louise Margaret Alexandra Victoria Agnes of Prussia; Leopold, Duke of Albany, born 7 April 1853, married 27 April 1882, Princess Helen of Waldeck, died 28 March 1884; Beatrice Mary Victoria Feodora, born 14 April 1857, married 23 July 1885, Prince Henry Maurice of Battenberg. Six of the queen's children survived her, and of the nine all but the Duchess of Argyll had issue. At the time of her death she had 31 grandchildren, and of her great-grandchildren there were 37.

Bibliography.—Biographies and sketches of Queen Victoria in great numbers are accessible everywhere. Among them may be mentioned Arnold, Victorica, Queen and Empress: the Sixty Years (1897); Benson, A. C., and Escher, Viscount, Letters of Queen Victoria (1837-61; 1908); Escher, Girlhood of Queen Victoria (1912); Gurney, Childhood of Queen Victoria (1901); Holmes, Queen Victoria (1901); the series by Clare Jerrold, Girlhood, Early Court Life, and Widowhood (1912); and widowhood (1920). Sir Sidney Lee (1903); Martin, Queen Victoria as I Knew Her (1908); Tooley, Personal Life of Queen Victoria (1897). Consult also the Greville Memoirs' and the other political memoirs of the reign.

VICTORIA, vĕk-tŏr'-i-ə, Guadalupé (Juan Félix Femandez), Mexican general and politician: b. Durango, 1789; d. Poroate, 21 March 1843. An ardent patriot he took part in the war for independence and changed his name to Guadalupe Victoria to commemorate a victory over the Spanish forces. He aided in the overthrow of Iturbide in 1823, was a member of the provisional government from March 1823 to October 1824, was the Federalist candidate for the Presidency and became the first President of the Mexican republic 10 Oct. 1824. Civil war broke out in 1826, but he retained his office till the expiration of his term, Feb. 1829.
Hydrography.—The rivers are numerous, but seldom large. In the rainy season they overflow their banks, and in summer they dry up and leave the country parched. This is the great climatic disadvantage of Victoria. The most important river is the Murray, which forms its border with South Australia, and is navigable for several hundred miles. Another short navigable river is the Yarra-Yarra, on which, at its entrance into Port Philip Bay, Melbourne, the capital, is situated. Most of the other principal rivers are tributaries of the Murray, except the Snowy, which crosses the east part of the state. Lakes are numerous, but are small and liable to dry up, and often salt.

Climate and Natural Products.—The climate of Victoria is temperate and salubrious, but liable to sudden fluctuations, and the hot winds from the interior which blow at intervals from November to February cause great discomfort. The annual fall of rain at Melbourne is 27 inches. (For the chief animal and vegetable products native to the colony, see AUSTRALIA). Some of the common English quadrupeds and birds have been introduced, such as hares, rabbits, deer (foreign as well as English), goats, sheep, cattle, pigs, poultry, ducks, thrushes, larks, etc. and are now becoming quite plentiful. Rabbits have become so numerous in some localities as to prove a nuisance. Victoria has a valuable asset in its forests, now under government management. The annual cut is about $9,000,000 in value.

Agriculture.—Besides wheat, barley and oats, fruits, and especially the vine, receive attention. Of the 4,000,000 acres under cultivation, fully 2,000,000 are under wheat. Victoria promises to become a great wheat country. Tobacco is also growing into a staple. Much money has been expended on irrigation and other waterworks. Sheep-farming, however, is the chief agricultural industry, together with horses and cattle.

Industries, Commerce, etc.—The chief mineral production is gold, which was discovered in 1851. The gold discoveries were important not only to the then colony but to the world at large, as they made Australia for a time the chief source of supply. In 1852 the yield of gold in Victoria was 2,218,782 ounces, valued at $44,375,640; in 1856 the yield was 2,985,991 ounces, valued at $59,719,220. In 1900 the total yield of gold was 807,407 ounces, of the value of $16,148,140; since then the production has steadily reduced, being in 1918 about $5,000,000 in value. (See Gold). Silver, tin, antimony, iron, limestone, granite and coal are also among the minerals worked. The antimony production increased both in Victoria and New South Wales, totaling over $400,000 in 1917. Half a million tons of coal are mined annually, valued at about $3 a ton. The staple product, however, is wool. In 1859 the value of the wool exported was $15,573; it has been as high as $30,000,000. The livestock reports of 1917 showed 12,577,000 sheep, 1,175,000 cattle and 515,000 horses. The total value of Victorian produce exported in 1868 was $66,489,465; in 1883, $66,461,470; in 1900, $87,112,760; in 1917, $95,000,000. The primary production in 1915 was $175,000,000 and with the manufactured value was over $100,000,000. The imports, in 1886, amounted to $91,452,473; in 1900 to $91,509,053; and in 1917 to $115,486,000. A very large proportion of the trade is direct with Great Britain. Manufacturing increases, there being in 1916 5,445 factories, employing 117,000 persons, with a capital investment of $71,000,000. Nearly all the vessels dock at Melbourne, where the annual clearances are about 7,000,000 tons.

Government, Finance, etc.—Victoria is divided into five districts and these into 37 counties. The districts are Gippsland, Murray, Wimmera, Loddon and Western. The executive is vested in the governor, who is also commander-in-chief of the state troops and is assisted by a ministry of 11 members. He is appointed by the Crown for six years and has a salary of £5,000. The legislative authority is vested in a Parliament of two chambers, the legislative council and the legislative assembly. The legislative council at present consists of 34 members, representing 14 provinces and holding office for six years. The legislative assembly has 65 members, representing electoral districts, and is elected triennially. Members are paid £1,500 a year in reimbursement of their expenses. A property qualification is required both for members and electors of the legislative council; the members of the legislative assembly are elected by universal suffrage. The revenue of Victoria amounted in the year 1917 to $59,000,000. The chief item of expenditure is railways and public works and there is a debt, contracted chiefly on account of these, amounting in 1917 to $380,000,000. In the year 1917, Victoria had 4,176 miles of railway opened, all belonging to the government of the state; 112,000 passengers were carried in the year and 5,963,000 tons of freight. The principal lines connect the leading towns, Melbourne, Geelong, Ballarat and Bendigo. There is telegraphic communication with the other Australian states and with England. There is a branch of the Royal Mint in Melbourne, where gold is coined since 1872 and silver since January 1916. The 17 banks of the state have 682 branches and assets in 1916 of $317,000,000. The post-office and other savings banks had total deposits in 1917 of $141,600,000. The government of Victoria is protective and gives bonuses on manufactures, which have consequently made some progress. The breweries, tanneries, soap and candle works, woolen mills and meat-preserving establishments may especially be mentioned. There are numerous minor manufactories for the supply of local wants. Among religious sects the Church of England is most largely represented in Victoria, the Roman Catholic next and the Presbyterians third. Attendance at school is compulsory between the ages of 6 and 14, the attendance to amount to 40 days in each quarter-year. In the state school, education is free in certain subjects and compulsory with certain exceptions. There are several colleges connected with various religious denominations, besides the Melbourne University. The number of technical schools is increasing.
VICTORIA

History.—Little was known of this part of Australia at the end of the 18th century. In 1802, Port Philip Bay was explored and the country and bay were taken possession of for Great Britain, the name being given in honor of Captain Phillip, governor of New South Wales. A convict settlement was established the following year at Port Phillip, but was transferred to Tasmania (then called Van Diemen's Land) in a few months. Victoria was first charted in 1813, and in 1835 from Tasmania, after one, or two other unsuccessful attempts from other quarters. It now made rapid progress, especially in breeding sheep, of which in 10 years it had 1,500,000. The population in 1846 amounted to 32,899. Melbourne had already become a municipality; in 1847 it was made a city and by 1850 the population numbered over 76,000. But the turning-point in its fortunes was the discovery of gold, which caused a rush of population from all parts. Hitherto it had been known as Port Phillip and formed part of the colony of New South Wales, but it was now erected into a separate colony under the name of Victoria. The present system of responsible government was introduced in 1856 and the year also saw the first line of railway (Melbourne to Sandridge) was opened. Ballot voting dates from 1856, and in 1857 manhood suffrage became the basis of election for the lower house. International exhibitions are held in Melbourne usually every decade. The colony suffered much during the commercial depression of the early nineties of the last century, when several banks suspended payment. The act establishing free, secular and compulsory education was passed in 1873. An income-tax law came into force in 1895. A very advanced Factories and Shops Act was passed in 1896 and an additional one followed in 1900. These provide for the fixing of minimum rates of wages. Woman suffrage was adopted in 1908 and old-age pensions in 1909. Pop. (1911) 1,315,551; (1916, estimated) 1,450,000. Of the population in 1911 577,053 were breadwinners and 60 per cent lived in towns and cities. Consult Ban- now, 'The Colony of Victoria' (1897); McCoy, 'Victoria and Its Metropolis' (1889); Turner, H. G., 'History of the Colony of Victoria' (London, 1893); Gregory, T. W., 'Geography of Victoria' (Melbourne 1907), and government reports. See AUSTRALIA; MELBOURNE.

VICTORIA, vik-töré-a, Brazil, a fortified town and seaport, capital of the state of Espirito Santo, situated on the bay of Espirito Santo, 275 miles northeast by east of Rio de Janeiro. The town is regularly built and has fine streets and some striking buildings. A Jesuit college, founded in 1551, is used as the government palace. Victoria comes next to Santos and Rio as a coffee-exporting port. It is one of the oldest Portuguese establishments in Brazil and succeeded the town of Espirito Santo, which was founded in 1535, a short distance to the east-southeast, and was soon afterward transferred to a neighboring island. Pop. about 13,000.

VICTORIA, Canada, a city on Vancouver Island, capital of British Columbia, located on the mainland opposite Victoria, B.C., and the Pacific Mail Steamer Line, is a quiet, pleasant, and healthy little city, noted for its picturesque setting. It is the principal port of call for the United States mail packets. Pop. about 15,000.

Railway and Steamship Connections.—The Canadian Pacific Navigation Company, the Victoria and Sydney Railway and the Esquimalt and Nanaimo Railway are important factors in the passenger and freight traffic of Victoria, while the Canadian Pacific steamers to China, Japan and Australia make it a port of call. There is also connection with Vancouver, the Puget Sound ports, San Francisco, the Fraser River ports and Alaska and ports in the Far East. The harbor was much improved in 1916 and 1917.

Agriculture.—The increase in home production in 1911 over 1910 amounted to $7,242,938; the estimated value of agricultural produce, including livestock, in 1911, being $21,641,926.44, whilst in 1910 the figures were $14,296,900. The following figures are for 1911: Livestock, $3,648,512; dairy products, $4,250,462; meats, $743,017; fruits and vegetables, $606,241; eggs and honey, $290,285; miscellaneous: grain, hops, nursery stock, $7,855,411. The estimated totals for 1918 are fully 50 per cent greater.

Industries.—Victoria has certain contributory interests, such as lumber, mining, salmon-fishing, which keep it to the front in a commercial sense. Its port is the first one reached by ocean vessels and the shipping business of the island naturally finds its centre there as well as a considerable and increasing shipbuilding interest. During the year the vessels arriving and departing number 4,000. The starting of the Esquimalt dry-dock in 1880 and the maintenance of that suburb as one of the great British naval stations and as the fortified headquarters of the Pacific squadron until recent changes helped greatly in building up the prosperity and stability of the city. Among the business interests and industries are immense warehouses and docks, shipbuilding, hardware, breweries, boot, shoe and trunk making, soap factories, powder works, pickling and spice factories, chemical and metalurgical works, furniture and biscuit factories, flour, feed and rice mills, iron foundries and machine shops, etc. There are two daily newspapers and several monthlies.

Public Works, Banks, Revenues, etc.—The city has an electric street railway, lighting and telephone systems, waterworks (established in 1873) and a new system of sewerage. The banking facilities are excellent and include branches of the Bank of Montreal, Canadian Bank of Commerce, Bank of British North America, Royal Bank of Canada and Imperial Bank of Canada. A chamber of commerce was established in 1863 with R. Burnaby as its first president and was merged in the Victoria Board of Trade in 1890.

Public Buildings, etc.—The great event of later years in the city's annals was the construction of the splendid Parliament buildings which were opened with stately ceremony on 9 Feb. 1898. The cost was over $1,000,000, the building was of gray stone, the site was admirable, the grounds were afterward improved and beautified to a striking degree and the whole appearance of the structure was and is imposing. In it were established the Provincial Museum and the Provincial Public Library, the offices of the government departments and the handsome legislative chamber, panelled in Italian marble,
and echoing since then with many a vigorous debate and keen political controversy. Within the past few years a new government house has also been built as the residence of the lieutenant-governor. Of the other city buildings the Jubilee Hospital, the city hall, the customhouse, the city electrical and Board of Trade buildings are the chief, with many churches and schools and several hospitals, orphanages, etc. With its splendid situation, its already large trade and substantial prosperity, and the public spirit pervading all classes of her citizens, Victoria's future as one of the important cities of North America is assured.

History, Population, etc.—The early history of Vancouver Island is a record of the work and business of the Hudson's Bay Company. In 1843 Fort Victoria (or Camosun as it was first called) was erected as one of the many trading posts with which that great company had dotted the continent from Lake Superior to the shores of Alaska. Two years later the first ship from England arrived at the fort and port. In 1850 the first British governor of the island arrived and one year later Victoria was surveyed and the preliminary work upon the future city commenced. Mr. (afterward Sir James) Douglas became governor of the island in 1851 as well as chief factor of the Hudson's Bay Company. Then came the mainland gold excitement of 1858, the influx of miners, the gradual growth of population, the foundation of newspapers such as The Colonist (which is still in existence with daily and Sunday issues) and the taking over of the island as a Crown colony with gradually developed representative institutions. From this time forward the progress of Victoria was steady and sometimes rapid. It was incorporated in 1862; was the home of the first legislature of the island in 1856; became capital of the newly-constituted colony of British Columbia in 1868. From it Sir James Douglas directed the development which made him the Father of the Province and within its confines occurred the legislative debates and discussions which ended in the entrance of British Columbia into the Canadian Confederation in 1871. The first mayor of Victoria (1862) was Thomas Harris.

From that time until the present the characteristics of Victoria have remained the same although it has grown in population from 3,270 in 1871 to 5,925 in 1881, 16,841 in 1891, 31,660 in 1911 and 50,000 in 1917. It is an English town in appearance and customs and environment with a climate not unlike that of England. Its people are of English, Irish or Scotch extraction chiefly English. The Chinese and Japanese number about 4,000. The Anglicans, Presbyterians, Methodists and Roman Catholics are the strongest religious bodies, but there are churches of all denominations.

VICTORIA, or KWAN-TAI-LO, kwän-tî-lo, the capital of the British Crown colony of Hongkong (q.v.), extends for upward of five miles along the lovely shore of a beautiful harbor facing the peninsula of Kan-lung on the Chinese mainland. It is dominated by the Peak, a steep hill, on which are many fine residences and up which there is an inclined plane and funicular railway. The government house, city hall, Roman Catholic and Anglican cathedrals, the large commercial houses and warehouses extending along the quays, public libraries, hospitals and clubs. A public garden and a race course are maintained; the town is electrically lighted and has also gasworks and a good water supply. The population of Hongkong, about 366,000, is mostly massed in Victoria.

VICTORIA, Mexico, the capital of the state of Tamaulipas. See CIUDAD VICTORIA.

VICTORIA, Philippines, pueblo, province of Tarlac, near the outlet of Canaren Lake, 10 miles northeast of Tarlac. It is at the intersection of three roads. Pop. 10,902.

VICTORIA, South Africa, a town of southern Rhodesia, the centre of an auriferous district, 188 miles due south of Salisbury. It has the usual government buildings and a hospital and is protected by a fort. The climate is unhealthy during the rainy season. About 40 miles to the east are the famous Zimbabwe ruins, the relics of a very ancient exploitation of the gold in the territory. (See ZIMBABWE.) Pop. about 25,000 natives and 100 whites.

VICTORIA, Tex., city and county-seat of Victoria County, situated at the head of navigation on the Guadalupe River, 136 miles by river from Victoria, Harrisburg and San Antonio and the Saint Louis, Brownsville and Mexico railroads, 127 miles west of Houston and 114 miles south of San Antonio. It contains jobbing and wholesale houses, modern retail establishments, three banks with deposits over $3,700,000. There are asphalted streets and the industrial establishments comprise cotton and oil mills, a broom factory, cotton gins, compresses and an ice factory. There are also electric-lighting and water systems. The city has a new modern high school with equipment for manual training, three large ward schools and two parochial schools. The city is the seat of Saint Joseph's College (R.C.), Nazareth Academy, the Bronte Library and courthouse. Pop. 3,673.

VICTORIA, a genus of plants of the natural order Nymphaeaceae, resembling the common water-lily, but most nearly allied to the genus Euryale, and distinguished from it particularly by the deciduous tips of the calyx, and the sterility of the innermost stamens. Only one species is known—Victoria regia; said to have been observed first by Hänke about 1801. It was described by Pöppig 1832; who observed it in the river Amazon; and it has since been found in many rivers of the northeastern part of South America. Its leaves are orbicular, float upon the water, and attain a diameter of from five to six feet; have the margin turned up, about two inches high; are of purplish color on the underside, and there exhibit a sort of wicker-work of very prominent veins, furnished with prickles. The flowers rise among the leaves upon prickly stalks; they are more than 12 inches in diameter, white, internally rose-colored, and very fragrant. The fruit is a capsule, almost globose, with a depression on the top, about half the diameter of the fruit, fleshy within, and divided into numerous cells, full of round farinaceous seeds, which are an agreeable food; the plant is, therefore, called Maíz del Agua, or 'Water Maize', in parts of South America. For cultivation of this plant, special hot-houses have been built in some places
in Europe; and it has been introduced into India from seeds produced in England.

VICTORIA AND ALBERT, Royal Order of, a British order instituted for women in 1862, enlarged in 1864, 1865 and 1880. There are about 70 women belonging to the four classes into which the order is divided.

VICTORIA CROSS. A war decoration instituted 29 Jan. 1856, by Queen Victoria for the purpose of rewarding individual acts of bravery performed by officers of the lower grades in the naval or military service of Great Britain, or by warrant and petty officers, seamen and marines in the navy, and non-commissioned officers and soldiers in the army.

By a second warrant, dated 13 Dec. 1858, the honor was extended to non-military persons who, as volunteers, had borne arms against the mutineers in India should be considered eligible, subject to the rules and ordinances, etc. An annuity of £10 is bestowed together with the decoration. Reward for any further act of exceptional bravery is presented in a bar being attached to the ribbon by which the cross is suspended, carrying with it an additional annuity of £5 with each bar. The Victoria Cross annuity of £10 may, in particular cases, be extended to £50. The present state of the Victoria Cross donation permits its award to civilians for acts of exceptional heroism in times of war. The decoration consists of a Maltese cross of bronze and was made from Russian cannon captured at Sevastopol (September 1855). The centre contains a royal crown surrounded by the British heraldic lion gardant. Below, on an escroll, is borne the inscription "For Valour." The reverse side of the bar bears the rank and name of the recipient. On the cross is inscribed the name and date of the action or campaign in which the honor was won. The clasp above, which is decorated with two horizontal branches of laurel, has a V appendage, into the centre of which is inserted the ring by which the cross is suspended. The cross is borne on the left breast suspended by a ribbon, blue for the navy, red for the army. The Victoria Cross is the most coveted of all the British military or naval orders. By 1913 there had been 522 Victoria crosses awarded; toward the end of 1918 the number had been extended so as to include about 670 recipients surviving from former periods, those conferred during the late war still living, and those whose death had occurred subsequent to its confirmation.

VICTORIA FALLS, called by the natives Mosi-oa-Tunya, ("smoke that thunders there"), the greatest falls in the world, on the Zambesi River in Rhodesia, South Africa, about 100 miles below Kazungula and the confluence of the Kuando with the Zambesi. The falls extend, in four main cataracts, over a breadth of more than a mile, the mass of water falling from a height of over 400 feet. The transverse chasm or rocky fissure, 400 feet deep, into which the Zambesi plunges, extends straight across the course of the river, like a gigantic trough, a mile long and from 100 to 300 feet wide, the walls being composed of hard basalt. From this fissure great columns of cloud-like spray rise to a distance of 1,000 to 3,000 feet, according to local atmospheric conditions, and are visible on a clear day 10 miles over the Falls. From the Falls, whilst the thundering roar of the Falls themselves can be heard at a distance of 20 or 30 miles. The spray clouds coupled with the noise gave rise to the native name of "Mosi-oa-Tunya." There is only one narrow outlet to the chasm, about 200 feet wide, through which the mile-wide waters of the Zambesi have, forced their way into what is called the "boiling pot," owing to its whirlpool turbulence. Thence the river continues a tortuous zigzag course for about 40 miles through a canyon averaging 600 feet wide between basaltic cliffs 400 feet high, before widening out again into a broad river which flows on, broken here and there by small rapids and cascades, until it pours itself into the sea some 1,000 miles away. One of the highest bridges in the world, with a span of 650 feet, crosses the gorge, a quarter of a mile below the Falls, from which, however, the Falls are hardly visible, the bridge being almost at right angles to them. A commodious hotel has been built for the immediate accommodation of visitors and a township called Livingstone has been laid out on the north bank of the Zambesi about four miles distant. The Livingstone, the great African explorer, was the first European to see the Falls, which he named after Queen Victoria. On the brink of the main cataract an island on which he camped in 1855, the year of his great discovery, has been named after him and the tree on which he carved his initials still remains. Other islands above the Falls have been named "Princess Christian," "Princess Victoria" and "Kandahar" in honor of some of the more recent visitors.

Great care is being taken by the British South Africa Company to keep the beauty of this valuable asset of their territory free from the ravages of vandalism.

VICTORIA LAKE, or ALEXANDRINA, or KAYINGA LAKE: brackish lagoon in the southeast of Africa, separated from the sea by a narrow strip of land. It receives the rivers Murray, Bremer, Angus and Finnis; and communicates with the sea by a narrow passage into Encounter Bay. It is 30 miles long and about 12 miles wide. The entrance to the lake is obstructed by a sand-bar.
VICTORIA LAND, Arctic Regions: the southernmost portion of an insular tract of Franklin Territory, Canada, constituting with Prince Albert Land and Wollaston Land, an island in the Arctic Ocean, with an area estimated at 80,000 square miles. The island is separated from the mainland by Dease Strait, Dolphins Union, and Victoria Strait. Victoria Land was discovered and named by Sir George Simpson, and was explored by Dr. Rae in 1851.

VICTORIA LAND, or SOUTH VICTORIA, in two regions, a vast continental plateau south of New Zealand, extending from latitude 71° to the South Pole between latitudes 160° to 170° E. Victoria Land was discovered and named by the British navigator Sir James Clark Ross during his voyage of exploration, 1841–42, when he sailed along a rocky icebound coast for 450 miles, finding in lat. 78° 10' S. a lofty active volcano 12,367 feet high and an inactive cone over 11,000 feet high, which he named respectively Erebus and Terror, after his vessels. The highest point of land is Mount Melbourne, which attains a height of over 14,000 feet. Since the expedition of the Belgica (1897–99) and of the British expedition (1898–1900) under the command of the Norwegian, Borchgrevink, Swedish, German, and British expeditions have added considerably to the knowledge concerning the meteorological and other conditions of the region. The British Antarctic expedition which sailed on a specially built and equipped steamship Discovery from London 31 July 1901 returned to Lyttleton, New Zealand, 1 April 1904 in company with the relief steamers Morning and Terra Nova. The Discovery had been frozen in for 13 months at the foot of Mount Erebus. Scientific work had been maintained throughout the whole period. At Cape Adare Borchgrevink's huts were found in good preservation; a new route to the west was discovered and a depot was established 2,000 feet up the glacier. In a dash to the South Pole, Captain Scott, Dr. Wilson and Lieutenant Shackleton (q.v.) reached lat. 82° 17' S., further progress being impeded by the softening of the snow and the death of their dogs. The fact was established that the interior of Victoria Land continued at a height of 9,000 feet and is evidently a vast ice-covered continental plateau. (See Antarctic Regions.) Consult Borchgrevink, 'First on the Antarctic Continent' (1901); Bull, 'The Cruise of the Antarctic to the South Polar Regions, or the Voyage to Victoria Land, 1894–95' (1896); Cook, 'Through the First Antarctic Night, or the Voyage of the Belgica' (1900) and reports of the South Pole discovery.

VICTORIA NYANZA, ni-an'za, or UKE-RWE, oo-ker-e-we, central Africa, the largest of the Nile lakes and the second in size of the fresh-water lakes of the world, extends from 0° 45' N. to 2° 50' S., and from 32° 30' to 35° E., and lies about 3,900 feet above sea-level, between British and German East Africa. Since 1901 a waterway has been opened from the Uvuma Island, near the northeast shore, connects the lake through British East Africa with Mombasa on the coast east and through German East Africa a line is being laid to connect Mwanza on the south shore with Tabora, on the railroad running westward from Dar-es-Salaam on the east coast to Ujiji on Lake Tanganyika. Including the numerous islands with which it is studded, Victoria Nyanza has an area estimated at 27,000 square miles. In the southeast the largest island, Ukerewe, by which name the lake is locally known, is 12 miles long with a maximum breadth of 12 miles, but is uninhabited. In the Sesse Archipelago in the northwest are a British government station and Catholic and Protestant missions. A few steamers and small boats ply on its waters. The lake receives numerous inlets, the most important of which is the Kagera, the head-stream of the Nile (q.v.), which enters it on the west. Other tributaries of the lake are the Katonga on the west, the Nzoia on the northeast, the Shimiyu on the south and the Ruwana on the southeast. The lake is supposed to be partly fed by springs. The outlet of the lake, or Somerset Nile, which flows northwest to the Albert Nyanza, whence it issues as the Nile proper, was discovered by Speke on 28 July 1862. While the western shore of the lake is mostly flat, and the northern in many places marshy, the eastern shore presents high mountains. The Victoria Nyanza was discovered by Speke, who discovered eight of its southern end near Mwanza on 8 August 1858, and it was afterward, in 1861–62, visited and further explored by its discoverer, along with Grant, and between January and May 1875 it was circumnavigated by Stanley.

VICTORIA REGIA, a magnificent water-lily, of gigantic size, which is found in South American streams, especially in the tributaries of the Amazon. It was discovered by Haenke in Bolivia in 1801 and, later, was introduced with great difficulty to horticulture. The first flower that bloomed in England was presented to Queen Victoria, in honor of whom the genus was named. The Indians of British Guiana called it the water-platter, in reference to its remarkable floating leaves, which are six feet or more across, and are circular with an upturned rim several inches high. The leaves are orbicular-pelate and provided with prickly petioles longer than the depth of the water on which they float—an apparent provision against submergence by changes in river level. The leaf-tissues are full of air-spaces and canals, which render the leaves so buoyant that they can support from 100 to 200 pounds of weight; the crimson under-surface is reticulated with many veins, protected by stout, fleshy prickles. The leaf also is punctured with minute holes, possibly for the escape of water from its fenced-in upper surface. The water-lily-like flowers are more than a foot across, nocturnal and open on two successive evenings. The first time a Victoria opens the inner petals over the stigma remain unexpanded and the flowers are creamy white, with a delicious fragrance. It closes the next forenoon, to open again at dark, this time expanding to its fullest extent, but has become rose-red in color and with a disagreeable odor. The flower is then closed forever and is expanded beneath the surface of the water. The fruits are like peas, hidden in the cells of a dilated torus or globular prickly capsule about as large as a coconut and the starchy nuts are called water-corn in Paraguay, where they are used for food. The Victoria is found in shallow inlets,
lakes and pools in bogs and has tuberous vertical rhizomes moored by stout, spongy roots. It is easily cultivated in greenhouses or in outdoor heated tanks.

VICTORIA UNIVERSITY, England. See OWENS COLLEGE.

VICTORIA UNIVERSITY, formerly situated at Cobourg, Ontario, Canada, now at Toronto, was organized in 1849 in federation with the University of Toronto. It was founded by resolution of the Conference of the Methodist Church in Canada, held at Kingston in 1830 and was incorporated by royal charter in 1836 under the name of "Upper Canada Academy." This royal charter was the first ever granted by the English government to a Non-Conformist body for an educational institution. In 1841 the charter was extended by the Parliament of Canada, the name was changed to Victoria College and power was given "to confer degrees of Bachelor, Master and Doctor of the various Arts and Faculties." On 21 Oct. 1841 the first session of the college under the enlarged charter opened with Rev. W. B. Young as principal, and with a full arts curriculum. In 1854-55 the faculty of medicine was added and established in Toronto. In 1860 the faculty of law and in 1871 the faculty of theology were added. In 1883-84 Albert College, Belleville, was united with Victoria College and the name was changed to Victoria University. The Ontario Ladies' College, Whitby, Alma College, Saint Thomas and Columbia Methodist College, New Westminster, British Columbia, have since that time been affiliated. On 12 Nov. 1890, by proclamation of the lieutenant-governor, Victoria University was federated with the University of Toronto. (See TOWNS UNIVERSITY.) New buildings were erected in Queen's Park, Toronto, and the federation was consummated in 1892. The faculty of arts then assumed the work and relation of a college in the University of Toronto, teaching such subjects as were assigned by the Act of Federation to the colleges. For all other subjects the students have access to the lectures and laboratory practice of the University of Toronto under the regulations of which all degrees except those in divinity are conferrable. In addition to the work in arts above mentioned provision is made for courses in theology, both elementary and advanced. The staff consists of 17 professors and lecturers and the number of students registered annually is about 375. There is also a Victoria University in Manchester, England, and in Wellington, New Zealand.

VICTORIAN ARCHITECTURE. See ARCHITECTURE.

VICUNA, Manuel, Chilean Roman Catholic prelate: b. Santiago, Chile, 1778; d. Valparaiso, Chile, 1843. He was graduated in theology from the College of San Carlos, was ordained to the priesthood and engaged in traveling missionary work. He inherited a large fortune which he used in his charitable work, employing a considerable share of it in building a house of retirement. In 1830 he was made a bishop, and in that capacity labored earnestly for the re-establishment of the theological seminary. In 1840, when Santiago was made a metropolitan see, he became the first archbishop. He subsequently served as a member of congress of the council of state.

VICUNA, Pedro Felix, Chilian journalist: b. Santiago, Chile, 1806; d. there, 1874. He was well educated and entered journalism at an early age, becoming at 21 one of the founders and editor-in-chief of the Valparaiso Mercurio. He was subsequently connected editorially with El Telegrafo (1827); El Elector (1841); El Republicano (1845), La Reforma (1847), and other leading periodicals, and in 1853 was elected to the national Senate, where he introduced the law abolishing imprisonment for debt. He wrote 'Unico asilo de las Republicas Hispano-Americanas' (1837); 'Porvenir del Hombre' (1858) and 'La Hacienda Publica' (1864).

VICUNA, a species of wild llama (Lama vicugna) which lives in the most inaccessible and precipitous portions of the Andes near the snow-line from Peru to Bolivia, and is generally seen in small herds. It is described as being very shaggy and woolly and is chiefly hunted for the wool and hide. The domesticated alpaca (q.v.) is by some naturalists considered to be an offshoot of the vicuña, though there is much reason to doubt this. See LLAMA.

VICUNA-MACKENNA, mäk-kä'nä, Benjamin, Chilian historian: b. Santiago, Chile, 25 Aug. 1831; d. Santa Rosa del Colmo, Chile, 25 Jan. 1886. He was educated at the University of Chile and early engaged in researches in national history and was one of the leaders in the Revolution of 1851-52; he was imprisoned and condemned to death, but escaped to this country and then went to Europe. In 1856 he returned and was admitted to the bar, but political disturbances caused his exile in 1859-63. Upon his return in the last-named year he became editor of the Valparaiso Mercurio, in 1864 was elected a deputy and in 1865-66 was special envoy to Peru and to the United States. He was senator in 1871-76 and in 1875 he was a candidate for the Presidency. His works include 'El Sitio de Chillan en 1813' (1849); 'Revolución del Peru' (1861); 'Historia de la Administración de Montt' (5 vols., 1862-63); 'Historia de Valparaiso' (2 vols., 1868); 'Historia de las Campañas de Arica y Tacna' (1881); 'Al Galope' (1885), etc.

VIDAL, Arnaud, a French poet active in the 14th century. He was closely connected with the literary movement in the South and was the first to win the golden violet of the college of the goiç science (1324) at Toulouse. He took for his subject the praise of the Virgin, a copy of which is still preserved in the records of the Academy of Toulouse. In the same year he was honored by the same society with the title of 'doctor of the gay science' (poetry) for another poem on the same subject. Vidal became a very popular poet and set a style of Virgin-homage which was largely imitated. He thus had considerable influence on the poetry of his day.

VIDAL, Pierre, a Langue d'oc troubadour who lived during the latter part of the 12th and the first part of the 13th century. He was one of the foremost poets of his time, the ideal lover, adventurer, singer and song-
maker, in which his age delighted. His poetic passion was frequently allied to madness and he himself finally died insane. Good living, good fortune, adventure were his constant aim in life and his themes in song. Endowed with a fine poetic talent and a magnificent singing voice, he was welcomed everywhere throughout the Provencal lands as a troubadour second to none in grace, courtliness and lyrical gifts. The most powerful princes and nobles and the most brilliant and high-born ladies were his patrons, paying homage to his charm of manners and his uncommon talent. During his adventurous life he went with Richard Cœur de Lion to Palestine. It was during this period that he seems to have gone gradually mad. His later poems show this change in the once gay singer of love ballads. In these he imagines himself a great hero, feared by the Saracens. Thus he sings: "My enemies tremble at my name, like the quail before the hawk, so well do they know my redoubtable valor. I have all the graces of chivalry; I know all the ways and practices of love. When I put on my shining armour and girt about me my sword, the earth trembles beneath my feet. Armed and mounted on my good steed, I bear down all before me. Single-handed I have taken prisoner a hundred knights; and a hundred others have I disarmed." His companions, playing upon his infirmity, had him married to a Greek woman, reputed to be the niece of the emperor of the East. Believing himself heir to a great kingdom he composed songs celebrating his high estate. On his return to France, after the failure of the Crusade, he committed other insane acts which gained him the title of the mad poet. Yet, with all his madness, there is a real wealth of imagery and imagination in his poems which makes them readable to-day; for he was master of his art. He ventured into poetic forms little or not at all used by his fellow-craftsmen, and successfully made them fit the poetic departures from the usages of his time. A very considerable number of his manuscripts of poems have been collected, and they all tend to confirm the high estimation as a poet in which he was held by his contemporaries. In addition to love poems, his surviving work contains three interesting poetical compositions on the Crusades, a tension composed for a troubadour poetical contest and a historical poem. All of these exhibit the same strange erratic talent coupled with eccentricities of metre, rhythm and rhyme that fitted in well with the abnormal life of the author himself. Consult Gingenue, "Histoire littéraire de la France"; Soulé, F., "Viscomte de Bézières"; and also the works of Nostradamus, Raynouard, Rochegude, Sainte-Fulaye.

VIDAL, Raymond, a Provencal troubadour of the 12th and 13th centuries. He is said to have been the son of the more famous Pierre Vidal; but Abbé Rive maintains that he was not his son but his father. Tradition says that he lived at the court of Alfonso X of Castile (1252-84). Vidal was the author of a Provencal grammar that seems to have been popular and still exists to this day. He also wrote "Patience in Love" and also "Jalous Chatie", both in the style of the prevailing "nouvelles."

VIDAUURRI, vē-thou'rē, Santiago, Mexican soldier: b. Nuevo Leon, Mexico, about 1803; d. City of Mexico, 8 July 1867. He came of a wealthy family of Indian extraction, was well educated, admitted to the bar in 1826 and entered political life. He was engaged in several civil wars, rose to the rank of colonel and in 1852 was elected governor of Nuevo Leon. He assisted in the overthrow of Santa Anna in 1854-55, though in refusing to join in conjunction with Alvarez, and was an unsuccessful candidate against the latter for the Presidency in 1855. He assumed a species of dictatorial power over the states of northern Mexico, forcibly annexed Coahuila and was long suspected of a design to establish a separate republic. He withheld recognition of Comonfort as successor of Alvarez until 1856, but was then forced to grant it in order to retain his control of the states Nuevo Leon and Coahuila. He at first participated in resistance to the French intervention in 1862-64; later became an officer in the Cabinet of Maximilian. He resigned in 1867, but after the fall of the City of Mexico he was captured and shot as a traitor.

VIDIN, Bulgaría. See WIDIN.

VIDOCQ, vē-dōk, Eugène François, French adventurer and detective: b. Arras, France, 23 July 1775; d. 10 May 1857. He was apprenticed to his father, a baker, at 13, and after constant pilfering robbed the shop of 2,000 francs and fled to Ostend. He soon lost his money and after living a life of vagabondage entered the French army, from which he deserted to the Austrians, but later returned to the French army. His career as a soldier was one of miserable intrigue and disgraceful adventure and he was finally implicated in a forgery for which he was sentenced to eight years' imprisonment. He escaped and after further discreditable escapades settled in Paris, where he gained employment on the secret police force. His wide knowledge of the criminal classes enabled him to render efficient service and in 1812 he was made an officer of the Royal de sûreté. His activity in the service cleared Paris of great numbers of the criminals with which it was infested, but in 1827 he was removed from office. His subsequent career was one of obscurity and failure, though he apparently endeavored to live an honest life and he died in wretched poverty. His "Mémoires" (1828) are not regarded as authentic.

VIDYASAGAR, Iswar Chandra, Indian author, philanthropist and social reformer: b. in the autumn of 1820 at Birshina in the district of Midnapur, Bengal, India; d. 31 July 1891. He was a Brahmin by birth. His father, the Kudra Bandopadhy, was a poor man. When Iswar Chandra was nine years old, his father took him to Calcutta. They walked their way to the metropolis—such was their poverty. The boy was educated in the village school and in all examinations he used to be invariably at the top of his class. At this time, he suffered from extreme poverty. Quite often he was forced to go without even proper food and clothing. He received the title of Vidyasagar (the ocean of learning) in 1840. Popularly he is called in India, *Danver Sagar*—the ocean of his kindness. His first work in Bengali prose,
Betal Pancha Bingshati,' was published in 1847 and his 'Sakoontala' in 1853. But his masterpiece, 'Sist Ramayان' ('The Banishment of Sita') was published in 1862. Raja Ram Mohon Roy, Iswar Chandra Vidyasagar and Akshya Kumar Datta were the fathers of Bengali prose. Vidyasagar was appointed as the Head Pandit of the Fort William College in April 1841 and the first principal of the Sanskrit College in January 1851. Apart from his scholarship, Vidyasagar was well known as a social reformer. He was the originator of the movement for the remarriage of Hindu widows. He proved from Hindu scriptures that there was no injunction against such marriages. He published his 'Remarriages of Hindu Widows' in 1853. He was vehemently attacked by the orthodox Hindus. Even his life was threatened. In this fight against orthodoxy, he was supported by two prominent men, Prosonno Kumar Tagore and Ram Gopal Ghose. Ultimately, the Widow Remarriage Act was passed in 1856. The extreme poverty of his boyhood and early youth, instead of turning him into a miscreant, as sometimes the case, made him a philanthropist. And it is as the benefactor of his people that the people of India cherish his memory. He gave away most of his income in charity. He supported scores of students and hundreds of poor widows and helped thousands of persons of all classes. To give higher education at a reasonable cost, Vidyasagar opened, in 1872, the Metropolitan College of Calcutta, entirely at his own expense, and the income from the college he used for the improvement of the institution. This college still stands in Calcutta as a living monument to the memory of this great man.

VIENNA, vi-ev-nya, Joseph Marie, French painter: b. Montpellier, 18 June 1716; d. Paris, 27 March 1809. He was a pupil of Natoire, went to Rome (1744) and returned to open a school of painting in Paris (1750). In 1775 he was director of the Academy at Rome but returned to Paris. Napoleon I made him senator and ennobled him. His chief works are 'Saints Germain and Vincent'; 'Dédalus and Icarus' and 'Cupids at Play' (all in the Louvre). His principal claim to importance lies in the fact that he was the teacher of David.

VIENNA, vi-ev-nya (German, Wien, vyan), capital of German-Austria, formerly capital of the Cisleithanian part of the Austrian-Hungarian monarchy and in earlier times capital of the Austrian empire, on the right bank of the Danube and on the Donaukanal, a narrow arm of the river, into which fall several small streams, 380 miles south by southeast of Berlin and 650 miles east by south of Paris. It
VIENNA

stands in a plain with the conspicuous Wiener Wald Mountain boundaries at 10 or 12 miles, distance. Most of the city rises from the right bank of the Donaukanal, on a considerable acclivity. The nucleus of the city, the Innere Stadt, comprising a small part of the whole, was formerly surrounded by a rampart, fosse and glacis, but these were leveled in 1857 and the space occupied by the Ringstrasse, a handsome boulevard averaging 55 yards broad, forming one of the finest thoroughfares in Europe. The inner or old town was the court and fashionable quarter of the city until the disturbance of the dual monarchy occurred in 1918. The streets here are often narrow and crooked; but on the whole Vienna is a handsome well-built town, with fine squares and spacious streets well kept. The houses are frequently built four or five stories high and occupied in flats with common stairs. The chief public park is the Prater, on the island between the Donaukanal and the river itself, about four miles long and two broad, beautifully laid out, planted and decorated. Vienna is situated at the latitude 48° 12' N.; long. 16° 22' E.; area, 10534 square miles; population, 30 June 1914, estimated at 2,149,800. More than four-fifths of the inhabitants are of the German race and the German language is everywhere spoken. The remaining one-fifth is composed mainly of Slavs and Hungarians. Seven-eighths of the entire population are Roman Catholics. Protestants number between 70,000 and 80,000; Jews between 170,000 and 180,000.

A general idea of Vienna as a whole is given most conveniently when we mention leading features of each of the 21 districts into which the city is divided. Thus in the first district, embracing both Altstadt and Ringstrasse, we find Saint Stephen's and the Hofburg near which are the chief government offices; the two great museums and most important banks; the famous street known as the Graben; the Reichsrath building, the Rathaus and the university; the opera-house and the Hofburg Theatre. The second district was, in 1623, assigned to the Jews; and a part of it is still inhabited by Jewish tradesmen; but another portion is devoted to the very extensive park called the Prater, which is particularly damp toward evening, owing to the close neighborhood of the Danube, but otherwise remarkably attractive. It was once an imperial deer-park, but since 1776 has been opened to the public. In the third and fourth districts an aristocratic quarter, Wieden, is a remnant that of district number one. The 5th, 12th, 14th and 15th districts are given over to the minor industries; the sixth and seventh to larger factories and shops. The eighth district is the quarter of officials and clergies, and of hospitals and university institutes; the 10th of Bohemian factory-hands. The 11th includes the central cemetery, factories, gas and electric works and large market-gardens. The 16th and 17th are manufacturing districts. The 13th district includes Schloss Schönbrunn, the public baths of 1854 and 1858, the villa quarters and a wine-growing region. Manufacturing is carried on in the districts numbered 20 and 21.

Industries and Commerce.—Vienna is the foremost city in all the region formerly em

braced in the Austrian Empire. Its manufactures include woolen, cotton and silk goods, leather, pottery, beer, beer, machines, tools, scientific instruments, hardware, furniture, chemicals, pottery, beer, machines, tools, scientific instruments and gold, silver, bronze and tin wares. Especially important articles of commerce are grain, wine, cattle, coal, iron, flour. Vienna is also the art publications. There is also a large inland trade. It is the centre of a great railway system. The diversion and deepening of the channel of the Danube, which brings the river nearer the city, has largely increased its shipping trade between eastern and western Europe. It has been well said that, as a commercial centre, Vienna owes its importance to its location at the point where trade routes from the Baltic to the Adriatic cross the great highway of the Danube.

History.—Vienna appears to have been a Roman station in the 1st century. It was afterward included in Upper Pannonia and received the name of Vindobona. It was taken and pillaged by Attila about 450. It was conquered by Charlemagne about 791, and became the capital of the Margravate of Austria in the 12th century and municipal privileges were conferred upon it in 1221. In 1278 it became the seat of the Hapsburg dynasty. About 1365 the university was founded. During the 14th and 15th centuries a share in civic government was obtained by the craftsmen. In 1515 Emperor Maximilian I entertained at Vienna the king of Hungary and Bohemia and concluded marriages of his children, by which Hungary, Bohemia and Moravia were acquired by Austria. In 1529 Vienna was besieged by the Turks under Soliman II, and again, in 1683, it was defended against a Turkish army under Mohamed IV. During the reigns of Charles VI (1712-40) and Maria Theresa (1740-80) the city's prestige was enhanced and its population more than doubled. After the battles of Austerlitz and Wagram it was held by the French for a short time. From 16 Sept. 1814 to 19 June 1815 the famous Congress of Vienna was in session, and the opinion has been repeatedly expressed that the political reaction which followed retarded the prosperous development of the city, which then had but 239,500 inhabitants, and that the insurrection of 1848 was required to clear the way for the introduction of better conditions. The facts which claim our attention at present are these: Vienna secured the right of self-government by elective representatives at the accession of Emperor Francis Joseph, whose reign extended from 2 Dec. 1848 to 21 Nov. 1916. Activity in building was stimulated by the removal of the fortifications in 1857 and by the Exhibition of 1873. Other manifestations of an enterprising spirit were noted and in half a century the population has nearly quadrupled. This growth has taken place despite the Compromise of 1867 between Austria and Hungary, by the terms of which Budapest was made the capital of that part of the empire beyond the Leitha River which Vienna had long regarded as a political and social dependency. The two decades before the World War witnessed such developments as that of the transportation system, including the city railway and a network of surface lines, new waterworks, etc. A brief account of
VIENNA

Painting. According to Béizzie developed in Vienna under the influence of foreign schools, of which those of Germany and France predominated. It follows that there is no precisely national Austrian art, but rather an intense and eclectic production of talents that are often distinguished but rarely personal and original. The early Vienna painters may well pass for Germans. Thus, J. E. von Steinle (born Vienna, 2 June 1810, died Frankfurt, 18 Sept. 1886); Joseph Führich (Rantzau, 9 Feb. 1800 — Vienna, 13 March 1876), and, more important in the same German environment, Ferdinand Waldmüller (Vienna, 15 Jan. 1793 — 23 Aug. 1865) and Moritz von Schwind (Vienna, 21 Jan. 1804 — Munich, 8 Feb. 1871) — all of whom Germany claimed as her own. Hans Makart (Salzburg, 29 May 1840 — Vienna, 3 Oct. 1884) studied under Piloty in Munich. Michel Lieb, called Munkacsi (born at Munkacs, 10 Oct. 1844; died at Endenich, 1900), whose 'Christ before Pilate' and 'Blind Milton dictating Paradise Lost to his Daughters' are so well known, has in Austria lived on so gradually that they have almost come to regard it as natural and have ceased to wonder at it. In August 1818 Italian airmen commanded by Capt. Gabriele d'Annunzio dropped copies of a manifesto over Vienna, and the message telling of American participation in the war. In November 1918 conditions in Vienna were reported as follows: Little disorder; order being maintained by Marshal A. von Boog; many arrests on charges of espionage with Red Guards to proclaim Bolshevism government; desperate conditions there owing to lack of food and coal. Austria had meanwhile appealed for an armistice (29 Oct. 1918); the abdication of Emperor Charles was announced 12 November and the German-Austrian republic proclaimed the same day. It was in connection with these events that the revolutionary outbreak took place at Vienna, the soldiers forming Soviets and making demonstrations against the Hapsburgs. On 16 Feb. 1919 the Constitutional Assembly was elected. On 4 Sept. 1919 the Swiss Minister at Vienna brought to light a plan to restore commercial relations on a large scale between Vienna and New York.

Architecture, Painting and Sculpture.— Only a few buildings dating from the period of the Middle Ages still remain, chief among which is the towering mass of Saint Stephen's (12th to 15th centuries), one of the most famous of cathedrals. The other architectural periods are distinguished as follows: That of the 17th century, mainly ecclesiastical; that of the 18th, baroque-palatial; the Biedermeier period, promoted by Francis I and Ferdinand I; the Francis Joseph era; and the modern period, commencing about 1900, examples of which are the 20th century residences of private citizens, the new palaces, the city railway structures, the cottage quarter and the artists' colony buildings in Heiligenstadt. But after all it is the *Ring*, with its monumental buildings, which gives the peculiar tone to Vienna, and the most beautiful edifice on the *Ring* is the Votive Church, completed in 1879. This appears to be the original from which was taken the design of Saint Patrick's Cathedral, New York City.
 VIENNA

1 The Opera House

2 The Bourse
father's successes, and another true Viennese was Otto Nicolai, composer of the 'Merry Wives.' Brahms lived for 34 years in Vienna and there Schumann wrote much of his best music.

Education and Charities.—The university has a staff of more than 450 professors and lecturers, and, in normal years, about 6,400 students and 1,200 occasional hearers. The Imperial Library contains 1,000,000 volumes, including 8,000 incunabula; 33,000 manuscripts; 350,000 engravings; 50,000 pieces of music and 30,000 autographs. One of the greatest of all art galleries is the Vienna Art History Museum. Other important institutions are: Academy of Science, Natural History Museum, Austrian Museum of Art and Industry (on the plan of the South Kensington Museum), Academy of Fine Arts, Conservatory of Music and Oriental Academy. Secondary education is furnished mainly by the Gymnasium and Realschulen. There are also governmental technical high schools. Statistics of the latter for the winter semester of 1913-14, as compared with the winter semester of 1912-13, show 183 teachers and (in 1913-14) 3,177 students, but only 639 students in 1915-16. For the Vienna Agricultural High School we find 86 teachers and (in 1913-14) 1,135 students, but only 186 students in 1915-16. This shows the enormous decline caused by the war. The most famous of the city's charity institutions are the hospitals: the general hospital; the epidemics and clinical hospitals; the Rudolph, the Jewish, the Brothers of Mercy, Children's and Convent hospitals; and those of Prater and Steppanien, Emperor Francis Joseph and Empress Elizabeth.

MARRION WILCOX.

VIENNA, Concordat of, also known as the CONCORDAT OF ASCHAFFENBURG, between Pope Nicholas V and the imperial estates of Germany, in February 1448, by which that eminent pontiff agreed to certain changes in the relations between the papacy and the empire in the spirit of the Concordat of Constance, made in 1418 by Pope Martin V with the representatives of Germany, France, England and other countries.

VIENNA, Congress of, a congress of powers assembled after the first overthrow of Napoleon to reorganize the political system of Europe, disturbed by the conquests of France. The congress assembled on 1 Nov. 1814. The principal powers represented in it were Austria, Russia, Prussia, England and France. Spain, Portugal, Sweden and other minor powers were also consulted on matters more nearly concerning them. The emperors of Austria and Russia, the king of Prussia and many other German princes were present in person. The leading territorial adjustments effected by the congress were the following: Austria recovered Lombardy, Venetia, while Tuscan and Modena were conferred on collateral branches of the imperial house. The Infanta Maria Louisa, queen of Etruria, received the duchy of Lucca in exchange for Parma, Piacenza and Guastalla, which were given with the title of empress to Maria Louisa, ex-empress of France. The legations, Benevento and Ponte Corvo, were restored to the Pope. The king of Sardinia recovered Piedmont and Savoy, with the addition of Genoa. Murat retained Naples. Holland and Belgium were erected into kingdoms for the Prince of Orange, William I. Hanover, with the title of king, returned to the king of England, and the Ionian Isles were as a republic placed under the protectorate of Great Britain, which also retained Malta, Heligoland and several conquered colonies. A federalist constitution, with a diet at Frankfort, was established for Germany. The kings of Denmark and the Netherlands were admitted in virtue of their German possessions to the diet. Bavaria was reinstated in her Palatine possessions with Würzburg, Aschaffenburg and Rhenish Bavaria, in return for her restorations to Austria. The demands of Prussia caused a dispute which nearly broke up the congress, but she was finally satisfied with the duchy of Posen, the Rhine province and a part of Saxony. The congress was suddenly broken up by the restoration of Napoleon; but its acts were signed by the powers interested on 9 June 1815.

The Congress of Vienna showed a disposition also to interfere in American affairs and an attempt was made to introduce monarchy in the South American countries then engaged in liberating themselves from the Spanish yoke, by the establishment of a French prince as sovereign over the Argentine provinces. The people of Argentina rejected the proposition. These and other meditated European aggressions, encouraged by the hostile attitude toward republican institutions of most of the powers represented at Vienna, led to the declaration of principle known as the Monroe Doctrine, which for a time put a quietus on monarchical plots against American republics. Consult Hazen, 'Europe Since 1815' (New York 1910).

VIENNA, Treaties of, various compact arrangements by representatives of European nations, at this capital, selected for its central position, and for the powerful position Austria had always taken in the wars of modern Europe prior to her defeat in 1918. The first treaty of Vienna (30 April 1725) was a mutual guarantee of dominions by Emperor Charles VI and Philip V of Spain; besides which, the former agreed to aid in the recovery of Gibraltar from Britain and to aid the Pretender in supplanting George I of England, in consideration of Philip guaranteeing the Pragmatic Sanction. The second treaty (16 March 1731) was a joint guaranty of the Pragmatic Sanction by George II of Britain and the states of Holland. The third treaty (18 Nov. 1738) was a similar guaranty by Louis XV of France. In consideration of the revision of Lorraine by Bavaria, the Bavarian prince (present meantime to Stanislas, ex-king of Poland), as well as a settlement of the Polish succession dispute, and a rearrangement of the possessions of Austria, Spain and Sardinia, in Italy. The fourth treaty (14 Oct. 1809) was between France and Austria, and in consideration of the cession of the Tyrol and the annexation of Znaim, by which Austria agreed to resign some districts on the western border of the archduchy to Bavaria; Gorizia, Friuli, Trieste, Carniola and parts of Croton, Cornithia and Dalmatia to France,
these provinces to be formed into the government-general of Illyria; some districts of Upper Lusatia to the king of Saxony; western Galicia, with Cracow and Zamość, and a share in the salt mines of Wielicza, to the grand-duchy of Warsaw; and the east coast of Galicia to Russia, a total loss to Austria of 58,170 square miles, with population of 3,500,000 and all her seaports.

The next and far the most important meet- ing of representatives of European nations was the Congress of Vienna, after the first treaty of Paris, for the general settlement of the affairs of Europe. The congress, assembling 30 Sept. 1814, was composed of Tsar Alexander I of Russia, with Count Nesselrode, the king of Prussia, with Hardenberg; Lord Castlereagh, and afterward the Duke of Wellington, representatives of Britain; Prince Metternich for Austria; Count Talleyrand for France; as well as representatives of Spain, Portugal, Sweden, Rome, Germany and all the other minor powers who were interested personally in the deliberations — the total number convened being about 500. But the representatives of the minor states, who had expected a large share of European importance, to which they would be admitted, were sadly disappointed by the preliminary resolution of the great powers to constitute two committees, one of which would deliberate on the affairs of Germany; and the other, composed of the representatives only of Austria, Prussia, Russia and Britain, would discuss the affairs of Europe generally, and decide respecting partition of the conquered districts (formerly belonging to France and her allies), and the frontier of each European sovereignty. To this latter council Talleyrand, by the influence of Castlereagh, who early saw the necessity of a counterpoise to the influence of Russia and her follower, Prussia, in the conferences, was admitted (5 October); and three days afterward it was increased by the representatives of Spain, Sweden and Portugal. The first resolution of the European committee, to rearrange Europe so as to leave the parties directly interested more to do than give their adhesion to the arrangements made for them — an arrogation of sovereignty over all Europe — was loudly exclaimed against; but the congress was one of rulers and their representatives, and not of the nations and their representatives; so the indignant clamor on all sides was unheeded. The points at once and unanimously settled were: the constitution of Belgium and Holland into one kingdom (the kingdom of the Netherlands); the annexation of Norway to Sweden; the restoration of Hanover, with a large slice of Westphalia, to the king of Great Britain; of Lombardy to Austria; and of Savoy to Piedmont. But the question to all the disputes — the division of Saxony and Genoa were not so easily settled. Russia and Prussia, vain of their prominent share in crushing Napoleon, were bent on extravagant aggrandizement — Russia insisting on the maintenance of the grand duchy of Warsaw (see Poland), while nothing less than the whole of Saxony and some of the trans-Rhenish provinces of Westphalia would satisfy Prussia; and both significantly hinted at the proximity of their colossal armies, with the view of awing the other powers into compliance. But Castlereagh was not amenable to such influences; and while steadily refusing to yield an iota to such preposterous pretensions, he joined with Metternich and Talleyrand in a secret treaty, offensive and defensive, 3 Feb. 1815, which was cordially acceded to by Hanover, Sardinia, Holland and Bavaria. The news of this agreement soon leaked out and produced considerable modification in the pretensions of the northern powers. At last it was agreed that Prussia should obtain a portion of Saxony, Posen, Cleves, Berg, the greater part of the left bank of the Rhine as far as the Saar and Swedish Pomerania; and cede east Friesland, Hildesheim, etc., to Hanover; Anspach and Baireuth to Bavaria; and Luneburg to Denmark; while Poland, except Posen, Thorn and those parts of the grand duchy which had been (1809) taken from Austria, was to be erected into a kingdom separate from Russia, but under the rule of the tsar. Austria recovered the cessions which she had been forced to make (1809), obtained also the Valteletines from Switzerland, and the establishment of collateral Hapsburg lines in Tuscany and Piombino; while Maria-Louisa obtained Parma. The Pope was restored to his possessions, and ferruginous sovereign; the ancient constitution of Switzerland re-established; and Genoa — despite the strongly expressed aversion of its inhabitants — incorporated with Sardinia. The news of Napoleon's return to France was, however, hurried the conclusion of these multifarious arrangements, yet the negotiations were not interrupted; Metternich's scheme for a new confederation of the German states (the same which continued till 1866) was unanimously agreed to — the question of mutual indemnities, rectifications of frontier, etc., being subsequently settled 20 July 1819 at Frankfurt, by a territorial commission of representatives of the four great powers. The questions of the slave-trade and of the free navigation of the Rhine and its tributaries were brought up by England and also satisfactorily settled. Finally a formal treaty (the fifth treaty of Vienna) was drawn up and signed 9 June 1815.

VIENNA PASTE, preparation extensively used as an encaustic, though not contained in the Pharmacopoeia; it consists of equal weights of caustic potash and freshly burned lime rubbed to powder in a warm mortar. To 50 parts of this compound 60 parts of quicklime are added, and the whole kept in a well-stoppered bottle. When required for use, the powder is made into a soft paste with a little spirit, and applied to the part to be cauterized. Vienna paste is much employed by some physicians in certain affections of the womb; and is one of the best applications to an indurated chancre.

VIENNE, vê-è̃n', department of western France; bounded north by the departments Maine-et-Loire and Indre et Loire, west by Deux-Sèvres, which intervenes between this and the maritime department of Vendée; 2,680 square miles. The Vienne affluent of the Loire, is the principal river, all the other parts of the department being tributary to it; it flows from south to north and receives the Clain, Gartempe and Creuse — of which only the last is navigable. The surface of Vienne is flat, with a gradual slope toward the north. The country consists of fertile plains, fine pasture-lands, and
extensive forests. The climate is soft, temperate and healthful. Grain is cultivated in greater quantity than is required for local consumption. On an average, more than 21,000,000 gallons of wine are produced annually. In general, however, agriculture is in a backward state. The mineral riches consist principally of iron and manganese and numerous quarries of building and other stone, including lithographic stone finer and harder than those of Munich. There are cutlery Works and national arms factories at Châtellerault; forge- blast furnaces, spinning-mills (both wool and hemp), and manufactures of serge and coarse cloth, paper-works, etc. Vienne is divided into five arrondissements — Poitiers, Châtellerault, Civray, Loudun, Montmorillon. The capital is Poitiers. Pop. 332,276.

VIENNE, France, an ancient town in the department of Isère, on the Rhône, 19 miles south of Lyons. The river Gère passes through the town and here joins the Rhône, after having built power to a number of mills and factories. Vienne was the chief town of the Allobroges, is mentioned by Caesar and by Martial, who calls it the rich Vienne; in the time of the Roman emperors it was the rival of Lyons. Besides numerous water conduits, etc., of Roman construction, there are a Corinthian temple of Augustus and Livia, remains of a theatre and an obelisk, called The Eagle, 72 feet high; and the museum containing many relics of Roman antiquity. The cathedral of Saint Maurice, partly Romanesque, partly Gothic, was built in 1107-1251; Saint Peter's dates from the 6th century. The town was prominent under the Burgundian princes, and its archbishop disputed with his neighbor of Lyons the primacy of Gaul. In 1312 a council was held here, in which Pope Clement V pronounced the suppression of the order of the Templars. There are manufactures of woolens, silk, gloves, paper, leather and iron goods, and trade in grain and wine. Pop. about 27,000.

VIENNE, Haute, France, a department of the Republic, formerly known as Haut-Limousin, bounded west by the departments of Vienne, Charente and Dordogne. It has an area of 2,130 square miles. It is watered by the Vienne and its tributaries — the chief of which is the Garonne. The surface is mostly level, but traversed by ranges of low hills, of which the Monts du Limousin, which traverse the south of the department, rise in their highest summit, to 3,000 feet. The Mont de Puy-Vieux, the highest in the department, is 3,200 feet above sea-level. The climate is cold, humid and frequently foggy. The soil is not fertile, and agriculture is in a backward condition; but domestic animals are reared in great numbers. Mines of iron, lead and copper are worked, and China clay, of which there is an inexhaustible supply, is largely exported to Russia and America. About 6,000 men are engaged in porcelain-making. It is divided into four arrondissements — Limoges, Bellac, Rochecouart, and Saint-Yrieix; capital Limoges. Pop. 384,736.

VIEQUES, vē-ē'kis, or CRAB ISLAND
West Indies, a dependency of the United States, administratively, a district of the department of Humacao, Porto Rico, a fertile island with coastal contiguous ports where the largest ships can ride at anchor. It lies six miles east of Porto Rico, about six miles from shore, is 19 miles long and four wide, has a fine climate and produces almost all varieties of fruit and vegetables that grow in the West Indies. The population of Vieques (in which Culebra Island was included as a ward) was given as 6,642 in the census of 1899, of the town called Vieques, 2,646. The principal settlement is located on a bay on the southeast side; on the north is the town of Isabel Segunda. Latest statistics under the direction of the War Department of the United States show: Native whites, 2,545; foreign whites, 138; negroes, 1,036; mixed, 2,923; married, 688; single, 4,539; living together as husband and wife by mutual consent, 1,185; widow, 230; inhabitants 10 years of age and over who attend school, 162; 10 years of age and over who could neither read nor write, 3,268; superior education, 22; inhabitants engaged in agriculture, fisheries, trade and transportation, 225; manufacturing and mechanical industries, 253; professional service, 39; domestic and personal service, 727; without gainful occupation, 4,002; total number of dwellings, 1,273; number of farms, 120.

VIETA, vē-tā, François, French mathematician: b. Fontenay-le-Comte, 1540; d. Paris, February 1603. He practised law until 1589, when he was appointed maître des requêtes under the Parliament at Paris, subsequently holding various civil offices. He was the founder of the modern algebra and the foremost algebraist of his time. His works were collected and published by Van Schooten (Leiden 1646).

VIEUXTEMPS, vē-ē-tām, Henri, French composer and violinist: b. Verviers, Belgium, 2 Feb. 1820; d. Mustapha, Algiers, 6 June 1881. He studied at Vienna and at Paris, and made his first appearance at Paris in 1841. He visited the United States in 1844-45, 1850 and 1870, where he was solo-violinist to the emperor of Russia in 1846-52, and in 1870 was appointed to a professorship at the Conservatoire at Brussels. A stroke of paralysis, in 1873, left his right arm useles and he was compelled to retire. He composed numerous pieces for the violin, comprising concertos, fantasies and dances.

VIGAN, vē-gān, Philippines, pueblo and capital of the province of Ilocos Sur, on Luzon Island and at the northern delta of the Abra River, about three miles from the coast, and 200 miles northwest of Manila. It is open to the coast trade, is on the west coast road connecting it with Dagupan, and the Dagupan and Manila Railroad, and carries on an important trade with the interior of the province by means of the river. It contains brick kilns, a boat-building yard and a carriage factory. It has broad streets and a number of important public buildings, including the casa real, courthouse, provincial administration building and the council seminary; it has been an episcopal see since 1755 and contains a fine cathedral and the bishop's palace. Pop. about 18,000.

VIGEVANO, Italy, town situated in the province of Pavia; 15 miles southeast of Novara and 24 miles southwest of Milan. It stands on rising ground on the banks of the Mora, not far from the Ticino. It is a walled town; has an arched market-place, a cathedral,
and a castle of the Sforza family, dating from the 14th century; manufactures silk, linen and cotton fabrics; and has active trade in grain and wine. Pop. 15,000.

VIGUSSON, vig'foos-sôn, Gudbrand, Scandinavian scholar: b. Frakkenes, Iceland, 13 March 1827; d. Oxford, England, 31 Jan. 1889. He was educated at Copenhagen University and lived in Copenhagen from 1849 till 1864, devoting himself to the study of old Icelandic literature. His first work, 'Timatal,' on the chronology of the Sagas, was published in 1855. In 1858 he brought out the 'Biskupa Sögur, or Lives of the Icelandic Bishops,' and in 1864 the 'Eyrbyggja Saga.' He then went to England to undertake the Icelandic-English lexicon, on which he was employed from 1864 to 1871. In 1878 the Clarendon Press published his 'Sturlunga Saga,' to which he prefixed the 'Prolegomena,' containing a complete history of the classic literature of Iceland. This was followed by the 'Corpus Poeticum Boreale' (with F. York Powell), a complete collection of the ancient poetry, with translation. In 1875 he was appointed lecturer in Icelandic and kindred subjects at the University of Oxford.

VIGIL, the day and night preceding a festival in the Roman Catholic Church. In the early period of the Church the night as well as the day was spent in prayer and fasting, but this practice, so far as the night was concerned, was found to promote immorality, and it was given up, the vigil being celebrated in the day time only, except the midnight mass before Christmas, which is a relic of the old custom. The term "vigil" is also applied to the devotional exercises held on the evening preceding a festival.

VIGILANCE COMMITTEE, a term used in the United States to denote a band of citizens organized to summarily punish crime or prevent the commission of crime, in instances where the civil and lawfully constituted authorities seem powerless to enforce the law. The most noted committees in the history of the country were those formed in San Francisco and contiguous territory in the Western States, and in New Orleans, in the Southern States. In the earlier years of San Francisco the city was so overrun with the lawless element among the miners and adventurers that the administration of justice in the hands of the constituted authorities was a travesty. It was then that the work of the vigilance committee, or Vigilantes, as they were styled, began. That work was short, sharp and terrible. Thieves and murderers were hanged on every side, while others were forced to seek safety in flight. In New Orleans the last instance of the organization of a vigilance committee was in 1891, when a body of citizens took from the city jail a number of Italians, suspected of being members of the Italian fraternity of murderers known as the Mafia, and accused of being the murderers of Chief of Police David Hennessy, and put them to death by shooting and hanging. This action produced serious complications between the Italian government and that of the United States.

VIGILUS, vijil-üs, Pope; b. Rome; d. Syracuse, 555. During the pontificates of Agapetus I and Sylverius, Vigilus was auctoritas (an office nearly corresponding to the later one of papal nuncio) at Constantinople, and having sided with the imperial government against Pope Sylverius, was sent to Rome to procure the imprisonment and exile of Sylverius. This being accomplished, Vigilus was proclaimed Pope in 537, but was not acknowledged by the entire Church as such till 540, when Sylverius died. It has been said that, according to a promise given to the emperor of Constantinople, he wrote in 538 a secret letter to the heads of the Monophysites, in which he approved of their views and condemned the anti-Monophysite decisions of Pope Leo I. Modern critics all agree in pronouncing this letter apocryphal; and later (after 540) he refused to issue a decree in favor of the Monophysites, declaring that he would abide by the decisions of the four ecumenical councils and the decrees of popes Agapetus and Leo. When Justianin in 544 condemned the so-called "Three Chapters" (the writings of Theodore of Mopsuestia, of Theodoret against Cyril, and the Epistle of Ibas), and the western bishops generally expressed resistance to this, Vigilus was summoned to Constantinople (546) and prevailed upon to condemn likewise the "Three Chapters," in a document called 'Judicatum' (548); saving, however, the authority of the council of Constantinople, which has refrained from condemning them. As this satisfied neither the opponents nor friends of the "Three Chapters," Vigilus called an ecumenical council, the fifth, to settle the dispute. In the eighth "Three Chapters" were condemned in nearly the same terms used by Pope Vigilus in his 'Judicatum.'

As a matter of prudence to allow the agitation occasioned by the controversy to subside, the Pope waited some months before announcing to the Catholic world that the "Three Chapters" had been regularly condemned by the council. Vigilus then obtained the emperor's leave to return to Italy, but died at Syracuse on the way back.

VIGNAUD, vê'n-yô', Jean Henry, American diplomatist and author: b. New Orleans, La., 27 Nov. 1830. He taught in the schools of his native city in 1852-56, and at the same time wrote for Le Courrier and other papers. In 1857-59 he was editor of Cours de la Cour and Lafourche at Thibodeaux, La., and in 1860-61 was one of the founders and the editor of La Renaissance Louisianaise, a weekly journal. In 1861 he joined the Confederate army as captain in a Louisiana regiment and was captured at New Orleans in 1862. The next year he was appointed secretary of the Confederate Diplomatic Commission at Paris; in 1872 he was translator at the Alabama Claims Commission at Geneva; and in 1873 a delegate from the United States to the International Metric Conference. He was appointed second secretary of the American legation at Paris in 1875, and first secretary in 1882, retaining this position when the legation became an embassy. He has written 'L'Anthropologie,' 'Glossary,' and 'Bibliographical Notices of All Voyages which Preceded and Prepared the Discovery of the Route to India by D'Azis, and to America by Columbus'; 'Toscanelli and Columbus—the Letter and Chart of Toscanelli on the Route to the Indies by way of the West' (1902); 'Toscanelli and Columbus—Letters to Sir Clements R. Markham and C. Raymond Beazley' (1903). The publication of his 'Toscanelli
and Columbusprovoked considerable controversy; its aim was to impugn the purely scientific and geographical views of Christopher Columbus. In Paris he continued to write, bringing out several books in French, his last contribution to the Columbus controversy being *Histoire Critique de la Grande Enterprise de Christophe Colomb* (Paris, 1810).

**VIGNETTE** (French vignette, a flourish, a head-piece—from *vigne*, a vine—from L. *vinēa*, a vine—lit., a little vine, the first vignettes having been adorned with borders of vine-leaves and grapes): in *Gothic architecture*, a running ornament or embellishment of vine-leaves, tendrils, etc.; in *books*, the small engraved embellishment, illustration, or decoration that precedes the title-page or chapters of a book, etc., originally bordered with a scroll of trailing plants or the like, hence the name; in general a picture, and specially a photographic portrait, displaying the head and upper part of the body only, and having no definite border, the ground shading off insensibly to an even color.

**VIGNOLA**, vēn-yōˈlā (Giacomo Barozzi), Italian architect: b. Vignola, near Modena, 1 Oct. 1507; d. Rome, 7 July 1573. He received his art training at Rome, later spent two years at the French court; was architect to the Pope and after the death of Michelangelo (1564), architect of Saint Peter’s. The two small cupolas are his additions to that building and the principal other works which he produced are Caprarola Palace near Viterbo and the Church of Jesus at Rome, which was completed after his death by Giacomo della Porta, but not in accordance with the original plans. His buildings are marked by taste and harmony, although chilling in their severity of design. He has had more influence as an architect through his work, *Rules of the Five Orders of Architecture* (1563), which for a long time was considered the standard authority, although on his theory the antique builder was restricted by narrower rules than ever actually were in vogue.

**VIGNY**, vēnˈyē, Alfred Victor, Comte de, French author: b. Loches, Indre et Loire, 27 March 1797; d. Paris, 17 Sept. 1863. He entered the army at the Restoration, but resigned from the service in 1827. By this time he had published two books of verse *Poèmes* (1822) and *Poèmes Antiques et Modernes*? (1826), the latter containing the ‘Moïse’; and *Cinq-Mars*? (1826), a work of fiction which, despite the author’s study of sources, is far from being true to history. This work owes much to Walter Scott. De Vigny made good translations of *Othello* and the *Merchant of Venice*, and won a great triumph in 1835 with his drama of *Chatterton*. At the highest point of his reputation, he did not, however, follow up his success; and he printed nothing further but a few poems in the *Revue des Deux Mondes*. He was elected to the Academy in 1843. Many critics regard his *Servitude et Grandeur Militaire* (1841) the others beside are in the pure style of Hindu architecture and are carefully preserved by government. The ruins of the ancient city, founded in 1386, and for 250 years the stronghold of a great Hindu empire, was effected by a confederation of Mohammedan rajahs, who took and sacked it in 1564. The site is still
estemed holy by the Hindus, and is the location of an annual festival. Consult Sewell, R., 'A Forgotten Empire' (1900).

VIKING, from the Icelandic vik, a bay or fiord, and the termination ing, implying one who belongs to or is descended from: literally one who lurked in bays and issued thence to plunder, a rove belonging to one of the bands of Northmen who scoured European seas during the 8th, 9th and 10th centuries. The wrong syllabic division of this word as vi-king instead of vik-ing has caused it to be frequently confounded with sea-king, a term which is applied to a man of royal race or rank, or to the title of king when he assumed the command of men, although only of a ship's crew; whereas the former term is applicable to any member of the bands. The Scandinavian vikings were excellent ship-builders and expert seamen, and were able to navigate in the open sea by the aid of the sun, moon and stars. Notwithstanding the origin of the term, which is unpleasantly suggestive of the methods of Malay pirates of present day, it has come to be the recognized designation of the Scandinavian adventurers who, by daring, hardihood and endurance, fought their way to thrones, and established kingdoms, principalities and dukedoms in all parts of Europe, from southern Russia to Britain. See NORMANS.

VILAINE, ve-lahn, France, a western river which rises in the department of Mayenne, flows west past Vitré to Rennes, where it receives the Ille from the north, and with a southwesterly course reaches the Atlantic at Penestin, in the department of Morbihan, after a course of 150 miles, one of which may be navigable. With the Ille it gives its name to the department of Ille-et-Vilaine.

VILAS, vil'as, William Freeman, American lawyer and politician; b. Chelsea, Vt., 9 July 1840; d. Madison, Wis., 27 Aug. 1908. He went to Wisconsin with his parents in 1851, and was graduated from the University of Wisconsin in 1858, and from the Albany Law School; was admitted to the New York bar, but returned to Wisconsin, was admitted to the bar there, and had just begun the practice of his profession, when he joined the Federal army (1862). He was promoted lieutenant-colonel, and commanded his regiment during the siege of Vicksburg; he resigned from the army in 1863 and returned to his law practice. He was professor in the Law School of the University of Wisconsin, 1868-85; and was a regent of that University, 1881-85 and 1894-1905. After the Civil War he was an active member of the Democratic party; from 1876 to 1886 he was the Wisconsin member of the Democratic National Committee, and in 1884 was permanent chairman of the National Convention; and in 1885 was elected to the Wisconsin legislature. In the same year he was appointed Postmaster-General of the United States, and in 1888-89 was Secretary of the Interior. His course as Postmaster-General marked by an improvement of the foreign mail service, economy of management and the negotiation of postal treaties with Mexico and Canada. In 1891 he was elected to the United States Senate for a six years' term. In 1896, being opposed to the free-silver movement, he was one of the organizers of the National or Gold Standard Democratic party, attended their convention at Indianapolis, and was chairman of the committee on resolutions. He edited (with E. E. Bryant) the 1st, 2d, 4th and 6th-20th volumes of the 'Wisconsin Supreme Court Reports.'

VILAYET, vil-a-yet', in the Turkish empire, the most important administrative division, governed by a vali, or governor-general and a council. Each vilayet is divided into levas or sanjaks.

VIKOMIR, or WILKOMIERZ, town situated in Lithuania, government of Kovno; on the Swenka, 130 miles southeast of Riga. It was a flourishing town in the 13th century, and continued prosperous till the 17th century, when it began to decline, in consequence of the wars with Sweden, Russia (Vilkomir being at that time a Polish town), and the Cossacks. Vilkomir contains an ancient church of the 13th century. Flax is exported to Riga. Pop. 15,000, of whom over 50 per cent are Jews.

VILLA, vil'a, a word which in the English and Anglo-American sense means a rural, suburban, or sea-coast dwelling, in some cases with a style, as distinguished from a farm-house and which is occupied usually in the summer months by a person who has also a residence in the town or city. In the Latin it had a similar meaning but also meant originally a small collection of houses, and as the country home of a rich Roman would be likely to have around it a cluster of dwellings of retainers and slaves, it is probable that the country house became known as a villa from this fact. The French and Spaniards have enlarged on the Latin meaning, and with them it is equivalent to the English word "town," either as designating an urban community, or as distinguishing town from country. Italians give about the same meaning to the word as their Roman predecessors.

VILLA ADRIANA, vil'a' ad-re-a'nah, or HADRIAN'S VILLA, the ruins of a splendid palace, temples, baths, theatres and other buildings erected by the Emperor Hadrian, near Tibur, now Tivoli, about 15 miles east-northeast of Rome. The emperor spared no expense to make it the most beautiful palace in Italy. Our modern knowledge of architecture is largely based on the designs and forms found in Hadrian's Villa. Many of the statues now in Roman museums were found there.

VILLA ALBANI, il-bahn'eh, a modern Roman villa containing many works of art. It was founded in 1760 by Cardinal Alessandro Alban. The first Napoleon caused many of its art treasures to be removed to Paris. These were restored to the Alban family in 1815, and were sold, and are now in the Glyptothek at Munich, and other collections. Prince Tornoni bought the villa in 1866.

VILLA ALDOBRANDINI, il-doh-bran'deh-neh, a noted villa at Frascati, near Rome, built for Cardinal Aldobrandini about the close of the 16th century, and afterward owned by the Borghese family.

VILLA BORGHESE, bor-ghezh, a villa, just outside the Porta del Popolo, Rome. The founder was Cardinal Scipio Borghese, nephew
VILLA LUDOVISI—VILLAGE

of Pope Pius V. The original museum was purchased by Napoleon I and sent to the Louvre, and another has been established in its place. The villa contains many fine sculptures.

VILLA LUDOVISI, loo-دو-و-سي, formerly one of the chief attractions of Rome until the palace and gallery of statues, and a large part of the grounds, gave way to the march of local improvement. The villa was built in the early part of the 17th century by Cardinal Ludovisi on the site of the Gardens of Sallust, and large sums were expended in beautifying the grounds and adorning the gallery of statues with a collection of antique sculptures, including the famous Ludovisi Juno and Mars. These were removed in 1891 to the Pio-Museo palace, and the only building remaining of the Villa Ludovisi is the Casino dell'Aurora.

VILLA MEDICI, má-de-ché, a famous Roman villa, south of the Pincio, with a fine collection of casts. It was built in 1540 for Cardinal Ricci de Montepulciano, became the property of the Medici family about 1600, and passed into the possession of the Grand Dukes of Tuscany, the younger branch of that family. Here Galileo was confined, when his sentence to imprisonment in a dungeon for advocating great astronomical truths was commuted to detention in the villa of the Grand Duke of Tuscany at Rome. In 1801 it became the home of the French Academy of Art, founded by Louis XIV. It is one of the most interesting features of the Eternal City.

VILLA NAZIONALE. See NAPLES.

VILLA PALLAVICINI, pä-ل-ا-ي-س-ن, the celebrated residence of the Marchese Durazzo, at Pegli, on the Gulf of Genoa, Italy. Nature and art are combined to make it one of the most picturesque and enchanting spots on the globe. The decorations display taste and magnificence, and the gardens are luxuriant with the choicest plants of that genial climate, while statues, grottoes, fountains, a Christian chapel, a mosque, a Roman temple, a triumphal arch with sculptures, and other works of art add to the grandeur and beauty of the scene. The villa commands an extensive view of the Mediterranean.

VILLA FRANCA DI VERONA, vel-lä-fräng'kä dé vä-ð’-ö-nä, Italy, a small town in the province of Verona, 10 miles south-southwest of Verona. It is of mediaval appearance, surrounded by walls and moats. The castle is now in ruins. The preliminaries of a peace between Francis Joseph of Austria and Napoleon III of France were signed here on 11 July 1859. Pop. about 12,500.

VILLAGE, The. The term village is popularly applied in the United States to any small community with less than 500 population, though popularly and distinguished from the town (not to be confused with the New England town) and the city. In a few of the older eastern States (Pennsylvania, Connecticut, New Jersey, Virginia) the designation village is used for more of these classes of small municipalities.

The incorporation laws of more than half the States do not provide for incorporated villages, but only for towns and cities. In general the older States are the more conservative in this matter, New England incorporating only a very few of the many villages communities within her towns. Kansas knew only one class—the "city." This legal practice seems to be the evidence of the urban ambitions of small communities in this rapidly growing nation.

These incorporation laws, moreover, are very liberal in allowing communities, almost without restriction even as to number of people, to incorporate either as villages, towns, or cities. In some cases a minimum population is required, but there is usually no limitation on the form of incorporation adopted, although such are beginning to appear in some States. Consequently there are many extremely small incorporated municipalities of the village type, and even of the town and city classes. This again is indicative of an ambition for public improvements and services which only grants of power to the higher grades of municipality can effect.

There were no such small municipalities in the Colonial period, and only reluctance even to incorporate communities which had every possibility of becoming places of importance. There were less than a score of incorporations down to the time of the Revolution, but at that time and immediately after much greater liberality was shown, and the number of municipalities grew rapidly. But the villages and towns had still no local self-government, although special laws were frequently passed allowing powers as local improvement districts, for roads and drains and the like. Out of these and probably first in New York State came the practice of incorporating villages. Later general laws were enacted, but it is only within very recent years that a system of village law is beginning to take form in the United States.

Consequently, this country presents to-day the unique and characteristic phenomena of some 12,000 incorporated places under 2,500, largely towns and cities. Since the United States census considers a community of more than 2,500 population as urban, these may be said to constitute the village proper. More than half of these are of less than 500 population. Nor does this include the many hundreds of unincorporated villages and towns in New England where practically every town has one and usually several. Their total population is more than 8,000,000.

To these incorporated places should be added the many thousands of hamlets, or as they are popularly called, villages, found in all parts of the United States. The best commercial atlases designate 75,000 "places" of stated population (50 up). These are pretty villages, often inland from railroads. They are more frequently found, and are less populous, in general in the older eastern and southern States. Conservatism as to incorporation is here greater than in newer sections, hence a considerable number of them are of quite large population (100 up). There are on the average, therefore, several of these for every incorporated one, and the total population is probably more than 5,000,000.

Thus this village sphere of community life includes about one in eight of the American people. It is neither urban nor rural in its characteristics. It is distinctly intermediate. In
the past the village has turned toward the town and city, but now more and more is related to the rural. Neither urban nor rural can be rightly judged until this large intermediate village sphere is separated from them. Many characteristics attributed to rural life are due to the inclusion in the rural of this class of communities, and the same is true of our judgment of the urban sphere. Villages should not be included with the population of the open country, nor with the town and city proper. Indeed, many communities of several thousand population are often essentially country towns, whose population is recruited from the farming population, and whose business and social interests are bound up with the surrounding farm district.

The tendency to incorporate village communities has been especially marked since 1890. More than half of all at present existing have been incorporated since that date. Three of the New England States (Maine, Vermont, New Hampshire) even have allowed incorporation, though it has only in a few school instances been availed of as yet. In the north and middle Atlantic States there is a conservatism in practice and only the larger places (over 500) are gradually incorporated. In the South this has been even more marked, often not more than one place in a county being incorporated and in many cases none such is found. But since 1890 and especially since 1900 many small places, particularly those on the railroads, have incorporated. In the North Central group of States incorporation of villages is more popular; already more than half of the total number of such are in this section, although only one-fourth of the nation is resident there.

Here, too, segregation of the incorporated village from its township has been adopted in several States. And special representation on county boards (supervisor type) has in a few cases been accorded to villages. But this represents an extreme tendency; generally the village remains part of the township for township purposes, while almost everywhere the school district is separate and independent of the village corporation, and is usually more extensive in area.

Such political independence of the American village is characteristic. The European "commune" includes both village and farm district in one political unit. Nineteenth of the people of Russia live in such village communities or "mir" and communal life is only less widespread in other European countries. There is practically no open country life or isolated as in this country. Moreover, the villages are more than merely business centres for the district, as they are with us. There the farming or peasant population live in the village centres and cultivate the surrounding plots. Thus there is no motive for political separation.

In America the village has always had town and city ambitions. In the early days the great majority of the places did not, though some, miss by the railroad and by industry, stood still or suffered decline. The later ones have little opportunity of becoming cities, and see their permanent future in relations with their countryside. This is the underlying reason for the less widespread desire to incorporate villages to-day than formerly. Incorporation was usually the outcome of an ambition to become a town or city. This divorced them politically from the farming community.

The early village was nothing more than a trading and later a shipping point. Latterly, since the advent of the automobile, a place of residence for retiring farmers and others for whom there was no place in the active life of the farm. This together with the investment in village business institutions on the part of surrounding farmers, tends to bind village and countryside together in interest. Retiring farmers, too, increasingly rent rather than sell their farms on retiring. In the first days of the rise of land values they usually sold. Increasingly, too, they rent to relatives, which gives them continued concern not only with the business but social interests of the country. The village schools and churches, too, draw many farmers and their families. It has become a custom to speak of village churches as country churches in the new sense recognizes the facts and tendencies of farmers' use of village schools. The village has become more broadly a business and social centre for its district.

The farmers are about as much concerned with village affairs and improvements as the villagers themselves. The conditions and needs of the new agriculture give the farmer a new concern in village business and social institutions. Problems of marketing, credit and labor all interest him in the village. The village is now, as it was not formerly, a shipping, a trade centre.

It is probable that as in a few States of the East, following the New England custom, added powers may be given the township to enable it to answer the needs of village improvements. Already many towns and villages are being made coterminous with reduced townships. Many villages have very extensive corporate limits and in some States some township powers, such as tax assessments, are being added to those of the village. In the future we may approximate somewhat to the conditions of the European commune.

The villages are, unlike the towns and cities, by no means uniformly growing in population. Stationary and even losing numbers is exceptional among larger places, although now increasingly frequent. In the villages it is the rule. More than half are not growing in numbers. Perhaps one in four is losing rapidly.

This is in part the result of rural depopulation, and itself a large factor in such. Of recent years the villages have lost in many cases more than their farm districts. The larger towns and nearby cities have drawn trade and residents. Village youth have sought opportunity elsewhere. In the newer farming regions or more so in the cities. Moreover, an abnormally large proportion of villagers are aged (above 45 years), the youths remaining in active farming or seeking the cities. But conditions are less gloomy; those ambitious, those ambitious for village growth and prosperity. Retiring farmers now more often seek their neighborhood centre than formerly, and the growth of village business, social activity and demands for farm labor furnish new opportunities. At present the collective village population is growing only
Village Improvement—Village improvement is a term coming into common use, to designate all forms of civic improvement in small incorporated places. The term just came into use in New England, but may well spread to other parts of the country, as the village problem becomes a conscious one there.

The term includes both the activities of the corporation and of private enterprise for village betterment. Recently it has come to include social and economic improvements other than what are generally known as municipal improvements, such as fire protection, street lighting, paving, provision of parks. An evidence of the widespread effort and attention to village improvement is the publication of a special edition of *The American City*, devoted almost exclusively to the town and village (since 1913).

In the past much more attention has been devoted to the physical improvement of the more enterprising villages than to other aspects. The great majority of villages (whether incorporated as villages, towns or cities) now have some form of municipal water supply. They quite often have some portion of the business district paved, and sidewalks quite generally. Municipal ownership and operation of electric light plants is very common. Even very small places have some park area. Public lighting is customary.

Naturally these are of limited scope. Water supply often has been installed chiefly for fire protection. Sewers are seldom found in places under 1,000, although most communities have some private systems of drainage. These, from the sanitary point of view, are very imperfectly guarded. Water supply is largely from shallow wells. Garbage disposal is of the most primitive kind. Sanitary conditions in villages from these points of view are very far from desirable.

Street paving is rather unusual, although frequently the business district or main street is paved. Many permanent sidewalks constructed privately preceded general municipal provision for such, and in general one-fourth of village streets are so provided.

In the Middle West, villages such improvements are more frequently found than elsewhere. Urban ambitions and imitation are most active here. Special influences, such as summer residents, have been strong in New England communities. But in the awakened villages and towns of these older States, and in the South, village improvement has a large future.

The growing practice of the light companies of larger towns and cities to furnish power for light in the surrounding villages is an important advance.

Village street plans have in general been based upon the supposition that the place would sooner or later become a town or city. Streets are usually the width of a country road, and often much wider. Moreover, all streets are generally of like width. This is in marked contrast with the Old World village, with its single main street, and its Courts and lanes. In the average village, the width of the average village, with its little, grass-and-weed-grown streets, faint wagon track and struggling footpath. Little used for traffic, and fenced off from the private house-lots, the
street is a neglected space. There has been little attention paid in this country to town planning for new communities.

The lay-out of the average village is rectangular and seldom takes any account of natural features. The American village is as a result seldom either orderly or picturesque. It consequently leaves much to be desired as a place of residence for retiring farmers, and must speedily correct such a condition if it would compete with towns and smaller cities.

Most villages prescribe fire-limits and compel brick or sheeted buildings in the business district. But such limited fire-ordinances as exist are very inadequately enforced. The fire hazard is exceptionally high and the losses out of all proportion as compared with the cities. Sweeping conflagrations are all too common.

The great majority of villages, even of a few hundred people, have graded schools, including high school facilities of a limited range. The school is usually the best building in the place, most frequently answerinng to more than one purpose, and in many cases constructed with some thought of its acting in some sense as a social centre.

Despair has settled down upon a great many of the villages which were settled one or more generations ago, and have seen their neighbors thrive and grow. Stationary or losing population, the aged and conservative character of a large proportion of the population make effort for improvement difficult. But current population movements will repopulate and somewhat change the character of village population. The average village will come to realize what its necessary future must be. A new civic spirit and outlook is coming to the American village. A change of front from imitation of the town and city to seeking to become an adequate village centre for its district is inevitable.

A first necessity of successful village improvement is a vision of the scope, the place and the function of the village community in American life. Journals like the American City can do much. The organized municipal interests of the country have hitherto paid little or no attention to places other than cities and the larger towns. The Massachusetts Civic League, under the able direction of E. T. Hartman, comes nearest to an organization such as is necessary for this purpose. But village improvement must by no means be confined to merely physical improvement, and least of all the mere imitation of urban communities.

WILLIAM L. BAILEY, Associate Professor of Political Science, Grinnell College.

VILLAGE COMMUNITIES. These are supposed to have been the primitive form of organized human society. In Africa, the South Sea Islands and among the American aborigines have progressed beyond savage isolation the village community exists, a survival of a system which was probably universal in the pre-historic period, and was prevalent throughout a large part of Europe as it is to-day in Russia, long after Greece and Rome had built flourishing cities and established new forms of civilization. In the Russian mir, a word which signifies union, all the land is held in common, and is divided for use among the several families. Such was the system of land tenure among the Romans, and although at a very early date — probably before the tribes from the North swept down on the Roman dominions — private proprietors of land had become a fixed institution among them — the village continued to have its common or "green," which every villager had a right to use and enjoy. This communal land system was brought to the New World by the first settlers, being represented by the Boston Common, and the "Commons" of New York now known as City Hall Park, and other similar public reserves.

It is unnecessary to trace the village community from its primitive condition through the feudal and more recent periods to the present day. Throughout all changes something of the commercial system survived, and the common enjoyment of land, which had been nearly effaced by private proprietorship, is being revived in the creation and the extension of public parks, open to every citizen. In Russia, on the other hand, the mir, or village community, is giving way to private proprietorship, Russia in this, as in some other respects, being in a period of transition from which western Europe evolved centuries ago.

VILLAGE IMPROVEMENTS. See Village Communities.

VILLAGREN, vēl-yā-grān', or VILLAGRA, Francisco, Spanish soldier and colonial governor: b. Astorga, Spain, 1507; d. Concepcion, Chile, 15 July 1563. He accompanied Valdivia to Peru, was engaged with him in the conquest of Chile in 1540-45, and in 1547-49 was governor in the absence of Valdivia. Upon the death of Valdivia in the Araucanian uprising of 1553-54 Villagran became governor.

While proceeding to march against the Araucanians he was severely defeated at Martiquen in February 1554. He, however, continued the war for months, killing the famous Indian chief Lantaro at Mataquito in 1556. He was superseded by Garcia Hurtado de Mendoza in 1557; and that governor, in order to be rid of his dangerous rival, sent Villagran a prisoner to Peru. On his release he went to Spain, secured a royal commission to succeed Mendoza and returned in 1561 to take charge of the colony. He pushed the Spanish conquests beyond the Andes, and though much harassed by the uprisings of the Araucanians, continued in office until his death.

VILLAIN, or VILLEIN. See Villeins.

VILLARD, vil-ārd', Henry, American journalist and capitalist: b. Speyer, Bavaria, 11 April 1835; d. Dobbs Ferry, N. Y., 11 Nov. 1900. His real name was Hilgard, but he changed it to Villard on coming to the United States in 1853. He entered upon journalistic work, writing at first for German-American journals, then as correspondent for the Cincinnati Commercial, and for the Chicago Tribune. He reported the Lincoln-Douglas debate of 1858 for the National Republican Convention of 1860; and during the Civil War won a wide reputation as a war correspondent, going to the front with the Army of the Potomac; he also
conducted a correspondents' bureau at Washington. In 1866 he went abroad to report the Austro-Prussian war for the New York Tribune. In 1871 he organized the society of Science Association in Boston. In 1873 he represented German bondholders in financial dealings with some of the railroads of the Pacific coast; going to the Northwest he organized the Oregon Railway and Transportation Company; and in 1881 by a pooling of railroad interests formed the Northern Pacific Railroad Company, and was elected its president. The road was completed in 1883, but was involved in financial difficulties, on account of which Villard lost a large part of his fortune, and resigned the presidency of the road. He regained his financial standing with the aid of German capital, and in 1889 became one of the directors of the Northern Pacific, holding that position until 1893, when the road went into the hands of receivers. He was also interested in Edison's inventions; in 1890 he bought the Edison Lamp Company at Newark, and later the Edison Machine Works at Schenectady, which he organized as the Edison General Electric Company, in which he was president two years. In 1881 he obtained a controlling interest in the New York Evening Post and Nation. Consult his 'Memoirs' (3 vols., Boston 1904).

VILLARE, vîl-lar', Pasquale, Italian historian; b. Naples, 3 Oct. 1827; d. Florence, December 1917. The son of a lawyer, he migrated to Florence after the failure of the independence movement in 1848 and began collecting new materials on Savonarola. He published the results of his researches in the Archivio Storico Italiano in 1856, and three years later was nominated professor of the philosophy of history at the University of Pisa, about the time that he published his 'Life of Savonarola,' a work that established his reputation as a historian. He held the office of vice-chancellor and representation. His social political writings, however, exerted the most powerful influence in Italy, especially after the collapse of 1866, when he plainly told his countrymen that the nation itself was capable of achieving its illustrious aims. His second most important work, the 'Life of Machiavelli,' appeared a few years later. In 1867 Villari was elected to the Chamber of Deputies, and appointed to the senate in 1884, and became its vice-president in 1887. In the Rudini Cabinet of 1891 he was Minister of Education, when he introduced valuable reforms in the curriculum of the schools.

VILLARS, vîl-lâr, Claude Louis Hector, Duc de, French soldier; b. Moulins, France, 8 May 1653; d. Turin, Italy, 17 June 1734. He entered the army in 1672, served under Turenne, Luxembourg and Créqui; was appointed lieutenant-general in 1693, and in 1699-1701 he was ambassador to Vienna. During the war of the Spanish Succession he received 1702 his first independent command, defeated Prince Louis of Baden at Friedlingen, 14 October, and was created marshal. He joined the Elector of Bavaria in 1703, gained a signal victory at Höchstädt in that year. In 1709 he succeeded Ven- domé as commander of the army in the Netherlands, and in order to save Mons he engaged Marlborough and Eugene at Malplaquet, 12 Sept. 1709. He was defeated and badly wounded, but was victorious over the allies at Denain, 24 July 1712. In March 1714, he concluded the peace of Rastadt, On the outbreak of the war with Austria he again took the field with rank of grand-marshal of France, and conducted a successful campaign with his wonted energy, although he was then 61. He resigned his command because the king of Sardinia to co-operate with his plans, but died before his recall came. His 'Mémoires' (1884-92) are not regarded as authentic. Consult the biographies by Seguy (1735), Anquetil (1764), and Babeau (1892).

VILÉHARDOUIN, vîl-âr-doo-ân, Geoffroi de, French chronicler; b. Villehardouin, near Troyes, France, about 1160; d. before 1213. He was one of the earliest of French historians, and of his life little is known save what is gathered from his 'Histoire de la Conquête de Constantinople.' He seems to have taken an important part in the Fourth Crusade; took the cross in 1199; was one of the commissioners to arrange with the Venetians for the transportation of the crusaders; fought at the siege of Constantinople, and gained high repute as a diplomat. He became marshal of Romaine after the establishment of the Latin empire and was granted the fief of Messina in 1207. From this time all trace of him is lost. His 'Histoire' is a clear and collected relation of the events of the Crusade from 1198-1207, and is valuable both from the historical and literary standpoint. The first printed edition was that of 1585; later ones include Du Cange (1657); Dom Brail (1823); N. de Wailly (1872); 3d ed., 1882, by Comte de Sainte-Beuve's 'Causeries du Lundi' (Vol. IX).

VILÉLEINS, serfs who grew up along with the feudal customs of Europe. A feudal lord received from his superior, on condition of military service, a grant of conquered land, which he distributed among his dependents on two distinct tenures or classes of tenure. The freemen, who were the kindred or followers of the conqueror, received their land on the same condition of military service as himself. The conquerors or the serfs who were not directly employed in domestic or personal service were allowed to cultivate the land on the tenure of menial or non-military services, either determinate or indeterminate. Such is the simple origin of village. In some cases the villeins were at the absolute disposal of their lord, who could sell them or deal with them as he pleased. In others they were attached to the soil, and formed part of its movable wealth. Sometimes they held by defined services, such as making and repairing roads, felling timber, or cultivating the lord's domains. In these cases the control of justice was commonly in the hands of their lord, against whose oppression they had no redress. Hallam says that in England
they were incapable of property; yet even in England, when the laws began to extend their protection to personal rights, the association of villeins with the rights and jurisdiction of property, subject to customary services, which were finally commuted into money rents. Villeneage appears to have died out in England, without special legislation to abolish it. The system of agricultural labor under yearly contract, with violation of contract on the part of the laborer punishable by imprisonment, which continued in England down to the latter part of the 19th century, partook essentially of villeneage, as the laborers had to face prosecution as vagrants or renew each year the obligation of servitude, which might fairly be called involuntary. Villein is the progenitor of the modern word villain, and has degenerated in meaning. Villena — if the involuntary servitude of white persons not convicted of crime comes within that term — has never existed in the United States, except in the form of indentured apprenticeship, which in colonial days was practiced to a considerable extent in the form of servitude known as redemption, as when immigrants were sold and bound out for a term of years to pay the expenses of their passage. Redemption servitude existed long after the United States became independent, and many respectable and even prominent families are descended from redemptioners. Consult Page, T. W., 'End of Villainage in England' (New York 1900).

The peasons of Mexico and New Mexico were essentially villeins attached to the soil. Peasancy was abolished in the United States, 2 March 1867. See Peons and Peonage; Serfs; Slavery; United States — Slavery.

VILLEMAIN, vēl-mān', Abel François, French author: b. Paris, 11 June 1790; d. there, 8 May 1870. He was educated at the Lycée Louis-le-Grand, and in 1810 became assistant professor of rhetoric at the Lycée Charlemagne. He was subsequently professor at the École Normale and also occupied the chair of eloquence at the Sorbonne. He was elected to the Academy in 1821, and in 1827 was elected with Lacretelle and Chateaubriand to draft its protest against the revival of the censorship. In 1827 he was a deputy, became a peer of France in 1832, was Minister of Public Instruction in 1838-44 and in the last-named year resigned because of ill health. After the establishment of the empire he retired from politics. He was three times awarded the prize of the Academy; in 1812 for his 'Euloge de Montaigne'; in 1814 for 'Advantages et Inconvénients de la Critique'; and in 1816 his 'Euloge de Montesquieu' in 1816. As a critic his keen wit, quick appreciation and brilliant command of rhetoric made him a power in French letters. His works include 'Histoire de Cromwell' (2 vols., 1817); 'Discours et Mêlange de Littéraire' (1821); 'Cours de Littérature Française' (5 vols., 1826-29); 'Souvenirs Contemporains d'Histoire et de Littérature' (1856); 'Histoire de Grégoire VII' (1873), etc.

VILLEMESSENT, vēl-mē-sā̃, Jean Hippolyte, French journalist: b. Rouen, 22 April 1812; d. Montaigu-les-Fonts, 14 August 1879. He went to Paris in 1839, entered journalism and for a time wrote the fashion department of the Girardin Presse, using the signature 'Louise de Saint Loup.' In 1854 he re-established Le Figaro as a semi-weekly, making it a daily after 1865. Consult his 'Mémoires d'un Journaliste' (1867).

VILLENAGE. See Villains.

VILLENUEVE, vēl-nūv', Pierre-Charles-Jean-Baptiste-Sylvestre De, French admiral: b. Valensole, September 9, 1749; d. 31 Dec. 1763; 22 April 1806, of ancient and noble family. Villeneuve entered the navy in his 15th year, and passed as captain 1793. In 1796 he was raised to the rank of captain of division (equivalent to commodore), and commanded the rear division at the battle of the Nile. In 1804 he was nominated vice-admiral; and in the following year was appointed to the command of the Toulon squadron. Having sailed to the Azores, he encountered British squadrons, under Sir Robert Calder, and a fierce fight ensued, which lasted till dark. On the following morning, neither side cared to renew the engagement (for which Villeneuve was abused by Le Moniteur, and Adhemar put on trial), and Villeneuve, unable to reach Brest, returned to Cadiz, where he was strictly blockaded by Nelson. The severity with which he was treated by Napoleon on account of these reverses, and the further indignity of being superseded, goaded Villeneuve into the desperate resolve of engaging Nelson before his successor could arrive at Cadiz. The memorable conflict of Trafalgar was the result. Villeneuve, whose vessel, the Bucentaure, was completely dismantled, was forced to strike his flag; and was made prisoner, and conveyed to England, whence he returned to France April 1806. He stopped at Rennes, with the view of ascertaining the kind of reception he was likely to meet at Paris from the empress. The result of his inquiries was unfavorable; and on the morning of 22 April he was found dead in bed, with six knife-wounds in his heart, inflicted by his own hand.

VILLENUEVE D'AGEN, vēl-nūv' dā-zhōng', or VILLENUEVE-SUR-LOT, vēr-lō̅', France, town, and the depart. of Lot-et-Garonne; in a charming valley, 22 miles by rail north of Agen. The river Lot, which flows through the town, is here crossed by a remarkably bold bridge of a single arch, with span of 118 feet and height of 59 feet. The town, formerly called Gajac, was completely destroyed in the wars of the early part of the 13th century. When rebuilt it received its present name. A great trade is carried on in wines, prunes, cattle, and iron, and there are manufactories of satin-cloth, table-linen and copperware. Pop. 13,181.

VILLIERS, vēl-yār, Charles Pelham, English statesman: b. London, 3 Jan. 1802; d. 16 Jan. 1898. He was graduated from Saint John's College, Cambridge, in 1824, was called to the bar of Lincoln's Inn in 1827, appointed secretary to the master of the rolls in 1830, the examiner of witnesses at the Court of Chancery in 1833. He was returned to Parliament for Wolverhampton in 1835 and until his death remained the representative of that constituency. From the first he strongly advocated the repeal of the corn laws, and the free trade movement, and was one of the principal advocates of free trade before Cobden and Bright entered Parliament and while Gladstone still favored the corn-laws. After the formation of the Anti-
Corn-Law League Villiers became the leader of the movement in Parliament and continued to press the agitation. The accession of Bright and Cobden to the ranks of Parliamentary free traders further strengthened the cause, and Villiers saw his purpose achieved when in 1846 Peel joined their ranks. In 1859 he became a member of the Palmerston Cabinet and also presided over the Board, which posts he resigned in 1866. During the American Civil War he ably seconded Palmerston in his support of the Northern States, and in later years was a determined advocate of the Union of Ireland and Great Britain. He introduced in Parliament the Union Chargeability Bill and secured its passage in 1865, supported the Penny-Postage Act and throughout his entire career never deviated from the principles of reform to which he had pledged himself on his election in 1835. A selection from his speeches was published in 'Free-Trade Speeches of Hon. Charles Pelham Villiers, M.P.' (2 vols. 1883).

VILLIERS, Frederic, English artist and war correspondent: b. London, 23 April 1852. He was educated in France and studied at South Kensington; he was a Royal Academy. He was a war artist for The Graphic in Serbia in 1876 and accompanied the Russian army in Turkey in 1877-78. He was a witness of the bombardment of Alexandria in 1882, was subsequently in Abyssinia, Bulgaria, Serbia and Burma, and in 1898 made a lecture tour in this country. As special artist and correspondent for the New York Herald and other journals he accompanied the Japanese army in 1894, represented the London Standard in 1897 during the Greco-Turkish War, and in 1898 accompanied Kitchener in the Sudan. During the Boer War in 1899 he was in South Africa as correspondent for the Illustrated London News. He has written and illustrated several books.

VILLIERS, George, Duke of Buckingham. See BUCKINGHAM, DUKE OF.

VILLIERS, John Henry de, 1st Baron De Villiers: b. 1842; d. 2 Sept. 1914. He was lord chief justice of Cape of Good Hope, president of the Legislative Council, member of the Judicial Committee of the Privy Council, and became chief justice of the Union of South Africa.

VILLISCA, vil-i'ska, Iowa, town in Montgomery County, at the confluence of the East and West branches of the Nodaway River, and on the Chicago, Burlington and Quincy Railroad, 65 miles southeast of Council Bluffs. It is in a rich agricultural region; in the vicinity are deposits of fire-clay and soapstone. The chief manufactures are clay products, which include brick and tile, and flour and dairy products. There are large shipments of fruit, wheat, corn, hay, vegetables, butter, eggs, poultry and livestock. There are two banks and a newspaper. Pop. 2,132.

VILLON, vil-on, Francois, French poet: b. Paris, 1431; d. about 1484. His real name was Francois de Montcorbier, but he adopted the name of his guardian, Guillaume de Villon, a priest. He received the degree of master of arts in 1452, and three years later fled the country because he had killed a priest. He was pardoned in 1450 when it had become clear that the deed was done in self-defense, but immediately afterward he engaged in a series of extensive robberies, for which he was sentenced to death. While lying in prison awaiting the execution of his sentence he wrote the epitaph in which he depicts himself and his companions suspended on the gibbet. His sentence was commuted to banishment, but in 1451 he was again in prison, this time at Meung, perhaps for sacrilege. He was set free in October of that year in consequence of a jail delivery ordered by Louis XI on the occasion of his visit to the town. Nothing is known of his subsequent career. His works include 'L'Infant Terrible' (1456); 'Le Grand Testament' (about 1461); and numerous ballads. The first dated edition of his works is that of 1469, and of modern editions the best are those of Moland (1879) and Longnon (1892). There is an English translation of much of his best work by John Payne (new ed., 1892). Andrew Lang, Swinburne and others have also made renderings. Consult Longnon, 'Etude Biographique' (1878); Stevenison, R. L., 'Familiar Studies' (1888); Schwebw, 'Le Jargon des Coquillards en 1455' (1890); Paris, 'Francois Villon' (1901).

VILNA, or WILNA, Russia, (1) Capital of the government of the same name, on the Vilia, 415 miles southwest of Petrograd, and the 10th city of European Russia. It was the former capital of Lithuania, but came under Russian control in 1795. It is a picturesque, partly on hills, partly on the banks of the river, and contains numerous convents and churches. The most notable buildings are the governor's palace, the town-house and the buildings of the now disused Polish University. The Greek and the Roman Catholic cathedrals are also worthy of notice. Educational institutions are numerous, including a fine museum and a large public library. The manufactures include tobacco, lead pencils, hats, leather, etc., and there is an extensive trade in grain and timber. Vilna dates from the 10th century. Pop. of which one-half is Lithuanian, about 204,290. (2) The government, which lies on the Baltic, has an area of 16,481 square miles and is a low marshy country. It is fed by the Venta and the Dvina, Niemen and Vilia rivers, which also provide means of transportation for a large area. Pop. about 2,083,200.

VINAGO, vi-nag'o, genus of fruit-pigeons, family Columbidae, the members of which have a comparatively stout solid bill, laterally compressed; with a hard, hooked and inflated tip; the tarsi short; feet large, and formed for perching or grasping. The species, of which not many are known, are natives of tropical Asia and Africa; they inhabit forests, and are shy and timid.

VINAIGRETTE (French, from vinaigre, vinegar; from vin, wine; aque, acid, sour), a small box or bottle (the inner cover of which is perforated) for containing a bit of sponge saturated with alcoholic vinegar or the like, used to stimulate or refresh by the sense of smell.

VINALHAVEN, vi-nal-hæ'ven, Me., town in Knox County, about 13 miles east of Rockland, the county-seat. The town is made of several small islands in Penobscot Bay. The
VINCIENNES

granite quarries are a source of income and the place is a favorite summer resort. Permanent pop. 2,300.

VINCIENNES, vihn-sen', Jean Baptiste Bis-
sot, Sieur de, Canadian explorer: b. Quebec, Canada, January 1688; d. Illinois, 1736. He came from a wealthy family of Quebec, was a relative of the explorer Louis Joliet, and from early on was engaged in Western expeditions. He became an ensign in the Canadian army in 1701 and was detailed to service in the West, where he became a favorite with the Miami Indians. In 1704 he rescued some Iroquois prisoners from the Ottawas; saved Detroit from an invasion by the Foxes in 1712; and afterward resided successively in Miami, Ohio, and Michigan. He founded the city of Vincennes, Ind., where he built a fort and a trading-post, and in 1736 he joined the expedition against the Chickasaw Indians. The expedition was conducted by d'Artagouette and was at first successful, but a series of victories were followed by defeat owing to the desertion of the Miamis. Vincennes was captured and together with the commander and others of the expedition was burned at the stake.

VINCIENNES, France, a town in the depart- ment of the Seine, a southeastern suburb of Paris, just outside the walls and close to the Bois-de-Vincennes. Its large old castle, which is surrounded by lofty walls and deep ditches, was once the frequent residence of the French kings, and was long a state prison. It now forms part of the defenses of Paris. The donjon or keep is a square tower 170 feet high with walls 16 feet thick. The Bois-de-Vincennes (q. v.) is a beautiful and extensive public park which contains an exercise-ground for infantry, and an area set apart for artillery purposes. There are manufactories of chemicals and hardware; also a large military school and hospital. Pop. of town, about 33,000; of commune, about 40,000.

VINCIENNES, vihn-sen', Ind., city, county-seat of Knox County, on the Wabash River and on the Pennsylvania, the Baltimore and Ohio, and the Cleveland, Cincinnati, Chicago and Saint Louis railroads, about 105 miles south- west of Indianapolis. The city is 50 miles north of Evansville. It is in a fertile agricultural region, a rich Prairie section, on a gradual slope to the river. There are a round hundred of manufacturing establishments, with annual products approaching $4,000,000. The chief manufactur- es are flour, lumber products, sewer-pipe, brick, tile, wrapping paper, iron and tin products, glass, furniture, paper, agricultural imple- ments, cement, plaster, and foundry and machine-shop products. The city is laid out in squares, with streets nearly all 50 feet wide. Harrison Park, the plaza at the city-hall, and the Courthouse square are the chief park-lands owned by the city. The principal public buildings are the county courthouse ($400,000), the city hall ($100,000), the government building, the old hall where the legislature met and then held by the city occupied by William Henry Harrison when he was governor of the Territory, the church once used as the Roman Catholic cathedral, the Vincennes Sanatorium and Saint Vincent's Orphanage for boys. The city has two high schools, one for white pupils and one for colored (1882). Vincennes University, founded in 1806. Saint Rose Academy (1811), a public and parochial grade schools, a public library and three school libraries. There are four banks and three daily besides several weekly newspapers. Vincennes was incorporated as a borough in 1839 and as a city in 1850. The government is administered by a mayor and a corporation of 5 persons elected for 2 years. The city is 1,800 feet long and 1,500 feet wide. Vincennes is founded on a gentle slope and is well adapted for the culture of cereals. The soil is good and the water abundant. The city is surrounded by a handsome avenue and has a handsome and commodious park. It is supplied with water from a well 100 feet deep. The population was 9,500 in 1860, and 10,000 in 1870.

History.—In the vicinity of Vincennes are many Indian mounds. The first missionaries and explorers, who entered this part of Indiana by way of the river, found, where is now the city, an Indian village called Chip-kaw-kay. Vincennes is the oldest place in the State. In 1702 the French built here a fort, and for several years it was the seat of the empire of France in the Ohio Valley. French from Can- ada settled here, and the place was called The Post,* for over 30 years, when the name was changed to Vincennes, in honor of Morgan de Vincennes, who had been one of the officers of the fort. In 1763 the British obtained possession of the place, but owing to disturbed conditions in the East General Gage gave the fort but little attention, so Vincennes was left in the hands of one of the Lieutenants, and was not a capital until 1777, when, on 19 May Lieutenant-Governor Abbot of Detroit arrived and took possession. He called the place Fort Sackville. The British incited the Indians to attacks on the whites who were governed by a council of the tribe or who were in rebellion against Great Britain. George Rogers Clark, of Kentucky, desiring to protect his country from those di- astrous attacks, conceived the plan of capturing Detroit, Vincennes and Kaskaskia, and sub- mitted his plan to Patrick Henry, then govern- nor of Virginia. After much argument on the part of Clark and hesitancy on the part of Henry, the governor authorised Clark to recruit 350 Virginians for the expedition, and gave him money and ammunition. Clark pro- ceeded with the undertaking, and 4 July 1778 captured Kaskaskia. With the aid of Father Gibault, of Kaskaskia, Clark secured the good will of the French people of Vincennes. In 1779 Clark captured Detroit and 50 miles north of Evansville. It was some time before the British in Detroit heard of the changes in the Ohio Valley. Then a force of 500 regulars and In- dians under the British commander, Henry Hamilton, embarked for Vincennes. Captain Helm, in charge of the force, did not learn of the approach of the British until they were within three miles of the fort. His garrison consisted of himself, a few inhabitants and one American soldier. The inhabitants went to their homes and Helm planted his two cannon; he took charge of one and the remainder of his force stood by the other. When Hamilton de- manded a surrender, Helm said no man could enter the fort until the terms of surrender were made known. Hamilton promised the honors of war and then both houses occupied by William Henry Harrison when he was governor of the Territory, the church once used as the Roman Catholic cathedral, the Vincennes Sanatorium and Saint Vincent's Orphanage for boys. The city has two high schools, one for white pupils and one for colored (1882). Vincennes University, founded in 1806. Saint Rose Academy (1811), a public and parochial grade schools, a public library and three school libraries. There are four banks and three daily besides several weekly newspapers. Vincennes was incorporated as a borough in 1839 and as a city in 1850. The government is administered by a mayor and a corporation of 5 persons elected for 2 years. The city is 1,800 feet long and 1,500 feet wide. Vincennes is founded on a gentle slope and is well adapted for the culture of cereals. The soil is good and the water abundant. The city is surrounded by a handsome avenue and has a handsome and commodious park. It is supplied with water from a well 100 feet deep. The population was 9,500 in 1860, and 10,000 in 1870.
Helm's request, sent to Clark before the arrival of the British. When Vigo approached Vincennes he was more than surprised to learn that the place was in possession of the British, who at once arrested him. He demanded release on the ground that he was from Saint Louis. Hammond said, "I have brought you not to discover that the French inhabitants would cut off the source of supplies for the soldiers unless Vigo were released. Vigo was finally given his freedom, on condition that on his way to Saint Louis he would do no hostile act to the British interest." This he promised, and at once took a canoe, descended the Wabash to the Ohio, then to the Mississippi and arrived at Saint Louis without breaking his pledge. As the boat touched the shore, Vigo sprang on land, then back into the boat, and started for Kaskaskia, to inform Clark about Vincennes. Clark saw at once that unless something were done the whole Ohio Valley would be lost to America. Desperate measures were resorted to. The3 small force of poorly clothed men was difficult at any time, but almost impossible in winter. On 5 Feb. 1779 he sent 64 men by boats, carrying provisions and ammunition, and with 170 men they began a march of 200 miles. There were no tents, no towns or even settlements where they were sure of finding friends. All the inhabitants of Kaskaskia accompanied them the first few miles of the journey; then soldiers and citizens knelt and the parish priest gave them his blessing; and Clark and his men marched on to Vincennes, leaving the people on their knees praying for the success of the American nation. On the 23d of February Clark and his men arrived at the heights back of Vincennes, and sending word to the French inhabitants that they were there, the hungry soldiers were soon supplied with provisions. That night the Americans marched into the town and at once began an attack on the fort. The next morning Hamilton surrendered, and the American flag was placed on the fort, and then and there the name was changed from Fort Sackville to Fort Patrick Henry. The place was held by Virginia until 1783, when it was ceded to the United States. The place was held by Virginia until 1800, when the Indiana Territory was established and Vincennes was made the capital. In 1813 the territorial capital was removed to Corydon. A university and a library had been established. The first church in the Northwest Territory was built in Vincennes in 1742, by Father Meurin, from France. The first school in Indiana was established here by Father Rivet.

Vincennes brought to the United States the great Middle. West and made the Louisiana Purchase a possibility. Had it not been for the bravery, intelligence and patriotism of George Rogers Clark and his Virginians, and the devoted French of the Ohio Valley, the western limit of the United States would have been, for many years at least, the Alleghany Mountains. But Vincennes has done more for the preservation and extension of the Union; here Aaron Burr received his first and most decided check when he sought to break up the Union. The great reform for the care of the insane was made by the Indiana constitution, and to Benjamin Parke of Vincennes is due the credit of inserting the clause regarding the matter. Not only may Vincennes, 'on the banks of the Wabash,' be called "The Key to the Northwest," but also a historic city that was the scene of many heroic deeds. Consult Law, 'The Colonial History of Vincennes and Smith in Powell's 'Historic Towns of the Western States.'

VINCENNES UNIVERSITY, located at Vincennes, Ind., non-sectarian and coeducational, is the oldest university west of the Alleghany Mountains. It includes the following departments: College courses leading to degrees for A.B., A.M.; normal (teachers' training course)—accredited for classes A, B, C; agricultural, courses in agronomy, animal husbandry, horticulture; home economics, courses in cooking, sewing, dietetics, household management, home nursing, etc.; preparatory, a commissioned high school under the laws of Indiana; music, courses in piano, voice and singing; expression, courses in reading, dramatics, effective speech correction. The enrollment in all departments averages 400 students; the teaching force numbers 24. It owes its establishment to a grant of land made by Congress in 1804 in the Vincennes land district for the use of a seminary of learning. In 1806 Vincennes University was incorporated and designated as the recipient of the land granted by Congress. In 1830 and subsequently the legislature assumed the right to sell and rent the lands and appropriate the proceeds for other purposes. The resources of the university were thus so crippled that it was forced to suspend work for a time; but in 1843 the trustees carried the matter into the courts and finally by appeal to the Supreme Court of the United States obtained judgment in favor of the university.

VINCENT, vín'sënt (or VINCEN'TUS, vín-sén-chi-ús), Saint, Christian martyr: d. about 303. He was archdeacon of Saragossa in Spain, and in the persecution of Diocletian was put to death for the Christian faith at Valencia. The narrative of his martyrdom, called 'Passio Sancti Vincentii' (in 'Acta Sanctorum' under date 2 January), is very ancient, being quoted by Augustine, Prudentius, Paulinus Nolarus, Venantius Fortunatus, and Gildas. It is full of almost incredible details of tortures and miracles.

VINCENT, vín'sënt, Boyd, American Protestant Episcopal bishop: b. Erie, Pa., 18 May 1845. He was graduated from Yale in 1867 and from the Berkeley Divinity School, Middletown, Conn., in 1871. He took orders in the ministry in the last named year, was assistant at Saint Paul's, Erie, 1871-72, rector of Cross and Crown Church, Erie, 1872-74 and rector of Calvary Church, Pittsburgh, 1874-89. In 1889 he was consecrated bishop coadjutor of southern Ohio. In 1910 he was chairman of the Episcopal House of Bishops.

VINCENT, Charles Edward Howard, English soldier and member of Parliament: b. Sunfold, Sussex, 31 May 1849; d. 1908. Educated at Westminster School and the Military College at Sandhurst, he entered the army in 1868-73, was called to the bar of the Inner Temple in 1876 and was military commissioner
of the London Daily Telegraph at the opening of the Russo-Turkish War in 1877. In 1878 he reorganized the metropolitan detective system and has sat in Parliament as a Conservative member for Sheffield since 1885. He has published 'Russia's Advance Eastward' (1872); 'Military Geography' (1873); 'Law of Criticism and Libel' (1877); 'Law of Extradition' (1880); 'Howardian Map of British Empire' (10th ed., 1902); 'Police Code and Manual of Criminal Law,' which has passed some 15 editions, etc.

VINCENT, Frank, American traveler: b. Brooklyn, N. Y., 2 April 1848; d. 1916. He was educated at Yale and for many years devoted himself to a systematic tour of the world. In 1884 he gave to the New York Metropolitan Museum of Art an extensive collection of Indo-Chinese antiquities and art. His published works include: 'The Land of the White Elephant' (1874); 'Through and Through the Tropics' (1876); 'Norsk, Lapp, and Finns' (1880), 'A Man About South America' (1890); 'In and Out of Central America' (1891); 'Actual Africa' (1895), etc.

VINCENT, George Edgar, American educator, the son of Bishop John Heyl Vincent: b. 21 March 1884 at Rockford, Ill. Graduated at Yale, A.B. 1888; Ph.D., University of Chicago, 1896; LL.D., 1911; LL.D., Yale University, 1911; also from the University of Michigan, 1913. After graduation from college he engaged for a time in literary and editorial work and spent a year abroad. He was a Fellow in sociology at Chicago while working for his degree. Thence he was promoted as assistant professor, associate professor and then professor and in 1900 was made dean of the junior colleges. From 1907 to 1911 he was dean of the faculties of arts, literature and science. Then he became president of the University of Minnesota (1911-17). Since 15 May 1917 he has served as president of the Rockefeller Foundation of New York. At the same time is a member of the General Education Board. In 1888 he became vice-president of the Chautauqua System. Ten years later he was made principal of instruction and served as president 1907-15 and since then has been honorary president. He served a term as president of the American Sociological Society. He is author of 'The Social Mind and Education' (1896); (with Albin W. Small) 'An Introduction to the Study of Society' (1895).

VINCENT, John Heyl, American Methodist bishop: b. Tuscaloosa, Ala., 23 Feb. 1832. He was educated at the Wesleyan Institute, Newark, N. J., engaged in preaching at 18 and in 1857 was ordained elder. In 1857-65 he was pastor at Galena, Ill., and at Chicago. He founded the Sunday-School Quarterly in 1865 and the Sunday-School Teacher in 1866, embodying in them the Sunday-school lesson-system since widely adopted. In 1874 he established, in conjunction with Louis Miller, the Chautauqua Assembly, of which he was chancellor 1878-1900. He was elected bishop in 1888, residing at Topeka, Kan., until 1900, when he became resident bishop in charge of the European work of the Methodist Episcopal Church. In addition to various textbooks published for the Chautauqua Socir, he has written 'Little Footprints in Bible Lands' (1861); 'The Modern Sunday-School' (1887); 'Unto Him' (1899); 'Family Worship for Every Day' (1905), etc.

VINCENT, Leon Henry, American author and lecturer: b. Chicago, 1 Jan. 1859. He was graduated from Syracuse University and since 1885 has given his time mainly to lecturing upon English and American literature. He has published 'The Bibliothèque and Other People' (1898); 'Hotel de Rambouillet and the Precieuses' (1900); 'The French Academy' (1901); 'Corneille' (1901); 'Molière' (1902).

VINCENT, Marvin Richardson, American Presbyterian clergyman: b. Poughkeepsie, N. Y., 11 Sept. 1834. He was graduated at Columbia in 1854; was classical instructor in the Columbia Grammar School 1854-58 and professor of languages in the Methodist University of Troy, N. Y., 1859-60. In the year last named he entered the Methodist ministry, but three years later became a Presbyterian and was successively pastor of the First Presbyterian Church of Troy, 1863-73, and of the church of the Covenant, New York, 1873-85. Afterward he has been professor of New Testament criticism at Union Theological Seminary, New York. With C. T. Lewis he translated Bengel's 'Gnomon of the New Testament' (1860-62). He is the author of 'Amusement at a Factory in Christian Training' (1867); 'The Two Prodigals' (1876); 'Gates into the Psalm Country,' a series of descriptions (1878); 'Stranger and Guest' (1879); 'Faith and Character' (1880); 'The Mist of a Man's Life' (1882); 'Christian as a Teacher' (1886); 'Word Studies in the New Testament' (1887-1900); 'That Monster, the Higher Critic' (1894); 'The Age of Hildebrand' (1896); 'A History of the Textual Criticism of the New Testament' (1899), etc. In 1904 he published a translation of Dante's 'Inferno.'

VINCENT OF BEAUVAINS, French priest and encyclopedist: b. about 1190; d. 1264. The years of his birth and death are uncertain and those given above are most generally believed to be approximately correct. Another historical little also is known. It is believed that Vincent joined the Dominicans in Paris about the year 1218 and with the exception of extended visits to Louis IX at Royaumont the remainder of his life was spent in the monastery of his order at Beauvains. Possessed of a keen, analytic and orderly mind and endowed with a remarkable capacity for work, Vincent undertook the stupendous task of compiling a systematic and comprehensive treatment of all branches of human knowledge. Louis IX helped him in procuring many of the works necessary for this task. The general title of Vincent's encyclopedia is 'Speculum Majus.' The first part, 'Speculum Naturale,' contains 32 books and 3,718 chapters; it treats of cosmography, physiology, psychology, physics, theology, botany, zoology, mineralogy, agriculture. There is an edition of this work in the Wheeler collection at the American Institute of Electrical Engineers. It comprises two royal folio volumes, containing 694 double-column pages of 66 lines to the column. It was probably published about 1468 and at Strassburg. The second part of Vincent's great work is the 'Speculum Doctrinali,' which contains 12 books and 3,274 chapters. It deals with logic, poetry,
rhetoric, astronomy, geometry, education, industrial and mechanical arts, anatomy, surgery, medicine, jurisprudence, etc. The third division is the 'Speculum Historiale' in 31 books and 3293 chapters and brings the history down to 1250 A.D. A fourth part, the 'Speculum Morale,' was included in early editions but its authenticity is questioned. The 'Speculum Majus' contains in all 80 books, divided into 9324 chapters, and is as large as the Paris, but was that it would be equal to 60 volumes, octavo, of our time, which gives some idea of the magnitude of the work undertaken by this Dominican in the early 13th century. More than five centuries were destined to pass before the encyclopedic idea was again formulated and then it required a brilliant group to perform what Vincent had accomplished single-handed. Other works of Vincent are 'De eruditione filiorum regalium' and 'Tractatus consolatorius de morte amici.' The best edition of Vincent's work is that edited by the priests of the Society of Jesus (4 vols., Donai 1624). Consult Bourget, J. B., 'Etudes sur Vincent de Beauvais,' in the presses of the Catholic University of the State of Lorraine. (Paris 1856); Bautric, E., 'Examen des sources du speculum historiale de Vincent de Beauvais.' (Paris 1883); 'Revue des questions historiques' (Vol. XVII, Paris 1875); Daumon, 'Guillaume le Breton.' (Paris 1878); Hauréau, B., 'Les notices de M.S.S. latins de la Bibliothèque Nationale' (Vol. V, in. 1882); Mâle, E., 'L'art religieux du XIIIe siècle en France.' (Paris 1889); Boutron, 'Histoire des hommes célèbres de Saint Dominique' (Paris 1875); Wattenbach, W., 'Deutschland, Geschichtsquellen' (Vol. II, 1894).

VINCENT DE PAUL, Fr. vàⁿ-sôⁿ dê pôl, Saint, founder of the Priests of the Mission: b. Pouay, Gascony, 1570; d. Paris, 27 Sept. 1660. Some of his early years were spent on the slopes of the Pyrenees tending his father's scanty flock; but as the boy exhibited signs of remarkable promise he was sent to be educated first at Dax and then at Toulouse. There he completed his ecclesiastical studies and was ordained priest in 1695. In 1695 while on a voyage from Marseilles to Narbonne, he was captured by Turkish pirates and sent to Tunis, where he was in slavery for two years under three different masters, the last of whom, a renegade from Nice, he converted to Christianity and induced to escape with him to France. They reached Aigues-Mortes in a little skiff 28 June 1667. The next year Vincent spent in Rome, where he secured the friendship of Cardinal d'Ossat, who sent him to Paris on a secret mission to Henry IV and who afterward procured his nomination to the Abbey of Saint Leonard de Chaume, in the diocese of Rochelle. The founder of the Oratory, M. de Berulle, induced Vincent to take charge of the parish of Clichy, near Paris, but in 1612 he entered the services of the Gondi family. With the assistance of Mme. de Gondi he began giving missions on her estate. Leaving the family for a brief interval he returned to them in 1617. Several parish priests joined him in giving in the peasant missions and after each mission a conference of charity was founded for the relief of the poor. Vincent was also deeply interested in the convicts of the galleys, whose moral state was only on a par with their frightful physical misery. Vincent began visiting the galley convicts of Paris and performed for them every manner of service however repulsive. He thus won their hearts and also succeeded in interesting other persons in their behalf. With funds he collected for this purpose he purchased a house and established a hospital. Louis XIII made Vincent royal almoner of the galleys and the latter now visited Marseilles where the condition of the convicts was equally as miserable as at Paris. Missions at the convicts at Marseilles and at Bordeaux were crowned with great success. The good wrought everywhere by his missions decided Vincent to found a religious institute of priests who would maintain the work of the missions. Thus was founded the Congregation of Priests of the Mission. At Beauvais, in September 1628, Vincent began the first of his conferences and instructions to candidates for holy orders. These conferences, at first of short duration, were soon extended to two or three years and gave rise to the seminaries, as these prevailed later in France. About the same time Vincent founded the Daughters of Charity. They were established at first in a small church of the Dauphine district of Paris, to distribute alms and to visit the poor. When their number increased he grouped them into a community under the direction of Mlle. Legras. He also secured for the poor the services of the Ladies of Charity, composed of pious women who nursed the sick poor entering the Hôpital-Dieu to the number of about 25,000 annually. They also visited the prisons. Many of their numbers were of the highest rank in society. Due to them Vincent was able to collect large sums for the benefit of the poor and unfortunate. The care of foundlings was the chief new work made possible by the liberality of the Ladies of Charity. Foundlings at that time were deliberately maimed by persons who exploited them later for their own profit. A special house and four nurses were secured and within two years 4,000 foundlings were housed there at a cost of $150,000. A generous friend placed at Vincent's disposal the sum of 10,000 livres ($50,000), with which the latter founded the Hospice of the Name of Jesus, where about 40 old people of both sexes were cared for. This generous donation stimulated others and soon all the poor of Paris were adequately provided for by the establishment of the general hospital on the lands of the Saltière. About $1,000,000 was donated to this end and the king granted the land. The administration was committed to the Daughters of Charity and the greatest humanitarian work of the 17th century was accomplished. Many districts of the provinces far and near were devastated by the Thirty Years' War. Vincent sent help to the stricken people of these regions and when his treasury at last was empty he decided to print and sell the accounts sent him of the devastation of these regions. This plan was successful and resulted in the periodical called le Magasin Charitable. In the ruined provinces Vincent founded the work of the potages économiques, the tradition of which has survived to our day in the modern kitchen. Societies were founded to clean away the dirt which was a permanent cause of plague. Seeds were distributed to the peasants to aid them in restoring value to their land after the storm of war had passed. Young women were removed from the dangers of the
military zones and sheltered in various convents. After the peace Vincent directed his aims to the Irish and English Catholics whom persecution had driven from their country. All this charitable work had made Vincent's name a household word in France. Indeed, his work finds no parallel until we consider the humanitarian work performed in France and Belgium during the late war and then we have several pious organizations working to the same end; which makes the work of Vincent stand out as most remarkable, since practically all details of organization and administration devolved on him alone. He was well received at court, but never used his influence save for the welfare of the poor and needy. During the Wars of the Fronde he approached the leaders in an effort to bring about peace, and failing in this, redoubled his efforts to lessen the miseries of the strife at Paris. Soup was distributed daily through his care to over 15,000 refugees, while about 900 young women were removed from the perils of the streets. Vincent's charity was not confined within the boundaries of France. In 1638 he sent priests to the patients of Italy; others were dispatched to Ireland, Scotland, Poland and Madagascar; but perhaps the work abroad which most interested him was that inaugurated among the Christian slaves of Barbary, whose hard lot he had once shared. These poor Christians, carried off by Turkish pirates, numbered about 25,000. They were treated with less consideration by their masters than beasts of burden. Vincent sent them a priest and a lay brother as early as 1645. Others followed. These missionaries did much to ameliorate the hard lot of these slaves and were able to free some of them. For others they acted as agents with their families. At the time of Vincent's death 1,200 had been ransomed through his efforts and he had expended about $5,000,000 in their behalf. At his death the poor of France lost their best friend and humanity a Christian benefactor unequalled in modern days. On 13 Aug. 1729 Vincent was declared blessed by Benedict XIII and on 16 June 1737 was canonized by Clement XII. He was declared patron of the Sisters of Charity in 1885 by Leo XIII. Saint Vincent's festal day is 19 July. Consult also Abellin (Paris 1664; last ed. 1891); Adderley (London 1901); Collet (Nancy 1756); Chantelouze (Paris 1860); Boyle (New York 1909); De Broglie (ib. 1899); Bourguad (ib. 1908). Consult also Coste, "A quelle date Saint Vincent de Paul est-il né?" (in Revue de Garagone 1911); id., "Saint Vincent de Paul a-t-il pris à Marseille les fers d'un forçat?" (ib. 1910); Degert, Antoine, "Histoire des séminaires Français" (Vols. I, II, Paris 1912); Lorti, "Saint Vincent de Paul et sa mission sociale" (ib. 1880); Maynard, "Saint Vincent de Paul, sa vie, son temps" (ib. 1850-74).

VINCENTIAN CONGREGATION, named from its founder, the Roman Catholic saint, Vincent de Paul; an association of secular priests, who, though not forming in the strict sense a religious order, are bound by vows, and are engaged in apostolic work, hearing confessions among the people, particularly the poor. Another object of the Vincentian Congregation is the direction of episcopal seminaries and other colleges for education of ecclesiastics, as also to direct the annual devotional exercises of the secular clergy, called the Ecclesiastical Retreat. (See Vincent de Paul, Saint.) At a somewhat recent enumeration the Vincentian Congregation numbered more than 12,000 members in France, Italy, Poland, the Levant and Algeria. The members founded numerous also in the United States, and branches exist in Ireland and Scotland. The name Vincentian is given sometimes also to the sistershoods (of which there are several, and of which that of Charity is the most notable) which were founded by Saint Vincent de Paul, and even to the Charitable Lay Association, better known as the Society of Saint Vincent de Paul, which has extensive ramifications in almost all the countries in communion with the Church of Rome, and which has been the occasion of some restrictive measures in France.

VINCENTIAN PRIORS. See LAZARIATS.

VINCETOXICUM, a genus of American vines, belonging to the milk-weed family. They have usually cordate leaves and rather large, white or purple-tinted, five-merous flowers with a cup-shaped crown, in axillary umbels of fives. The United States species are found chiefly in the South. V. shortii has the odor of the strawberry shrub. Cynanchus acuminatus, with star-shaped, creamy flowers, called mosquito-catcher, because its juice has a nauseating substance on which insects become fixed, was formerly placed in this genus. Vincetoxicum is the official name of the swallow-wort.

VINCI, vënché, Leonardo da, Italian painter and sculptor: b. Vinci, Tuscany, 1452; d. Castle Cloux, France, 1519. He was the illegitimate son of Piero da Vinci, a prominent notary of Florence, and a woman of the lower class. By his father he was turned over to his grandparents at Vinci, who seem to have taken a great interest in him and to have attended to his education. When he grew older his father took him to his own house and there he lived with the other children, apparently on an equality with them and received, with them, an excellent education. He proved a good student and gradually developed an intense desire for knowledge of every kind. But he was not a bookworm. His wonderfully keen intellect enabled him to acquire information with very little effort; and his remarkable musical and social gifts made him one of the most popular young men in Florence, in the intellectual centre of Italy and the peculiar home of art. There was nothing more natural, given his remarkable talents in so many directions, than that he should have learned to paint, an art which was then taught to children as music is to-day. Among his first teachers was Andrea de Verrocchio. Little is known about his early studies in painting and sculpture, at which he seems to have worked with as much earnest endeavor and interest as at his studies in the natural sciences, in the latter of which he excelled all his companions. At the age of 20 he became a member of the Painter's Guild of Florence, then one of the most notable organizations of the age. The works concerning his early work are as few and as doubtful as the information respecting his youthful studies. It is certain that he was already a master painter in 1478 and that he was then employing others in the business of producing pictures. Much legend and tradition
have collected about this period of his career and numerous existing pictures, some of them completed and others unfinished, and others of them parts of larger works, have been attributed to him without sufficient evidence of a really trustworthy character. It is known that on this last account he was put to work by the Signoria of Florence to paint a certain picture for the Saint Bernard Chapel, in the Public Palace, but what this picture was or whether any of those put forward as it are really the picture in question, or his work at all, is very doubtful. That Da Vinci had advanced well in his art and made the most of his social talents seems certain for we find him in 1482 acting as the specially commissioned bearer of a present from the famous Lorenzo de'Medici, to another character of the age, now famous in history and tradition, Lodovico il Moro, ruler of Milan. The present itself indicates the favor in which Da Vinci was regarded at court. It was a strangely-constructed, yet beautifully-constructed, as a guide and mentor, the ambassador had himself invented and upon which he played with great skill and wondrous sweetness. This mission proved one of the most eventful undertakings in his life, since it was destined to connect him most intimately, for over a quarter of a century, with the city of 'il Moro.' But it seems it was not as a painter that the ruler of Milan valued him, so much as for his talents as an engineer and general manager. While in Milan Da Vinci seems to have been useless. He was, on all occasions, representative and manager for the duke, and acted as the ducal engineer not only in the city but on that ruler's numerous military expeditions and undertakings; and he appears to have had a higher reputation in his day in this activity of his life than in painting and to have prized it higher himself. Among his other activities, at this period, he planned and constructed the Martesana Canal. He was also one of the most notable figures at the ducal court, where he managed the most brilliant state affairs and public functions and festivals with consummate skill. He seems to have been also a sort of director of public works and, in this capacity, to have himself acted as architect of various public buildings not only in Milan but in the construction of the very handsome Milan Cathedral, but what his part was is not known definitely. Notwithstanding all these wide and varied activities, he was carrying on painting on a very extensive scale and employing numerous talented painters to execute his designs or to do the less important parts of paintings which he was executing. About this time he wrote an important work on painting, which showed a wonderful knowledge of the art. This, it is said, was intended as a guide and mentor for his own numerous pupils. Thus occupied with so many and important activities, he continued in Milan until the duke was driven out of the city in 1599. After the departure of the duke, Da Vinci went to Venice, where he remained two years, which were devoted mainly to art. Then he returned to Florence, where he seems to have been received with great favor by the Church and the artist fraternity. He secured numerous commissions from churches and monasteries; and some of the works that he executed in this connection, and the designs he drew for others to paint from created a great impression upon the artists of his days. They were consequently copied and imitated extensively not only in Italy, but a little later on throughout all the Latin countries. One of the most remarkable of these was a Madonna, the design for which was worked out by Da Vinci several times afterward, notably in his famous Madonna and Saint Catharine in the Louvre.

In the midst of his triumphs in art Da Vinci became military engineer to Cesare Borgia (1502), a position which he probably retained for some considerable time, as it enabled him to move about through central Italy, and when occasion required to make visits to other parts of the peninsula, one of which he made the following year to Florence, where he served on artistic commissions and did additional military engineering. It was about this time that he painted the famous 'Mona Lisa' (Louvre), a portrait that has probably been more written about than any other in the world, especially during the second decade of the sixteenth century. Da Vinci spent four years on this portrait, and it is said that even then (1503-06) he was not satisfied with it. But notwithstanding his own opinion in the matter, the art judgment of the world is inclined to pronounce it his greatest triumph. About the time of the conclusion of this latter painting Da Vinci was appointed painter to the king (Louis XII). This was perhaps the busiest period in his life. He maintained studios for painting and carried on engineering projects and studies in natural sciences in Florence and Milan, in both of which places he had numerous pupils of surpassing worth who executed his designs for him to supply the incessant demands for his art work from churches and individuals. The art work done by his pupils in Milan was especially notable, and much of it was, at one time, believed to be altogether the work of the master himself. One of the most remarkable canvases of this period is the 'Madonna of the Grotto,' of which two copies exist, one in the Louvre and the other in the National Gallery. Much discussion has taken place as to which of these is the original. It is probable that both are, though many critics pretend to see in the copy in the Louvre the more direct work of Da Vinci's style and peculiar artistic qualities. However, both copies are truly worthy of the master; and if one of them was painted by a hand other than his it must have been some one who was able to enter fully into all his moods and who had worked under him so long as to have completely absorbed his atmosphere. From 1513 to 1515 Da Vinci seems to have resided in Rome, having gone there on the departure of the French; but he returned to Milan in the latter year to take charge of the decorations and festivities attendant upon the entry of the French king, Francis I, who rewarded him by appointing him court painter with an annual allowance of 700 scudi in gold. The king also commissioned him to buy up all his own pictures. This he did, and with them he accompanied the French sovereign to France the following year, where he seems to have remained for the rest of his life, giving his time to the study of art and sciences.

Da Vinci, in a sense, revolutionized the art of painting and drawing. His technique was
VINE—VINE IN ART AND SYMBOLISM

masterly and really wonderful for his age. It enabled him to work with the greatest freedom and an awareness of touch and the mystery of design, of drawing and coloring until his day unknown. His portraits, his figures and his designs were always wonderfully true to life; and they led the artists of his age to seek for a fuller and truer expression of all the manifold manifestations of life. This is perhaps the greatest of the many great qualities of the art expression of Da Vinci. Undoubtedly his studies in the natural sciences and, especially in physiology and anatomy, helped him solve many questions that his predecessors had not been able to; and the perfection of his drawing and the representation of the human and other forms seems to have quickened his already keen sense of coloring and of contrast of light and shade and of the blending of the two. He surpassed all his predecessors in the mastery he attained in the depicting of the mystical, the poetical, the sympathetic and the attractive in the human face. It is said that his several years spent in the painting of the Mona Lisa were constant strivings to catch the fleeting manifestations of the secret soul of his attractive and winsome subject. But he was not satisfied with mastering the atmosphere of the human face; he turned his attention to the atmosphere of landscape; and here again he succeeded so well that he was very fond of introducing landscape backgrounds into his pictures and portraits, which he did with telling effect. His strange genius is manifested in the perfect unity, form and artistic sense of the human and the landscape elements in his pictures. They seem to have been made for one another, to have grown up together. Insensibly the Italian artists of his day and of the following generation felt his power and recognized his superior genius; and among his numerous pupils were several who understood him so well that, as we have seen, their work has been frequently taken for his. There was not a great painter in Italy for the generation following his death who did not owe much to him. Not the least of these was Raphael; and among them were also such masters of the graphic art as Fra Bartolommeo and Andrea del Sarto, who in turn influenced hundreds of art students in favor of the High Renaissance whose great master was Da Vinci.

Da Vinci was an inventor of note, one of the greatest and most successful engineers of his time and perhaps the deepest thinker and most profound investigator into all the known branches of science of his age. In many of his investigations he went far beyond his contemporaries.

Bibliography.—For a list of pictures consult any good history of Italian art; Da Vinci's own manuscripts, published in facsimile (Paris 1881–91; Milan 1891–95); and his Trattato della pittura, which has been published numerous times (London 1802; Vienna 1882; and Rome 1890). An English edition, with original text, of his literary works, was published by J. P. Richter (London 1883). Consult biographies by Amoretti (Milan 1803) and Paul Müller-Weider (Osnabrück 1849); the biographies by Rosenberg (Bielefeld 1898; English translation 1903); by E. Müntz (Paris 1899; English translation, London 1899); Voynysk (Saint Petersburg 1900; English translation by Heaton and Black, London 1904); Horne (London 1908); McCurdy (London 1904); Séailles (Paris 1912) and Gronow (1902); also Uzielli, Ricerche intorno a Leonardo da Vinci (2d ed., Turin 1896 et seq.); and the critical works of Dr. Jens Thûs (London s.d.) and Oswald Sirén (New Haven, rev. ed., 1916); Lomazzo, Gli storici della Pittura (Milan 1858); id., Idea del tempio della pittura (ib., 1591); Venturi, J. VINE. See Viticulture.

VINE IN ART AND SYMBOLISM.

The grape vine (vitis vinifera) figures frequently as a symbol from far distant times. In the Greek mythology Dionysius (and with the Romans Bacchus) was god of the vintage and, therefore, a grape vine with bunches of the fruit are among their attributes. Their attendants on the Bacchanalian festivals—the Bacchanales—hence had the vine as an attribute, together with the cornucopia often entwined with vine branches. For the same reason the Greek wine-cup (kantharos) is commonly decorated with the vine and grapes; wine, of course, being drunk as a libation to the god. In Christian iconography the vine also frequently enters. It is several times mentioned in the New Testament. We have the parable of the kingdom of heaven likened to the father starting to engage laborers on a vineyard. The vine is used as symbol of Christ or based on his own statement, "I am the vine." In that sense a vine is placed as sole symbol on the tomb of the sister of Constantine, the Empress Constantia, and elsewhere. In Byzantine art the vine and grapes figure in early mosaics and on the throne of Maximian at Ravenna it is used as a decoration. The vine as symbol of the chosen people is employed several times in the Old Testament. The vine and wheat—ear have been frequently used as symbol of the blood and flesh of Christ, hence figures as symbols (bread and wine) of the Eucharist and are found depicted on ostensories. Often the symbolic vine laden with grapes is found in ecclesiastical decorations with animals biting at the grapes. At times the vine is used as symbol of temporal blessing. In decorative art, while the vine is not as favored as many other motifs it is frequently found in works of the Middle Ages, and in the Renaissance we find the vine as ornament on frescoes, wall-panels, etc. Its supple branches, the beauty of the leaf and the artistic formation of the bunch of grapes, all tend to make the plant one whose characteristics we would expect to find more
VINE-PESTS — VINEGAR

VINE-PESTS. See Grape Insect-pests.

VINEGAR is a liquor containing the acetic acid obtained by the acetous fermentation or oxidation of alcoholic liquids — hard cider, wine, beer, malt infusion, beet-root juice, fermenting molasses, dilute spirits or the like. Its color comes from a pale-yellow to a deep brownish red, and its odor and taste are influenced to a large extent by the materials employed in its manufacture. Vinegar obtained by acetous fermentation possesses different properties from pure acetic acid because it contains besides acetic acid and water — the essential constituents of vinegar — also small quantities of substances, which being analogous to those occurring in wine may properly be termed bouquet bodies. These substances give the vinegar an agreeable odor and taste entirely lacking in synthetic vinegar prepared from commercial acetic acid. Even if an agreeable odor is obtained in the latter by the addition of certain volatile oils and compound ethers, the bouquet peculiar to vinegar obtained by acetous fermentation is never realized, the relation being homologous to that existing between artificial and genuine wine. Any one gifted with a delicate and practised sense of smell can at once distinguish acetic acid vinegar from wine, malt or fruit vinegar.

Vinegar obtained by the aceticification of wine has been known from the very earliest times, being used in this form contemporaneously with wine. Many noted scientists, such as Stahl, Davy, Berzelius, Naegeli, Liebig and Pasteur studied the process of acetous fermentation, and in 1822 Doebereiner suggested that aceticification is due to the action of oxygen on alcohol, which is converted into acetic acid and water; Liebig sought to clarify this theory, and maintained that by the exposure, under suitable conditions, of alcohol to the action of oxygen one-third of the entire hydrogen contained is withdrawn and aldehyde formed, which latter, however, immediately combines further with oxygen and acetic acid; the formation of vinegar from alcohol, therefore, being a partial process of combustion. Aceticification, however, a far more complicated process than Liebig supposed and later investigations have shown it to be a chemico-physiological process with the co-operation of a living vegetable organism. It has been shown by Buchner and Weissheiner that the acetous fermentation is due to enzymes existing in the plant cell. The presence of alcohol and oxygen alone will not suffice for aceticification, the presence of nitrogenous bodies and certain mineral salts are absolutely necessary. Pasteur was the first to consider the formation of vinegar from alcohol as a peculiar process of fermentation, maintaining that a certain organism which he termed Mucoderma acetii, the "vigor fruit" or "vinegar yeast" (popularly known as "mother" of vinegar), consumes the alcohol, the nitrogenous substances and the salts; on the other hand Naegeli thought the vinegar organizer decomposes the particles of the substance to be fermented into simpler compounds. This organism, of which there are several different kinds, consists of a single cell, its special characteristic being its manner of reproduction, which is effected by a division of the cell into two and then a separation of the cell walls. The cells form chains, which at 104° F. readily grow into long threads (involution forms). It is interesting to note that this organism not only oxidizes alcohol into acetic acid, but will also oxidize the latter into carbonic acid and water, in case alcohol is lacking. This is an important factor in storing vinegar, as if it is allowed to come in contact with air the strength of the vinegar is lessened, owing to the consumption of acetic acid by the temper.

Vinegar may be made according to the slow process or the newer quick process. The principle embodied in the old process is to allow wine, which is unfit for consumption as such, beer, malt-infusion, etc., to oxidize and to draw off the vinegar formed. We may say that this slow process is an adaptation of the spontaneous souring of beer, wine or fermented liquors in general but under such conditions as tend toward an improvement of the product. While this process is employed especially for the preparation of wine vinegar it can of course be used just as well for making malt or fruit vinegars. In this process old oak vats or casks are thoroughly cleansed with boiling water and saturated with strong boiling vinegar, whereupon the vats are filled two-thirds with the mixture of alcohol and vinegar. It is essential that the liquid contain no more than 14 per cent of alcohol, as the vinegar ferment persists in the presence of more alcohol; a content of not less than 3 per cent of vinegar, while not absolutely necessary, is nevertheless beneficial as it hastens the aceticification. This alcoholic liquid is technically termed the "wash." The temperature is maintained as nearly as possible at 76° F., and in a few days the acetic fermentation will have begun, which is then allowed to continue until completed, which requires from 12 to 16 weeks. The vinegar is then drawn off and stored in a cool place in barrels which are filled to the bung hole and closed air-tight, in order to prevent the vinegar from gaining the air and finally to which with which to oxidize the acetic acid and thus weaken the vinegar. Before storing, however, the vinegar is commonly passed through a "rape" or filling vat, having a layer of the residue cake from wine factories — the stems and skins of the pressed grapes. Through this it is passed again and again until every trace of alcohol has been oxidized. Another way is to draw off the vinegar every week as it is formed and to add as much fresh "wash" as vinegar is drawn off. The process is practically continuous and need only be interrupted after several years, when the accumulation of tartar and sediment renders a cleansing absolutely necessary.

Wine vinegar made according to this process obtains its peculiar bouquet from the wine employed and contains besides the substances of the wine either unchanged or only partly transformed, some new ones, as acetic ether and other compound ethers. In a similar manner malt and fruit vinegar may be made. The former contains the extraneous substances of the malt, as, for example, dextrin, nitrogenous bodies, phosphates, etc., and the latter contains also malic acid. A very pure vinegar which
contains only a little acetic ether is made from a mixture of dilute spirits, some vinegar and a malt-infusion.

Schuetzenbach, perceiving that if the relative surfaces of contact of the alcoholic liquid with air be greatly enlarged the formation of vinegar would be accelerated, in 1823 invented what is termed the "new" or "quick process" for making vinegar. Almost at the same time in England Hope and Wagman in Germany, brought out similar propositions. By spreading the liquid over as much space as possible and allowing it to percolate slowly through and diffuse over a mass of shavings, mostly of beechwood (or similar material), a thin layer, presenting a large surface, is formed, one gallon being spread out over 100 square yards. This arrangement favors the chemical appropriation of the oxygen in the current of air caused to pass through the shavings, which not only serves to divide the liquid but also to carry the vinegar ferment, thus hastening aceticification. The shavings are first "soured" by soaking in strong vinegar for 24 hours. Cleansed charcoal in pieces the size of a walnut is better than pine in this connection.

In this process the generator, which is technically termed a "graduator," consists of a large vessel divided into three superimposed compartments of which the uppermost serves to divide the alcoholic liquid into many fine drops; in the middle compartment, which is the largest, aceticification takes place, and the lower one is a reservoir for the vinegar formed. This apparatus is built in various forms but the most practical is that of a truncated cone, as the alcoholic liquid in its descent can spread over a constantly increasing area, and continually comes in contact with fresh air, entering from below. Fir or other durable wood, except oak, which contains too many extractive substances, is used. All metallic parts (hoops, etc.) must be well-waxed, as heavy rusting will otherwise be caused by the vapors of the acetic acid. Various sizes have been tried, but a generator which is about 10 feet high, and three and four feet in upper and lower diameter respectively, has been found the best. A well-fitting cover in which holes are bored closes the top. The current of air is regulated by opening or closing some of these holes, as may be necessary. The alcoholic liquid is generally introduced through a rotary sprayer. A thermometer is of course a necessary adjunct. The liquid used in this process is usually a mixture containing four and one-half gallons of 42 per cent brandy, nine gallons of old vinegar and 27 gallons of water containing some bran and crushed rye.

Dr. Bersch of Vienna recently invented the automatic plate generator which is so arranged that a formation of aldehyde and the destruction of acetic acid already formed is impossible and that the evaporation of alcohol is almost wholly eliminated. By means of thin plates of beechwood he is enabled to have the alcoholic liquid and the air in undisturbed continual contact, so that vinegar is formed all the time. His generator has the shape of a prism eight feet high, having a base three feet square; the interior is lined with 10 layers of very thin beechwood arranged in such a way that the liquid can descend on both sides of the plates, while the air ascends between them undisturbed. Once aceticification is induced it can be main-

tained for years, providing of course the influx of the alcoholic liquid and the admission of air are properly regulated.

Theoretically 100 grams of alcohol will produce 130 grams of acetic acid and will require 300 grams of oxygen to oxidize the alcohol, but in actual practice the yield is less, the losses being in general due to evaporation of alcohol, caused either by imperfect apparatus, or by too rapid oxidation. In general such losses average 15 to 20 per cent, although they sometimes amount to 30 per cent. While it is true that rapid oxidation will produce vinegar quickly, yet it is also true that in such rapid oxidation too much of the alcohol evaporates and is not oxidized, so that what is gained in time is lost in material, which is the more expensive of the two. The fact that air which has passed a generator still contains three-fourths of its oxygen shows that four times the calculated amount of air is necessary in order to fully convert the alcohol into acetic acid. Inasmuch as the formation of vinegar is a process of combustion, it is self-evident that heat is developed. This fact must always be borne in mind by the manufacturer, because the vitality of the vinegar ferment depends upon the temperatures to which it is exposed. Its activity is greatest between 68 and 95°F. (20 to 35°C); if this limit is passed the formation of vinegar decreases rapidly, while at 104°F. (40°C) it ceases altogether, and 122°F. (50°C) the ferment perishes. Lower temperatures do not affect the ferment as much as higher temperatures do, but a change from one to the other is beneficial for the development of the ferment.

Wood vinegar made by the distillation of wood is used to a large extent for the manufacture of various acetates, esters, etc., and in dilution is sometimes used as vinegar for household and preserving purposes, which practice is, however, not advisable, as such vinegar is injurious to health on account of the numerous secondary ingredients contained in the pyrogallous acid (q.v.). The use of such vinegar in food is forbidden by law in some States.

In the household certain precautionary measures are to be followed in the use of vinegar. Vinegar, or foods prepared in vinegar, should never be allowed to stand long in copper, brass or tin vessels; even the enamel of iron and the glazing on earthenware vessels sometimes contain lead, which forms lead acetate in connection with the vinegar. Glass or porcelain vessels are best adapted for this purpose.

VINEGAR BIBLE, a Bible printed in 1717 at the Clarendon Press, in Oxford. So named because in the running headline of Luke xxii, vineyard was misprinted vinegar.

VINEGAR HILL, Ireland, an elevation 389 feet high, close to the town of Enniscorthy, in County Wexford, scene of the defeat of the Irish by General Lake, 21 June 1798. The Irish had camped here for about a month, and discredited their cause by outrages on the lives and property of the loyalists in the surrounding country. About 400 of the Irish were cut down, the remainder fled to Wexford, whither Lake marched the day after, killing all whom he found with arms.

VINELAND, N.J., borough in Cumberland County, on the Pennsylvania and the
Central of New Jersey railroads, about 32 miles southeast of Philadelphia. It was founded in 1681 by Charles K. Landis, on a flat sandy soil, and widely advertised as a navigable for small fruit farms. It was settled mainly by New Englanders, who mostly lost their investments. In time heavy fertilization small fruit farming was established, and manufacturing followed. The grape juice manufacturers are widely known. Other manufactures are silos, sash, door and blind factories, pearl button works, glass works (in which are made flint and plate glass) and a paper box factory. Squabs are raised on a large scale. The grape juice manufacture is widely known. Other manufactures are thermometers, chenille curtains, rugs and men's clothing. There are three banks and daily and weekly newspapers.

The educational institutions are the State Training School for Feeble-Minded Children, a high school, graded schools, the Vineyard Public Library and the library of the Historical and Antiquarian Society. There are here also the State Home for Disabled Soldiers and the State Institution for Feeble-Minded Women. The town has the commission form of government, and owns and operates the electric-light plant and the waterworks. Pop. about 5,282.

VINES, Richard, English colonist in America: b. near Bideford, Devonshire, 1585; d. Barbados, 19 April 1651. Educated in medicine, he was sent out in 1609 to explore Maine, then became agent to Sir Ferdinando Gorges (q.v.), and, having returned to New England, passed a winter, probably that of 1616-17, at Winter Harbor, near the Saco. Some doubt is said to be cast on the authenticity of his signature to a deed containing a patent to himself and a certain amount of land now occupied by Biddeford, Me., and executed in 1629, by the fact that in that year he was in England. Until 1635 he was principal superintendent of Saco, and then he was made councillor. In 1643 he became governor of the government of the colony. Some trouble arose in 1644 between him and George Cleaves, who had been sent out by Alexander Rigby to take possession of and administer a territory covered by what was known as the Plimoth or Plymouth patent and conflicting with the grant made to Gorges. Cleaves sent a messenger to Saco suggesting that the matter be left to the arbitration of the Massachusetts magistrates. Vines refused, and went to Boston to represent his case. The controversy came to nothing at the time. Vines returned to England in 1645, and went thence to Barbadoes, where he became a planter and also practised his profession.

VINES, Richard, English Puritan divine: b. Blaston, Leicestershire, about 1580; d. London, 4 Feb. 1658. Educated at Magdalene College, Cambridge, he was instituted to the rectory of Waddington, Warwickshire, 11 March 1628, and in 1630 to that of Caldecote also. He gained considerable fame as a preacher, and his first sermon before the Privy Council (30 Nov. 1642) increased it. In 1643 he was placed in the rectory of Saint Clement Dane's, and in 1644 made master of Pembroke Hall, Cambridge. He resigned Saint Clement Dane's on presentation to the rectory of Watton, Hertfordshire. At the Westminster Assembly he was a member of the committee for drafting a confession of faith (1645). In 1649 he refused allegiance to a government without a king or House of Lords, and was thereupon removed from Pembroke and the rectory of Watton. From 1650 he was minister of Saint Lawrence Jewry, London. He was styled the "English Luther," was greatly learned and favored a modified episcopacy. He published some individual sermons and others were posthumously collected in such volumes as 'Institution,' 'Preparation to Magistrate' (1656), and 'A Treatise on the Institution of the Lord's Supper' (1657).

VINET, vë-në, Alexandre Rodolphe, Swiss theologian: b. Orchy, near Lausanne, 17 June 1797; d. Clares, Switzerland, 4 May 1847. He studied for the Protestant ministry in which he was ordained in 1819, having previously been appointed, when only 20, professor of French language and literature at the gymnasium of Basel. In 1829 he published his 'Chrestomathie Francaise,' comprising a valuable survey of French literature. Subsequently he was a prolific contributor to the journal 'Le Semeur,' and in 1837 published a selection of essays written for it under the title 'Essais de Philosophie Morale.' In 1838 he mentioned he accepted the chair of practical theology in the academy at Lausanne, but gave it up in 1845, and seceded from the national church, holding the principle that there should be no connection between church and state. His views on this subject were enforced in his 'Essai sur la Manifestation des Convictions Religieuses, et sur la Separation de l'Eglise et de l'Etat' (1842). As a preacher Vinet was noted for eloquence and earnestness, qualities which also form the distinguishing characteristics of his writings. In addition to those already referred to may be mentioned his 'Discours sur quelques Subjets Religieux' and 'Nouveaux Discours,' selections from both of which have been published in English, under the title of 'Vital Christianity'; 'Etudes Evangeliques' and 'Nouvelles Etudes Evangeliques,' translated into English as 'Gospel Studies.' His 'Histoire de la Litterature Francaise au XVIII Siecle;' and 'Etudes sur la Litterature Francaise XIX Siecle' display considerable critical insight.

VINEYARD (vin'yard) SOUND, a passage separating Martha's Vineyard (q.v.) from the Elizabeth Islands (q.v.), near the southeast coast of Massachusetts. It is about 42 miles long and from three to six miles wide. There is one lighthouse where Vineyard Sound opens into Nantucket Sound and one about midway and off the coast of Elizabeth Islands.

VINGT-ET-UN, vënt'-a'n, a card game played with a whole pack and with any number of players. The cards count according to the number of pips (or spots), the face cards counting 10 and the ace 11 as the holder chooses. The object of the game is to obtain a hand the total value of which equals 21 (hence the name). Two cards are drawn to each player and if no one has a hand equal to 21, on the first deal, the players have the right of drawing cards in turn; if the cards drawn bring the total to more than 21 the player is out of the game. The player first obtaining a hand of 21 takes the pool or any other winning determined upon.

VINLAND, or WINELAND, the chief settlement of the early Norsemen in North
America, represented in modern times by part of Massachusetts and Rhode Island. The first voyager to see the north coast was Bjarne Herjulfson, who was driven thither by a storm in the summer of 986 a.d., when making a voyage from Iceland to Greenland, on which country his father, Herjulf, and Eric the Red, were the earliest colonists. But Bjarne did not touch the land, which was first visited by Leif the Lucky, a son of Eric the Red, about 1000. One part of the country he named Heluland; another Markland; *Woodland,* the modern Newfoundland and Nova Scotia. A German in his company having found the grape (most probably the *Vitis vulpina*) growing wild, as in his native country, Leif called the region Vinland. The natives from their dwarfish size they called skraelings. Two years after Leif's brother, Thorvald, arrived, and in the summer of 1003 led an expedition along the coast of New England south, but was killed in the year following in an encounter with the natives. The most famous of the Norse explorers, however, was Thorfinn Karlsefne, an Icelander, who had married Gudrid, widow of Thorstein, a son of Eric the Red, and who in 1007 sailed from Greenland to Vinland with a crew of 160 men, where he remained for three years, and then returned, after which no further attempts at colonization were made. Ralf, in his *Antiquitates Americae,* published the first full collection of the evidence which proves the pre-Columbian colonization of America. Both he and Finn Magnusen labor to show that Columbus derived his first hints of a new world from the accounts of these old Icelandic expeditions. Finn Magnusen is believed to have established the fact that Columbus did visit Iceland in 1477, 15 years before he undertook his expedition across the Atlantic, and so may have heard something of the long-abandoned Vinland.

VINSON, Alexander Hamilton, American Protestant Episcopal bishop: b. Brooklyn, N. Y., 30 Nov. 1832; d. 18 Aug. 1910. He was educated at the College of the City of New York, and at St. John's College, Annapolis, Md., 1852. He graduated from Stephen's College, Annandale, N. Y., in 1873, and from the General Theological Seminary in 1876. He studied later at the University of Leipzig, took orders in 1877 and was in charge of the Memorial Church of the Holy Comforter, Philadelphia, 1879-84. He was rector of All Saints' Church, Worcester, Mass., 1884-1902, and was consecrated first bishop of the diocese of western Massachusetts in January 1902.

VINSON, David Hammond, American soldier: b. Providence, R. I., 4 May 1803; d. 21 Feb. 1873. Having graduated at West Point in 1822, he was commissioned to an artillery regiment, but was transferred to the infantry 1823; became chief quartermaster on the staff of General Wool, with rank of major, 1846, and served through the Mexican War. He was chief quartermaster of the Department of the South, 1857-61; and was made prisoner of war in February 1861, when General Twiggs surrendered to the Confederates; was exchanged after six months and thereafter was deputy quartermaster-general of the army till 1866, when he was placed on the retired list. He was brevetted colonel and brigadier-general 1864 for "faithful and meritorious services."

VINTON, Francis, American soldier and Protestant Episcopal clergyman, brother of David Hammond Vinton: b. Providence, R. I., 29 Aug. 1809; d. 29 Sept. 1872. After graduation at West Point, he was lieutenant of artillery in 1830. He served against the Indians in Georgia and Alabama, receiving the thanks of Congress and a land-grant in Indiana. While stationed at Boston, he studied law and was admitted to the bar in 1835, then resigned his commission in the army in 1836; studied theology; was ordained deacon 1838, priest 1839, in the Protestant Episcopal Church. He was rector in succession of churches in Providence, R. I. (1840-42), Newport, R. I. (1842-44), Brooklyn, N. Y. (1844-46), New York (1855-72). He declined election to the episcopate of Indiana 1848; was elected professor of ecclesiastical law and polity in the General Theological Seminary, New York, 1869. He published *Arthur Trelawny, or Annals of Cadet Life*; *Oration on the Annals of R. I.;* *Commentary on the General Canon Law.*

VINTON, Francis Laurens, American military officer: b. Fort Preble, Me., 1 June 1835; d. Leadville, Colo., 6 Oct. 1879. He was graduated at West Point in 1856, studied metallurgy and was graduated at the Imperial School of Mines in Paris. When the Civil War broke out he became a captain in the 16th United States Infantry, and later colonel of the 43d New York Volunteers. He participated in the Peninsular campaign, and was in command of a regiment at the action before Fredericksburg, promoted brigadier-general of volunteers in March 1863 and was professor of engineering in Columbia College 1864-77.

VINTON, Iowa, city, county-seat of Benton County, on the Red River, and on the Burlington, Cedar Rapids and Northern Railroad, about 30 miles southeast of Waterloo and 22 miles north of Cedar Rapids. It is in an agricultural and stock-raising region. The chief manufacturing establishments are a pearl-button factory, two corn-canning factories (about 1,000 employees during the corn-canning season), flour mill and creameries. There are six churches. The educational institutions are the State College for the Blind, Tillford Academy, public schools and a public library. There are four banks and three newspapers. The government is vested in a mayor and a council of eight members elected biennially. Pop., estimated, 3,996.

VIOL, an ancient musical stringed instrument which is regarded as the precursor of the modern violin. They were played on with a bow, and were usually made with six strings, though specimens are extant with three to seven strings. From these primitive viols were gradually developed the violin (q.v.), viola, violoncello, and all this class of stringed instruments having a sounding box and tension screws, but without frets. Instruments with frets have developed as guitars (q.v.). The modern viol is a shortened term for double bass viol, the largest instrument in a stringed orchestra, having three or four strings and a compass usually of three octaves.
VIOLA — VIOLET

VIOLA. (1) The heroine of Shakespeare’s comedy of “Twelfth Night.” (2) The chief figure in his tragic comedy “The Cuckhold,” first played about 1613.

VIOLA, or ALTO VIOLA, or TENOR VIOLIN, a large kind of violin, to which the part between the second violin and bass is generally assigned. It has four gut strings, the two lower covered with silvered copper wire. These are tuned an octave below the violinecolo. The music is generally written on the alto clef.

VIOLA DA GAMBA, a bass viol held between the legs of the player; an organ-stop with metal pipe of narrow scale, and ears on the sides of the mouths, giving viol- or string-like quality.

VIOLA D’AMORE, vi-ōlā dā-mōrā, an instrument of the viol tribe, which had fallen into disuse, but was revived with a degree of success by Urban at Paris. It had five or six strings of catgut, placed and played as in other bowed instruments, but below them, and passing underneath the bridge, were five or seven other strings of metal tuned in unison with them, which vibrated sympathetically when the former were played, giving to the music a peculiar resonant character. The compass was at least three octaves and a half. The strings of Urban’s viola d’amore were tuned in thirds and fourths.

VIOLACEAE, vi-ō-lāsē-ē, natural order of exogenous plants, of which about 300 species are known, natives of temperate and tropical countries, those belonging to the former generally herbaceous, and to the latter generally shrubby. They have simple leaves with persistent stipules. The calyx consists of five persistent sepals, usually elongated at the base; the ovary of five hypogynous petals, unequal in the sub-order Violaceae, and equal in the sub-order Alscaceae. There are five stamens inserted in a hypogynous disc; the filaments prolonged beyond the anthers. The ovary is one-celled generally with many ovules; the style simple, with an oblique stigma. The fruit is a capsule with many seeds. The best known species are the Violets (see Violet), prized for beauty and fragrance. Emetic and purgative properties prevail in the order; and some South American species, particularly of the genus Ionidium, yield valuable medicines. The Ircacuanha; Cuchunchul. The leaves of the Lobolobo (Conchoria or Alscedia lobolobo) are used in Brazil as spinach.

VIOLET, a genus (Viola) of mostly perennial herbs of the family Violaceae. The species, of which about 200 have been described, are natives of the northern and southern temperate zones. In North America there are about 80 species distributed as far south as the mountains of Costa Rica. They are all of branches, to the ground or often bent in height; bear heart-shaped leaves upon usually long stems, and irregular flowers either solitary or two together on axillary peduncles. The capsular fruits contain numerous globose seeds. In some species cleistogamous flowers are borne in the bud. Of the American species cultivated in gardens only two, V. palmata and V. pedata, are well known though several others are offered for sale. Of the two mentioned the latter, which is known as the chicory-root violet, is apparently the most promising as a garden plant for improvement. The Australian violet (V. kederacea) is grown to a small extent in California. The horned violet (V. cornuta), also called bedding pansy, has long been popular in gardens for its variously colored solitary flowers which appear in early spring. It is a native of southern Europe. The pansy or heart’s-ease (V. tricolor) is another well-known European species which has long been popular in gardens. (See PANSY). The most important species, however, is the sweet violet (V. odorata). This is a native of western Asia and the Mediterranean region whence it was introduced into cultivation and has given rise to numerous varieties having white and reddish purple as well as variously tinted blue flowers, both single and double. The species is the parent of the popular florists’ flower which in the United States ranks third in the list of important commercial flowers. Its season under glass lasts about seven months; that of the entire nation, its principal rivals, about nine months. (See Floriculture in America).

When violets of ordinary quality will satisfy the needs of the grower the violet plants are not particularly exacting in regard to soil, cultivation, etc., but when really choice flowers are required the plants demand considerable skill and attention. It has not irreversibly happened that growers who after several years’ success with the crop considered themselves experts have been disappointed with their repeated failures to produce good blossoms. Hence the business of growing this plant is steadily gravitating into the hands of specialists. And certain sections of the country are becoming noted for their violet industry. Probably the best known of these violet centres is the district near Poughkeepsie, N. Y.

The plants are propagated by division which may either necessitate their removal from the ground or not. In the former case the old parts are destroyed, in the latter the from the shoots or young crowns are separated after becoming well rooted. In each case the little plants are set about four inches apart and transplanted to permanent quarters when well established. Cuttings are also widely used. They are either obtained from well-developed runners or from to young unrooted crowns and treated like cuttings of geranium until well rooted and ready for transplanting in soil.

In general, the florists’ violet will thrive well in any rich loamy soil, but best results are generally obtained with soil resulting from the decay of thick sod paved with an old blue grass pasture upon sandy but rather heavy loam. This should be prepared the season previous with alternate layers of well-decayed cow manure, and after six or more months’ exposure to the weather sliced, when about one and one-half pounds of bone meal should be added to each cubic yard of soil. This soil is then spread on benches or made into solid beds in the greenhouses or frames, the former preferred. The plants are set from 8 to 12 inches asunder in rows 10 to 18 inches apart, according to the size of the variety, the single flowered varieties usually demanding the maximum space. Most
growers agree that planting in early spring is preferable to other times because the plants become well established, vigorous and strong, whereas if set in late spring or later they do not seem to thrive so well during the hot weather. At all times weeds must be kept out of the beds and except when needed for propagation the runners should be removed so as to divert growth toward flower production. The summer temperature should be kept as low as possible and the winter temperature between 45° and 50° at night with a maximum day temperature of 60°. The beds should be kept moist but not wet at all times and the supply of fresh air abundant. Careful attention to these two details of management is one of the most important means of preventing the so-called plant diseases which sometimes destroy the crops of careless growers.

The above method of growing violets continuously under glass is considered the most satisfactory since the plants are always under complete control. There are, however, other methods which are of more or less importance, such as combining house culture with field culture, the plants being cultivated out of doors under early or mid-autumn and then transplanted to the greenhouse. Large quantities are also cultivated in frames either with or without artificial heat, the plants being grown either in the field or in beds which are covered with the frames at the approach of cold weather. This method is most popular where the winter temperature is not very low, as in Virginia and southward. Violets are sometimes grown in pots but this method is considered too expensive for commercial purposes and is also likely to prove unsatisfactory and inconvenient.

Since the violet is esteemed mainly for its fragrance, the flowers should be gathered just before reaching prime condition and placed on sale as soon as possible because the odor is evanescent. A definite knowledge of the demands of the market is also essential since some markets demand bunches of certain sizes or forms and will not handle other sizes or forms profitably. The bunching demands great skill and care and in the larger establishments is usually done by girls.

Several insects feed upon the violet, the most common being the black fly (Rhopalosiphum violae), the green fly (Aphis sp.), gall-fly (Diplolepis violicola), violet sawfly (Emphytus canadensis) and the greenhouse leaf tyer (Phytanthis rubigalis). The red spider (Tetranychus tetrarius), which is not an insect but a mite, also lives upon the foliage. Its visitations may be prevented by due attention to ventilation and humidity of the air. The method of controlling the others seems at present to be hydrocyanic acid gas, but intelligent management is considered more satisfactory. It is preventative rather than remedial. The so-called diseases are most effectively prevented by attention to watering, ventilation and ample space for each plant to grow in.

Consult Galloway, 'Violet Culture' (New York 1900); Bailey, 'Standard Cyclopedia of Horticulture' (New York 1916).

**VIOLET FANE.** See CURRIE, LADY MARY MONTGOMERIE LAMB SINGLETON.

**VIOLET-GREEN SWALLOW.** See SWALLOW.

**VIOLET MOSS** (Byssus lohiithus), by some botanists ranked as a lichen, and by others as a fungus. It consists of simple articulated threads, and spreads over the "Violet Stones" (q.v.) in the form of a delicate incrustation, at first reddish, but later browned by the advanced stage, yellowish green. It was formerly in use as a popular remedy for feverish cutaneous eruptions.

**VIOLET STONES,** certain stones found on high mountains—as in Thuringia, on the Harz Mountains and the Riesengebirge—which, in consequence of being covered with what is called Violet Moss, emit an odor like that of violets. They retain this odor a long time, and it is increased by moistening them.

**VIOLIN,** a musical instrument consisting of four strings stretched by means of a bridge over a hollow wooden body, and played on with a bow. The principal parts of the violin are the scroll or head in which are placed the pins for tightening and slackening the strings; the neck, which connects the scroll with the body and to which the finger-board is attached, that is, the board upon which the strings are pressed with the fingers; the tail-piece, at which end it holds the neck in playing; the belly or upper surface of the body, over which the strings are stretched, and which has two sound-holes, one on each side in this shape \( \frac{1}{2} \); the back or under side; the sides or ribs, uniting the back and belly and completing the body; the tail-piece, a piece of wood of somewhat triangular shape, to the broad end of which the strings are fastened, and which is attached by a piece of catgut to a knob at the opposite end of the body from the head, and so is stretched above the belly; and the bridge, rising between the tail-piece and the finger-board, with one of the sound-holes on each side. The back and belly have both a considerable convexity, and the edge of the bridge on which the strings rest is also convex so as to allow of each being touched separately by the bow. Some instruments consist of as many as 38 different pieces, but so minute a division is not necessary. The back, neck and sides are generally of sycamore, the belly of deal, the finger-board and tail-piece of ebony. Almost all the different pieces are fastened together with glue. The strings are of catgut, the lowest or bass-string being covered with silvered copper wire, silver wire or even gold wire.

Instruments of the violin kind have been in use from an unknown antiquity. The viola, which preceded the violin in Europe, has been traced back to the 8th century. In several important respects the violin is superior to almost every other instrument, and there is none which combines so many excellencies. Within its range it can take every interval of pitch to the minuter fraction, its susceptibility of division being limited only by the delicacy of manipulation of the performer; so that it can always be played either in just intonation, or in any temperament required by the accompanying instruments. It is thus equally adapted to solo and orchestral performances. For the former it is fitted by its clear and brilliant tone, as variable in volume as in intonation, inexhaustible in continuity and variety of shading,
and capable of the sharpest strokes of staccato as well as of the most sustained efforts of legato music. Its place in the orchestra is marked by these perfections as the leading one, to which the melody is entrusted. As a solo instrument it has also a peculiar faculty of imitation, not only of the actual sounds of other instruments, but of non-musical sounds, as far as they are capable of musical imitation. This and its indefinite range are somewhat liable to abuse.

As an orchestral instrument its powers are multiplied by the making of similar instruments varying in size, but nearly identical in principle and form of construction. The full orchestral set consists of the violin, which is used for first and second parts; the viola, or tenor violin; the violoncello, or bass-violin; and the violone, contra-basso, or double-bass violin, which usually accompanies the violoncello at an octave of interval. The four strings of the violin are tuned at intervals of fifths, thus the highest range of the instrument depends to some extent upon the performer, but the high notes when forced are apt to be thin and squeaky. Its legitimate compass extends three octaves. The violoncello can, to a limited extent, be made to produce harmony by sounding two or three strings together, but this is only a tour de force, not suitable for rendering a sustained composition, although a fugue in four parts for a single violin has been written by Sebastian Bach. The viola is tuned thus, the music being written in the alto clef. Its range extends to the G above the treble clef.

The violoncello is tuned thus:

\[ \text{E, A, D, G} \]

Its compass extends to the A above the second line in the treble clef. With the assistance of harmonics it may be carried one or two octaves higher. The double-bass has three, four or five strings.

The structure of the violin while closely imitated is still imperfectly understood by musical mechanists. The finest violins are by old makers, which cannot be rivaled, and the practice to their superintendency, whether in the wood or the varnish used, has never been satisfactorily explained. The Cremona violins stand in the first rank, the celebrated masters of this school being the Amati, Antonio Stradivari (Straduarius), and Giuseppe Guarneri (Guarnieri); of German makers Stainer or Steiner and Klotz (both belonging to Tyrol) are the most celebrated; Vuillaume of the French; and Forrest of the English. Consult Abele, H., 'The Violin and its Story' (New York 1906); Engel, C., 'Musical Instruments' (London 1875); Hart, G., 'The Violin: Famous Makers and their Innovations' (Boston 1885); Hill, 'Antonio Stradivari' (London 1902); Hipkins, A. H., 'Musical Instruments, Historic, Rare and Unique' (Edinburgh 1887); Morris, W. M., 'British Violin Makers, Classical and Modern' (London 1904).

VIOLET-LE-DUC, vē-lē-lē-duk', Eugene Emmanuel, French architect and historian: b. Paris, 27 Jan. 1814; d. Lausanne, Switzerland, 17 Sept. 1897. He made special study of medieval architecture in Italy and France; and became professor in the Ecole des Beaux Arts in 1863. His great work is 'Dictionary of French Architecture from the 11th to the 16th century' (10 vols. 1854–69). His other chief works are 'Essay on the Military Architecture of the Middle Ages' (1854); 'Dictionary of French House Furniture from the Carolingian Epoch to the Renaissance' (6 vols. 1854–75); 'Discourses on Architecture' (1855–72); 'Chapels of Notre Dame de Paris' (1867–69); 'Memoir on the Defense of Paris' (1872); 'History of a House'; 'History of a Cathedral'; 'History of Human Dwelling in the History of a City Mansion and of a Cathedral' (4 vols. 1873–78). As a practical architect he restored the east towers of Saint Ouen, Rouen, and the cathedral at Carcassonne, besides executing many other works, among the most important of which are the restorations of the chateau of Pierrefonds and the fortifications of Carcassonne. Consult Sauvageot, 'Viollet-le-Duc et son Œuvre' (1880); Saint Paul, 'Viollet-le-Duc, ses Travaux d'Art' (1881).

VIOLONCELLO, vē-lōn-chěl'o or vi-lo-nēl'o, a powerful and expressive bow instrument of the violin series, held by the performer between the knees, and filling a place between the violin and double-bass. It has four strings, the two lowest covered with silver wire. It is tuned in fifths, C (on the second ledger-line below the bass staff), G, D, A, reckoning upward, and is an octave lower than the viola or tenor violin. Its ordinary compass from C on the second ledger-line below extends to A on the second space of the treble, but solosists frequently play an octave higher. An eight-foot pedal stop on a pipe-organ also bears the name violoncello. Both are frequently abbreviated to cello.

VIOMÈNIL, vē-ō-mē-nil', Antoine Charles du Houx, Baron de. French soldier: b. Voreppe, France, 3 Nov. 1728; d. Paris, 9 Nov. 1792. He entered the army at 12, served in Holland and Handover, became brigadier-general in 1762, and commanded a regiment in the Corsican campaign of 1768–69. Promoted major-general in 1770, served in Poland in aid of the confederation of Bar and captured the castle of Cracow. He was appointed second in command under Rochambeau of the army sent to the aid of the American revolutionists in 1780, won the Grand Cross of the Legion of Honor for his conduct at Yorktown in 1781, and was promoted lieutenant-general. In 1783–89 he was governor of La Rochelle, and while defending Louis XVI, during the attack on the Tuileries in 1792 received injuries from which he died.

VIOTTI, vē-o-tēt', Giovanni Battista: eminent Italian violinist and musical composer: b. Fontanetto, in Piedmont, 23 March 1753; d. 10 March 1824. From his father, a veterinary surgeon, he learned the rudiments of music, and received lessons in violin-playing from Giovanni 1764. Two years later he was placed under Pugnani at Turin. After holding for a short time the appointment of first-violinist in the royal chapel at Turin, he retired to his father's office, in order to travel in Europe with Pugnani. In Berlin, Saint Petersburg, Paris and London his playing created a furor. He visited London first 1792, and was engaged there at Salomon's concerts, and for a time as leader of the orchestra in the King's Theatre.
groundless charge of being a revolutionary agent drove him from England; but after living for a time in retirement at Hamburg, he returned to London, 1795, where he continued to reside until 1818, when he settled in Paris and resumed the direction of the opera there. He retired in 1822 with a pension, but, returning to London, entered into ruinous speculations. He died in London. His compositions include violin concertos, sonatas for violin, cello, and violin and violincello, violin duets and solos, and a few pianoforte compositions. His playing was characterized by a vigor of style and purity, as well as brilliance and elegance, previously unknown; and he has been considered the father of the modern violin school. Consult Bailiot, F., "Noticeri sui Votti" (Paris 1825).

**Viperidae** family of snakes constituting with Crotalidae, the Viperina, or third sub-order of Ophidia. The general characteristics of vipers are wide angular depressed head, causing an apparent small in comparison with short, thick body; and tail tapering suddenly to a point. In some of the largest vipers, the short, unmistakable tail is only two inches in length. The head is mostly covered with scales, rarely plates, or only a few about the eyes and lips. This highly venemous family of serpents are furnished with a pair of long, curved fangs. In this order the upper maxillary, bearing two isolated fangs firmly fixed to it, is reduced to a mere wedge of bone, which is movable and retractable, and causes. The skin of the vipers are calecarious, often rough, even spinous. The ventral shields are broad, and the subcaudal plates in two rows. The nostrils are large, and in some species they close with a valve. This family consists of many genera and species, found in Africa, Asia, and America. The name of the viper, protected by a membrane, always supine along the jaw; but when in use springs down by the rotation of the maxillary bone, just as a scythe might point downward or horizontally raise the edge of the blade. The fang has a canal in its interior, connected with a poison gland, whose contents are ejected into the wound made by the fang in the act of biting. Behind the pair of functional fangs, others, in a rudimentary stage, are found, and may even create a wound, though, being as yet unconnected with the poison-duct, they do not convey venom into the wound. The lower jaw has numerous solid teeth of the ordinary form. Former vipers were colored yellow; attached, and even at the present day authorities differ in the arrangement of genera and species, according to the forms running so much into each other. Dumeril gives six genera and 17 species; Wallace, three genera and 22 species, and Gray nine genera and 20 species. Strauch gives three genera; *Viper* (with 20 species) *Echis* (with one species), and *Atheris* (with three species). Those of the family best known are the "River Jack" of western Africa, the "Cerastes" (q.v.) of northern Africa and western Asia, the Puff Adder of Africa, the Death Adder of Australia, Russell's Viper and the Carpet Snake of India. The *cobra de capello* and the Egyptian *Naja haje* also belong here. The vipers, as above mentioned, are mostly distinguished by their broad flat, angular head; thick, heavy body, short, tapering tail; calecarious, carnate, and a generally hideous physiognomy, which seems to express their noxious qualities. Nevertheless some have a handsome exterior and are adorned with dark, rich coloring and patterns. The *Daboia* of India is one of these, and, being of less clumsy form, has been named *Vipera elegans*. The true vipers, or those which have not the nasal fossa, are mostly represented in Africa, which has about 12 species. Europe has three, India two. The anomalous Death Adder (*Acanthophis antarctica*) of northern Australia, with its unmistakably venomous look, is included among the vipers, notwithstanding it has a pair of fixed fangs like the *Elapidae*. The largest and deadliest species are found in tropical countries. They inhabit dry, sandy deserts, and are of retreating, sluggish nature. See LACHESIS ASP.; PUFF-ADDER; RATTLE-SNAKE, etc.

**Vipers**, a family (*Viperidae*) of venomous snakes belonging to the suborder *Serpentes* and closely related to the *Crotalidae*, or pit-vipers and rattlesnakes. In the character of the poison apparatus the vipers closely resemble the rattlesnakes, under which heading a full description will be found, but they differ as a family from the *Crotalidae* in lacking the pre-orbital sensory pit and the excavation of the maxillary bone for its accommodation. None of them have the tail terminated by a rattle; but in form, scale characters and habits they exhibit much the same range of variations as the various genera and species of the pit vipers. Their distribution, however, is totally different, for while the *Crotalidae* are scarcely represented outside of America the *Viperidae* are absolutely confined to the tropical and temperate regions of Europe, Asia, and Africa. The greatest number and most formidable species. The family embraces 40 or 50 species, many of which are variable. The typical vipers are the characteristic poisonous snakes of most of Europe and Africa. That which has two rows of scales or urosteges on the short tail, the head covered almost exclusively with numerous small scales, with those at the end of the snout and above the eyes often turned upward, and the body-scales keeled.

The common viper or adder (*Vipera berus*) is found throughout most of temperate Europe, including England and Scotland, but is absent from large areas, while in others of different geological formation and even in well-cultivated districts it is common. It attains a length of from one and one-half to two feet, and is variously colored. Its most frequent and stable markings appear to be a brownish-yellow ground, with a series of continuous zigzag markings along the back, and a set of triangular black spots along each side. Specimens are frequently found with light tints and sometimes nearly black. The viper is the only poisonous reptile of Britain that is not very dangerous of fatal consequences, but may induce pain, sickness, fever and even delirium and as a sequela a protracted period of nervousness and
a tendency for the wound to suppurate. The effects have been known to persist for a fort
night or more; and in children a fatal result
has occasionally followed the adder’s bite. The
food consists of frogs, mice, birds, eggs, and the
tertiary prey of young, quartering the ground
systematically and following the runways of
meadow mice. The viper is viviparous—re
aining its eggs within the body till the young
are hatched, and the young are known to han
to the mouth and esophagus of the mother when threatened by danger. Like
the rattlesnake vipers often collect in large
numbers in caves and holes during the season
of hibernation.

The common asp of southwestern Europe
(V. aspis) has the snout plate turned up
ward, a character which is much exaggerated in
the prominent nasal horn of V. ammodytes, of
southeastern Europe. Supra-orbital horns, re
calling those of the horned rattlesnake of the
southwestern United States, and found in
Cerastes and Colcho. The former inhabit the
hot desert-region of northern Africa and south
western Asia, one small and very venomous
species being the horned viper (C. cornutus).
The asp used for the weapon Cleopatra, and of
the Scripture is not a viper, but one of the cobras
(Naja haje). To Cleopatra belong the large and
dangerous rhinoceros-vipers of Africa. One of
the most dreaded serpents of Africa is the puff
adder (Bitis arietans) which, besides some dif
cferences in arrangement of the head-scales in
cluding the absence of any horns, has the nos
turis directed nearly upward. It reaches a length
of five feet, and is of robust build, its apparent size being further enhanced by its habit
of puffing up the body when molested. The puff
adder inhabits dry plains throughout the greater
part of Africa and like the horned vipers con
ceals itself by partially covering its body with
loose earth. In general habits it resembles the
European viper but is more sluggish, and owing to its large size and the virulence of its venom
is exceedingly dangerous to man and beast. Its
bite is followed by the most severe constitutional
and local symptoms, including a rapid and pro
gressive gangrene. In Africa are found also the
tropical small snakes with thin, forked, and
hissable tails and usually bright green colors.
Several species of vipers are among the most
poisonous snakes of India and contribute largely
to the number of fatalities resulting from snake
bites in that country. The most notable are
Russell’s viper or cipolonga (Daboia russellii),
reaching a length of five feet, and the little, but
for that reason even more dangerous, krait
(Echis carinata). The name viper is also ap
plied erroneously to several American snakes,
especially to the copperhead and moccasin
(q.v.) and to the hog-nosed snake (q.v.), the
last of which is quite harmless, notwithstanding
its unfortunately had reputation and threat
ening appearance.

A number of mostly small, poisonous snakes
of Africa and India have been separated from the
Viperidae under the names Causidae and
Atroacaudae. They differ variously in having
large head plates, grooved fangs, no postfrontal
bone, and in being oviparous. The vipers of
Australia are related to the cobra de capello
(q.v.) and belong to the family Viperidae.

Consult Bouleguer, ‘Catalogue of Snakes of
the British Museum’ (London 1896); Gunther,
‘Reptiles of British India’ (London 1864); Boulenger, ‘Reptiles of British India’ (London
1890); Anderson, ‘Zoology of Egypt,’ Vol. I
(London 1898).

Viper’s Bugloss, plant of the genus
Echium of the natural order Boraginaceae; hav
ing a calyx with five deep, bell-shaped corollas with dilated throat and ir
regular limb, very long unequal filaments, and a bind style. The species of this genus are
large herbaceous plants or shrubs, rough with
tubercles and hairs. Their flowers are often very
beautiful. The Common Viper’s Bugloss (E.
vulgaris), a large annual plant, is a native of
Europe, growing in dry places, frequently
in cornfields, and is a troublesome introduced
weed in Virginia, but rather rare in the north
er States. Its flowers are at first reddish and
afterward blue. It derives its name, Viper’s
Bugloss, from spots on its stem, which some
what resemble those of the viper—whence the
property of healing vipers’ bites was ascribed to it. Other herbaceous vipers are found in
southern Europe, North and South America,
and other parts of the world. Shrubby species
are found chiefly in the Canary Islands and in
southern Africa.

Viper’s Grass. See Scorzonera.

Vichow, vîr’shô, Rudolf, German scienti
Berlin, 5 Sept. 1902. He studied medicine in
Berlin in 1839-43, and in the latter year became
a surgeon’s assistant. From 1844 to 1846 he
was assistant at the Charité Hospital, and in the
latter year he became inspector there. He
qualified in 1847 as a lecturer at the University
of Berlin, and in that year also he was associ
ated with Benno Reinhardt in founding the
Archiv für pathologische Anatomie und Physi
ologie und für klinische Medizin, world
famous as "Vichow’s Archives," which he
edited alone from Reinhardt’s death in 1852 till
his own. He made himself known as a pro
nounced democrat in the year of revolution,
1848, and his political action caused the gov
ernment to remove him (1849) from his pro
sectorship, but he was soon reinstated, and ac
cepted the chair of pathological anatomy at
Würzburg. In 1852 he became joint editor of the
Cannstatt reports on the progress of medi
cine, which he continued in conjunction with
others till his death. In 1856 he returned to
Berlin as professor of pathological anatomy,
general pathology and therapeutics, and direc
tor of the recently founded pathological insti
tute. He became a member of the Municipal
Council of Berlin in 1859, and began his career
as a civic reformer. Elected to the Prussian
Diet in 1862, he became leader of the Radical
or Progressive party; and in 1880-93 he was
a member of the Reichstag. Vichow was a
determined opponent of Bismark’s policy, and
in 1865 was challenged to a duel by the "man
of blood and iron." He exercised especial in
fluence in matters relating to public health, and
during the wars of 1866 and 1870-71 he took
an active part in organizing the army sanitary
services. During his membership of 40 years
in the Berlin Municipal Council he was active
in promoting the sanitary improvement of the
city. In 1870 he assisted in founding the
Deutsche und Berliner Gesellschaft für Anthropologie, Ethnologie, und Urgeschichte, of which he was several times president and in 1879 he made a journey to the site of Troy, described in 'Beiträge zur Landeskunde in Troas' (1879) and 'Altkroatische Graber und Schädel' (1882). He visited England in 1893 and delivered the inaugural lecture of the Royal Society on 'The Place of Pathology in Biological Studies,' receiving on the occasion the honorary degree of D.C.L. from Oxford. In 1898 he delivered the Huxley lecture in London, his subject being 'Recent Advances in Physiology.'

Virchow was the founder of cellular pathology, was scarcely less distinguished in archaeology and anthropology and was the author of many important works, among which are 'Handbuch der speziellen Pathologie und Therapie' (1854-76), prepared in collaboration with others; 'Vorlesungen über Cellularpthologie in ihrer Begründung auf physiologischer und pathologischer Gewebelurch' (1859), his chief work, forming the 4th edition the first volume of 'Vorlesungen über Pathologie' (1862-71): 'Vier Reden über Leben und Krankheit' (1862); 'Ueber den Hungerrhythmus' (1868); 'Ueber einige Merkmale niederer Menschenrassen am Schädel' (1875); 'Beiträge zur physischen Anthropologie der Deutschen' (1876); 'Die Freiheit der Wissenschaft im Modernen Staat' (1877); 'Gesammelte Abhandlungen aus dem Gebiete der öffentlichen Medizin und der Schädellehre' (1879), etc. It was in fulfilment of the desires of Virchow that the German government erected in Berlin the Pathological Institute and Museum, the greatest institution of its kind in the world. Consult his 'Life' by Beecher (1901), and Pagel's 'Rudolph Virchow' (Leipzig 1906).

VIRDEN, vér'den, Ill., city in Macoupin County, on the Jacksonville and Saint Louis and the Chicago and Alton railroads, about 22 miles southwest of Springfield and 30 miles southeast of Jacksonville. It is in an agricultural region in which there are large beds of bituminous coal and valuable deposits of clay. The principal products are brick and tile. The principal shipments are farm, coal, clay and dairy products. There are two newspapers and a bank. Pop. about 4,000.

VIRE, France, an ancient town of Normandy, in the Department of Calvados, on the right bank of the Vire, 35 miles southwest of Caen. It stands on a rock, is built of granite and is surrounded by hills, between which are the celebrated valleys of Vire—Vaux de Vire. It has an old church dating from the 12th to the 15th century and ruins of a castle of the 12th century. Its industries are cloth and paper-making and cotton and wool spinning. Pop. 7,000.

VIRELAY, vërrɛlɛ (French, viveloi, from vire, to turn; loi, a lay): a short poem of two stanzas, common in Old French; also a succession of stanzas on two lines, the rim of the last line of each stanza becoming the rim of the first couplet in the next.

VIREONIDE, family of American oscine passerine birds, of which Vireo (q.v.) is the typical genus; the greenlets. The other genera are Ciciorhys, Hylophilus, Laetes, Neohio and Vireolaudis. The vireo are all small birds, less than seven inches long and of a greenish color. They are mostly insectivorous and live in woods and shrubs and are known as 'vireos,' or greenlets, of small fly-catching passerine birds, restricted to America, where they range from Patagonia to Canada. They have bills conical, much compressed, decurved at the end and notched, but scarcely toothed, with numerous conspicuous rictal bristles; frontal feathers briskly and erect, or bent slightly forward; nostrils overhung by membrane; 10 primaries; tarsus usually longer than middle toe and claw; lateral toes generally unequal. The vireos are all small, none of them exceeding about seven inches in length and their colors are plain, generally more or less greenish above, with few conspicuous markings beyond wing-bars and eye-stripes. The iris is frequently bright in color, red, yellow or pure white. The vireo are typically woodland birds, many of them preferring well-watered ravines, others swamps, while some inhabit open woods, parks or the trees of city streets. They are migratory and characteristically insectivorous and search for small caterpillars among the leaves or in cracks of the bark or capture insects on the wing, and they exhibit great activity in these pursuits. Some of the species also eat berries, particularly in the fall. Their nests are very characteristic, being deep cups composed of well-felted vegetable fibres lined with fine grasses, often ornamented externally with bits of paper, lichens, etc., attached with spider's web and nearly always pendent from the twigs of a horizontal fork in a low limb. The three or four eggs are pointed, of a crystalline whiteness and spotted with sharply defined reddish-brown markings. Generally the song is weak, monotonous and repeated almost continuously, but some species are excellent songsters.

South and Central America is the headquarters of this family of birds and there the greatest number of generic types and the greatest variety in habits are exhibited, some of the species approaching the shrieks in structure and some exhibiting marked distinctions in the colors of the sexes. All of the 12 North American species, some of which include several subspecies, fall within the typical genus Vireo. While the differences in the colors, form of the often stout, shrike-like bill and proportions of the body are evident enough to the initiated, no group of birds is more confusing to the tyro in ornithology, and the reader is referred for descriptions of the species to some standard work on ornithology. The red-eyed vireo (V. olivaceus) is generally the best known of the Eastern species. It is strictly a bird of the woods and is noted for its quarrelsomeness, activity and the energy and persistence with which it sings its simple song throughout the year, as it searches for insects throughout the hottest summer days. The warbling vireo (V. gilrus), of still wider range and locally almost as common, is a striking contrast in the last in that it forsakes the woods for the fields and even the shade trees along much traveled streets and because of the surpassing sweetness of its song which, however, is so soft that it does not always reach the ear from the tree-tops where these birds dwell. A much more conspicuous songster, because of its greater power
and marked ventrilogistic ability, is the white-eyed vireo (V. noveboracensis), a species which must be sought in regions sparsely timbered or covered with a scrubby growth or in thickets bordering swamps. The blue-headed vireo (V. sylvarius) is recognizable as the largest and most stoutly built of North American species, the yellow-throated vireo (V. flavifrons), about one-fourth smaller. The blue-headed is, to its head, by its unusually bright colors, while the remaining species are chiefly restricted to the west and southwest.

VIRGIL, vér'jil (PUBLIUS VIRGILIUS MARO), Roman poet: b. near Mantua in Cisalpine Gaul, 15 Oct. 70 B.C.; d. Brundisi, Italy, 21 Sept. 19 B.C.

The Roman writers differ greatly in the amount of biographical information which they themselves give us, and Virgil forms a marked contrast in this respect to his friend and contemporary, Horace. This is doubtless due in part to the nature of the themes which he treated, but in part also to his natural modesty and shrinking from every form of publicity. Fortunately, however, besides allusions of a casual nature in the works of other Roman writers, three ancient biographies of the poet have come down to us. The best of these is that of Aelius Donatus, of the 4th century, which, though distorted in some particulars, seems to be based upon good sources and to give accurately the main details of Virgil's life.

Virgil was born in the country, in a district called Andes, not far from the modern Pietola, three miles below Mantua on the river Minio. His father was of humble origin and is said by some to have been a potter, by others the hired laborer of one Magius. He married Magia Polla, the daughter of his employer, and finally became himself the owner of a small estate, from which he made a living by farming and bee-keeping. He prospered sufficiently to be able to give his son a thorough education, at first in the neighboring town of Cremona, and afterward at Naples and Rome. Of these opportunities Virgil took the fullest advantage. He was always a diligent student and like Cicero made thorough preparation for his life work. At Naples he took up the study of Greek literature under Parthenius; at Rome he not only applied himself to the regular curriculum of rhetoric and philosophy, but besides studied medicine, mathematics and natural philosophy. He seems to have owed most to the Epicurean Siro, through whom he probably became acquainted with the work of Lucretius, by which he was strongly influenced, as was recognized by the ancient critics. He also acquired a love for philosophical speculation which lasted throughout his life and profoundly affected his literary work. Virgil is said to have suffered constantly from dyspepsia and headache and his ill-health, as well as his retiring disposition and studious habits, turned him from the scholarly pursuits to an easier environment. He held no public office of any sort and in fact spent little time in Rome, finding the milder climate of Campania and Sicily more congenial. He seems to have amassed a comfortable fortune from the liberality of his patrons, for in his later life he owned several country places and a house at Rome, on the Esquiline Hill. He enjoyed the friendship of the most distinguished men of his day, both in the world of letters and in public life, and his name is associated neither by himself nor by others with any affairs of the heart. After the completion of his course of study at Rome, we lose sight of Virgil completely for about 10 years. It seems probable that he retired to his native place and busied himself with the management of his paternal estate and with study. This quiet life was rudely interrupted after the battle of Philippi in 42 B.C. His estate was included in the proscriptions which were made in Cisalpine Gaul for the benefit of the veterans of Antony and Octavian and he is said to have had a narrow escape from death at the hands of one of the soldiers. The details of the affair are confused and uncertain. We know, however, that Virgil went to Rome to appeal for protection, where he made the acquaintance of Mæneas and of Octavian. He was unable to recover his property, but seems to have been given another estate, perhaps the one which he is known to have owned near Nola in Campania. His visit to the capital had, however, much more important consequences, which influenced his whole future life. He became a member of the literary circle which Mæneas had gathered about himself, to which he was afterward the means of introducing Horace, and through the generosity of his patron was enabled to devote all his time to literary work and to study. In the year 19 B.C. Virgil undertook a journey to Greece and Asia Minor, with the intention of revising the Æneid, of which he had made a preliminary draft, and then devoting the rest of his life to his favorite philosophical studies. At Athens he met Augustus, who persuaded him to return with him to Italy. Virgil had contracted a fever from exposure to the sun at Megara and was ill when he embarked. He died shortly after landing at Brundisium and was buried near Naples. The exact location of his tomb is a matter of uncertainty.

We know something of the poet's personal appearance from the description of Donatus. According to him, Virgil was large of frame and dark complexioned, and had a certain air of rusticity. This description tallies with the authentic portraits which we possess, which form a very small part of the great number which bear his name. The best are two mosaics, one discovered at Trier in 1884, the other at Susa in Africa in 1896. In character he was gentle and lovable and so extremely modest, that he is said to have taken refuge in the nearest shop or doorway to avoid notice. Although Virgil, like nearly all of the great writers of his nation, was born outside of Rome, he is one of the most patriotic and intensely Roman of all his countrymen. He belongs with Horace to the national school; for, though, unlike his friend, he was strongly influenced by the Alexandrine Greek writers, to whom he was introduced by Parthenius, he kept himself in the main at Naples, and drew from them only what was best in their work and avoided their defects. He owes to them the cosmopolitan tone which has made him popular with all nations and all ages, and his mastery in the treatment of the passion of love. He is not an Alexandrine in the sense
in which that term is ordinarily used, but like Cicero developed a characteristic style of his own.

The first undoubtedly genuine work of Virgil which has been preserved is a collection of 10 pastoral poems, called variously the 'Eclogues' (Elogiae) and the 'Bucolics' (Bucolica). These were probably composed between the years 45 and 37 and are the first Roman representatives of that branch of poetical literature. They were, however, far from being an original creation, but on the contrary are modeled on the 'Idyls' of Theocritus with a closeness of imitation which is rare even among Roman writers. The names of the characters are in most cases taken from the Greek original and the landscape has nothing which suggests the scenes amid which Virgil passed his early life, but is throughout Sicilian; and yet these shortcomings the poet more than compensated for in impressing itself on this early work and it has at least justly been given a high rank in the history of Roman literature. The 'Eclogues' fall into two distinct classes, each represented by five poems, the purely pastoral pieces, which sing of various phases of the life of the idealized shepherd, especially contests in song, and the allegorical poems, which introduce the poet himself and his contemporaries in the guise of shepherds. The latter are naturally the more original and they are also by far the more difficult of interpretation. The most widely known of all is probably the 4th Eclogue, which celebrates the birth of a child, about whose identity there is a difference of opinion, who is to bring back the Golden Age to Italy. It owes its renown in a great measure to the belief, which became current in the Middle Ages, that it was a prophecy of the coming of the Messiah.

Virgil's next work dealt also with the country life with which he was so familiar and loved so much. Maecenas and Augustus are said to have suggested to him the writing of a poem on agriculture, in the hope of making farm life more attractive to the people of Italy, but the poet must have required little urging to induce him to take up a subject so congenial. He had an abundance of material at hand to draw on among the Greek writers and the topic had been a favorite one with the Romans as well, though it had not as yet been treated in verse. Virgil expressly acknowledges his obligations to Hesiod, but he owes more to the Alexandrine writers Nicander and Aratus. In four books he writes of the management of fields, the growing of trees, the rearing of horses and cattle and bee-keeping. He avoids the great social skil of the didactic work by the introduction of such digressions as the praise of spring and by a general lightness of touch which gives an attractive form even to the most commonplace details. He composed slowly and with loving care and polished his language and versification to the highest degree of refinement. The 'Georgics' have justly been called the most finished poems in the Latin language and Addison even calls them the most finished of all. Probably after the publication of the 'Georgics' in 29, Virgil set about the greater task of writing a national epic. This was a plan which he seems to have formed early in life and for which he had been preparing for many years. He was forced against his own judgment to take it up thus early by urgent requests from Augustus and Maecenas. In this field he had the advantage of being preceded by Nearchus, in his 'Bellum Punicum,' and more particularly Ennius in his 'Annales' had treated of the early history of Rome in this way. The latter had connected the destiny of Rome with that of Troy and his epic was regarded as a great achievement. Virgil could hardly depart radically from the plan of his great predecessor, though he surpassed him not only in finish of style, but also by introducing the philosophical reflection and the breadth of treatment which distinguish history from mere chronicle. He made very free use of the works of his predecessors, and among the Greeks not only of the 'Iliad' and the 'Odyssey,' but of the Cyclic poets and of Apollonius of Rhodes. The proud boast of Propercius: 'nec quis in aetas meam / primas versarit et oculos humanos / liciade, as well as the subject of the epic, at once challenged a comparison with the Homeric poems which was freely accepted in antiquity; but in modern times this has been detrimental to Virgil's fame. The question of the 'Aeneid' is unfair, because the 'Aeneid' and the Homeric poems really represent different types of the epic. The primitive epic, of which the 'Iliad' and the 'Odyssey' are unrivaled specimens, is not represented in Roman literature and is foreign to the Roman national character. The works of Navius and Ennius, as well as those of Virgil and the later Roman epic writers, are of the historical type and in this field the supremacy of Virgil is almost universally recognized. While the Homeric poems represent the gradual accumulations of generations of singers, the 'Aeneid' was composed as a complete work of art, with a definite purpose, the glorification of Rome and of the Julian house. The introduction of the gods of the Greek pantheon is in the nature of "epic machinery," since Virgil's generation had no faith in them, and the poet himself was doubtless too much influenced by Lucretius and by his philosophical studies in general, to be an exception to the prevailing skepticism. At the same time his nature was reverent and religious, and a desire to effect a revival of the old Roman piety doubtless formed part of his plan and was thoroughly in accordance with the wishes of his patrons. The 'Aeneid' describes the wanderings and adventures of Aeneas from the time of the fall of Troy until the establishment of his destined empire in Latium. In accordance with the regular rule of epic composition the poet plunges at once in medias res, and begins his tale with the sixth year of the ten-year voyage of his hero. The story of the earlier years is told graphically by Aeneas himself at Dido's court in Carthage. While the greatness of the poem can only be fully appreciated when it is studied as a whole, it is more generally known in part; the last six books, though full of beautiful episodes, are less generally read because of the numerous and somewhat monotonous battle scenes which epic-tradition demanded of the poet, in which he is not at his best in the matter of all poems. Probably the best known part of the poem is the episode of Dido, which forms a complete epic tragedy and bears witness to the poet's familiarity with the masterpieces of Greek drama. The unhappy Carthaginian queen, like Aeneas, had her mission
to perform and her empire to establish, but her plans were forced to give way before the mightier energy of the House of Venus, which even Juno's power cannot thwart, she falls in love with the Trojan hero and strives to detain him in Carthage. He finally leaves her in obedience to the command of Jupiter, and Dido slays herself as his ships are passing out of sight. As she dies, she prays that there may be eternal hatred between Carthage and Rome and the long and bloody struggle which ended in the destruction of the city which she founded forms the sequel to the tragedy. These wars furnished a motive for a great historical epic, which, however, found no worthy poet than the painstaking but insipid Silius Italicus, of the time of Nero and his successors. The desertion of Dido by Aeneas finds little sympathy with the modern reader, and the pious Aeneas appears in many respects a somewhat pitiful hero, but from the ancient point of view his action was justifiable and even praiseworthy, due as it was to submission, in the will of the gods. Aeneas is to be the representative of the old Roman virtues, steadfastness of purpose, endurance, fidelity to a trust, courage and reverence for the gods. It is to the last quality especially, together with his devotion to his father, that he owes his epithet of Pius. To the Roman reader he was the champion of civilization against barbarism, represented by Turnus and his godless associates. So far as the form of the poem is concerned, we see in it Virgil's growing mastery of the heroic hexameter and the results of his long years of study and training, and we may note an advance even in the progress of the work itself. It is the hexameter of the Aeneid which deserves above all others the praise, "the statelyst measure ever moulded by the lips of man."

But Virgil himself was conscious that he had not realized the ideal of his youthful days. In a letter to Augustus of the year 26, in answer to a request to see the poem, he at least some part of it, he says that he feels that he has been mad to undertake so great a task. A few years later, however, he was ready to read three books to the emperor, including the 6th, in which he inserted the tribuneship, and the 7th, in which the Eneas was introduced, 860-886. It is said that Octavia, who was present, fainted as Virgil finished his effective rendering of these beautiful lines, and afterward presented the poet with 10,000 sesterces (about $500) for each verse of the memorial to her son. This story confirms in a general way the statement of Suetonius about Virgil's method of composing the Aeneid. He is said first to have written a version in prose, and he has turned it into verse in no special order; and he seems to have followed the same plan in putting the finishing touches to his work. That he never completed the latter process is evident from various inconsistencies which appear in the poem, and more particularly, since he also wrote and demanded a set of a set of the numerous incomplete and less polished lines. It is shown also by his project of a three years' tour amid the scenes of his earlier books, and by the fact that on his deathbed he directed that all the notes and the lines should be destroyed. This request was fortunately not granted, but Augustus had the work published, with only such revision as was absolutely necessary, by the poet's friend and admirer, Quintus Horatius Flaccus, who was also a skilled poet and a man of letters.

Besides the works of Virgil which are undoubtedly genuine, there have come down to us under his name a number of lesser poems: the Culex, the Cispa, the Moretum, the Dirae, the Etna and the Gnapa, together with a collection of shorter pieces, called the Catalepton (minor poems). Donatus and Servius attribute poems with these titles to Virgil; and Lucan, Statius and Martial mention a Culex of Virgil. It is certain that the Etna and the Dirae are not his work; a fact which in itself discredits the testimony of the grammarians; as regards the rest there is a difference of opinion. The majority of scholars are inclined to regard nearly all these poems as spurious, assuming that they were collected and attributed to Virgil in the time of Nero, a view which disposes of all the ancient testimony, except perhaps that of Lucan. It is argued besides that some of them are unworthy of the author of the Georgics and the Aeneid, and that an objection to which too much weight should not be given, while some, though not open to that charge, are in a manner wholly unlike that of Virgil as we know him. The arguments which have been based on certain metrical features of the poems seem to have little force. Just at present there is a growing tendency to claim these works for Virgil, and while the evidence in his favor cannot be said to be very strong, the same thing may be said of the contrary testimony. It is not likely that universally an opinion on this point will ever be reached.

Virgil's fame among his countrymen was immediate and permanent. He was hailed as the Roman Homer, and the efforts of a few jealous rivals to depreciate him were of no avail. His influence on the later Roman poetry was marked, notably on Persius, Silius, Statius, Ausonius and Prudentius. The same thing is true of the later prose, for example, that of Livy and Tacitus. The Aeneid was used as a textbook in the Roman schools even after the days of Juvenal, and was made the subject of grammatical and stylistic commentaries by numerous writers. The writers of the decline not only imitated him freely, but introduced the custom of writing in verse, by ranging lines and half lines from his works in such a way as to give a sense entirely different from the original. This became a regular form of literary production, and they were even improved. Among the Christians the works of Virgil escaped the general condemnation of the pagan literature, and he was believed to have received some measure of divine inspiration. From the Renaissance to the present time his influence on the poetry of most European countries has been great. Dante, Chaucer, Spenser, Milton and Tennyson, as well as many others, bear testimony to their acquaintance with Virgil; and his poems, especially the Aeneid, have been translated into all the principal languages of Europe, not only in comparatively recent times that the searching methods of modern criticism, especially in Germany, have brought Virgil's fame into question, and his detractors and his champions have in many cases shown equal lack of discrimination. The most common charges brought against
him are those of inferiority to the Homeric poems and of lack of originality. The former point has already been discussed; in considering the latter we must bear in mind that the ancient ideas about literary work differed decidedly from those of our own day, and that wholesome borrowing from the work of one's predecessors was not considered to be at all improper. Furthermore, Virgil had the power which all great writers have, of making what he borrowed his own; and, a thing which may be regarded as the supreme test, he not only imitated, but he was able to inspire imitation.

Besides the Virgil of history there is a mythical Virgil, singularly unlike the original. In comparatively early times the ancient biographers associated prodigies, prophetic of his future greatness, with his birth and the adoption of his works by the grammarians as canons of usage gave him a reputation for vast learning. This feeling brought about the custom as early as the 2d century of consulting the *sortes* Virgilianae (or Virgilius) at random and drawing an omen from the words of the first passage on which the eye fell, a custom which that work has shared only with the Homeric poems and the Bible. As early as the days of Silius Italicus we see traces of the Virgilian cult, for the younger Pliny tells us that Silius made annual pilgrimages to Virgil’s tomb, and kept his birthday with more ceremony than he did his own. A special series of legends of a most grotesque character grew up among the common people of Naples, who with an entire disregard of chronology and of historical truth associated his name with many marvelous inventions and with numerous undignified and disreputable adventures. These two streams of tradition united and found their way into the romantic literature of the Middle Ages, and even into works of a more serious character. They have given us the mythical Virgil, the necromancer and ally of the powers of darkness. His name was in consequence associated in the popular mind with *virga*, a magician’s "wand," which led to the spelling Virgilius, and hence to our Virgil.

As regards the spelling of the poet’s name, the Latin form Virgilius is established beyond question by inscriptions, coins, and other evidence, especially the only one until the 5th century. In English, Virgil was the current form until comparatively recent times, when *Vergil* was introduced in common with a general reform in the spelling of Greek and Latin proper names; this is the usual form in Germany. In England and in America both forms are used, as may be seen from the biographical list given below.

The first printed edition of Virgil was published at Rome, about 1469. Since then there have been many editions in all countries. The standard critical text is that of O. Ribbeck, Leipzig, 1859-68 (containing the famous *prolegomena* and 1894-95 (without the *prolegomena*). Consult, Norden, *Vergil, Book VI* (Leipzig 1903). The best edition in English is on the whole that of J. Conington, revised by H. Netteship (3 vols., 4th ed., London 1881-83). Of translations, which are numerous, may be mentioned those of Conington, of the *Eclogues* into prose (1822), of D. Blackmore, the well-known novelist, of the *Georgics* (1871), and of C. S. Calverly, of the *Eclogues* published in the *Works* (1901). See *Aeneid; Georgics of Virgil; Virgil’s Eclogues*.

**John C. Rolfe,**
Professor of Latin Language and Literature,
University of Pennsylvania.

**VIRGIL, Polydore,** English ecclesiastic and author: b. Urbino, Italy, about 1470; d. there, 1555. He was educated at Bologna and dedicated his first work, *Proverbiis Libellus* (1498), to the Duke of Urbino. His *De Inventoribus Rerum,* which followed (1499), became popular and was translated into English, Spanish and Italian. Being appointed chamberlain to Pope Alexander VI, he went to England in 1501 to collect the Peter’s-pence with his kinsman, Adrian de Castello, then Cardinal Santi Chrysogoni, who was soon after made bishop of Hereford. Polydore was presented to the living of Wem in Shropshire and to the Rectory of Leicestershire, in 1503, and after obtaining several preferments and becoming naturalized in England, he was imprisoned for sending abroad slanderous letters about Wolsey (1513), but apparently was soon released. In 1525 he published the first genuine edition of Gildas, the year after the treatise *De Prodigis,* dialogues in an attack upon divination. His most important work, *Historiae Anglice Libri XXVI,* appeared in 1534, the 27th book was added in 1535. About 1550 he obtained leave from Edward VI to return to Italy for his health’s sake, without forfeiting his preferments and there he lived in Urbino until his death. His *History* is a work of research, written in elegant Latin, and is the fullest narrative of the reign of Henry VII extant. He spared no pains to ensure accuracy, and a rational mind hindered him from accepting the exploits of Brut and Arthur as related by Geoffrey of Monmouth. The Camden Society’s translation of Polydore Virgil’s *History of England.*
VIRGILIA — VIRGIN ISLANDS

VIRGILIA, vör-jil-é-á (from name of Latin poet Virgil), genus of leguminous trees, comprising only one species, P. capensis, the Cape Virgilia, native of the Cape of Good Hope. It attains a height of 15 to 30 feet; has rose-purple flowers, pinnate leaves with small leaflets. It is cultivated as an ornamental tree. In Cape Colony the fruit of Virgilia is used for yokes, spars, etc.; but it is not durable, being liable to be attacked by worms. The American yellow-wood tree, formerly regarded as a species of virgilia, is now referred to Cladastris, a genus native in Kentucky and Tennessee.

VIRGIL'S ECLOGUES. Virgil's Eclogues, or Selections, also called 'Bucolics,' Songs of Herdsmen, are 10 pastoral poems, the longest of which contains 111 lines. They were written in 43-37 B.C., when the poet was 27 to 33 years old and the times were troubled with the results of Philippi, and are his first unrequited work. They are a series of adaptations or imitations of the idylls of Theocritus, the Greek originator of pastoral poetry, who wrote in Syracuse and Alexandria about 270 B.C., and show that their author was enamored of his own poetic gifts.

The Eclogues are separable into two groups. The first group, comprising the second, third, fifth, seventh and eighth, are in the real pastoral strain, with a herdsman or shepherd song running through the verses with his fellow-poets in a friendly contest of song. The poems of the second group, composed after the confiscations by Octavian in 41, which involved Virgil's own estate at his birthplace, Andes, near Mantua, perhaps soon afterward restored through the offices of powerful friends, introduce real personages and contain many contemporary allusions. In the first and ninth the poet himself appears in the guise of shepherd, in the sixth and tenth Varus, a governor of Cisalpine Gaul, and Gallus, soldier-poet and commissioner of lands to whom, with Varus, Virgil was under obligation, are celebrated. The fourth, in honor of Pollio, the author and statesman who was Virgil's chief patron in the recovery of his lands, is the famous prophetic idyll so long thought of as a foretelling of the birth of Christ.

The Eclogues are thus a mingling of the ideal and the actual, of pastoral and political, and are imitative, conventional and artificial in the extreme. In literary history, those of the second group are important as inaugurating the pastoral convention. The shepherds of Theocritus had been real in speech, action and emotion; those of Virgil's second group are poets and public men masquerading as rustics in landscapes compounded of Italy, Theocritean scenes, and the poet's Arcadia, no more real than Marie Antoinette and her court playing damoisaux in the Petit Trianon. Yet in spite of their being in parts little more than translation, in spite of their mingling of the real and the ideal in the world of nature, and their dragging of city characters into pastoral scenes, criticism has agreed that the Eclogues are poetry of a high degree of charm. Their conception in realism is genuine. They express so genuine and so deep a love of beauty in nature wherever it is found, that in the reading of them the imagination is as little disturbed by the consciousness of incongruity or artificiality as it is in the reading of Lydias. They have always been criticized for their unrequited defects, but have always been admired and imitated as well. Lydias speaks for Milton's admiration, and Pope's 'Messiah,' inspired by the fourth, is only one evidence of his esteem. Horace, Patarch, Boccaccio, Erasmus, Spenser, Cowley, Dryden and Wordsworth were fond of them, and Macaulay praised them beyond reason, setting them above both the 'Æneid' and the 'Georgics.' The Eclogues may be read in the prose translation of Conington, or of Fairclough in the Loeb Classical Library, and in the verse of Dryden. For appreciation, see works cited in the article on Virgil's Æneid.

GRANT SHOWERTON.

VIRGIN ISLANDS, an island group formerly known as the Danish West Indies, situated about 40 miles eastward of Porto Rico and comprising 50 islands or islets, only three of which are of sufficient size to be known, except locally, even by name. The three major islands of the group are Saint Thomas, Saint John and Saint Croix or Santa Cruz.

Saint Thomas lies 30 miles southwest of Puerto Rico, a direct line east and west, and is about 13 miles long, with an average width of a little more than two miles. It is the most important of the group because of the fine harbor at Charlotte Amalie on the south side; moreover its location on the direct line of communication between European ports and the entrance of the Panama Canal, as well as the direct line for vessels plying between ports of North and South America, makes it a logical distribution centre for goods coming to the Lesser Antilles. Its distance from New York is 1,400 miles; from Colón, 1,020 miles; from La Guaira, Venezuela, 480 miles. The commerce of Saint Thomas itself — although its imports constitute about 70 per cent of those for all three islands — amounts to less than $1,000,000. The chief imports are foodstuffs and wearing apparel; exports, bay rum and a few hides. Charlotte Amalie is the only town on the island. Population of Saint Thomas is about 10,700.

Saint John — area 21 square miles — lies about four miles east of Saint Thomas. In size and importance the least of the major islands, it nevertheless possesses a harbor at Coral Bay which, according to engineers, requires only development to make it a rival of the better-known harbor at Charlotte Amalie. A very small acreage is devoted to sugarcane, but the chief industry is the growing of bay leaves and the distillation of the bay oil from which bay rum is made. The inhabitants, numbering less than 1,000 in all, are colored or of mixed blood, with a few exceptions.

Saint Croix, the largest, wealthiest and most thickly populated of the islands, lies about 40 miles southeast of Saint Thomas and has an area of 84 square miles. Upon it are the two towns, Frederiksted and Christiansted, locally known as Westend and Bassin. Christiansted (population about 4,500) was the seat of the Danish colonial government, and the largest government house in the West Indies is located on the main street of Christiansted near the wharf. Frederiksted, though smaller (population about 3,000), is much more important commercially. The southern districts
of Saint Croix are well suited to the application of modern agricultural methods, and here are found the large sugar estates, as well as a considerable acreage of sea-island cotton. The roads are excellent and many of the sugar estates are connected with the factories by industrial railroads. The total population of Saint Croix is given as 14,000, about 10 per cent being whites of unmixed blood.

The climate of these islands is healthful. For the year ending 30 June 1915 the record, furnished by the director of the colonial agricultural experiment station in Saint Croix, show that the coolest weeks were 18 to 31 January with a maximum temperature of 83° F. and a minimum of 65° F., and 8 to 14 March, maximum 82° F. and minimum 66° F. The hottest weeks were 31 August to 6 September, with 91° F. as maximum and 76° F. as minimum, and 7 to 13 September, with maximum 92° F., minimum 74° F. No records of rainfall are available for any of the group except Saint Croix. On that island, the average annual rainfall for 63 years was 31.26 inches. Steamer of the Belgium Steamship Company running from New York to British Guiana stopped at Saint Thomas in the middle of 1914. Eight steamer lines were making regular calls at Saint Thomas. Monthly service between Saint Thomas and Porto Rico was formerly maintained by the Compagnie Générale Transatlantique. The provisions of the coastwise shipping laws excluding vessels of foreign registry now apply to this service.

Saint Thomas is headquarters of the West India and Panama Telegraph Company (Ltd.), whose duplicate cables extend to the west coast of South America and connect at Jamaica with cables from the United States and Europe. Two newspapers are published in Saint Thomas and three in Saint Croix. Both of these islands are provided with telephone service. The islands have been exported from the whole group in the last 15 years was recorded in 1903, when the total was 19,275 short tons. The estimate for 1916, 16,000 short tons. The manufactures are hay rum, sugar, molasses, rum, concentrated lime juice, etc. There are two banks—the National and the Saint Thomas Savings Bank. The islands originally belonged to Denmark, by which they were sold to the United States in 1916 for $25,000,000. Ratifications of the treaties of sale were exchanged on 17 Jan. 1917 and the United States took possession of the islands on 31 March 1917. Consult Brock, H. G., Smith, P. S. and Tucker, W. A., 'The Danish West Indies' (Special Agents Series, No. 129, Washington Government Printing Office, 1917).

**VIRGIN MARTYR**, The, a powerful tragedy by Philip Massinger and Thomas Dekker. It is based on the legend of the martyr Dorothea slain in the reign of Diocletian. It was licensed in 1620 and was first printed in quarto form in 1622. It contains many passages of great beauty as well as several scenes most repellant in their coarseness but which in all probability are not the work of Massinger.

**VIRGIN MARY**, The. See Mary, the Mother of Jesus.

**VIRGIN QUEEN**, The, a term popularly applied to Queen Elizabeth, on account of her determination not to marry.

**VIRGIN SOIL**, a novel by Ivan Turgeneff, published in 1876, and in an English translation in 1879. Turgeneff gives in 'Virgin Soil' a graphic picture of the social and political influences at work in the Nihilistic movement in Russia. The motive of the story is deep and subtle, and developed with masterly skill and refinement.

**VIRGINAL**, an obsolete stringed instrument played by means of a keyboard, like the modern pianoforte. It was in form like a box, or desk of wood without legs or supports, and was usually placed on a table or stand. The strings were of metal, one for each note, and the sound was made by means of pieces of quill, whalebone, leather, or occasionally elastic metal, attached to slips of wood which were provided with metal springs. The compass was about three to three and one-half octaves.

**PHANOR**, VIRGINIA, ver-jin't-a, the daughter of Lucius Virginius, whom Appius Claudius, the decemvir, endeavoured to carry off from her parents. Her father, finding he could not save her by any other means, slew her in the open forum and raised an inscription, which overthrew the decemvirate and restored the old magistracy (449 a.c.). The story is given in Livy, and Dionysius of Halicarnassus, and one of Macaulay's 'Lays' is based on it.

**VIRGINIA**, the chief of the 13 original States, the most southern of the Middle Atlantic group and one of the easternmost of all the States, lies on the Atlantic slope in lat. 36° 31' and long. 79° 37' N. and long. 75° 13' and 83° 37' W.—half way between Maine and Florida. The extreme length from the Atlantic to Kentucky (east to west) is 440 miles and the greatest width, from north to south, is 196 miles. Its land surface is 40,125 square miles and water area—rivers, land-locked bays and harbors—2,325 square miles. Virginia, called the Old Dominion, was certainly the mother of States. The colony included the territory of nearly every Southern State in whole or in part, and of every other State with the exception of Maine. In its present proportions Virginia's boundaries are Maryland and West Virginia on the north, Maryland and the Atlantic Ocean on the east, North Carolina and Tennessee on the south and Kentucky and West Virginia on the west. Capital, Richmond.

**Topography.**—Physiographically the State is divided into three provinces of widely different characteristics. The first of these is the coastal plain, the most eastern of the provinces, constituting the area between the Atlantic Ocean and the higher-lying Piedmont country on its west, containing 9,500 square miles of surface, nearly one-fourth of the area of the State. It is known as Tidewater Virginia. The streams crossing this province are tidal, with deep channels. The Piedmont plateau, is the middle province and stretches from the coastal plain westward to the southeastern base of the Appalachian mountains. Its width varies from 40 miles to nearly 175. From an altitude of nearly 1,000 feet it slopes gently eastward to
an altitude of 200 to 400 feet. This province differs from the coastal plain in the nature and origin of its surface features and in the age, kinds and structure of its rocks. Here is the outcrop of the Blue Ridge, found in the eastern part of the United States contiguous to tidewater. This section is known as Piedmont Virginia. Its extent is about 15,500 square miles.

From the southeastern slope of the Blue Ridge the Appalachian Mountain province in Virginia stretches to the western boundary of the State, but physically the province extends northeast and southwest far beyond these limits. Within Virginia it covers about 16,250 square miles, with these characteristic divisions: (1) The Blue Ridge, easternmost range of the Appalachians, a mountain belt from 3 to 20 miles in width, extending from Harper's Ferry in a southwesterly direction across the State, advancing from an elevation of 1,200 to more than 4,000 feet. The rocks are igneous pre-Cambrian, Cambrian, sandstones and shales and silicious sediments of the same age; (2) the Great Valley and (3) the Allegheny mountains. The Blue Ridge extends on the southeast and the Allegheny front on the northwest. The rocks are limestone, shale and sandstone ranging in age from Cambrian to Carboniferous.

The highest points in Virginia exceed 5,000 feet in elevation and 17 fall between 4,000 and 4,500. Nine thousand seven hundred square miles of the State's surface have an altitude from 0 to 100 feet above tide; 10,500 square miles from 100 to 500; 5,950 square miles from 500 to 1,000; 4,700 square miles from 1,000 to 1,500; 4,200 square miles from 1,500 to 2,000; 6,800 square miles from 2,000 to 3,000 and 600 square miles from 3,000 to 4,000.

Rivers.—The chief rivers in Virginia are the James, Potomac, Rappahannock, York, Blackwater, New River, Holston, Mattapony, Pamunkey, North Anna, South Anna, Rapidan, Chickahominy and Shenandoah. All of them are historic, but the James is the best known. Rising in the Alleghany uplands, it passes through several mountain gorges in the Great Valley which it leaves at the beautiful water gap in the Blue Ridge at Balcony Falls. Thence it winds its way through the most historic country in Virginia to the Atlantic. The Roanoke rises in Montgomery County, in Southwest Virginia, passes through the Blue Ridge by the Roanoke Water Gap, where its name is changed to Stanton River, on to its confluence with the Dan, where it recovers its original name. New River rises on the Piedmont plateau, and, unlike the general trend of Virginia water courses, flows westward through the Blue Ridge, across the Valley of Virginia, through the Appalachians into the Great Kanawha and eventually mingle with that of the Ohio. The eastern Virginia rivers—the Pamunkey, the Chickahominy, the York, the Blackwater—are sluggish, unpicturesque streams of great value to the country they drain. They are occasional fresh-water lakes. The largest of the tidal estuaries in Virginia are the tidal estuaries which have invaded the coastal plain as far as the "fall line" belt, dividing it into peninsula long and narrow in outline. The greatest of these estuaries is, of course, Chesapeake Bay, to which the estuaries of the Potomac, the Rappahannock and the James—from 150 to 200 miles long—and the smaller ones of the York, the Wicomico, the Patuxent and the Patapsco rivers and of Mobjack Bay and many of lesser tide pay their constant tribute. The rivers of the coastal plain are tidal with low velocities and are navigable as far inland as the Piedmont border—the so-called "fall line" belt.

Climate.—Virginia lies within the temperate zone and, speaking broadly, there are no great extremes of heat and cold. The temperature is quite stable from day to day in the coastal plain. The extreme temperature is: Winter 39.8° spring 56.8°, summer 77.2°, autumn 60.8°. The average number of days each year with a maximum temperature above 90° is 28; below 32°, 55. Greater ranges in the monthly and seasonal mean occur in the elevated area known as the Piedmont province. Marked changes occur suddenly, but not frequently in winter. Mean temperature: Winter 35.8°, spring 55.3°, summer 75°, autumn 57.4°; annual 55.9°; average number of days each year with maximum temperature above 90°, 13; below 32°, 98. The average annual precipitation in the coastal plain province is 46.61 inches; the Piedmont 42.50 and the Great Valley 43. The prevailing direction of the wind is northeast in the coastal plain; northwest in the Piedmont plateau and west in the Great Valley; mean annual velocity for the State 6.3.

Geology.—The coastal plain is composed of sediments, mostly sands, clays and marls, ranging in age from lower cretaceous to quaternary. The beds strike in general from north to south, with a low easterly dip. The Piedmont plateau is formed of highly metamorphosed sedimentary and igneous rocks of pre-paleozoic and early paleozoic age, with exposures of fresh rock less numerous than farther north. The rocks are crystalline with gneisses and schists. The abundance and excellence of the granite make them important in commercial work. There are areas of triassic sediments and over parts of the south central portion of this province are found volcanic-sedimentary rocks. The Blue Ridge is composed of pre-Cambrian igneous rocks with Cambrian sandstones and slates on the northwest and on the southeast, in places, by silicious sediments of the same age. The Valley of Virginia and the Alleghany ridges are composed of paleozoic sedimentary rocks ranging in age from Cambrian to carboniferous.

Minerals.—Coal is by far the largest mineral interest of the State. The annual output has been about 8,000,000 short tons, of which more than nine-tenths was bituminous, and the value of the mines has been somewhere in excess of $8,000,000. In 1916 the output was 9,707,474 short tons, valued at $10,261,424. Practically all of it was mined in the mountains.
of southwest Virginia, in the counties of Wise, Tazewell, Montgomery, Lee, Russell and Pulaski although there is coal elsewhere. Iron is mined in the Valley and Piedmont provinces of the west and southwest. At Crimora, in the Valley of Virginia, more manganese has been taken than from any other mine in the United States. In 1910 the output of manganese and carboniferous iron ores was 40,117 long tons, valued at $217,136. Other mineral productions for the year 1910 were: Coke, 1,242,332 short tons, value $1,695,361; clay products, including brick and tile, clay mined and sold and pottery, $1,695,361; limestone $1,087,247; iron ores 486,798 long tons, $1,000,118; soapstone and talc 28,355 short tons, $564,228; granite $451,677; mineral waters 2,313,616 gallons, $288,906; slate 36,007 squares, $163,483; sandstone $66,217.

Natural Attractions.—The best known and perhaps the most visited of the natural attractions of the State is the Natural Bridge, 14 miles from Lexington in the county (Rockbridge) named for it. The formation of which human agency had no part, is 215½ feet high, measuring from the top of the span to the creek which flows under it. In the same county, 12 miles southeast of the Warm Springs, is the "Blowing Cave," which emits a constant current of air which is strongest in dry, frosty weather and weakest in long periods of rain. Regular inspirations and expirations of air by caverns and fissures have been probably enough accounted for by supposing they combined with intermittent fountains, as they must, of course, inhale air while their reservoirs are emptying themselves and again emit it while they are filling, but a constant issue of air only varying in its force as the weather is dryer or damper will require a new hypothesis. Sixteen miles northeast of the Warm Springs, in Bath County, is a spring whose waters ebb and flow. At intervals, in the driest weather of summer, the water flows out as if suddenly released from a dam, and continues at flood 10 or 12 hours, and then gradually declines. In the same kind of weather the periods of flow will vary from two to three days and sometimes occur daily. There are numerous caves. The most noted are Warm Springs, Bath County and the Lime Kiln caverns in Page. Crabtree Falls, near the summit of the Blue Ridge mountains, in Nelson County, consist of three descents, the longest leap being 500 feet. Balcony Falls, at the meeting of Rockbridge, Amherst and Bedford counties, where the James makes its way through the Blue Ridge, is a scene but little inferior to the spectacle of the Potomac through the same mountains at Harper's Ferry. Mountain Lake, in Giles County, 3,500 feet above the sea, is the antithesis of Lake Drummond in the Dismal Swamp. Scott County furnishes a Natural Tunnel by which buffalo made their way through the mountain. The use of it by the Virginia and Southwestern R.A.R. Co. has taken place since the days of Daniel Boone.

Agriculture.—Livestock is the most considerable interest, the value of the product of 1917 being estimated at $290,000,000, an increase of $158,973,000 over 1910. Dairy products have grown from $1,000,000 in 1910 to $17,000,000 in 1917, and, in the same period, poultry from $2,000,000 to $13,000,000. Beets yielding fruits from $2,663,000 to $7,000,000. Corn is the great Virginia crop. Wheat has moved up to second place from fourth, changing places with tobacco. Crop products and their value for 1917 (the value of the 1900 product in each case known is given in parentheses, for comparison) as estimated by the Commissioner of Agriculture are: Corn, 66,700,000 bushels, value $100,000,000 ($16,300,000); wheat, 19,300,000 bushels, value $38,000,000 ($6,200,000); potatoes, 17,300,000 bushels, value $33,000,000 ($2,500,000); tobacco, value $32,000,000 ($7,000,000); peanuts, value $7,000,000 ($2,261,000); oats, 5,000,000 bushels, value $3,000,000 ($1,104,000); rye, 1,000,000 bushels, value $2,500,000; buckwheat, 500,000 bushels, value $625,000; all trucks, value $15,000,000 ($5,000,000); miscellaneous, value $11,000,000 ($470,000).

Fisheries.—The product of fish and oysters reached the value of approximately $18,000,000 in 1917. Attention to oyster planting yielded an enormous return. The value of fish and oysters in 1900 was $7,000,000.

Manufactures.—In 1916, 2,793 manufacturing plants in 53 industries reported to the Virginia bureau of labor and industrial statistics. Capital, $199,093,905; wages, $62,504,658.75; persons employed, 132,934; value of product, $379,529,582.04. This summary includes the production of coal and coke but not the capital invested nor the wages paid. The industries with products valued at more than $3,000,000 individually were: Iron and machinery, $69,905,517.39; tobacco stemmers and rehandlers, $22,672,814.80; cigars, cigarettes and cheroots, $17,808,239.53; cotton mills, $16,322,036.07; tanneries, $16,208,548.86; peanut factories and coffee roasters, $14,873,579.39; flour mills, $14,064,076.30; coal and coke, $11,539,641.57; paper and pulp mills, $10,881,349.98; tobacco factories, $10,050,714.14; woodenware, baskets, boxes and shooks, $9,359,171.92; boots and shoes, $6,152,066.30; overalls and shirts, $4,676,065.11; sash, doors and blinds, $4,602,140.61; printing, engraving and binding, $4,235,746.19; knitting mills, $4,138,526.18; trunk and bag factories, $3,237,586.08, and artificial ice, $3,101,367.60. Stable labor conditions, modern raw material, including the best of steam coal, and abundant water power and almost unsurpassed transportation facilities by rail and water are favorable.

Tobacco Industry.—Tobacco became the most important industry in Virginia in the first decade of the colony; at the beginning of the fourteenth century it had become the sole legal tender currency. It has always ranked near the top of Virginia staples. In 1916 it was second; in 1917 the fourth, corn, wheat and potatoes having first, second and third places. The value of the product in 1917 was $32,500,000 ($18,863,000 in 1916). Danville, Lynchburg and Richmond are the largest tobacco markets in Virginia and among the largest in the United States.

Forest Products.—According to the best available information the estimated volume of merchantable timber in the State is approximately 30,000,000,000 board feet, of which about 11,000,000,000 are oak, principally white, red, black and chestnut oak. About 9,000,000,000 board feet are yellow pine, mostly short leaf, Virginia loblolly, and the remainder chestnut, yellow
poplar, maple, beech, sweet gum, hickory, hawthorn, hemlock, white pine, cypress, black gum, black locust and black walnut, approximately in the same proportions. In the cleared and cleared areas and cleared areas are about equal in extent. The dominating species is lobolly pine (*Pinus taeda*), with oaks, sweet gum, cypress, yellow poplar and hickory. There are considerable stands of juniper in the Dismal Swamp section. In the Piedmont plateau probably rather more than half of the area is wooded, the typical timber being a mixture of yellow pine and hardwoods, the hardwoods predominating except on lands that were formerly cultivated. The yellow pine is chiefly short leaf (*Pinus echinata*), with considerable amounts of lobolly pine on the eastern edge of the region. The hardwoods are the various oaks, hickory, yellow poplar, chestnut and some maples. There are still considerable areas of practically virgin timber in the more inaccessible parts of the mountains.

Transportation.—There were, in 1916, 26 steam railroads with operating revenues exceeding $100,000 a year, and 20 with operating revenues under that total, with an aggregate mileage in Virginia of 4,777.61. The longest of these within the State are the Norfolk and Western, 1,176.78 miles; Southern, 844.78; Chesapeake and Ohio, 783.50; the Virginia Railway Company, 333.51. Other important railroads are the Seaboard Air Line, Atlantic Coast Line, the Virginia and Southwestern, the Norfolk Southern; the Carolina, Clinchfield and Ohio; the New York, Philadelphia and Norfolk; the Richmond, Fredericksburg and Potomac, and the Louisville and Nashville Railroad. Communication with every section of the State and with every leading port and city is ample, and is expanding as increased facilities are required. Mileage of electric railroads in the State in 1916 was 486.9. In tidewater Virginia the waterways are a vast means of transportation.

Commerce.—The imports of merchandise into Norfolk, Newport News and Portsmouth during the year ending 30 June 1917 amounted to $17,986,946; Richmond, $767,399; Petersburg, $575,661; a total for the State of $19,363,300. All exports were recorded at Newport News, Norfolk and Portsmouth and amounted to $13,009,596. Hampton Roads is unsurpassed in harbor facilities; it is the largest and safest on the Atlantic Coast — and the cities on its shores are of great and increasing importance in foreign, coastwise and internal commerce. In a decade Virginia imports have increased fivefold and exports tenfold.

Banks and Banking.—At the close of business 11 December 1917 there were in Virginia 148 national banks with a capital of $19,918,000 and deposits of $151,988,000, and 288 State banks and trust companies with a capital of $13,663,710 and deposits of $91,503,926.73. Deposits in the Federal Reserve Bank, Richmond, on 7 Dec. 1917 were $97,149,000.

State Government.—Seven of the State officers — governor, lieutenant-governor, attorney-general, secretary of the commonwealth, commissioner of agriculture and immigration, superintendent of public instruction, and State treasurer — are elected by the people every four years. The adjutant-general and the members of the Corporation Commission are appointed by the governor, and other commissioners and the judiciary are elected by the legislature. The legislature is elected every four years, and members may be re-elected biennially in every session limited to 60 days, which may be extended without pay. The governor's salary, $5,000. Representatives in Congress are 10. The present constitution was proclaimed in 1902.

State Finances.—On 1 Oct. 1916, the State debt was $23,347,125.97, of which $5,518,754.16 were Riddleberger bonds (Act 1882), $15,360,763.96 Century bonds (Act 1892) and $2,467,608.85 the school and college and asylum and church certificate debt. The assessed valuation — about two-thirds of the actual value — on the land books of 1916 was: Personal property, $343,119,226; real estate, $627,625,643; mineral lands, minerals, improvements, machinery, etc., under development, $9,180,894; mineral lands, minerals, etc., not under development, $17,951,995; standing timber, $1,723,557. Receipts (including balance, etc.) for the year ending 30 Sept. 1916 were $11,037,303.01 (including surplus), (including $119,423.52 paid to sinking fund), $8,440,340.05. The balance, 1 Oct. 1916, was $356,962.96.

Charities and Corrections.—The State provides four hospitals for the insane — the Eastern at Williamsburg, the Western at Staunton, the Southwestern at Marion and the Central, for colored insane, at Petersburg — an epileptic colony and a colony for the feeble-minded (Madison Heights), two sanatoria for the tuberculous ( Catawba and Charlottesville), a school for the deaf and blind (Staunton), one for colored deaf and blind (Newport News). Private philanthropy maintains 33 orphanages, 7 foundling hospitals, 2 placing-out agencies, 3 travelers' aid societies, 4 juvenile protective associations, 8 Salvation Armies, 3 industrial schools, 15 organized charity associations, 8 social settlements, 10 homes for the aged, 12 visiting nurse associations, 6 dispensaries (not connected with medical colleges) as hospitals, of which 23 do charity work, and 7 maternity and rescue hospitals. In 1916 2,532 white persons and 2,366 colored were supported in almshouses at an annual per capita cost of $123.29; 3,037 white and 2,361 colored were given outdoor relief. There were 741 convicts in the penitentiary 30 Sept. 1916; 878 were received during the year (56 less than the previous year); released by discharge, death, pardon and escape, 891; per capita cost of maintenance for the year (based upon operation and average attendance), $160.96. Jail commitments in 1916, 29,426, a decrease of 2,599 from 1915.

Education.—The Virginia free school system dates from 1870. It is controlled by the State Board of Education, composed of the governor, the attorney-general, the superintendent of public instruction, three members from the faculties of State institutions for higher education, one Baptist and one Methodist, and six members of the State board of education. In 1915 the public school population (between the ages of 7 and 21) was 657,513; number of schools, 12,343; pupils enrolled, 474,210; teachers, 12,507; revenue, $7,215,682.57; total cost of the public schools, $7,045,810. For technical and advanced education, the State has made provision as follows: The University of Virginia, Charlottesville; Virginia Military
Institute, Lexington; William and Mary College, Williamsburg; Virginia Polytechnic Institute, Blacksburg; four female normal schools (at Farmville, Radford, Harrisonburg and Fredericksburg). In addition to these are Washington and Lee University located at Lexington, and colleges founded by religious denominations as follows: Randolph-Macon College for men, Ashland; for women, Lynchburg; Hampden-Sidney College, near Farmville; Emory and Henry, at Emory; Richmond College (coeducational), Richmond; Roanoke College (coeducational), Salem; Bridgewater College, Bridgewater, and Lynchburg College (formerly Virginia Christian College), Lynchburg. Hollins College, at Hollins, Martha Washington College, Abingdon, and Sweet Briar College, Sweet Briar, are institutions for the higher education of women, as is Westhampton College, Richmond, co-ordinate with Richmond College. The Miller Manual Labor School in Albemarle County is an industrial school for boys opened by the Martha Jefferson and Blue Ridge Industrial School for mountain boys and girls. There are law schools at the University of Virginia, Washington and Lee University and Richmond College, and for medicine, the medical schools at the University of Virginia, Charlottesville, and the Medical College of Virginia, Richmond; theological seminaries for white students at Richmond and Alexandria, and for colored at Richmond, Lynchburg and Petersburg. For the higher education of colored students are the Hampton Normal and Agricultural Institute, at Hampton, and the Virginia Normal and Industrial Institute at Petersburg.

Religion.—The total number of communicants or members of churches in Virginia in 1800 was 793,546. In numerical strength the 10 largest denominations stood in the following order: Baptist, Methodist, Presbyterian, Roman Catholic, Protestant Episcopal, Disciples or Christian, Lutheran, Dunkers or German Baptists, Christian (Christian connection) and United Brethren. There were 5,965 Sunday schools, with 50,226 officers and teachers and 430,452 scholars.

History.—In 1760 the population of Virginia was 747,610; 1800, 880,200; 1810, 974,600; 1820, 1,065,116; 1830, 1,211,405; 1850, 1,421,661; 1860, 1,596,318; 1870, 1,225,163; 1880, 1,512,565; 1890, 1,655,980; 1900, 1,854,184; 1910, 2,061,612. The population (1910) was divided by sex and race as follows: Male 1,035,348; female 1,025,264; white 1,389,809; negro 671,096; Asiatic 168; Indian 539. There were 27,057 of foreign birth, of whom 3,687 were English, 2,430 Irish, 4,228 German, 4,379 Russian and 1,246 Scotch. The United States Bureau of the Census estimated Virginia’s population was 2,213,025 on 1 July 1917. The population of the chief cities by that estimate was—Richmond, 158,702; Norfolk, 91,146; Roanoke, 46,282; Portsmouth, 40,693; Lynchburg, 33,497.

Colonial History.—Herjulfsen, a Norseman, sailing the Greenland Sea, and storm-driven westward to the coast of Labrador, was the first European to see the shores of North America. He was inquisitive, and did not land. Later, 15 years later (A.D. 1001), landed in 41½° N. lat., well within the patent of Virginia territory which James I granted to the London Company six centuries later. For 300 years these prowlers of the sea occasionally visited the northern shores of the continent, sailed away and left no trace. The greatest date in the annals of discovery is 1492, the year the Italian, Christopher Columbus, commissioned by the royal pair of Spain, reached the Western World. They claimed all the country in the new country soon to be called Virginia, and the English entered upon the scene, led by a Venetian-born sailor, Cabot, and by a sure instinct for colonizing and possessing. They claimed all the continent extending 300 sessions on the south to the French on the north. This vast territory was the original Virginia, the first of the American colonies settled by the English. Jamestown, on the James River, was founded 13 May 1607 by 105 colonists sent out by the London Company, to whom James I had granted South Virginia, as it was then called in distinction from the territory to the northward, named North Virginia. The colonists were mostly worthless adventurers; Wingfield, the president of the colony, proved dishonest, and the whole enterprise was only saved from a disastrous end by the courage and energy of Capt. John Smith. (See Smith, John.) In 1609 the London Company was reorganized and received a grant of territory extending 300 miles north, and the same distance south of Old Point Comfort, and westward to the Pacific. The government council was superseded by a governor to be appointed by the company’s council in England, and to have the sole superintendence of local affairs. Lord Delaware was appointed governor, Sir Thomas Gates lieutenant-governor, Sir George Somers admiral, Christopher Newport vice-admiral and Sir Thomas Dale, high marshal, all for life. Nine vessels with 500 colonists, including 20 women and children, set sail at once. Gates, Somers and Newport accompanied the fleet, but the governor was detained for some time in England by his private affairs. The three officers all embarked in the same vessel and as a precaution landed on one of the Bermudas; one of the other vessels was lost, but the remaining seven arrived in safety in the James River. The old government was abrogated, but none of the officers of the new one having been appointed, Smith obtained the government, as the charter authorized him to do, but the new colonists, like the old, were mostly a profligate set of adventurers, whose whole study seemed to be to create disturbances. Smith was soon after severely wounded by an accident and obliged to return to England for surgical aid, and left a colony of 500 persons well supplied with arms, provisions and goods for traffic with the Indians, and provided with a fort, church, storehouse and 60 dwellings and a good stock of domestic animals. After his departure the colonists gave themselves up to riot and idleness, and a party of 30 seized a vessel belonging to the colony and sailed away as pirates. Six months after Smith’s departure only 60 colonists remained. At this juncture Newport, Gates and Somers, with 150 men arrived from the Bermudas in vessels which they had built there. Finding the condition of things at Jamestown, they resolved to abandon Virginia, and sailed with the remnant of the colonists to Newfoundland to seek food and a passage home from the fishermen. As they descended the river (10 June 1610) they met Lord Delaware, who had just arrived from
VIRGINIA

England, bringing supplies and colonists. He persuaded them to return to Jamestown, took measures for procuring supplies, established a tobacco plantation at James River, and punished the Indians for their barbarities toward the colonists by attacking and burning several of their villages. His health failing, he returned to England, leaving his brother-in-law in his place. His son was superseded by Sir Thomas Dale, who arrived with 300 settlers and some cattle. Under Dale's property, theretofore held in common, was divided among the colonists. The right of property in land in America was then first recognized. He was followed in the governor's office by Sir Thomas Gates, who brought 350 more colonists. New settlements were commenced at Henrico, some distance above Jamestown, and at the junction of the Appomattox and the James, then called New Bermuda. The laws for the colony were harsh and strict, and occasioned much dissatisfaction. In 1616 Dale, who had resumed the government of the colony at the departure of Gates, returned to England, and after Gates was appointed deputy-governor. He used his office so much to the distress of the colonists that Lord Delaware sailed from England to resume his duties, but died on his passage, at the mouth of the bay which bears his name. George Yeardley now appointed governor (1619) and knighted, deserves to rank as the first American Democrat. He called the first legislative body ever constituted in Virginia to meet at Jamestown, July 1619. Its membership was composed of two elected representatives from each of 11 boroughs of the colony. This house of burgesses was the first act in the long drama of self-government in Virginia. Twelve hundred colonists were sent over during this year, among whom were 90 respectable young women, who were disposed of to the planters as wives at the cost of their passage. Among the new colonists were 100 sent by the king's special order from the prisons, to be shipped as servants to the planters. This was the first instance in which felons had been sent to a British colony, and despite the protests of the colonists they continued to be sent in increasing numbers to Virginia for 100 years. In 1620 a Dutch trading vessel brought to Jamestown 20 negroes, who were sold as slaves for life. The number did not much increase for the next 40 years, being limited to a few cargoes brought in by Dutch traders. More settlers arriving, new plantations were established on the York, James and Potomac rivers, and on the eastern shore of the Chesapeake Bay.

In 1622 occurred a bloody war between the colonists and the Indian tribes led by Opechancanough, the brother and successor of Powhatan. On the night of 22 March 350 persons were massacred, and in a brief period Indian murders, sickness and famine reduced the number of the colonists from 4,000 to 2,500. In 1624 the London Company was dissolved, and the colony passed under the direct charge of the Crown, except during the period of the Commonwealth, 1649-60. Its condition at this time was not prosperous, tobacco being the only article of export which paid a profit. In 1630 a fort was built at Point Comfort on the James River, and the colony passed under the direct charge of the Crown, except during the period of the Commonwealth, 1649-60. Its condition at this time was not prosperous, tobacco being the only article of export which paid a profit. In 1630 a fort was built at Point Comfort on the James River, and the colony passed under the direct charge of the Crown, except during the period of the Commonwealth, 1649-60. Its condition at this time was not prosperous, tobacco being the only article of export which paid a profit.

In 1632 the laws of the colony were revised and consolidated, and, though occasionally troubled by the Indians, and by vicious and vagabond colonists, it seems to have maintained a fair share of prosperity for a number of years. In 1641 Sir William Berkeley became governor, and being a staunch loyalist soon came into collision with the parliament. The colony remained firm in its adherence to the Stuarts till March 1652, when an English fleet which had been sent to the colony overthrew it. The island that was to be submitted visited the Chesapeake and arranged terms of capitulation with the loyalists; and Berkeley's commission being declared void, Richard Bennett, a Puritan settler in Maryland, was elected governor. On the restoration of Charles II, Sir William Berkeley returned and was elected governor. The right of suffrage, which had been almost universal during the protectorate, was limited by act of 1670 to freeholders and householders, not too much from the pressure of the royal authority as from the aristocratic views of the prominent planters. The code of the colony was again revised in 1662 and the Church of England re-established and severe laws were passed against nonconformists. At this period the supremacy of the courts of the courtiers of Charles II, upon two of whom, Arlington and Culpeper, he had bestowed a patent of the Virginia colony, and the heavy taxation encouraged for his own purposes by Sir William Berkeley, led to great discontent, which in 1676, on the occasion of a levy of fresh taxes to provide against a threatened attack from the Indians, culminated in what is known as "Bacon's Rebellion." (See BACON, NATHANIEL.) This provision met with the popularity of the men and their discontent.

The winter of 1677 he visited England to justify his conduct, but died before having an interview with the king. Lord Culpeper was then governor for a time and was followed by Lord Howard of Effingham, both rapacious and greedy. In 1689 the colonial government was reluctantly proclaimed William and Mary. In 1705 the fifth colonial revision of the code took place. By it the slave was declared real estate, and thus, like the Russian serf, attached to the soil. This provision remained in force while Virginia continued a colony. In 1696 Williamsburg, founded and named in honor of William III, became the capital of the colony. In 1754 hostilities broke out with the French, who had built a line of military posts along the western slope of the Alleghenies and at the headwaters of the Ohio; and in this war George Washington first entered the service of his country, commanding the colonial troops at the battle of Fort Necessity (1754), and being placed at the head of the Virginia forces after Braddock's defeat in 1755. The assertion by Parliament in 1764 of the right to tax the colonies without their consent called forth an earnest petition, memorial and remonstrance from the Virginia house of burgesses in December that year; and the stamp, mutiny and quartering acts passed by Parliament in 1765 led to the adoption of resolutions denying the right of any foreign body to levy taxes upon the colony.

The first colonial Convention met in New York 7 Oct. 1765. Virginia was not represented, her legislature having adjourned before the issuing of the Massachusetts circular; but
its action was approved at the next session of the legislature. The passing of Townshend's measures of indirect taxation by Parliament produced a remonstrance on the part of the Virginia legislature and a renewed assertion of their exclusive right of self-taxation and of trial by jury at the expense of the crown. The name of Thomas Jefferson appears for the first time in connection with these resolutions, which were passed 16 May 1769. Lord Botetourt, the royal governor, at once dissolved the assembly, but its members in their private capacity met and entered into a non-importation agreement, which was very generally signed by the merchants and planters of the colony. The commerce of Virginia with Great Britain was at this time larger than that of any other colony. In March 1773 the house of burgesses, under the zealous advocacy of Patrick Henry, Jefferson and R. H. Lee, appointed a committee to obtain the most clear and authentic intelligence of all such acts of the Parliament or ministry as might affect the rights of the colonies; and the same committee were authorized to open a correspondence and communication with the other colonies. On the passing of these resolutions Lord Dunmore, the newly appointed governor, dissolved the assembly. In the autumn of 1774 a conflict occurred between the Indians under Logan, Cornstalk and other chiefs and a Virginia force of about 1,200 men, at Fort Pleasant, on the Ohio River. The Indians were defeated, but the Virginians had 60 killed and 70 wounded, and a large number wounded. The Virginia convention which met at Richmond 20 March 1775 to appoint delegates to the new Continental Congress, took measures for enrolling companies of volunteers in each county. On 21 April Governor Dunmore ordered the powder belonging to the province to be taken from the public store at Williamsburg and placed on board an armed vessel in the river. Learning this, Patrick Henry collected some companies of volunteers, marched upon Williamsburg and compelled the king's receiver to give bills for the value of the powder taken away. On 23 November Lord Dunmore with a British and Tory force took possession of Norfolk. He was driven from it 3 December, but, in January 1776, returned and, with 70 killed and 1,120 merchant vessels on the James and Elizabeth rivers. In January 1781 Gen. Benedict Arnold captured and burned Richmond, then a village of 1,800 inhabitants; but being pressed by the general Steuben and some French frigates in the Chesapeake, he was forced to escape with a few prizes to Newport, R. I. In the spring and early summer of the same year Cornwallis and Phillips plundered the northern part of eastern Virginia, seizing and destroying property to the value of not less than $10,000,000. The surrender of Cornwallis at Yorktown on 19 Oct. 1781 virtually closed the war.  

State History.—Independence won, the arts of peace took the place of war's strategy. The first achievements of statesmanship in Virginia were the bill exempting dissenters from tribute to the established church, the statute for religious freedom (1785) and the act abolishing primogeniture (1785). The constitution of 1788 was the result of the new Commonwealth's Federal obligations. To hasten the ratification of the Articles of the Confederation of the Union, Virginia ceded to the general government her vast territory northwest of the Ohio. Her statesmen realized that the Articles under which the colonies had achieved their independence were not suited to accomplish a union of States and were the first to call a convention to remodel the government. In September 1786 the convention met at Annapolis to "consider the subject of a national convention," but only a minority of the States were present and it adjourned to give place to a fuller convention, which assembled in Philadelphia in May 1787 when every State but Rhode Island was represented. Virginia's members were George Washington, John Blair, James Madison, George Mason, James McClurg, Edmund Randolph and George Wythe. Washington was elected president. In September 1787 a committee reported the document which became the Constitution of the United States. The Virginia Convention, called to ratify the compact, met in Richmond in June 1788 with Marshall, Madison, Monroe, Mason, Nicholas, Cary, Randolph, Pendleton, Lee, Washington, Wythe, Innes, Bland and Grayson in the membership. The alien and sedition laws, which Congress passed during the Adams administration, were aimed at troublesome French emissaries and authorized the punishment of all such aliens as the President should judge dangerous to the peace and safety of the United States. Virginia statesmen, led by Jefferson, regarded these enactments as a dangerous invasion of the liberty of the citizens of the States, for in their strict interpretation of the Constitution each party to the Federal compact had "an equal right to judge for itself as well of infraction as of the mode and measure of redress." The famous "98-99," written by Jefferson, were the first formal expression of the principle of states-rights and the policy of a strict and narrow construing of the Constitution. For many years after the adoption of the Federal Constitution Virginia maintained a predominant influence in the affairs of the nation; of the first five Presidents, four were natives and residents of that State, and each of them was re-elected for a second term; and since that period four other natives of the State, one of them at the time of his incumbency a resident of it, have filled that high office. In the convention which met in Richmond in 1829 to revise the State constitution sat many distinguished statesmen, among them Madison, Monroe, John Marshall and John Randolph of Roanoke. The Constitution enacted by the Convention of 1829-30 was revised in 1850, the 1850 Constitution, which was in effect until 1862. The successive changes register, in a measure, the development of the State in a material way, and, much more truthfully, the evolution of its spirit and ideals. At the time of the secession of the Southern
Virginia

States at the close of 1860 and beginning of 1861, a majority of the people of Virginia were strongly attached to the Union, but they also went farther. On the 21st of February, 1861, an extra session the legislature passed a bill (23 Jan. 1861) appropriating $1,000,000 for the defense of the State and issued a call for a convention, the members of which were to be elected 4 Feb. 1861. All the number of delegates elected to the State Convention was 152, of whom the greater part were "conditional" Union men, a few in favor of immediate secession, and about as many unconditional Unionists. The convention met at Richmond 13 February and on 10 March the committee on Federal relations submitted several reports. The majority report, composed of 14 resolutions, avowed the doctrine of State rights, condemned all interference with slavery as dangerous, asserted the right of secession and defined the circumstances under which Virginia would be justified in exercising that right, viz., the failure to procure such guarantees from the Northern States as she demanded, the adoption of a warlike policy by the general government or the attempt to exact payment of duties from the seceded States, or to reinforce or recapture the forts. The majority resolutions were discussed and adopted as far as the 12th, when the capture of Fort Sumter by the Southern forces and the consequent proclamation of the President calling for troops, led to the passing on 17 April of an ordinance of secession by a vote of 88 yes to 55 no. Twelve of those voting no were not long after expelled from the convention. The people of the State had by a majority of 52,857 required that the action of the convention should be submitted to their decision and a vote on the ordinance of secession was accordingly ordered to take place on the fourth Thursday of May. The State government, however, proceeded as if the ordinance had already been ratified by the people. The Federal flags were removed, troops to the number of 50,000 were placed in the State and loans effected for their arming and equipment; and on 25 April the convention passed an act for the adoption of the constitution of the provisional government of the Confederate States. The Southern states had already appointed delegates to the Confederate congress and invited that congress to make Richmond the seat of government of the Southern Confederacy; an invitation which was accepted soon afterward. The popular vote was taken as provided in the ordinance 23 May and resulted in a majority of 94,000 in favor of the secession ordinance. Eastern Virginia voted almost unanimously for it, while the western counties were as unanimous against it. The convention of western Virginia, representing about 40 counties, met at Wheeling on 11 June, passed a declaration of independence from the action of the State convention, declared vacant the offices held by all State officers acting in hostility to the Federal government, and took measures for the establishment of a provisional government. Virginia was the centre of the war zone in the East and became the scene of some of the most important battles of the Civil War (see Bull Run, Winchester, Fredericksburg, Chancellorsville, the Peninsular campaign and the battles of the Wilderness campaign. Virginia troops throughout the conflict played a valuable part. The military operations in Virginia were distinguished by desperate fighting and this is particularly true of the war near the Rappahannock. Richmond was the strategic capital of the Confederacy. The Federal forces came to occupy the greater part of the State; and the customary effects of war were seen in the desolation of the country. Every section was invaded and at the time of the surrender at Appomattox Court House (9 April 1865), the Confederate army and civilians were threatened with famine. General Lee, commander-in-chief of the military forces of the Confederate States, and Stonewall Jackson and J. E. Johnston, commanders of Confederate armies, were all Virginians.

The Civil War was the last notable event in connection with the history of Virginia. Since that time there have been numerous political difficulties. The Reconstruction acts granted to negroes the right of voting for delegates to a State convention. In 1868 a new constitution was adopted. Among various new features therein embodied was that of negro suffrage. There was much dislike of the new instrument, which was not submitted to popular vote until July 1869, when it was adopted by a large majority, though the clause disfranchising Confederate officials and demanding an oath of past loyalty was rejected. G. C. Walker was elected governor; United States senators were also chosen, the 14th and 15th amendments were ratified and the military occupation, never required, was brought to an end. On 26 Jan. 1870 Virginia was readmitted to the Union. There was soon trouble in connection with legislation respecting the State debt. By a bill passed in 1871 two-thirds of the debt of Virginia was funded into bonds, the coupons of said bonds to be held receivable in payment for taxes assessed. The remaining one-third was held to be the suitable share of West Virginia, though the latter State refused to admit such obligation. In 1872 the Virginia Supreme Court decided that the tax-coupon arrangement of the law; but the courts decided that the State was under obligation to receive the bonds, even should the treasurers be thereby kept bankrupt. At that time $17,000,000 in these bonds had been issued. Attempts toward a compromise were made and conflicts between Federal and State courts were frequent. In 1891–92 a settlement was finally arrived at. The bondholders received for bonds and coupons amounting to $23,000,000 the sum of $19,000,000 in new century bonds. During the period of discussion regarding the State debt, politics was much affected by the question; a Readjuster party was formed, finally absorbed by the Republican, and elections were based on the matter. The negro vote was divided. A constitutional convention, held in 1901–02, had as its chief objects in view the restriction of the suffrage and financial retrenchment. The new constitution was proclaimed 19 May 1902 but was not submitted to popular vote. Virginia has been throughout almost steadily Democratic in Federal politics. In 1860 it voted for John Bell, the Constitutional Union nominee, and in 1872 for Grant; but otherwise it has consistently supported Democratic national candidates. In 1881 the 100th anniversary of the surrender of Lord Cornwallis to Washington at Yorktown was celebrated by the
laying there of the corner-stone of a national memorial (18 October). At the time of the Spanish-American War, in 1898 an extensive military camp, Camp Alger, was established and maintained near Falls Church, Fairfax County.

JAMES M. CALLAHAN.

**VIRGINIA**, University of, the State university located at Charlottesville, Va. As early as 1779 Thomas Jefferson presented to the Virginia assembly his plans for public education, which included a university. This scheme was not, however, immediately carried out; and after 1814 Jefferson devoted himself largely to the work of founding a university in accordance with his ideal. It was finally established by act of the State legislature in 1819; and was founded on its present site in 1825. From 1859 to 1861 was a time of especial prosperity and large attendance; during the war the college suffered a large loss of students, but nevertheless continued in session; after that its work continued successfully with gradually increasing attendance. In 1895 the Rotunda, Annex and some adjacent smaller buildings were destroyed by fire, but the Rotunda, restored exactly and three other large buildings were formally opened in 1898. Since this several other important buildings have been added. The government of the university is vested in a board of visitors of nine members appointed by the governor with the approval of the senate for terms of four years. The organization of the university comprises five departments: (1) The Academic Department; (2) the Department of Engineering; (3) the Department of Agriculture; (4) the Department of Law; (5) the Department of Medicine. The work in these departments is grouped in 22 distinct schools, each offering an independent course, under the direction of the professors who are responsible to the board of visitors alone for their work. The work in the Academic Department is entirely elective; the courses are arranged from each of which one course must be elected; the other courses required may be elected from these seven, or from an eighth, including courses in law, medicine, engineering, etc. The degree of B.A. is conferred for the completion of 10 undergraduate courses chosen from the eight groups; the degrees of M.A. and Ph.D. are conferred for graduate work, suitable graduate courses being offered in each school. The Department of Engineering offers four courses leading respectively to a degree in civil, mining, mechanical and electrical engineering; the degrees conferred are civil engineer, mining engineer, mechanical engineer and electrical engineer. The faculty numbers 70; the average annual attendance of students is over 770. The students maintain an athletic association, having charge of athletic sports, two literary societies, several department and graduate societies and a Young Men's Christian Association. The original buildings of the university were planned by Jefferson and are purely classical in style; the more recent additions have been made to harmonize with and complete his plan. The central group encloses a quadrangle, 1,000 feet in length and 300 feet wide. The dominant structure of this group is the Rotunda, the library building at the north end, modeled from the Roman Pantheon; other buildings around the quadrangle are the main academic building, the physical laboratory, the mechanical laboratory and original buildings designed by Jefferson. Parallel with the large north, east, southern and western ranges of dormitories; outside the quadrangle group are the chapel, the natural history museum, the chemical laboratory, the medical building, the observatory, the infirmary, several dormitories and the gymnasium. The campus also contains an athletic park, recently laid out, comprising 21 acres. Tuition in the Academic and Agricultural departments is free to Virginia students; the university awards scholarships to accredited schools; and there are several alumni scholarships, and a number of special scholarships. The general library contains over 90,000 volumes; and in addition there are law and other departmental libraries.

**VIRGINIA CITY**, Nev., city, county-seat of Storey County, on the Virginia and Truckee Railroad, about 200 miles north of Reno, 155 miles south of Carson City, and 21 miles northeast of Carson City. It is on the eastern side of Mount Davidson, about 7,825 feet above the level of the sea. It was settled in 1859, when the famous Comstock Lode was discovered and chartered as a city in 1864. Mines under the city have produced nearly $400,000,000 in gold and silver bullion. There is still considerable silver mining in the vicinity. The city has a daily supply of 10,000,000 gallons of water for use for domestic and mining purposes, brought from the Sierra Nevada Mountains, 30 miles west, at a cost of $2,500,000. The principal mines are drained by the Sutro tunnel (4 miles long, cost $4,500,000) at a depth of 1,650 feet. The deepest mining works have a depth of 3,300 feet, and there are great mining plants have been erected in the city at a cost of from $350,000 to $1,000,000 each. The city has gas and electric light plants and a daily newspaper. The Miners' Union Library, the courthouse, churches and schools are the principal buildings. The population decreased from 10,900 in 1880 to 2,244 in 1910, a fact mainly due to the decline in the price of silver.

**VIRGINIA CONVENTIONS OF THE REVOLUTION**, The. The change from colony to commonwealth in Virginia was made by means of five conventions, called together between 1774 and 1776. These conventions are important not only as marking the transition of this ancient colony to statehood, but also because they greatly influenced the course of continental or national affairs. For example, they had to do with the summoning of the First Continental Congress, and with the appointment of delegates thereto so decisive as Peyton Randolph (its first president), George Washington and Patrick Henry. The constitutional principles formulated by these conventions, especially by the one in 1776, which drafted the Virginia constitution, were later built into the Federal structure.

**First Convention** (1 Aug. 1774). The circumstances which led to the calling of the first Virginia convention were as follows: During the session of the House of Burgesses, as the popular branch of the colonial legislature was called, news arrived from Boston of the
decision upon the part of the British ministry to close that port as a punishment for the destruction of the famous tea. The indignation felt upon every hand in Virginia headed up in a resolution, passed on Tuesday, 24 May, to appoint the first day of June as a day of fasting and prayer to God to avert this doom from Boston. As soon as this action of the legislature became known to the royal governor, Lord Dunmore, he in high dudgeon dissolved the House of Burgesses. The following Sunday afternoon, when only a score or so of the late burgesses remained in the sleepy little capital of Williamsburg, the messenger arrived from Boston, bringing a circular letter, appealing to the colonies for united support, and advocating the cessation of all trade with Great Britain. The responsibility for a final answer to this appeal from Boston was too grave for the Committee of Correspondence at Williamsburg to assume alone. After consultation, it was decided the next morning at a meeting of the 25 burgesses remaining in town, to ask the counties to appoint deputies to a convention, which should consider the question of the cessation of all trade relations with Britain, and should select delegates to the proposed Continental Congress. The time named for this convention was 1 August, and the place Williamsburg. This summons, the original of which is in the Virginia State Library, was evidently written by Peyton Randolph, the moderator, whose name stands first in the list of signers. Then follow the names of Thomas Jefferson, George Washington, Henry Lee, etc. This call for a Virginia Convention has the same purpose as the progress of the Virginia Revolution as the meeting of the Tiers-État in the Versailles Tennis Court, 15 years later, in the French Revolution. It was in both instances an assertion of the sovereignty of the people over against the prerogative of the Crown. Sympathy for Boston in its sufferings had called forth in Virginia the representatives of the sovereign people, whom royal writs did not summon nor royal governors dissolve. The first Virginia Convention met in Williamsburg, on 1 Aug. 1774, and remained in session six days. Fifty-six counties and four boroughs were represented; the counties by two delegates each and the boroughs by one each. Peyton Randolph, the former speaker of the House of Burgesses, was made president. Delegates were chosen to represent Virginia in a General Congress, namely, Peyton Randolph, George Washington, Richard Bland, Benjamin Harrison and Edmund Pendleton. In support of Boston, it was agreed to buy no goods, except medicines, from Great Britain, after 1 November; and neither to import slaves nor purchase slaves imported, after that date, from any place whatsoever. The delegates further declared that unless American grievances were redressed by 10 Aug. 1775, they would stop all exports of their produce to Britain. Provision was made for future sessions of the convention should the condition of the country demand. This meeting was also the means of making known to the public Thomas Jefferson's paper, afterward entitled "A Summary View of the Rights of British America," a forerunner of the Declaration of Independence. For the proceedings of this convention, consult the files of the Virginia Gazette, 4-11 Aug. 1774.

Second Convention (30 March 1775).—The second Virginia convention was held at Richmond, 20 to 27 March 1775. It sat in Saint John's Church, which crowns an eminence overlooking the valley of the James. The historic church is still used as a house of worship, the spot being indicated where Patrick Henry stood as he made the famous speech in favor of arming the colony. The members were grouped into two parties, the one conservative, denouncing radical measures and relying still upon reconciliation with Great Britain; the other aggressive, believing that pacific means had been exhausted, and urging that the colony be armed. Peyton Randolph, the president, was the leader of the former group. Patrick Henry was the mouthpiece of the latter. For three days neither party committed itself. But upon the fourth day a resolution was adopted, thanking the Assembly of Jamaica for its Memorial to the king in behalf of the American colonies, and expressing an ardent desire for peace. This seemed to Patrick Henry to savor of servility. He thereupon brought forward his famous resolution for putting the colony in a condition of defense, asserting that a well-regulated militia, composed of gentlemen and women, is the natural strength and security of a free government. Despite opposition this resolution was carried, chiefly by the passionate eloquence of Henry, and the military resources of the colony were at once directed to be organized and made efficient. The convention appealed to the people for contributions for the relief of the inhabitants of Boston, "suffering in the common cause of American freedom." The former delegates to Congress were re-elected, Thomas Jefferson being made alternate for Peyton Randolph, in case the latter could not attend. The people were asked to choose delegates to represent them in convention for one year.

Third Convention (17 July 1775).—Meantime, events moved rapidly. The battles of Lexington and Bunker Hill, the session of the Second Congress at Philadelphia, Lord Dunmore's seizure of the powder in the magazine at Williamsburg and his subsequent escape to a British man-of-war lying at Yorktown, had called forth in the mind of the patriots to a high state of excitement. The governor threatened the colony with fire and sword. Such were the circumstances under which the third convention met at Richmond, on 17 July 1775. Some changes of consequence had occurred in the membership of the body. Fifteen days before the planters came together at Richmond, George Washington had taken command, under the old elm at Cambridge, of the American army. His place as a delegate was taken by his neighbor, George Mason, whose mind for the next year was to be engaged in the constructive work of the Virginia Commonwealth. For nearly a month, the convention suffered more or less distraction, owing to the absence in Congress of such experienced leaders as Henry, Jefferson and R. F. Lee. The legal status and method of procedure differed materially from those of the previous conventions. Both the outward circumstances of the colony and the inner movement of thought strengthened the hands of the delegates and forced the convention to assume responsi-
Virginia Conventions of the Revolution

The growth of the idea of American independence was slow in the Old Dominion. The burning of Norfolk on 1 January and the successes of Washington in the early spring in ousting the British from Boston, precipitated opinion in Virginia. The election of delegates to the May convention took place during April and the two points which constantly recur in the instructions given them are independence and representative government. For instance, the freeholders of Charlotte County, on 23 April 1776, said to their representatives: "We give it in charge to you to use your best endeavors that the delegates which are sent to the General Congress be instructed immediately to cast off the British yoke." The fifth convention met on 6 May 1776, at Williamsburg, 66 counties and corporations being represented by 131 delegates. Twenty-nine of these were new members, whose selection is perhaps attributable to the increase of religious dissent in the colony. Among the new members were James Madison, recently from Princeton College, and Edmund Randolph, son of the king's late attorney general, who had taken ship with Lord Dunmore for England. George Mason, owing to sickness, did not take his seat until 18 May, bringing perhaps in his pocket both a declaration of rights and a draft of a constitution for the anticipated commonwealth. The convention was at once a legislative, constituent and executive body. The three great measures of constructive policy which it formulated were: First, the instructions to the Virginia delegates in Congress to propose independence; second, the bill of rights, and third, the constitution of Virginia. Its session lasted 51 days, a brief space, considering the novel and momentous task of organizing a commonwealth. Edmund Randolph tells us that the resolution instructing the delegates in Congress to propose the declaration that "the United States are free and independent States" was "drawn by Mr. Pendleton, proposed by General Nelson, and enforced by Mr. Henry." The first drafts of the constitution in the convention were found some years ago in the Virginia State Library, by William Wirt and may be seen in his "Life of Patrick Henry." They were endorsed by the clerk, "Rough Resolutions, Independence." After the passage on 15 May 1776 of the resolution instructing the delegates in Congress to propose independence of Britain, the British flag was at once struck on the capitol at Williamsburg and the colonial colors hoisted in its stead. At night, the town was illuminated and the people were jubilant. On 27 May, Archibald Cary presented to the convention the "Declaration of Rights," which had been originally drawn by George Mason. In it the well-known guarantees of personal liberty are added for the first time, emphasizing the distinction between religious liberty and toleration and contending boldly for an expression of outright religious liberty.
In consequence, the convention declared in the 16th article, that all men are entitled to the free exercise of religion, according to the dictates of conscience. The Declaration thus framed has been the Magna Charta of Virginia, forming an integral part of every constitution since that day. It is the bed-rock of republican government. The original draft of the Declaration of Rights, in Mason's own handwriting, was presented to the State of Virginia, 15 Feb. 1844, by Gen. John Mason, the last surviving son of George Mason of Gunston Hall. This copy now hangs on the wall of the Virginia State Library. Seven different schemes of government are known to have been before the convention. From these was evolved the first constitution, which was finally adopted on 29 June 1776—the natal day of the commonwealth of Virginia. This constitution provided for a bicameral legislature, called the House of Delegates and senate, elected by freeholders. The executive was to be a governor, elected annually by the house and senate on joint ballot. There was to be an attorney-general elected by a privy council, consisting of eight members chosen by the legislature. The judges of the Supreme Court of Appeals, judges of admiralty and attorney-general were elected also by the legislature and continued in office during good behavior. All laws were to originate in the house of delegates, but were, except money bills, amendable by the senate. The convention immediately elected Patrick Henry as governor and Edmund Randolph as attorney-general. The new government went into operation at once. After making provision for an increase of troops and for the vigorous prosecution of the war the convention adjourned on 5 July 1776. The commonwealth of Virginia was thus launched upon its historic development. See United States—Formation of State Constitutions.

S. C. Mitchell, President, Delaware College.

Virginia Creeper, a very ornamental American climbing shrub (Parthenocissus quinquefolia). It is frequently confounded with poison-ivy; the two are closely related; but it should be remembered that the innoxious creeper is distinguished by its leaves, which are not shining and are palmately parted into five divisions, whereas the poison-ivy's leaves have but three leaflets and are glossy. The small, white, five-petalled flowers, with spreading petals, are in ample panicles, but are not so conspicuous as the fruits, which consists of dark-blue berries, on red pedicela. They are ripe in autumn and are set off by the rich tones of crimson which the foliage assumes at this season. The Virginia creeper or American ivy or woodbine, as it is variously styled, is one of our most decorative vines. It travels over rocks and fences, sending out delicate trailing branches, with the leaves regularly diminishing in size down to the smallest ones near the curving tip. It soon starts climbing by numerous tendrils, which are often tipped with disc-like enlargements that adhere to rough surfaces of walls or trees and is further supported by aerial roots, springing from the stems.

Virginia Deer, Quail, etc. See Deer, Quail, etc.

Virginia Exposition. See James-town, Va.

Virginia Fence, a rail fence common in the United States and Canada, known also as snake-fence, worm-fence and stake-and-rider fence. It consists of tiers of split rails laid horizontally in a zig-zag manner, the ends resting on each other and generally set in place by a pair of posts driven slantingly into the ground at the angle formed by the intersection of two tiers.

Virginia Military Institute, a State school located at Lexington, Va. It was established in 1839 by act of the legislature and opened to students in the same year. It is governed by a board of visitors consisting of the superintendent of public instruction and the adjutant-general, members ex-officio, and nine other members appointed from different sections of the State by the governor with the approval of the senate. In accordance with the laws of Virginia the professors and officers hold commissions in the State militia, and the students are organized as a military corps of cadets. The school played an important part during the Civil War; in April 1861 the cadets were ordered to Richmond, where they took part in drilling volunteers; in 1862 the Institute was reopened, and in May 1864 the cadet corps was ordered out for active service and took a leading part in the battle of New Market, Va. During the war the cadets were in active service 14 months. In June 1864 the buildings and equipment were burned by the Federal army; in October 1865 the Institute was reopened, the buildings and equipment rapidly restored and the course of instruction greatly improved and extended. The regular course covers four years and though largely scientific and technical include some general culture subjects. The work of the first two years is the same for all and includes English, a foreign language, science, mathematics and drawing, none of the courses being elective; at the end of the second year students may elect between courses in civil engineering, applied chemistry and electricity; the degree of the Bachelor of Science is not the completion of any of these courses. There is also post-graduate work offered leading to the degrees of C.E. or M.S. For military instruction and drill the cadets are organized in a battalion of four companies; the discipline is strict, the regulations being based on those at West Point. Instruction is given in infantry and artillery tactics, ordnance and gunnery, military science and the art of war and military engineering. A certain number of cadets, not less than 50, are admitted as cadets, without charge for tuition or board. The Institute is located outside the city on a hill overlooking Wood's Creek; the new academic building was completed in 1900. The library contains about 15,000 volumes, the students number 375 and the faculty and military staff 25. Since the foundation of the school in 1839 there have been about 7,000 matriculates, of whom 2,500 became full graduates.

Virginia-Pennsylvania Boundary Dispute. Several years before the American Revolution the rapid increase of settlements in the transmontane region beyond the western limits of Maryland, and especially along
the waters of the Monongahela, precipitated a bitter boundary dispute which threatened to result in open hostilities in the disputed territory. Virginia — on the basis of certain words of an early charter — claimed territory at least as far north as the 40th parallel, which would have included the "key to the West" at Fort Pitt (now Pittsburgh), Pennsylvania threatened to renew her claim to the line of 39° as originally demanded by the Penns before the establishment of the Mason and Dixon line as the boundary between Maryland and Pennsylvania. In 1773 Governor Dunmore of Virginia, determined to resist the claims of Pennsylvania, jurisdiction recently exercised through courts established at Hanna's Town (now Greensburg), sent to Fort Pitt a trusted representative, Dr. John Connolly, who established a rival court and rival magistrates, thus beginning a struggle which was postponed only by the Revolution.

From 1774 to 1780 Virginia courts continued to sit in western Pennsylvania on territory claimed by Pennsylvania. Finally, following negotiations of 1779 an agreement for a survey to establish the boundary was reached in June 1780. A temporary survey was completed in 1780, each of which, under a joint boundary commission, completed the extension of the Mason and Dixon line to the southwest corner of Pennsylvania in 1784, and established the western boundary line of Pennsylvania in 1785-86.

JAMES M. CALLAHAN.

VIRGINIA POLYTECHNIC INSTITUTE, The, located at Blacksburg, Montgomery County, Va. It was established as the Virginia Agricultural and Mechanical College by the State of Virginia in 1872, in accordance with the provisions of the Land Grant Act of 1862. (See Colleges, Land Grant). In the same year it was opened to students. Its name was changed by authority of the legislature in 1896 to Virginia Polytechnic Institute. It is under the control of a board of visitors, consisting of the superintendent of public instruction of the State, the president of the State board of agriculture and immigration, ex-officio members, and eight members appointed by the governor with the approval of the senate. One of the eight members are appointed every two years for terms of four years. The Institute offers 15 degree courses, leading to the B.S. degree, and a two-year short course in practical agriculture, a farmers' winter course of one month and in the summer a special course to members of the boys' 4-H clubs from over the State. The B.S. courses embrace courses in general science, in agriculture, in horticulture, in agricultural engineering, in preparatory veterinary medicine, in applied physics, in applied chemistry, in chemical engineering, in metallurgy and metallography, in applied geology, in applied biology (preparatory course for the study of medicine), in civil engineering, mechanical engineering, electrical engineering and in mining engineering. Graduate work is also offered, looking to the degrees of M.S., C.E., M.E., E.E. and E.M. Each course includes elements of general culture, while in all of the degree courses English, modern languages, mathematics and political science are required. Laboratory practice or practical work in the shops or fields forms an integral part of each course and consumes about one-half of the number of hours. It is readily seen, therefore, that, while the Institute is a technical school, the endeavor is to give well-rounded courses. In addition to the practical work required, students are given the opportunity to pay part of their expenses by manual labor. Instruction in military science and tactics and drill is required of all students. The battalion of cadets consists of five infantry companies, a signal corps, drum and bugle corps. The State agricultural experiment station, the State entomological work, the State livestock sanitary work and the extension division are departments of the Institute under control of the board of visitors. In addition to the above courses, there have been introduced for the session 1918-19, under the Smith-Hughes Act, courses in agricultural education and industrial education. The president of the Institute is also, by virtue of his office an president, head of these various departments. Under the guidance and by aid of the Institute authorities, extension work in all agricultural subjects and farmers institutes are conducted in various portions of the State. Two literary societies are maintained, each with its own hall and furnished hall. The Institute is situated on the crest of the Alleghanies at an elevation of 2,100 feet. The campus contains more than 100 acres and the farm about 450 acres. The plant consists of about 70 buildings, including the shops and farm buildings. The shop building is a new one recently completed, covering approximately one and one-quarter acres of ground, made of stone and reinforced concrete, is thoroughly equipped with most modern machinery and is, in fact, one of the most commodious and up-to-date shops in the East. The library is housed in a large and handsome building of native stone and contains about 25,000 bound volumes and 80,000 pamphlets. The income is derived from the Morrill Act of 1862, the Nelson Act, the Adams Act, the Smith-Lever Act and from the appropriations from the State of Virginia. The faculty of the Institute, including officers, numbers about 65 and the total matriculation of students during the year 1917-18 was 526.

VIRGINIA QUAIL, or COLN, bird (Ortix Virginiana) of family Tetraonidae, abundant in North America east of the western plains; in some parts commonly known by the name of quail, in others by that of partridge. In size it is intermediate between the common quail and the common partridge of Britain. The prevalent color of the plumage is brownish red, underparts whitish; but all parts are more or less mottled with different colors. The feathers of the head are capable of being erected into a sort of crest. The male is popularly regarded as resembling the words "Bob White," and this name is often given to it. The coveys of the Virginia Quail often approach houses in winter and mingle with domestic poultry, and are killed by guns and taken in snare; and in the western and southern States many hundreds were often caught in a day by parties of men on horseback, driving the coveys into a great cylindrical net. It has been introduced into parts of Europe and may almost be regarded as a native species.
as naturalized, though rare in England. There are several species of allied genera in Mexico, California, and South America, of which one, the California Quail (Lophortyx Californica), is remarkable for its long and beautiful black crest. See PARTRIDGE.

VIRGINIA RESOLUTIONS, The, in American history, a set of resolutions drawn up by James Madison in 1798. They were similar to the Kentucky resolutions (q.v.) drawn up the same year.

VIRGINIA UNION UNIVERSITY, Richmond, Va., an institution of higher learning for colored students, combining Wayland Seminary opened 1865 in Washington, D. C., and Richmond Theological Seminary, opened in 1865 in Richmond, Va., the union taking effect in 1899. It is a member of the Association of Colleges for Negro Youth and its special work is the training of leaders. It was established and is in large part maintained by the American Baptist Home Mission Society, but is Christian rather than denominational, welcoming teachers and students from many denominations. There is an endowment fund of $85,000 for salaries, scholarship funds of $14,000, and a library fund of $4,000, which are supplemented by contributions. The grounds comprise 45 acres adjoining Hershorn Memorial College; six handsome granite buildings, power-house and athletic field constitute a very efficient equipment. Annual tuition fees are $260; board and expenses from $129 to $140. Degrees of B.A., B.S. and M.A. are conferred. The faculty numbers 18. The average annual enrollment of students is 300. The graduates since organization number over 4,000.

VIRGINIANS, The, a novel by William Makepeace Thackeray, published in 1859. It is a sequel to 'Henry Esmond,' and revives a past story with the same brilliant skill as characterizes the first book.

VIRGINIUS AFFAIR, The. The "Virginian affair" occurred in the harbor of Santiago de Cuba in 1873 and almost caused a war between the United States and Spain. The Virginian, a ship registered in the New York custom-house 25 Sept. 1870 as the property of an American citizen, was captured on the high seas near Jamaica by the Spanish man-of-war Tornado, 31 Oct. 1873. The reason given was that she was about to land men and arms in Cuba, which was then engaged in the Ten Years' War against Spain. At the time of capture the Virginian was flying the American flag. She was taken to Santiago. President Grant remonstrated with the Spanish government, and through the United States Minister to Spain, Gen. Daniel E. Sickles, demanded the release of the Virginian and her crew.

Spain was at that time a republic, under President Castelar, and while his government was asking for time to obtain information and weighing propositions, the authorities in Cuba determined to take matters into their own hands. On 7 Nov. 1873 the captain of the Virginian, Joseph Fry, and 36 of the crew, were shot. The next day 12 of the most prominent passengers were also shot. When the news of this action became known in the United States the excitement was intense, meetings were held, and the bloody work was denounced.

President Grant authorized the putting of the navy on a war footing, diplomatic relations were on the point of severance and war was imminent. Meanwhile President Castelar made the excuse that his orders to stay proceedings were received too late to prevent the crime.

Several times it seemed that hostilities could not be avoided. Once General Sickles sent for a ship to take him from Spain. At last, however, on 29 November, a protocol was signed between Secretary Fish and Admiral Polo, by which Spain agreed to surrender the survivors of the crew and passengers of the Virginian, together with the ship, and to salute the flag of the United States on 25 December. If, however, it should be proved in the interval that the Virginian had no right to fly the United States flag, the salute should be dispensed with, though Spain should disclaim any intention to insult the flag. Three days before the time agreed on, Secretary Fish announced himself as satisfied that the Virginian had no right to fly the flag, and the salute was dispensed with. On 23 January the claimant, welcoming the survivors who survived were surrendered on 18 December at Santiago de Cuba, and landed in safety in New York.

VIRGIN'S-BOWER. See CLEMATIS.

VIRGO, ver'gō, the sixth sign of the Zodiac, and also the name of a constellation which formerly marked this sign, but is now in the sign Libra. It contains the bright star Spica, and an interesting double star and a spiral nebula; it is on the meridian in the evenings of May and June. See ASTRONOY.

VIRIATHUS, vi-rā-thūs, Lusitanian patriot; d. 140 B.C. He was originally a herdsman, but became a leader in the 10 years' struggle against the Roman power about 151 B.C. He conducted a successful defense against the Roman army, defeating them repeatedly and finally hemmed in their forces and compelled the conclusion of a treaty of peace in order to save the army. The independence of Lusitania was acknowledged, and she became an ally of Rome, a treaty ratified by the Roman Senate. In 140, however, Servilius Cepio succeeded to the consulship in Further Spain, invaded Lusitania and by bribery secured the murder of Viriathus, after which he conquered the country.

VIRQUA, vi-rō-kwā, Wis., city, county-seat of Vernon County, near the Kickapoo River, and on the Chicago, Milwaukee and Saint Paul Railroad, about 85 miles northwest of Madison and 22 miles south of La Crosse. The city is in an agricultural region, and is noted for the abundance of trout and game in the near vicinity. There are large shipments of grain, farm products and livestock, tobacco growing and sorting is an important industry. Railway ties and poles are cut and shipped; there are also machine shops. Pop. 2,569.

VIRUS, morbid poison; the contagion of an infectious disease. It is the morbid principle, associated with a germ that is the medium for communicating disease between men and
animals. The term more especially designates those peculiar poisonous matters which can reproduce themselves under favorable conditions to an endless degree. The poison of the cobra is a specific virus which, when introduced into the human system, acts as a most virulent poison; but the poison is not multiplied within the human subject, and one person affected by the animal's bite will not infect another. In like manner, morbid products from decaying vegetables under certain conditions of heat and moisture may possibly originate the virus of malarial fever; but the virus is not propagated within the human organism, or, at all events, never in such a form as to render it capable of producing the same disease in others. By some the virus of the contagious or infectious disease is supposed to be a contagium vivum seu animatum, the theory being that the virus consists of living beings or low organisms. Such views have been advocated by Kircher, Lancisi, Vallisneri, Réaumur, Linné, Henle, Roberts and others; and although the theory of a contagium vivum is not as yet complete, the discussion of it is the most important which has ever engaged the attention of medical men. The most prominent characteristic of each specific virus is that it can reproduce itself within the human organism, and to an unlimited extent, each virus preserving its own specific- ness. Experience and observation tend to confirm the hypothesis that each specific disease breeds true, though, in the course of ages, it is possible that changes within certain limits may take place in animals and plants. The natural conclusion follows that diseases of this class do not originate spontaneously, but are propagated each from its own kind, though some contend that they do not originate, even in our own day, spontaneously or autoclonotously. Another remarkable peculiarity belonging to many, but not to all, diseases propagated by a specific virus, is that a single attack of the disease successfully sur- mounted produces absolute or protective immunity (q.v.) for a certain length of time, or even for the remainder of life. Others hold the theory that the germ is a result not a cause of the poison and disease. See BACTERIA; Disinfection.

VIS MAJOR, a civil law term used to denote an inevitable accident, that is, one which could not have been avoided by the exercise of care because it is the result of the operation of the forces of nature.

VISALIA, vi-sal'ê-a, Cal., city, county-seat of Tulare County, on the Kern River, and on the Visalia and Tulare Railroad, about 40 miles, in direct line, south of Fresno and 10 miles north by east of Tulare. It was settled about 1850, laid out as a town in 1852, made the county-seat in 1853 and incorporated in 1874. It is a great agricultural region, and the city manufactures are canned fruits. There are extensive shipments of farm products, fruit, and canned foods. Long distance electric power has been installed and there are planing mills, match factories, etc. The city has three banks and two daily newspapers. Pop. (1918 est.) 7,000.

VISAYAN (vé-sâ'yân) ISLANDS, or VISAYAS, the central and largest group of the Philippine Archipelago, lying between lat. 9° 5' and 13° N., and between long. 121° 49' and 125° 51' E.; south of Luzon, and north of Mindanao; land area, 23,502 square miles; total area, 77,840 square miles. It consists of the islands of Bohol, Cebú, Leyte, Masbate, Negros, Panay, Rombón and Samar and their dependent islands, numbering in all 490. Many of the dependent islands are of geographical and commercial importance, and several of them are Lapenin, Grande and Panglai (belonging to Bohol), Maclan (Cebú), Biliran and Panañon (Leyte) and Guimaras (Panay). The staple products, hemp, sugar, tobacco, coffee, rice, cotton, corn and cocoa, of the archipelago are cultivated, the production of hemp being especially important in Cebú, Leyte and Samar. All the islands are well wooded; the best varieties of hardwoods grow in abundance, and many resin and gum trees. The mineral wealth is also of importance, the first coal discovered in the Philippines having been found in Cebú. Gold, silver, iron and copper are also found; though these are mined to some extent, the mineral resources are by no means fully exploited. The mechanical and manufacturing industries of the islands include sugar manufacture, weaving, the making of sugar sags and cheese-making (in Cebú). Stock-raising and the taping, pearl shell and pearl fisheries are also important industries. There is a large export trade in the products of agriculture, the manufacturing and the fisheries. The land transportation facilities are especially good in Bohol, Cebú, Leyte, Negros, and the province of Iloilo, Panay.

VISAYAS, vé-sâ'yás, or BISAYAS, a Malay people of the Philippine Islands, inhabiting the Visayan Islands (q.v.), and the northern and eastern coast of Mindanao. At the time of the arrival of the Spaniards they had a written language and considerable culture of their own; they practised the custom of tattooing, and were, therefore, called by the Spaniards Pintados (painted men). They were easily Christianized, and joined with the Spaniards in helping to subdue the Tagals. They are a docile and industrious people; particularly the inhabitants of Bohol are good mechanics, and for their success in trade have gained the name of the "Chinese of the Philippines." Their language shows a variety of dialects, of which the most important are the Cebunao and Pauyanos.

VISCACHA, the Lagostomus trichodactylus, a stout rodent belonging to the family Chinchillidae, and resembling a marmot. It is from 18 inches to two feet long, plus the tail, which measures from six to eight inches. The fur is mottled gray-brown, yellowish-white beneath; a dark band stripes each cheek, and a white band is on the muzzle, running back on each side almost as far as the eye. Viscachas are nocturnal, live in communities and resemble rabbits in their habits, but are less active. They are found on the pampas, from Buenos Aires to Patagonia. These animals have the strange habit of dragging all sorts of hard and apparently useless objects to the bottom of their burrows, where bones, stones, thistle stalks and lumps of earth may be found collected into a large heap, sufficient, according to Darwin, to fill a wheelbarrow. They form the principal
food of the wolves, pumas and jaguars of their country.

**VISCAINO, vēs-kā-ĕn’ō, Sebastian. See Viscaino, Sebastian.**

**VISCELLINUS, Spurius Cassius**, first Roman agrarian agitator. He was victorious over the Sabines as consul (502 B.C.) and in his second consulship (493) made a treaty with the Latins, which was advantageous to both parties. In his third consulship (486) he proposed a measure by which the plebeians should have a share in the ager publicus. The patricians immediately accused him of making favor with the commons in order that by them he might be chosen king and set on the throne of the recently expelled Tarquins. He was condemned to be thrown from the Tarpeian rock, in the execution of which sentence his own father took part.

**VISCHER, fisch’er, Peter**, German sculptor. b. Nuremberg, Oct. 14; d. there, 7 Jan. 1529. He was invited by Philip Elector Palatine to Heidelberg, but soon returned to Nuremberg, where he executed a great many works with the assistance of his five sons. Among his most celebrated works, whose architectural parts combine Gothic with Renaissance features, while his figures have all the realism of the Renaissance, may be mentioned ‘The Tomb of Bishop John IV.’ in the cathedral at Breslau (1496); the ‘Tomb of Archbishop Ernest’ in the cathedral at Magdeburg (1497); the ‘Tomb of Saint Sebalus’ in the church of that dedication at Nuremberg; and the ‘Tomb of Eitel-Friedrich II von Zollern and of his wife in the church at Hechingen,’ etc.

**VISCHEL, vish’er, William Lightfoot**, American author and actor: b. Owingsville, Ky., 25 Nov. 1842. He was graduated from the law department of the University of Louisville, but never practised, subsequently engaged in journalism and in 1904 went on the stage. He has published several novels, among whom are: ‘Out Yonder’; and ‘Peter Vansant’; ‘Blue Grass Ballads,’ etc.

**VISCONTI, vēs-kōn’tē or vēs-kōn’tē, an old Milanese family, celebrated for its political consequence and its patronage of science. History makes mention of the Visconti in the 11th century; but they disappear from the time of the destruction of Milan by Frederick Barbarossa, when, with some other noble families, they were obliged to yield to the superior power of the opposite party, the Torriani or family Della Torre. The first of the Visconti who laid the foundation of their greatness was Orione: b. 1208; d. 1295, created archbishop of Milan in 1263, and perpetual lord of Milan in 1277, who gained the ascendancy over his enemies, and bequeathed his power to his nephew; Matteo: b. 1250; d. 1324. The latter was driven into banishment by the Torriani, but after living in exile seven years had the address to obtain the title of imperial vicar 1294, which he soon exchanged for that of lord-general of Milan (1311). Matteo transmitted the dignity by his son to his first cousin; Galeazzo: b. 1277; d. 6 Aug. 1328, who was overpowered by his enemies and thrown into prison by Louis of Bavaria in 1327, but was soon afterward released. His son Azzo: b. 1302; d. 14 Aug. 1329, who succeeded him and increased the extent of his dominions, acquiring nearly all of Lombardy, was not less distinguished for his pacific virtues than for his military talents. His uncle Lucchino: b. about 1287; d. 24 Jan. 1349, succeeded him. The latter extended the dominions of the family, and was the first of the name who was distinguished as a patron of science and art. He corresponded with Petrarch. After his death in 1349 his brother, Giovanni: b. 1290; d. 5 Oct. 1354, archbishop of Milan, assumed the reins of government. He was a zealous patron of learning, appointed a commission of six learned men to compose a commentary on Dante, fostered the University of Bologna and received Petrarch on his arrival at Milan with the highest marks of distinction. Giovanni was succeeded by his nephew, Matteo II, d. 1355; Barnabo, d. 1385; and Galeazzo II, d. 1378. Matteo’s two brothers, who shared their estates on his death, though eminent for their warlike talents, rendered themselves obnoxious by their cruelty and other vices. Galeazzo, however, continued to treat Petrarch with the same respect that his predecessors had shown him, and employed him in several negotiations. He was succeeded in 1378 by his son, Gian Galeazzo: b. about 1347; d. 3 Sept. 1392, who gave himself to the glory of his uncle Barnabo in the castle of Trezzo, and took upon himself the sole government (1385). In him the Visconti family reached the summit of its grandeur and splendor. In 1395 he received from the Emperor Wenceslas the ducal dignity; and his territories were more extensive than those of any of his predecessors. Pisa, Siena, Perugia, Padua and Bologna were subject to his sceptre; and he had already shown a disposition to assume the title of king of Italy, when his ambitious projects were cut short by his death of the plague. He fostered science and art, collected the most distinguished scholars at his court, restored the University of Piacenza and connected that of Pavia with it, and founded a large library. He built the celebrated bridge over the Ticino at Pavia, and began the magnificent cathedral at Milan. Gian Galeazzo left three sons, Giambattista: d. 16 May 1412; Filippo Maria: d. 13 Aug. 1447, and an illegitimate child, Giannantonio: d. 1408. Giambattista succeeded to the dukedom, and was assassinated, after which Filippo Maria reigned alone till his death. His natural daughter, Bianca, had been married to Francesco Sforza, who was named Duke of Milan in 1450 Consul Supremo, de l’histoire des Républiques Italiennes (1826-33); Symonds, ‘The Age of the Despots’ (1875).

**VISCONTI, Ennio Quirino**, Italian archaeologist: b. Rome, 1751; d. Paris, 7 Feb. 1818. He was the son of Giovanni Battista, and from his earliest years was trained in the habits of an antiquary. He continued the work begun by his father entitled ‘Il Museo Pio Clementino Descritto,’ of which he wrote the greater part and which extended to seven volumes, the last appearing in 1807. In 1785 he was appointed keeper of the Capitoline Museum. His writings on the sculptures of the Roman Republic, and during a consulate of seven months founded the Roman Institute. In 1799 he left Italy and settled in Paris, having been appointed an administrator of the museum of the Louvre, and professor
of archaeology. His archaeological works are very numerous, and among the most popular are "Description des Antiques du Musee Royal," "Description des Vases peints du Musee," "Iconographie Grecque," and "Iconographie Romaine."

VISCONTI, Louis Julius Joachim, French architect: b. Rome, 11 Feb. 1791; d. Paris, 1 Dec. 1853. His architectural studies were prosecuted at Paris under Percier and Fontaine, and at 17 he entered the Ecole des Beaux Arts. In 1817 he was superintendent of building on the Paris Wine Market; in 1822 inspector of building to the city government; and in 1825 architect of the great library of Paris. His most important works are the tomb of Napoleon I., under the dome of the Invalides; and the additions to the Louvre, which latter he did not live to complete.

VISCONTI-VENOSTA, vâ-nos'ta, Emilio Morquis, Italian statesman: b. Milan, 22 Jan. 1829; d. 1914. In 1846 he entered journalism as a liberal and for a time was an adherent of Garibaldi. In 1859 he was appointed by Cavour royal commissioner in Lombardy, was elected to the Chamber of Deputies in 1860 and was Minister of Foreign Affairs 1863-64, 1866-67 and 1869-76. He became senator in 1886, was Minister of Foreign Affairs from 1890-98 and in the Pelloux Cabinet held the same post 1899-1900, as also in that of Saracco, 1900-01. His foreign policy was characterized by an ardent desire to retain the goodwill of France.

VISCOITY, that property of a fluid or semi-fluid which resists rapid change of shape or arrangement of parts; the indissociation of a body, by reason of internal function, to yield to the force of gravity, pressure, etc., and flow readily. All substances, ranging from gases to solids, are supposed to possess this property in a greater or less degree. A noteworthy instance of viscosity is exhibited by sealing wax; for while it is quite rigid in resisting forces quickly applied, it will change shape greatly under the action of a small force (cf. plasticity). Viscosity is applied continuously for a long time. Molasses, tar, asphalt and many other substances also illustrate this property in a striking way; while water, alcohol, air and other liquids and gases, as shown by suitable experiments, possess the same property in a very slight degree. Ballou Stewart defines viscosity as "a property which prevents freedom of vibration and which ultimately converts vibrations into heat." In practice, the hard metals exhibit no noticeable viscosity, but the fact that a long bar of the hardest steel will bend of its own weight shows the property. The viscosity of a medium is measured by the quotient of the tangential stress developed along any plane in the medium divided by the rate at which the velocity of the medium is changing with distance perpendicular to that plane. More briefly, this measure, which is commonly called the coefficient of viscosity, may be defined as the quotient of the resultant tangential stress at any point of the medium divided by the resultant angular velocity of the medium at the same point.

VISCOUNT, vîkOUNT, a British title of nobility, next in rank to that of earl, and immediately above that of baron. It was first conferred by letters patent on John, Lord Beaumont, by Henry VI., in 1440. The title is frequently attached to an earldom as a second title, and is held by the eldest son during the lifetime of the father.

VISCUSOUS FERMENTATION, an undesirable form of fermentation that sometimes accompanies alcoholic or acetous fermentation. It yields a gum-like roty substance that injures the fermenting mass.

VISE, vis (Old French, vis, a screw, a winding stair; from Latin visus, a vine), a spiral or corkscrew staircase, the form most generally used in mediaeval buildings in which the steps wind round and rest at one end on a perpendicular pillar called the newel, and at the other end rest in the wall; the newel itself: in mechanics, a gripping appliance of wood or iron, consisting essentially of two movable jaws moved by a screw and used to hold an object in place while work is being performed on it; it may be either portable or fixed to a work-bench.

VISE, vîz, or VISA, vîzà (French, visé, pp. of viser, to put one's visa to; from Latin visus, pp. of visère, to see), indorsement made on a passport or the like, denoting that it has been examined by the proper authorities to show that it is in order.

VISEU, vî-sôö, Portugal, city of the province of Beira; in a wide, fruit-producing plain, 1,300 feet above sea-level, 50 miles northeast of Coimbra. Its cathedral is a striking flamboyant edifice and contains excellent pictures by Gran Vasco, the Portuguese Fra Angelico. In the vicinity is the old Roman camp, Cava de Viriato. The town, one of the oldest in the country, contains other Roman as well as Gothic and Moorish remains. A large fair is held here. Pop. 8,000.

VISHNI-VOLOTCHOK, vîsh'-ni-vô-lô-chok, Russia, town situated in the government of Tver, on the river Tana, about 230 miles southeast of Saint Petersburg by railway. It is the point on the Vishni-Volotchok railway constructed by Peter the Great, connecting the navigation of the Baltic and Caspian seas by means of the Volga, etc. There is a very extensive transit trade. Pop. 16,000.

VISHNU (vîsh'nu, to work, encompass, or "vis" to penetrate, related to the Latin "vis," energy, activity), the second god of the Hindu triad or trimurti, but worshipped as the supreme deity by the Vaishnava sect, which numbers about 60,000,000. Their belief, however, does not prevent them being vortaries of deified heroes, and of thus presenting various attitudes toward their supreme deity and of dividing themselves into numerous sub-sects, in accordance with their various interpretation of Vishnu's activities. Vishnu was originally the nature gods, probably the sun, but as he progressed from the position of one of a vast number of deities to that of the supreme god of the Vaishnava, he gathered to himself most of the powers and as many of the other gods of his own pantheon, and in addition to these other attributes of deities belonging to tribes of India possessing other religious ideas, organization and myths. It seems probable
that the numerous incarnations of Vishnu, which are variously definitely given as from 10 to 24, had their origin in attempts to explain the many and contradictory forms in which the god is said to have appeared upon earth at various times. This, too, would explain the more than a thousand epithets, phrases and names appended to him to describe or define his power, grandeur, attributes and spheres of action, to which numerous tribal myths contributed. There are at present 20 distinct Vaishnava sects scattered throughout India, out of the 43 sects of the Hindu religion; and there are 42 towns and cities that have famous shrines looked upon as sacred places. Of these 20 are especially sacred as directly connected with incarnations of Vishnu. The orthodox Vaishnava adherents hold to 10 incarnations of Vishnu, but they do not agree as to what these incarnations were. However the general Vaishnava opinion now gives them as follows in their order of happening: Fish, Tortoise, Boar, Man-lion, Dwarf, Parasu Rama, Rama Chandra, Krishna, Buddha and Kalki or white horse. Under each of these incarnations Vishnu is said to have appeared with some definite object in view, and so about them has grown up a vast amount of legendary and religious lore, myth, tradition and poetry which have woven themselves into the life of the Indian people, whether or not they be of the Vaishnava sect.

Vishnu is a personification of the preserving power and of the sun; though some claim that the sun is the type of Vishnu. Nine of his incarnations have taken place, but his tenth, that of the white horse, is still to be assumed. When this shall have been accomplished, he will have assumed five different animal and five different human forms — Vishou, Brahma and Siva together form the trinity of the Hindu religion. At one time these were distinct Hindu deities. Their rival claims for recognition were finally met by making them the forms of the one supreme god. This was, however, a creation of the priests and ecclesiastical students; while the great mass of people continued to retain their belief in a multiplicity of deities. As the worship of Vishnu spread more widely over India it took in all the attributes of the gods and goddesses of the Hindu religion. These brought with them into the faith myths, religious ideas, superstitions and traditions to many of which they continued to cling tenaciously. All this added vastly to the body of traditional lore connected with Vishnu and undoubtedly was the cause of the popular belief in his many incarnations, each of which, in all probability, represented some tribal deity or some mythological character of an older faith. Thus Vishnu is sometimes time, at others, the earth, water, air, space. He is the creator of the universe, the maker of Brahma. Vishnu is thus a manifestation of himself. He is represented either in his own person or in that of his incarnation or avatar. Quite frequently he is represented as lying down, the lotus in each of his hands one of his four symbols, a disc, conch-shell, mace, lotus (or sometimes a sword). These have been variously interpreted; but now the shell (or trumpet) is the sign of battle; the disc is emblematic of his solar origin; the lotus of his creative power, since from the lotus that sprung from Vishnu was born Brahma, the planet of physical power and the punishment of the wicked. One representation of Vishnu presents him as resting on a huge, coiled, many-headed serpent; others picture him as reclining upon the lotus while a three-headed, many-headed of the serpent that guards and shades him. Again he is seated upon a throne indicative of his supreme power, or as the culture god, he drives the plough or handles the tools of the artisan; or he rides on the swift Garuda, an animal with the body of a man and the head, beak, wings and talons of an eagle. In the Rig-Veda he is represented as striding through the seven regions of the earth and planting his feet in three ways.* This metaphorical language is explained as being a picture of the sun at rising, at midday and at setting.

The growth of the divine attributes given to Vishnu is clearly exhibited in the sacred Hindu writings. In the Rig-Veda he is a representation of the personified sun; and there are internal evidences to show that his worship must have stretched back into an age when the sun was looked upon as a powerful living personage. Yet he has not grown to be the supreme deity, nor is he even regarded as the equal of the other great Hindu gods of the Vedic period. But the literature constantly gathering about the Hindu pantheon began to be of very great extent and to take itself an epic character. In this literature Vishnu begins to play a very important rôle, and in the Sanskrit writings the Mahabharata and Ramayana he occupies the centre of the stage as the figure of chief interest. In fact the latter of these writings may be considered one long epic in praise of Vishnu, the supremely powerful and illustrious of the gods, incomparable, the all-wise, all-seeing, the eternal presence, the maker of heaven and earth, the supreme ruler of the spacious firmament. As the war god, he commands an innumerable host of monkey-warriors. Almost countless are the attributes of his majesty, and boundless the extent of his dominion and power. Yet even in his pre-eminent position attained by Vishnu in comparatively modern times in which the Hindu mind approaches the position of monotheism, where one deity takes the supreme place, and the others become helpers in the work of looking after the universe, and are ultimately softened down into saints and other less heathen-sounding names, there constantly appear the grotesque faces and attributes of the ancestral nature deity and imaginative mythology of a primitive race. Vishnu appears in animal incarnations. From the depths of the ocean Vishnu proceeds forth from his navel the lotus from which Brahma is born; as the ever-existing tortoise he bears on his back the universe; as the filler of all space he has the power to contract himself into the form of the lotus to give birth to the other deities, the supreme god is said to be the champion and defender of gods and men. This taking over the powers and attributes of
other deities made it easy for other creeds to come under the wing of Vishnu. The local deities became identified with the main deity and as such continued to hold his place in the hearts of his people, often to the extent of making Vishnu himself a somewhat shadowy character; and in that, as already stated, to the growth of a great number of sects in which there are really wider differences of faith and practices than between the different branches of the religions which have their origin in the Jewish faith, so far is the Hindu religion from being a unity. Vishnu makes his home in his glorious paradise, Vaikuntha, where he is surrounded by the 1,000 Gopis or shepherdesses who are eternally and passionately in love with him. There, too, with him is his matchless wife Sitā or Śrī (q.v.).

Vishnu is represented as a very kind deity, and to this, undoubtedly, is due the increase of his popularity throughout India. His festivals are joyous and some of them tend to be licentious. Flowers are his most characteristic offerings and his crowded temples are decorated with them.

VISHNU, Institutes of, a work of standard authority in the religious faith and practice of the Hindus. It is recognized and partly modern form it consists of 100 chapters of legal precepts and aphorisms, put under the name of Vishnu, originating from the early Vedic school, called the Caukas, but much added to in subsequent times. See INDIA; Sanskrit Language and Literature; VEDA; VISHNU.

VISIBLE CHURCH, an ecclesiastical term meaning the Church, as seen by man, not as it appears to God. It includes the whole body of professing Christians, some of them regenerate, others unregenerate, as distinguished from the Invisible Church, consisting of all those who are worthy in the sight of God to be members of His Church.

VISIBLE SPEECH, the name given by its inventor, Alexander Melville Bell, to a system of alphabetical characters designed to represent every possible articulate utterance of the human organs of speech. It is based on an exhaustive classification of the possible actions of the different organs concerned in speech, and to every organ and every mode of action of an organ a symbol is assigned. Of the radical symbols there are in all 30, and by combinations of these 30 symbols some hundreds of characters may be formed to represent the sounds of the human voice; but little more than 100 characters are actually required for all the ascertained sounds of different languages, and only two-thirds of the 30 radical symbols are required in forming the signs or letters necessary for the writing of any European language. In form the letters are as simple as those of the Roman alphabet. After completing this system, Mr. Bell submitted it at the direction of a large number of gentlemen well qualified to judge of its value, and allowed it to be tested in its presence in such a manner as to make quite clear its efficiency for the purposes for which it was devised. See DEAF, EDUCATION OF THE.

VISIGOTHS, vīṣī-goṭhas, or WEST GOTHs, the western branch of the Goths (q.v.), who, after the death of Theodosius, broke into Italy under the leadership of Alaric, and captured Rome in 410. Alaric died later in the same year before he had matured his plans, and after his death his brother-in-law Athisal, who was placed at the head of the nation, turning toward Gaul, made new conquests on both sides of the Pyrenees. He reached Barcelona, where he was murdered in 415; but his successors continued to extend his dominions in Gaul and Spain. Wallia made a treaty with the Romans, and in return for certain services received under their nominal suzerainty, though in virtual independence, western Aquitania, with Toulouse as capital. He died in 419. His successor, Theodoric I (419-451) was treated by the Romans as an independent ruler, and took part in the victory over Attila on the Catalaunian Fields in 451. Euric (466-483), third in succession to Theodoric, conquered the Suevi and other races, and is considered the founder of the Visigothic kingdom. Clovis, king of the Franks, on pretense that it was unjust to let the heretic Visigoths possess the fairest portion of Gaul, attacked the peaceful Alaric, Euric's successor, and defeated him at Vouillé in 507. The Franks obtained possession, without resistance, of most of the cities in southern Gaul, and the kingdom of the Visigoths would have been in great danger had not Theodoric, king of the Ostrogoths, undertaken its defense. While guardian of the Visigothic prince his grandson, he embraced the favorable opportunity to make himself master of a part of the territories still belonging to the Visigoths in southern Gaul; and after a long separation of the two nations there existed for a time an intimate connection of the Ostrogoths and Visigoths. After his death, dissensions arose among the Visigoths, and the pernicious influence of differences of religion became more and more evident. The kingdom of the Visigoths arose again with new energy under Leovigild (568-586), who totally subdued the Suevi, improved the laws, limited the power of the nobles, made Toledo the royal residence and tried to render the regal power hereditary. His son Recared adopted the Catholic faith on his accession (580-601), upon which the divisions of the people ceased, and Goths and Spaniards became one nation. Under his reign was held the Council of Toledo. His conversion had the most important influence on the character of the government. As soon as the Catholic faith became the established religion, the clergy, who had been completely subservient to the king under the Arian form of Christianity, acquired a predominant influence,
and constituted a hierarchy under the direction of the papal authority. The Arian bishops had been quietly in no influence on the public administration; but the Catholic bishops obtained an active participation in public affairs. The grandees of the kingdom, usurping the rights of popular representation, remained in the first class in the state; the mode of choosing the king was altered in favor of the bishops; and under weak kings these found it easy to place themselves at the head of the state and to procure exemption from all public burdens. As early as 633 the regulation was made that those secular grandees alone should be admitted to the councils who should be pronounced worthy by the bishops. Internal disturbances facilitated the conquest of the country by the Saracens, who were settled on the north coast of Africa. In 675 these Mohammedans had begun their attempts to settle in Spain, and during the reign of the weak Roderrick were enabled to execute their project. The Goths were defeated in 711 at Xeres de la Frontera; the king was slain, and the Saracens spread themselves over the greatest part of the country. (See Spain). The remainder of the Goths, who, after the downfall of the kingdom, fled to the mountains of Asturias and Galicia, founded there new kingdoms, in which the constitutions of the Visigoths were in part retained, and which, when their descendants broke forth from their fastnesses and wrested from the Moorish settlers one tract after another, finally gave rise to the kingdoms of Spain and Portugal. The traces of the public institutions of the Visigoths were preserved in the laws. The most ancient collection of Spanish laws, the Fuero Juzgo, or Forum Judicium (see Fuero), is drawn from the ancient laws of the Visigoths; and many of their institutions have been retained to the present day in the provincial laws of Castile and Catalonia. The Spanish language contains a strong admixture of the Gothic element. (Consult Hodgkin, 'Italy and her Invaders' (1888-89).)

VISION, the sense of sight. Visual sensations include brightness qualities (blacks, whites and shades), and color qualities (reds, greens, yellows, purples, etc.). They are produced by the action of light upon the eye and, taken in conjunction with certain other sensations, which are set up in and about the eye by the functioning of muscles and tendons, they give rise to the visual perception of objects and processes in the outside world. A descriptive account of vision has to deal (1) with the visual apparatus, both as a dioptic or refracting mechanism, which conveys light-rays to the retina, and as a nervous organ, which transforms the vibratory stimulus into neural excitation and transmits it to the brain; (2) with the sensations of brightness and color as regards their quality, number, classification, etc.; (3) with the specific processes which determine and condition visual sensation; and (4) with those perceptions of things and events which come to mind through the avenue of sight.

The Visual Apparatus.—This apparatus consists of the eye, the optic nerve, subcortical centres (of the corpora quadrigemina and thalami), and terminal or central areas in the cortex of the occipital lobes. It is generally believed that visual sensations are directly corelated with the functions of the last or cerebral part, only, of the visual mechanism; the office of the eyes, and the centres being the transmutation of ether-vibrations, the transmission of nervous impulses to the brain and the setting up of various movements—such as rotation of the eyes, accommodation and adukiing—which are important factors in visual perception.

In the human adult, the eye is a spheroidal mass having an antero-posterior diameter of about one inch. The central part of its front surface (the cornea) possesses a higher convexity than the remaining opaque surface. It is seen from a lateral position as a bulging transparent covering. The eye is invested with three coats and its interior is divided into two chambers; a smaller anterior cavity containing the aqueous humor and a larger posterior cavity filled with the vitreous body. Between the two chambers lie the iris (the colored part of the eye), its circular opening (the pupil) and the crystalline lens.

The function of the refracting mechanism—which includes the cornea, the aqueous and vitreous humors, and the lens, is to focus the light entering the eye, and to project upon the retina a small inverted image of the object seen. The eye is essentially a small camera. It differs, however, from the ordinary photographic camera in adjusting its focus for different distances by changing the convexity of its lens—not by altering the position of its sensitive surface, the retina. The process of increasing the convexity of the crystalline lens is known as accommodation. It is compassed by the reflex action of the ciliary muscles which permits the lens to bulge forward in viewing near objects and to flatten out in viewing distant objects. The retinal focus is thus maintained. The eye rests in its socket on a cushion of fat, and is turned in its orbit by the joint action of three pairs of antagonistic muscles, the internal and external recti, the superior and inferior recti and the superior and inferior obliqui. Since the two eyes function as a single organ (binoeular vision), it is important that they work together and thus bring the images of an object upon corresponding retinal areas. The turning inward of the eyes in their common fixation of an object is called convergence.

The true nervous end-organs for vision lie in the retina. The retina is a complex structure, of no less than eight strata or layers, which forms the innermost coat for the posterior part of the eye. Within it are the rods and cones, which stand closely connected with the neural elements leading to the brain, and which are probably the seat of those changes that transform the light-energy transmitted to the eye into the immediate stimulus for nervous excitation. The neural elements (nerve-fibres) which transmit the excitation unite near the centre of the retina, pierce the outer investments of the eye at the porus opticus — called also the "blind spot," because the retina at this point is insensitive to light—and continue as the optic nerve. The two optic nerves come down below the brain, in the median plane of the body, and form the optic chiasma. Beyond the chiasma there is a second division, a part of the fibres of both nerves passing to each hemisphere of the cerebrum.
Sensations of Color and Brightness.—Visual sensations include the colors seen in the solar spectrum, a series of purples ranging between red and violet, and all the grays, whites and blacks. Colors proper (that is, excluding mere brightness qualities) form a closed series in which one may pass by small gradations from any quality, as red or green, through every other quality, and arrive finally at the starting point. For this, it is only necessary to join the red and violet ends of the spectrum by inserting the purples. The closed color-series naturally falls into halves. The one half contains the reds, oranges and yellows, which obviously belong to a single group of qualities, the "warm" colors; the other half, the greens, blues and violets, the "cold" colors. The line of division falls in the purples on the one side, and in the yellow-greens on the other, both these colors including transitional points between the two types. Within each group, again, may be distinguished two subtypes, the red and yellow types in the one, the blue and green in the other. To each group belong several neighboring qualities which merge gradually into one another. To complete the classification of visual sensations it is necessary to bring the color sensations into relation with brightness (the gray series). That an intimate relation obtains between the two series is shown by the fact that each color has itself a certain brightness; the yellow of the spectrum, for example, has a brightness corresponding to a light gray, while the blue, green in the other. To each group belong several neighboring qualities which merge gradually into one another. To complete the classification of visual sensations it is necessary to bring the color sensations into relation with brightness (the gray series). That an intimate relation obtains between the two series is shown by the fact that each color has itself a certain brightness; the yellow of the spectrum, for example, has a brightness corresponding to a light gray, while the blue, green in the other.

To produce the large number of possible color tones it is not necessary to have recourse to a corresponding number of wave-lengths; for, given a small number of tones, properly chosen, it is possible to produce all the others by the process of color-mixture. One of the most common methods of mixing is by the use of pigments; another is by rapid rotation of the color-wheel, which carries two or more sectors of colored paper or cardboard. At a certain rate of revolution of the color-wheel the observer ceases to see the separate sectors and sees instead a single homogeneous color which is different from either of the sectors used. The tone of the "mixed" color depends upon the relation of the colors mixed. If two colors stand near each other in the color-wheel, the "mixed" color is intermediate; for example, red and yellow mixed give an orange; violet and red, a purple. There is, however, for each color, a "complementary" color which when mixed with it in a certain proportion gives—not a color tone at all, but—a pure gray or white. It should be noted that, in every case, it is stimuli that are mixed and not sensations; that the mixture is of physical or physiological processes not mental processes. A "mixed" color is as simple, psychologically, as any other.

Visual sensation depends not only upon the light stimulus to which the eye is exposed and upon the mixture of stimuli; it depends also upon (a) the part of the retina stimulated, (b) the stimulation of adjacent areas and (c) certain more or less permanent effects left by the stimulus upon the visual organ.

(a) It is only in the central part of the retina—the part lying about the fovea or spot of clearest vision—that all the colors are seen; further out toward the periphery of the retina lies a zone in which reds and greens are not sensed (only blues and yellows), and, still further out, an outermost zone whose stimulation gives rise to brightness sensations only. That is to say, the normal eye is totally color-blind over a part of its sensitive area and partially color-blind over a second part. Abnormal color-blindness, then, which is relatively common in the race, may be regarded—at least in its commoner forms—as an extension to the fovea of the normal color-blindness of the normal eye.

The eye is a chemical sense; that is, chemical processes are interpolated between the reception by the eye of light-waves and the neural processes that are ultimately set into function by them. Two special results follow from this fact: First, stimulation is not strictly confined to the part of the retina directly affected by light; and,
secondly, nervous excitation continues after the external stimulus has ceased to operate. (b) The first of these results, retinal irradiation of chemical or photo-chemical processes, is strikingly demonstrated by the phenomena of contrast. A patch of white looks whiter if it is placed on a black surface; black looks blacker in the neighborhood of white. In a similar manner, the saturation of a color (for example, red) is enhanced if it is brought near a complementary color (blue-green); and, finally, a gray in the immediate neighborhood of a color (for example, green) is tinged, under certain conditions, with the complementary of that color (purplish red). The last case, induction of a contrast color upon a gray, may be observed in the shadows of snow, which often look blue under yellow sunlight. The general effects, both of brightness and of color contrast, are, moreover, frequently to be seen in clothing and in interior decorations. The fundamental law of contrast is that the contrast effect is always in the direction of the opposite brightness or of the complementary color. (c) The result of continued stimulation of the eye is to change the condition of excitability of that organ. If large colored glasses be worn before the eyes for several minutes the unnatural hue of objects, which is at first very noticeable, gradually disappears. With blue glasses, objects at first look bluish, but finally return to their proper tones. The eyes are said to have become blue-adapted. A similar effect is produced if only a small part—not the whole of the retina—is exposed for some moments to colored light. A piece of red paper, for example, hung on a gray wall and fixated steadily gradually loses its saturation and approaches a gray. But not only is the excitability of the eye altered under continued stimulation; it remains altered, as noted above, even after the exciting cause has ceased to operate. When the blue glasses are removed the landscape looks yellowish; the observer is yellow-sighted. Similarly, when the red paper is removed, a bluish-green patch appears upon the gray wall. The first result is due to general adaptation, the second to local adaptation. In both instances, adaptation forms a predisposition for seeing colors complementary to the originally stimulating colors. The result of local adaptation (as the bluish-green patch induced by the reddish paper) is a negative after-image. Adaptation and after-images follow the same course with brightness as with colors. It is, for example, a matter of common observation that confinement in a darkened room enhances the brightness of objects seen subsequently in full light; that exposure to a strong light (sunlight on snow) tends to reduce the apparent brightness of objects seen afterward in moderate illumination, and, finally, that fixation of a dark or a light area, induces a negative after-image of the opposite brightness. All these phenomena illustrate the effects of adaptation.

Theories of Visual Sensations.—These theories aim to set forth the conditions under which the sensations arise. The most important in the field are the rival theories of Hermann v. Helmholtz and E. Hering. The Helmholtz theory provides for three primary sensations, red, green and blue (or violet), which rest upon three distinct processes of excitation, in the visual apparatus. To explain the large number of spectral qualities, it is assumed that these three processes, combined in varying proportions, give rise to all possible color qualities, and that in equal amounts they produce gray. The theory, which was outlined by Thomas Young and elaborated by Helmholtz, was designed primarily to account for the facts of color-mixture; that is, for the production of a large number of intermediate qualities and of grays by means of a few elementary sensations. These facts of color-mixture it covers well; but it fails particularly in its traditional form—to explain many other facts of color vision, notably the possibility of obtaining gray in the absence of color tone (as in color-blindness, peripheral vision and from stimuli of small extent). Recently, important modifications and additions have been introduced into the theory which have, in a measure, removed its deficiencies.

The Hering theory rests upon a basis quite different from that of the Helmholtz theory. Hering posits three retinal substances; but he makes each of these the seat of antagonistic processes—processes of assimilation or building up and of dissimilation or tearing down. To each of these processes in each substance corresponds a primary color. Assimilation of one substance gives rise to blue; dissimilation of the same substance, to yellow. This substance is called briefly the blue-yellow substance. Similarly the other two substances are called the red-green substance and the black-white substance. Blue, green and black correspond to the three assimilative processes; yellow, red and white to the three dissimilative processes. All forms of stimulation affect the black-white substance; but certain wave-lengths produce no effect upon the other two substances. Moreover, the black-white substance appears in greatest quantities, is most widely distributed throughout the visual apparatus and is most easily set into function. Since assimilation and dissimilation are opposed processes, the principle of antagonism assumes great significance in Hering's theory; the principle is, indeed, its most characteristic feature. Its application to complementary colors is as follows: if we stimulate in the several substances cancel each other—to contrast, to adaptation, to after-images, etc., follows naturally from the fundamental conception. Although the Hering theory is open to attack on various technical grounds, it undoubtedly covers the whole range of visual sensation more adequately than its rival. There is considerable that is hypothetical in both theories. This is, however, a fault that recent work on the histology of the eye and on the function of the retinal elements is doing much to remedy. Within the last few years several new theories of visual sensation have come into the field. Most of them may, however, be regarded as modifications of one or other of the more classical theories just discussed. Their value and their relation to the older theories must be sought in the current literature of the subject.

Visual Perception.—It is characteristic of visual perception that all objects seen are spatial objects; that is, they occupy some position in the spatial world; and they possess, likewise, spatial properties, form, distance,
direction, etc. This characteristic, it should be noted, is shared by tactual perceptions; but it is not a perception in general—not, for example, of the perceptions of melody, harmony and rhythm. Since all visual perceptions are spatial, the chief problem they offer to psychology is the analysis of the spatial factors and the search for the conditions under which these factors operate.

The simplest factor in visual space is extension. Every visual sensation comes to consciousness as an extended sensation. A color is always "spread out"; its parts are adjacent. In this respect, colors and brightnesses are essentially different from tones and noises, which lack the attribute of extension. Space, as it is perceived, is an orderly arrangement of extended objects. It never exists by itself alone. There is no such thing, in perception, as "mere" space or "empty" space. Only by abstraction are the spatial properties removed from objects; only by abstraction, as in mathematics, does empty space come into existence. Even our quotidian constructions as the line and the point do not properly figure in the psychology of space. It is, however, customary, within psychology, to distinguish two-dimensional and three-dimensional spaces; not because they differ fundamentally, but because they rest in part upon different conditions. The retina, being an extended organ upon which stimuli fall in patterns—thanks to the refractive functions of the transparent media—forms a natural substrate for the perception of surface magnitudes. But the retina is not so well adapted for tridimensional perception—perception of solid objects. A special provision for depth-perception is made, however, in binocular vision; that is to say, in the difference of the two retinal images which are thrown upon the two eyes by a single object. This difference in binocular images depends upon the different positions from which the two eyes observe the object. Now it is conceivable that the two unlike images should have come to consciousness as two of distinct objects. But, as a matter of fact, they do not, except under unusual circumstances—as when one squints or presses with the fingers upon one eyeball. They do not even come to consciousness in two different views of the same object. The difference in retinal images functions solely in the perception of depth or solidity. This is the principle involved in stereoscopic vision. Binocular perception of depth may be produced artificially by means of the stereoscope, an instrument which presents to the two eyes, under favorable conditions, two slightly different plane pictures of an object. Stereoscopic vision derives secondary aid, in ordinary perception, from linear and aperceptual, from the known size of objects of reference, from change of position of the observer as well as of objects from distribution of light and shade, etc.

The spatial functions of the eye depend as well upon muscular movement and the sensations which these arouse as upon the immediate retinal factors just considered. It has been demonstrated by many lines of experimentation that were the eyeballs set firmly within the head, the possibility of movement (a condition which is approximately in the extinction of certain fishes) visual perception of objects would be enormously handicapped. In the first place, movement allows the eye to travel over the object, exploring it from point to point; in the second place, it sets up sensations both in the external muscles that rotate the eye and in the internal muscles of accommodation; and, finally, it is probable that to these factors must be added articular sensations from the rubbing of the eyes in their sockets. All these sensations, muscular, tendinous and articular, play important roles in the determination of the spatial properties and relations of objects.

The eyes, regarded as perceiving organs, may be said, then, to fall into three parts: the retinas, which mediate visual sensations proper, and which function as a true double organ, the dioptric media, which focus the rays of light upon the retinas, and the movement-apparatus, which both alters the position of the retinal image and itself contributes kinesthetic sensations from muscle, tendon and orbit.

ADAM BENTLEY,
Professor of Psychology, University of Illinois.

VISION. Defects of. The conditions classed as defects of sight or vision are mainly due to anomalies in the structure of the eye, causing errors of refraction and other visual irregularities. Among the more common of these defects is that of astigmatism (q.v.), which is usually characterized by a symmetry in the curvature of the cornea (q.v.) in different meridians. Color-blindness (q.v.) is a serious disability in certain occupations. Day-blindness (nystagmus) is a condition in which one sees better in a dim light than in a bright light, due to some opacity in the cornea, the crystalline lens, etc. It occurs in amblyopia (q.v.) and other affections which produce dimness of vision. Night-blindness (hemeralopia), on the other hand, is a state in which the person affected has normal vision in ordinary light, but in twilight becomes suddenly blind. Double vision (diplopia) occurs when, as in some cases of squinting, each eye sees things separately. This defect arises from derangement of the visual axis, sometimes through muscular paralysis.

In longsightedness or farsightedness (hyperopia or hypermetropia) objects are seen distinctly only at a range beyond that belonging to normal vision. Owing to the shortness of the eye-cavity the lenses are unable to converge the rays to a focus within the limits of the eye-chamber, the image being, therefore, formed (theoretically) behind the eye. This defect is corrected by the use of convex lenses, which by converging the rays of light cause the image to fall on the retina. Shortsightedness or nearsightedness (myopia) is the reverse of longsightedness in causes as well as in effects. In this, owing to the too great power of the crystalline lens or to the extension of the eye-cavity too far backward images from objects at some
distance are formed in front of the retina, making the sight confused, if not entirely defective, for things beyond a certain limited range, while rendering it very clear for near objects. For remedying this condition biconcave glasses are employed, which, unless the myopia is serious, need be worn only for looking at objects far off. Short sightedness and long sightedness are usually congenital.

Presbyopia is a defect similar to hyperopia and usually comes on with advancing years, naturally beginning from the 40th to the 45th year. It is due to diminished focusing power and lessened elasticity of the lens, the result of which is that the image of a near object is not clearly formed on the retina, but is formed behind it, while distant objects are seen as well as ever. Convex lenses are used for remedying this condition.

Strabismus or squinting is a deformity often seen, and is ascribed to want of parallelism in the associated axes when the effort is made to direct both eyes to an object. It may be due to loss of power (paralysis) of one or more of the eye muscles; and this may depend on a merely local affection, or may be a symptom of serious brain disease. But in the majority of instances, and in all ordinary cases, no such condition is present. The squint is said to be convergent when the squinting eye is directed toward the nose, and divergent when it is directed toward the temple; the convergent is much the more common. Concomitant strabismus is a variety of which the amount continues about the same in all positions of the fixation-point. When the direction of the eye or eyes is upward or downward the squinting is said to be vertical. Convergent squint usually occurs during childhood, most often from the second to the seventh year. It is sometimes due to defective sight in the squinting eye, from congenital abnormality, severe inflammation or injury; but very often no such condition is present. In a large proportion of cases it is accompanied by hypermetropia, and is due to the increased effort of accommodation required to see near objects, being associated with an increased and disproportionate effort of the squinting eye. In such cases, in suitable glasses can be worn as soon as the squint begins to show itself, it may be prevented from becoming permanent. In other cases the presence of a squint may be traced to worms, the irritation of teething, etc.; and it disappears when the cause is removed. Divergent squint is very rarely present without considerable defect in the sight of the squinting eye, except where it is the result of over-correction of a convergent squint by operation. It is often associated with myopia, as the other form is with hypermetropia. The surgical operation for the correction of a squint consists in the division of the muscle whose excessive activity leads to the faulty position—in convergent strabismus the internal rectus, in divergent the external. It is often necessary to operate on both eyes in the same manner, even where the squint is monocular. In some cases it is requisite in addition to shorten the opposing muscle. See ASTIGMATISM; EYE; OPHTHALMIA; SENSES; VISION.

VISION AMONG FISHES. See EYESIGHT IN THE LOWER ANIMALS.

VISION OF JUDGMENT, The. If we accept Byron's 'Don Juan' as something more than satire, his 'Vision of Judgment' is by far his finest satirical poem and, with the exception of Dryden's 'Absolom and Achitophel' (q.v.), is the best of its kind in English literature. It sprang directly from the last phase of a long-standing quarrel with Southeby, the poet-laureate, whom Byron detested as a Churchman, a Tory and a literary man-of-all-work; but, more remotely, it had its origin in a complex of personal, political and literary causes. George III died in 1820 and in 1821 Southeby wrote a preposterous panegyric of the dead king entitled 'A Vision of Judgment,' which shows Michael and Satan contending for his soul, with victory to the former, and ushers George into heaven, where he is enthusiastically acclaimed. In his preface Southeby attacks what he terms 'the satanic school,' meaning thereby chiefly Byron and Shelley. In this Southeby blundered; he had provoked the most pitiless satire of his own age. Byron had been waiting for the chance. Southeby's absurd poem suggested a means of flaying the poet-laureate himself; of showing up George III as a model of private virtue but of public vice, and of attacking Tory politics and the whole reactionary political policy of European statesmen in general. Byron takes Southeby's title for his own poem and for the method of his satire employs a travesty of the original, using the trial scene before the gate of heaven, only changing the tone of the whole from the would-be sublime to the intentionally ridiculous. The metre and the style of Byron's poem are those of the purely satiric portions of his 'Don Juan,' with its Italian ottava rima, or eight-line stanza, its free and often burlesque rhymes, its realism, its sudden drops from the sublime to the ridiculous and its equally sudden rises from pure burlesque into poetry. The 'Vision of Judgment' is perhaps the only poem in which Poems in which the very few in which poetry and humor exist not merely side by side but are actually fused. Throughout its 800 lines there is no flagging of the wing of its superb energy. In indignation, in wit, even in humor, it has been equalled by other satires, but in high imagination, its attainment of the sublime, it remains unapproachable. Satire more scathing was never compressed into smaller compass; yet its scorn does not seem petty or spiteful: it has much of the Olympian spirit of the age. Though without the masterful characterizations of 'Absolom and Achitophel' (q.v.), it not only flies higher but sustains its flight even better, and it is not without its great lines that linger in the memory. Who can forget that "between his Darkness and his Brightness There passed a mutual glance of great politeness?"

The 'Vision of Judgment' was published in the first number of John Hunt's periodical The Liberator, in October 1822. The whole of the Tory press rose in its wrath. Even the satire ever aroused a greater storm of abuse. A king had been made ridiculous; a great
party system had been attacked by a renegade and an agnostic. Hunt was prosecuted and was fined £100. The satire has survived the scrimmage, which it ridiculed. Goethe called its stanzas on George III "the sublime of hatred"; Swinburne said that in it Byron gave satire wings to fly with. It was the last of the great verse satires written in English and it could have been written only by the poet who was on the whole the greatest of English verse satirists. Consult Fussell, Claude M., 'Lord Byron as a Satirist in Verse' (ch. IX).

MARION TUCKER.

VISION OF SIR LAUNFAL, Lân'fal. The, a poem by James Russell Lowell, founded on an Arthurian legend and published in 1845.

VISION OF MIRZA, mé rs'â, The, a famous allegory by Joseph Addison, which appeared in No. 159 of The Spectator.

VISION OF PIERS PLOWMAN, pêrz plow'man, The, an English poem of the 14th century, ascribed, on account of its resemblance to William Langland (q.v.) and Longland, a monk of Malvern, in spirit a Carlyle of the Middle Ages, crying out against abuses, insisting upon sincerity as the first of virtues. This poem belongs to the class of dream-poems and reflects both the England of the 14th century and the visionary, child-like mediæval mind. Internal evidence fixes its date about 1362. Forty manuscript copies of it, belonging, for the most part, to the latter end of the 16th century, attest its popularity. Three distinct versions are extant, known as Texts A, B and C. The probable date of Text A is 1362-63; of Text B, 1376-77; of Text C, 1398-99. The variations in these texts are considerable. An imitation of the poem, called 'Piers Plowman's Crede,' appeared about 1393. The poet's vocabulary is similar to that of Chaucer and several dialects are combined in it, the Midland dialect dominating. The metre is aliterative, long lines, divided into half-lines by a pause. Each line contains strong, or accented syllables in fixed number and weak or unaccented syllables in varying number. Consult Jusserand, 'Piers Plowman: a Contribution to the History of English Mysticism' (1893).

VISION, in an ecclesiastical sense, the visit of inspection by a bishop, archdeacon, elder or other authority to the churches within his jurisdiction. In the Protestant Episcopal churches the term is applied to an annual assembly of clergy and church-wardens, for the purpose of admitting church-wardens-elect to office, reviewing the condition of the parish, answering inquiries relating thereto from the superior ecclesiastical authority and receiving a charge from the bishop or his representative. Under the church establishment in England, the annual visitation of an officer as an official character and acts of Parliament bearing on Church affairs are then formally communicated to the clergy and laity. The Salesian Sisters are often termed Sisters of the Visitation. The 21 convents of this order in the United States.

VISION, Right of, the act of a naval commander who visits a ship of another nation to ascertain her character, and the object of her voyage. In time of war, a search is likely to follow if the replies to inquiries are not satisfactory.

VISITATION NUNS. See Orders, Religious.

VISITATION OF THE SICK (ecclesiastical). This is an office of the Anglican Church for the comfort and consolations of sick persons. It is founded on the offices of ancient liturgies and, with some exceptions, is practically the same as Extreme Unction.

VISITATION OF THE VIRGIN MARY (ecclesiastical). A festival celebrated on the second of July, to commemorate the visit of the Virgin to Elizabeth, the mother of John the Baptist, as described in Luke i, 39-56.

VISITATIONS, Heralds', periodical circuits formerly performed by the provincial kings-at-arms in England, to take cognizance of the arms, pedigrees and marriages of the nobility and gentry. The earliest visitation, in pursuance of a royal commission, was made by Thomas Benolti, Clarenceux, 1528-29; thereafter the visitations were repeated in periods of 25 to 30 years: the latest commission was dated 13 May 1685, and under it some pedigrees were recorded as late as 1703-04. The records of the visitations contain a mass of historical and genealogical information of great value: they form the principal source of evidence regarding the hereditary right to bear arms in England.

VISITING CARD, a card bearing one's name, and sometimes an address, etc., used to send in as an announcement when calling, and for other social purposes governed by the customs of the time and place. It is probable that some form of evidence of a call on absent friends was used in very early times, perhaps originally among the Chinese or some other Oriental nation. It is somewhat uncertain when European custom first adopted the device, but it is generally stated that visiting cards were first used, in the Western World, by the Germans in the 16th century. The court of Louis XIV, of France, the centre of the fashion and etiquette of the 17th century, seized upon the custom as peculiarly apropos to the manners of the time, but added many an elaborate touch to the plain German taste in cards, in finish, execution and adornment. Thus, under Louis XV, designs even of real or fanciful landscapes were added and, later, an autograph signature beneath the engraved picture. When England followed the lead of France in the use of visiting cards, in the 18th century, they came into use everywhere, with a return to their early simplicity; and, while they vary in size, shape and style of announcement, the modern tendency is decidedly in favor of simplicity and avoidance of ostentation.

VISOKO or VISOKI, a town of Bosnia, on the river Bosna, 15 miles northwest of Sarajevo. It has a good trade in leather, tobacco and carpets. Pop. about 5,000.

VISSCHER, Cornelis, a Dutch engraver who lived about 1629-62. His portraits, the best known of which are "The Doctor," "The Surgeon," and "Susanna at the Bath," are among the finest examples of Dutch engraving. In the last 15 years of his life he produced about 150 plates.

was graduated L.L.D. from the University of Louisville, but never practised law. He served throughout the Civil War, and was then appointed to judge in Kentucky, which he held for a few months. Thereafter he was engaged in newspaper work for nearly 40 years, became a prominent public lecturer and acted for several seasons in drama. He is the author of ‘Carroll of Colorado’; ‘Way Out Young’; ‘The River Pilot’; ‘Fetch Old Folks on the Canoe’; ‘Ten Wise Men and Some More’; ‘Amos Hudson’s Motto’; ‘The Pony Express’; ‘Black Mammy’; ‘Harp of the South’; ‘Blue Grass Ballads’; ‘Chicago, an Epic’; ‘Poems of the South’; ‘My Lady of the Island.’ He has been acclaimed the “Poet of the South.”

VISTULA, vis’ťū-lə (German, Weichsel), a river of central Europe, about 750 miles long, navigable from Cracow. It rises on the frontier of Galicia and Austrian Silesia, on the northern declivity of the Carpathian Mountains, flows first north-northwest through the foothills, then eastward past the town of Cracow, forming from a point about 15 miles below Cracow, the boundary of Galicia and Poland, till it receives the San on the right bank, when it turns north-northwest through the Polish provinces. A little north of Warsaw it is joined by the Bug; then it flows westward entering West Prussia a little south of Thorn, and after traversing Marienwerder divides into two branches, of which the eastern, the Nogat, empties into the Frisches Haff; the western divides again about five miles from the Baltic into an eastern and a western branch, the latter, the Danzig Vistula (which is much the larger), proceeding toward Danzig, the former to the Frisches Haff. A new channel cut since 1895 from the head of the Danzig branch now carries most of the water directly to the Baltic. The mouths were heavily fortified by the German government. The navigation of this river is important, especially to Poland, though often obstructed by ice or shallow water. The canal of Bromberg connects the Vistula, through the Netz, and Warthe, with the Oder. Several navigable rivers enter its delta. The area of its basin is about 76,000 square miles.

VISUAL INSTRUCTION is commonly considered as synonymous with teaching through the use of pictorial representations. In a wider sense it includes all instruction by which the material world reaches the mind through the sense of sight. The process is by no means a newly devised one. The human race has at all times depended upon the eye more largely than upon any other organ of sense for learning about material objects.

Photography has been the chief factor in the fuller use now being made of the visual method. By it even the most remote objects of every variety may be represented with a large degree of accuracy, and pictures of them may easily be placed before any observer. That is easily understood, which is visually small. Photographic processes of producing plates from which excellent pictures are quickly made are understood in enormous quantities on a printing press have made pictorial expression so common that it is no longer subject to special attention. Schools, publishing houses and business concerns of all kinds have been quick to recognize the effectiveness of the visual presentation of ideas and are making very large use of this form of expression. Man’s first means of communicating his ideas to others through speech and language was probably his first effort to make a record of his notions for the benefit of those at a distance or of a later time, and so invented symbols. These consisted of rude drawings and of characters known as the alphabet. The early pictographs express only a few simple ideas. Words formed from the alphabet do not directly suggest ideas. They come to have content only through much study and long familiarity with them. To the spoken and the written word must be added the picture form of expression. In considering the value of visual instruction it is important to recognize the fact that pictures serve not merely to make a pleasing appeal to the eye, but have actually come to be a universally used mode of representing the physical world to the mind. In the early stages of this fact, the problem is to determine the mental laws according to which the learner is affected by them and the special fields of usefulness of visual presentation. That the true place of pictures as an means of expressing ideas must be understood and used most effectively there needs to be a clear appreciation of the relative value of language and pictures in conveying ideas. An analysis of the whole body of ideas, which the mind has occasion to give expression must lead to the conclusion that pictures are most calculated to represent material objects. In other words they present to the mind facts to be perceived. Higher ideals and abstract relations must for the most part continue to be expressed through the medium of language. All notions of the objective world are gotten through the senses, chiefly sight. The primary function of the mind by which the individual has experience with material things is called perception. The powers of judgment, imagination and reasoning are absolutely dependent upon perception. They will work true only as perception has been clear, exact and vivid. Obviously one’s first dealing with an objective field of study should be through observation. Children are aided in their studies through visual aids. More mature minds are dependent upon a visual presentation whenever they enter upon a new field of study that has to do with objective realities.

The perceptive facts that may be acquired through the medium of the eye are form, size, position, which inhere in every object, and sometimes color and sometimes motion. Pictures do not directly convey any other notion. Where the mind seems to see more than these elements, it is only by inference made through the experience. The quantitative element is an important factor in visualization. Understanding how large an object is requires a known standard of measure. There must be comparison, doubtless involving the function of judgment. One’s practical interest in the position of an object or part of an object usually lies in knowing its place in relation to something else already known. Form is dependent upon relative position of parts. The clearness and distinctness of pictures depend upon factors. Most of the factors determine the accuracy and vividness of the visualization. A clear distinction is to be made between
visualizing an object and looking at a picture of it. The latter may be little more than the physical act of keeping the eye directed to the picture. Visualizing is a mental act which may or may not be passive. Visualizing is strictly a mental act. It involves the exercise of several mental functions. In the end the phenomenon observed, though absent, is imaged in the mind. The image is more than the recollection of some thing impressed upon the mind. A small amount of mental reaction may be sufficient to enable the mind to recognize an object when again presented, but a complete visualization involves a full analysis of the phenomenon and a later synthesis of parts. There must be a rebuilding in the mind of the thing observed and the mental image is probably never precisely like the object. The mind appropriates only what concerns its ends or interests.

There is among teachers and others who think upon mental processes an interest in the question of the relation between visualization and imagination. Some would see an opposition between the use of visual aids and imagination. They particularly analyze the mental processes involved and to discover the nature of what should be avoided. It is impossible to perceive too much or too accurately. On the other hand true visualization is imagination. Every mental image is made up of perceptive elements. Without them there could be no material out of which to build the reconstructed image. This statement gains force if one keeps in mind the distinction between the mere remembrance of a past visual impression and the construction within the mind of a mental picture, the latter being the highest form of visualization. Reproductive imagination is little more than memory. To visualize has come to be a phrase in common use. It is usually employed as equivalent to "imagine the thing or situation." What the objector really fears is the lack of ability to create entirely new combinations in a visualization of something not corresponding to what has already been observed. This creative power doubtless varies with different individuals and is also susceptible of cultivation. The danger is not so much that the visual presentation will be used too extensively as that its use will be unintelligent. There are limits to the fields of usefulness of pictures as an educational agency. Unquestionably a person may continue so fully absorbed in observation that insufficient attention is given to the exercise of other mental functions. The arguments for the use of pictorial expression must remain unshaken so long as such expression is confined within its fields of special usefulness and full mental reactions are secured.

An incentive for the use of pictorial representation is the belief that it is specially interesting. Interest as a motive for effort plays a large part in the modern educational program. The nature of interest may, however, be misinterpreted and dependence upon it may be carried too far. According to the etymology of the word interest the implication is that the mind is in the object or idea under consideration. Mental energy hangs upon what is actually before the mind. It is developed by the mode of approach through such elements as the mind can easily comprehend, which are necessarily certain objective facts. The objective elements, such as form, color and motion, attract attention, though attention at the beginning may not remain so. True interest on the other hand is an active principle. It is difficult to arouse, particularly in untrained minds, hence with children and uneducated adults objects and their pictorial representation can advantageously be used to attract attention and initiate interest. One must have some experience with an object of study before an interest in it can be aroused. The problem of the educator is to convert into active interest passive attention to the physical elements that for the time hold the mind. Failure to secure adequate mental reaction means the loss of the advantages of the visual presentation.

There is a very direct relationship between impressions and memory. Abstract ideas are not only difficult to acquire but they are not easily retained in mind. The mind is so constituted that it depends upon the law of association. There is a very strong tendency to associate a general notion with a particular illustration of it. So while the mind should move on to the general or abstract it cannot do so without first detecting the truth in some particular concrete illustration of it. The sense presentation, chiefly visual, is surely the easiest if not the only approach to the higher and more difficult idea. Further such idea is again brought into the field of consciousness through recalling one or more of the specific illustrations from which it was originally derived. With much experience with the material world and the people who move in it one cannot go far in the exercise of the higher function of judgment, reason and restrained, well-ordered emotions. One has but to visualize the ordinary schoolroom in which pupils commonly receive eight or possibly 12 years of their formal education to be convinced that there are powerful arguments in favor of a larger introduction of the visual means of instruction. Even when the picture expresses but a small part of the idea to be presented it may often serve as a suitable starting point about which to build a group of related thoughts.

There is need for recognizing the fact that visual representations like language vary greatly in significance, expressiveness and other respects. The rules of grammar and rhetoric have been fully developed and stated. It is understood that words should be selected and combined with a view to precision, clearness and force. There are rather few standards for judging the value of oral and written speech. But there is still much carelessness and indifference in the selection and use of picture expression. This condition probably grows largely out of the fact that pictures are so often used merely as supplementary to the language form of expression, that they are commonly prepared by inferior mechanical processes and by persons not thoroughly acquainted with the ideas to be expressed and that they who are supposed to learn from them are content with a very superficial observation of them. The chief standards for selection and use of pictures are their authenticity, truthfulness, expressiveness, quality and attractiveness.
When a verbal statement is made one properly asks what authority there is for it? What evidence can be adduced to support it? So with a picture one should want to know its source. What evidence is there to show that it expresses what is purported? There is particular need for applying this standard to pictures used to illustrate history. On any adequate test many of those appearing in books on history would be found altogether unreliable. The pictures have been thrown in to catch the eye but without having been as critically examined as the text.

A picture may be attractive but untruthful. This is particularly likely to be the case with fanciful drawings where the illustrator lacked specific knowledge of the subject or was indifferent to the criterion of truthfulness. A picture may of course be authentic and yet not truthful, for example, a reproduction of Leutze’s ‘Washington Crossing the Delaware.’

A challenging attitude should be assumed toward a picture both as to its authenticity and its truthfulness. In the matter of expressive netness pictures of all sorts vary as much as do verbal expressions. There is much trash in pictures. Many of them have little significance, while some are worth long study. A picture that is full of significance commands repeated attention. In education the selection of pictures is largely a work of elimination.

The quality of pictorial expression should be judged as critically as that of verbal expression. There is no more excuse for carelessness and indifference in one case than in the other. Rarely does a poorly made photograph or drawing actually give full and accurate expression. A picture is defective to the degree to which the observer is unable to see in it the idea intended to be expressed. Many factors, including quality, enter into the attractiveness of a picture. While a pleasing appearance is very desirable it should not obscure the importance of the other factors. The tendency is to produce merely an appeal to the eye rather than to the mind.

In most cases some pictures may be classed as prints, lantern slides and films. Prints are pictures or drawings made by transfer from engraved plates, lithographic stones, photographic negatives or the like. They are used in books, magazines, pamphlets and other publications or appear alone. A stereograph is a pair of photographic prints made in a particular way. They bring out the third dimension or depth better than the single print. They are of advantage only where perspective is an important feature to be observed.

Obvioulsy a print is suitable for individual study rather than for class instruction. It is usually too small to be observed by several persons at the same time.

A lantern slide is a photographic positive on a glass plate. The image is projected upon a screen giving a picture sufficiently large for effective instruction. Slides are pre-eminently the form of pictures suitable for class use for illustration by visual means. The attention of every member of a class or audience can be directed to the same thing at any moment, which is essential to class instruction, and there is ample opportunity for close observation and discussion.

A motion picture consists of a succession of images projected on a screen from a film with such rapidity as to produce the illusion of movement. The chief function of such pictures is to tell a story. They are not well adapted for the observation of any of the aspects of material things other than motion. The distinctive place of the motion picture is in the field of entertainment though it may have supplementary educational value in showing processes when other related facts are known. There is no possible advantage to be derived from the motion picture for representing objects that are static, such as buildings, works of art and physiographic features of the earth. Motion is sometimes so characteristic of a living form or mechanical contrivance as to be in itself an object of interest and when the moving form cannot be examined a pictorial representation of the movement is distinctly useful, for example, for most persons the movement of a seal.

For educational use, aside from the question of expense, the chief objection to the motion picture are the absence of discussion while observation is going on and a consequent lack of training in observation and in the power of verbal expression. The deeper and more significant features to be observed are overlooked, true mental reaction is weak, and study is superficial. The same results may attend the use of still pictures but are much less likely. It is important at least, so far as the school course is concerned, to determine for what studies the verbal method is best adapted. Obviously its principal field of usefulness is in those studies that deal with physical phenomena that cannot be brought into the schoolroom, such as geography, industries, nature study, physiology and art. Few pictures can be used to advantage in teaching mathematics, though success in mathematical studies doubtless depends very largely upon ability to visualize. The chief elements dealt with are size, form and position. Of these ideas the quantitative stands foremost, ideas of much, more or less. Some unit of measure is visualized in relation to the thing measured. A pupil who visualizes readily has little trouble with geometry, while one who depends chiefly upon verbal memory struggles with it in vain.

Spelling is in large part a visualization of the form of words, secured particularly by attention to the construction of syllables. Hence spelling is now learned more by observation, than by the repetition of letters in a fixed sequence. The form of words is visualized.

Reading as an exercise in learning to recognize and pronounce words is not taught through pictures, though learning the content of certain words is to a large extent acquired by association of word and picture. Further, after a pupil has acquired some facility in the more mechanical aspects of reading, the interpretation of a picture may be made a powerful incentive to read for thought getting.

In the field of literature pictures should be used sparingly and with caution. Language is pre-eminently the medium in which literature is expressed. The material objects mentioned are but incidental and for the most part would be readily visualized if visual instruction has had its proper place in those studies where it
is most applicable. Such value as pictures have in this study is altogether secondary, such as stimulating an interest and creating a motive for reading. A motion picture may give in part someone's interpretation of the story, which is but the literary skeleton, but it tends to relieve the pupil of the need of effort and hinder his acquiring insight into literary expression by substituting a lower objective. The photoplay may doubtless express dramatic situations and acts but is not in itself literary expression. To eliminate this difficulty in the use of language observation of pictures is a great aid, for it leads to a body of definite notions to be expressed. If observation has been orderly, expression will be clearer, more accurate, more vivid and better organized. This is on the assumption that the learner is actually required to prove what he has gotten from the visual presentation.

History introduces so many factors that lie outside of the observation and experience of the student that a visual presentation is extremely helpful if not the only field in which the purposes they are to serve. It is useless to expect to re-act history before the physical eye. The study calls for true visualization, the creation or building of mental pictures out of the material which the student collects. So far as pictures truly and authoritatively represent material features belonging to an earlier time such as places, utensils, dress, monuments, customs and modes of living, they are an aid to the student in his attempt to put himself into the historical environment. The possibility of using visual aids successfully becomes small when the student reaches such vital things in history as character, ideals, motives of action, political, civil and social problems, policies and the like.

In the natural sciences, nature study and geography, and any other study that deals with material objects, pictorial expression may be used with particular effectiveness and become necessary for obtaining results when the facts of study cannot be observed directly or through types. Practically every feature of artistic productions can be expressed by pictures and drawings. Form, size and position are the key factors in any class of art conception and color is usually an important element. All these factors may be perfectly represented by still pictures and here verbal description fails utterly. The field includes painting, sculpture, architecture and the minor arts. A verbal description of Amiens cathedral would be quite unintelligible to one not conversant with architecture.

Too much may be claimed for the visual presentation but on the other hand the importance of it for certain purposes cannot be denied. After the fields of its special usefulness have been determined and the aids have been selected with due reference to their value it still remains to use them in a way suited to the purposes to be attained. What is the visual method?

At the outset, there is some difference of opinion as to whether pictures should be used merely as illustrations of a general statement of a truth or as the means of approach to an understanding of a truth. The practice of the former is probably the best. It must be admitted that there is a place for each, but the latter is more in need of encouragement. The studies most in need of visual presentation are generally acknowledged to be inductive in character. In the use of pictures then let observation come first. On the whole, reading may better follow than precede observation. This is particularly true when there is an intensive use of pictures with special reference to teaching pupils how to pursue the study rather than to give him merely some general information about it. Granting that the primary feature of the method is observation, one has only to follow the recognized rules for observing. The procedure is not essentially different whether the object itself or its pictorial representation is observed.

In leading pupils to study a picture it is usually advisable to give them a start. Avoid a question like, "What do you think this picture shows?" for by such a question attention is scattered instead of concentrated and there is likely to be guessing. Rather direct the class to note a particular moment and tell about it. Have a definite purpose in using a picture. It probably expresses some facts not pertinent to the immediate end in view. Do not suppress a disposition on the part of the pupil to see for himself, but lead him to report his observations along chosen lines.

First ascertain just what perceptive facts are shown. When these have been clearly and accurately expressed, call for judgments. What does the pupil infer that is not actually shown? Some additional points of interest merely associated with the object may be stated, but in doing this the instructor has departed from a visual presentation. In the main leave such additional information for separate presentation or for the pupil to get from reading.

A picture is not seen as a whole. It must first be examined as to the features that make it up. It is exceedingly important that beginners be led to make their observation in such an orderly way that the mind will not waver in its search for the content of the picture but will quickly detect one feature and then pass on to another. Such ability to read a picture is developed rapidly under proper guidance.

The following are some of the advantages to be derived from the use of visual aids to instruction: a keener interest in the subjects studied, a growth in voluntary attention, clear and more definite percepts of the things involved, truer and more vivid mental images, much better results in oral and written expression, increasing ability to grasp new truths when presented.

ALFRED W. ABRAMS, Chief, Visual Instruction Division, New York State Education Department.

VISWĀMITRA, vis-wə-mi-tə, personage prominent in the legendary history of India; a descendant of King Purūravas, who was an ancestor of Kusika. According to several accounts, Visvāmitra was maternal uncle of Jamadagni. He had 100 sons, 30 of whom were, for an offense that they committed, degraded to outcasts, and the progenitors of the Andhras, Pundras, Sabaras, Pulindas, Māthas and other frontier tribes, which in the Vedas are called Dasyus, or robbers (see VEDA). His fame is founded chiefly on the remarkable fact that though by birth a Kshatriya, or a
man of the military caste, he gained admission into the Brahmanic caste, after a long lawsuit with the Rishi Vasishtha. A kind of consecrated biography of Viswamitra is given in the first book of the Rāmāyana. Its substance is as follows: Roaming over the earth with his armies, Viswamitra came to the hermitage of Vasishtha and was received by the saint in the most sumptuous style. Vasishtha could afford thus to entertain the king, because he possessed a fabulous cow of plenty, that yielded him whatsoever he desired. Viswamitra becoming aware of the source of Vasishtha’s wealth, wished to possess the cow, and offered to purchase her from Vasishtha. The saint refused the offer, and the king seized her, intending to carry her off by force. But the cow resisted, and ultimately displayed her supernatural powers in producing from different parts of her body numerous peoples, by whose aid Vasishtha destroyed Viswamitra’s armies. The king then had recourse to his magical weapons, but he was defeated by those of Vasishtha; and in his humiliation he exclaimed: ‘Contemptible is the might of a Kshattriya; a Brahman’s might alone is right,’ and to attain the rank of a Brahman he immediately resolved to practice the utmost austerities. Accordingly he went to the south, and performed severe penance for 1,000 years. At the end of this period, the god Brahman appeared, and announced to him that he had become Mahārṣi, or, retrospectively, Rāshi. Not satisfied with this degree of holiness, Viswamitra continued his austerities, and at the end of another 1,000 years the god Brahman conferred on him the dignity of a Rāshi. Not yet satisfied, he went on practising still fiercer austerities, though interrupted by the allurements of a heavenly nymph whom the gods sent to him for that purpose: thus he attained the rank of a Mahārṣi, or great Rāshi. After another 2,000 years of still more rigorous penance (again interrupted by the gods, as before), the god, headed by Brahman, came to acknowledge that he had now become a Brahmārṣi, or Brahmanic Rāshi; and Viswamitra himself was compelled to acquiesce in the result. For other legends relating to this topic, consult Muir’s ‘Original Sanscrit Texts’ (Vol. I, London 1888).

VITA NUOVA, vē’ta noo-ō’vā (It. ‘The New Life’), an early work by Dante, completed probably in 1307.

VITACEAE, a natural order of exogenous plants, known also as Ampelidæ and Sarmentacæ, of which the common vine may be regarded as the type. About 260 species are known, natives of warm and temperate climates, all shrubs, mostly climbing; with simple or compound leaves, with or without, stipules, lower leaves opposite, upper leaves alternate; the flower stalks racemose, opposite to the leaves, sometimes as in the vine, by abortion, changing into tendrils. The only plant of the order of much value in an economical view is the vine; nor are there any fine fruits except the grape, and that of species so closely allied to it as to be properly ascribed to the same genus. Species of the genus Cissus and of Ampelopsis are sometimes planted for ornament. Cissus antarctica is the Kangaroo vine of New Holland; and Ampelopsis quinqufolia, often called Virginia Creeper, is a frequent ornament of the fronts of houses both in America and Europe, attaching itself to the wall by tendrils terminating in a peculiar kind of sucker and climbing to a great height.

VITAL STATISTICS. By this term is meant the statistical record of facts which pertain to life and death in any given community. The term is sufficiently comprehensive to include the records of the smallest kind of a village, or those of a nation, or even of all the nations of the world. Vital statistics may be said to constitute a science, and such a science, indeed, as requires very considerable knowledge in mathematics and mnemonics to master it. It is well defined in the statement that it comprises analysis and synthesis of facts concerning the life-history of populations. Its practical utility in the history of communities is very great, and is increasing every year. Any community which pretends to keep a record of its doings must have vital statistics, hence all civilized nations must have them. It not only enables a nation to know where it stands, but where it stands with reference to other nations. It informs those who seek such information as to the prevalence of disease and death, it suggests sanitary measures for the cure of the utmost austerities. In 1910 the attempt to enumerate deaths was discarded, reliance being placed upon the results of actual registration in the respective area. This area for deaths, up to 1915, included 25 States, or 4.13 per cent of the area of the country, and 66 per cent of the population. Among the Southern States it includes only Kentucky and Virginia and part of North Carolina. The birth registration is more effective than that of deaths it is fairly well known that more than 2,500,000 of babies are born in the United States every year though less than half of them are recorded. A registration area for births has not yet been organized; many States have good laws on it subject which, however, are not enforced. A model law was passed in Pennsylvania in 1905, one provision of it being that primary schedules for vital statistics must be uniform. A standard death certificate is now used in nearly all of the United States. Now the census includes not merely a count of the people every 5 or 10 years, in a city, State or nation, as anybody knows who has ever examined the bulky volumes of the census of the United States, but many other things of great importance. The registration of vital statistics in the United States belongs to one of the bureaus of the Census Department. It collects statistics of death obtained from State registration and is supplemented by municipal returns from cities which as yet have no efficient registration laws.

Vital statistics when well prepared and accurate give valuable information, not only in regard to disease and death, but as to the number of the people and as to birth, age, sex,
color, race, occupation and conjugal relations. They are also the basis of data for life insurance and are used in the estimation of ratios in regard to births, marriages and deaths and with the manipulation of figures for making a great many important deductions. It is essential that these fundamental statements should be accurate but unfortunately this is not always the case. There is, therefore, an element of possible error in vital statistics which must almost always be considered. They, however, usually permit conclusions which are approximately true, and by the aid of corrections they can be brought still nearer to the truth.

The vital statistics of the United States are by no means complete for the entire country. Bulletin 109 published by the Census Bureau 1 Oct. 1911, and which gives the mortality record to 1 Jan. 1911, declares that in only 21 of the States are the mortality statistics complete (at date), while in 16 other States they are given only for one or more of the large cities. This condition is sometimes the result of the overcrowding of the large cities. Other tables of vital statistics are equally incomplete and for some of the States they are wanting altogether. Much remains to be done, therefore, to place these data upon a basis which is as scientific and as accurate as the best records of the nations of Europe. The United States is practically the only civilized nation which lacks an effective system of vital statistics. It is a subject which might well be taught in the medical schools, under the supervision of the government. It is to be hoped that this end will be attained in the census of 1920. The subject will be considered in this article under the divisions of population, birth, marriage, death, disease and life tables.

Population.—This is the first fact which will be sought in preparing the vital statistics of any community. It is obtained by the census which is taken once in 10 years by the nation, once in five years or oftener by some of the States and cities. It is inaccurate in various localities, sometimes from the dishonesty or incompetency of the enumerators and sometimes from the fault of those from whom information is sought. Revision of the last census in many of the cities and towns showed remarkable variations from the figures which had been obtained by the official gatherers. When the population of two or more places is known we have the first factor or element for making comparisons between these places.

In the interval or intercensal years, when a direct count is not taken, an increase of population is usually presupposed, and is estimated by comparison of the two previous census enumerations. This is an inaccurate method, furthermore a decrease instead of an increase is often known to be the fact. Increase of population, for a given period, is due to the excess of births over deaths, as recorded in the archives of the board of health, or other office of registry, and to this must be added the excess of those who come into a community over those who leave. Decline of population is due to excess of deaths over births as well as removals from the community.

Population may increase slowly or rapidly and is greatly influenced by prosperity or the reverse, by sickness, by climatic conditions or by the advantages or disadvantages of residence in the given community. Make-up of population refers to the relative numbers of males and females, and their ages. It also includes details as to color or race, and nationality. In many communities, especially in those which are large and highly organized, there is an excess of females over males. This is especially apt to be the case in manufacturing communities, while in pioneer settlements there is always an excess of males. In villages and small towns, especially in farming communities with their preponderance of outdoor work, this is also the case.

Age statistics are usually arranged according to decades, except that the infant population includes those who are under one year of age. Stillbirths, of course, make no addition to the population, but a record of them is important for it may lead to deductions which are of great significance for a given community. Age statistics have a very important relation to mortality statistics. The highest mortality rate is in infancy, and as this condition in the United States is extreme, it should call for study and investigation in such localities, especially when the total mortality rate is unusually high.

Color is an important detail in the records of population. There are many communities in which there is but one color, black, white, red or yellow, but on the other hand the United States is a very composite nation, and hence there is a very positive necessity for the color distinction for a large portion of the population. The statement applies even to a greater degree in regard to nationality. At there may be 20 or more nationalities in a single city, the necessity for classification is apparent enough.

The sparse population in certain farming districts, especially in the less fertile or the newly-settled portions of the country, or in those which are unfavorably located from sanitary or commercial conditions, the crowded population of the great cities where opportunities for labor are abundant, the overcrowding of the slums and the abnormal housing of multitudes of human beings in many of the factory cities and villages furnish material for vital statistics which are invaluable from a sociological standpoint. They are also the basis of some of the most educating calculations with regard to mortality and morbidity rates.

The rule was formerly accepted by statisticians as generally applicable that the greater the density of population the higher the death rate, but the many sanitary improvements in housing arrangements in recent years have changed the conditions in localities where the density of population is great, have considerably modified this rule. The mortality rate in such localities is now much lower than it was a few years ago and this improvement applies not to the United States only but to the civilized world. Public health is purchasable. Twenty-five thousand lives can be saved in New York State within the next five years. (H. M. Biggs, commissioner of health of New York.)

Statistics in regard to population are taken periodically or intermittently, while those which relate to birth, death, marriage and disease, which are sometimes called registrar's returns, are constantly in the process of making. Every community, large or small, has them as an
essential portion of its records or archives. In the record of diseases, especially those which are of an infectious or contagious character, the list is increasing from year to year. It is easy to see that many valuable deductions and comparisons can be made from such records, especially in regard to sanitary and hygienic improvement. In all parts of the country they are now under the control of boards of health which are usually endowed by the legislatures with ample legal powers.

In using statistics of this character it is not only desirable that they should be accurate but that they should be extended over as long a period of years as possible. This permits comparisons, the establishment of averages and the drawing of conclusions which would not otherwise be possible. In making comparisons it must be remembered that data should be of the same class or kind, for only such admit of comparison.

Births.—Making a record of births is a custom which is at least as old as civilization. It was a standing custom in the Roman Empire at the foundation of the Christian era, to go back no further, and has been continued ever since by the town or parish clerk or notary, or by the clerk of the church. It is now one of the functions of the board of health and physicians, midwives and others are authorized or compelled by law to report all births within a given time of their occurrence, usually within one or two days. These records are usually inaccurate because those who should report them are frequently careless and negligent about it, or the authorities are careless in enforcing the law. Many births which are unattended by physicians or midwives are never recorded. A proper penalty, but not one which is too severe, ought to be inflicted when this law is disobeyed. This trouble could be remedied in part, at least, by having vital statistics returned by those who are engaged in public health nursing. However true it may be that physicians ought always to make birth returns, the very busy and the very careless will not do it accurately and promptly although there is a risk of losing their license to practice.

Bearing in mind the facts which have been mentioned and remembering also that in some of the States there is no law requiring the registration of births, deaths, marriages and sickness, the statement concerning the imperfect character of our vital statistics and their consequent want of value will be found correct.

Crude birth-rate is estimated at so many per thousand of the population. The birth-rate must also be considered in preparing tables with reference to the number of women of childbearing age and with reference to legitimacy and illegitimacy.

Stillbirths, as already stated, do not form an element in population, but they must be registered. They have been estimated at from 25 to 4 per cent of all births, and this estimate is probably too low. There should also be a record of abortions though this would undoubtedly make it difficult to obtain, particularly in account of the great number of criminal abortions. If it were possible the entire number of pregnancies per year should be tabulated.

The birth rate of different countries or cities or States is often a matter of study and comparison. It is usually higher in the cities than in the country. The rate is higher when times are prosperous than when they are adverse, as economists noted a century ago. It is higher in manufacturing communities than in those which are residential, higher among the ignorant than among the intelligent.

The birth rates of countries which were engaged in war is of exceeding importance and will be increasingly so in the near future. Already the French government is offering premiums to women who bear two or more children, whether legitimately or illegitimately, and other nations which have lost so heavily in men will probably do the same. The importance of accurate registry will be very great in all these countries.

A high birth rate often, but not necessarily, means a high death rate, for the mortality in infancy, as already stated, is higher than at any other period of life, but a high birth rate may also mean that the population is a vigorous one. A low birth rate may signify a low death rate but it may be followed by a high death rate.

For a number of years the birth rate in most of the civilized countries of the world has been declining, and in view of the increasing cost of living in all of them it will probably continue to decline. It is declining in England, it is declining in the United States, while it has been declining in France for so many years that it causes persistent alarm to her government.

Marriages.—A record of marriages is equally as important as that of births, and the custom of keeping it is almost equally ancient. It is the bond of the family and one of the most important props of civilization. Both Church and State have kept marriage records and continue to do so. It seems unnecessary that there should be a double record.

In countries in which Church and State are united, the Church will insist upon its right to this record, and in those which are like our own, and in which Church and State are separate, the right of the State to keep it should be insisted upon. It is so insisted upon wherever there are boards of health and a license or permission to marry must first be obtained from the local government, while the record of the marriage performance is preserved.

A custom which is increasing in its frequency is the giving and receiving of a certificate of health, after a suitable examination, by those who are about to marry. It is a desirable custom and if it were universally insisted upon like the marriage license it would prevent a great deal of the disease which follows marriage between those who are physically unfit. Tables of vital statistics should, for completeness sake, include the physical condition of those who marry, at the time of their marriage.

Marriage rates, like birth rates, are estimated at so many per 1,000 of the population, the number of persons who are actually married being double the number of the marriages. A better record would include the period of marriageable age. The marriage rate varies and fluctuates in accordance with certain conditions. It increases in times of commercial prosperity with abundance of labor, and in communities in which the occupations are healthful and productive of vigor and vitality. It
VITAL STATISTICS

Diminishes during hard times, during war and at times when the physical condition of those who are of marriageable age is lowered by disease, especially by epidemic disease or by disease which results from unhealthful occupations. In many communities there are more marriages during the summer than during the winter. An unusually high marriage rate may be followed by one which is correspondingly low, as when great business prosperity is followed by great business depression. This is simply the verification of a well-settled economic law. It has been observed that more women than men marry several times during their lives. This must mean either that the inclination to marry repeatedly is more common in women than in men, or that women, more than men, feel the need of a home and of other things which marriage is supposed to afford, or that marriageable women live longer than marriageable men.

The age at which marriage is consummated is greater now than formerly. This is perhaps due to the increasing sense of the responsibilities which are connected with marriage, which is a hopeful indication, or it may be due and often is due to inability to support a family in early life, in consequence of the increasing cost of living, according to present standards. The fact that so many women are now working at gainful occupations, and that so many elect a career from their own efforts, in preference to the cares of a household, is an additional reason for the change in the marriage rate. The marriage age is an important factor in reference to population. Children who are born of mature parents are much more likely to be vigorous and healthy than those of the immature and the aged.

The statistics of divorce are intimately associated with those of marriage. In a country like the United States, in which divorce prevails to such an alarming extent, it is especially desirable that the records should be made with the greatest care and accuracy. The spreading of such facts before the people ought to act as a deterrent to this great evil and to develop habits of greater thoughtfulness and wisdom before entering into marriage.

The ratio of divorces to marriages in the different States is a matter of importance for record, and so is the actual number of divorces which are granted in the several States, and the relation of that number to the population in each State.

Deaths.—The death record, or the mortality statistics, is probably prepared with a greater degree of accuracy than are the other records. For various reasons births and marriages may escape the record, whether intentionally or unintentionally, but the record of a death is not easily evaded.

Those whose duty it is to report deaths—doctors, midwives and others—are likely not to neglect this duty, and in those cases in which death occurs from violence or from unexplained causes, the coroner, who is an official in every county, has a responsibility in making the record which he is unlikely to neglect.

The following table shows death rates in the registration area of the United States, which, as before stated, embraces 21 States and one or more cities or towns in 16 others, is interest-

The death rate of a community is the ratio of the deaths to the entire population, and the unit of time is one year, although death rates are stated and also computed for shorter periods. In many States the board of health publishes a weekly or monthly bulletin of deaths in connection with other vital statistics. In comparing the death rates of different localities the rate per year 1,000 of population is the measure of comparison. The death rate may be found by dividing the actual number of deaths by the number of thousands in the population.

This is the crude death rate and in many places, especially large cities or places in which there are large institutions, such as hospitals, almshouses and penitentiaries, it is decidedly inaccurate.

Deductions must, therefore, be made for the deaths in such institutions, which are usually far more numerous than in the community at large. Additions must be made if any considerable numbers of the population have gone to other places and died there.

Suppose, for example, that a large number of people with tuberculosis in an advanced stage were transported to another place, and died within the period for which the death rate of the first place was taken. It would manifestly be unfair to charge this mortality to the second place in preparing the death rate of the first.

The death rate should also be analyzed and modified with reference to age, sex, race, occupation, density of population and any unusual influence such as an epidemic, an earthquake, or any other abnormal experience.

The influence of age in such a computation is very considerable, when the deaths include a large number of infants, or a large number of very old persons. Infant mortality varies between 90 and 300 or more per thousand births. In the crowded tenement houses, in the homes of vice and intemperance, among the children of diseased parents, and during the heat of summer the death rate among infants is always very high. In manufacturing towns it is very high but it varies with the town.

Thus in Fall River, Mass., with its overcrowded tenement houses, the rate is 239.7 per 1,000, while in Lynn, Mass., where the factory people have better pay, better houses and more salubrious work, it is only 140.7 per 1,000. In
VITAL STATISTICS

Boston, with its intelligence and all its civic advantages it is 188.2 per 1,000, and for the entire State of Massachusetts it is 160.4 per 1,000.

Causes for high infant mortality are pre-natal death, heredity, intemperance, early marriage, neglect, carelessness, ignorance, bad food, unsanitary surroundings, bad industrial conditions and infantile diseases.

The influence of sex upon the death rate is noticeable in those communities in which females predominate in the population, the average life of females being greater than that of males, except between the ages of 10 and 20.

The influence of race is becoming more and more striking as the higher races acquire greater freedom from morbidity and greater longevity: The less favored races are still very sensitive to certain diseases, particularly in crowded cities, in unsanitary surroundings, and when bad habits are acquired. The mortality among negroes is very great, especially from such diseases as tuberculosis and the venereal diseases, though there has been very great improvement in this direction, especially during the last 15 years. Indians have a high mortality rate as they adopt the habits and customs and vices of civilized life, though education is also bringing improvement to them. The Chinese are far less influenced by unsanitary conditions than either negroes or Indians.

The influence of occupation upon disease and mortality is just beginning to be adequately realized. There are many occupations which will produce disease and shorten life, no matter what safeguards may be thrown around them; there are others which are and always will be hazardous to life and limb, there are yet others which can be made relatively safe when there is greater interest in the welfare and happiness of human beings than there is in exploiting them as a means of making money.

Those who work in certain kinds of phosphorus are bound to suffer injury under any possible precautions, those who put up the frames of steel buildings, who work on telegraph poles and who handle electrified wires are always in danger and those who are skilled in the tools that suffer from disease, but their work can be so safeguarded that the danger may be eliminated to a great extent.

Some of the occupations which have a large element of danger, in addition to those which have been mentioned, are those of cassowary workers, in which the workers must sustain a pressure of five or six atmospheres, miners, molders, and slaters, of workers in iron furnaces, in potteries, in chemicals and metals, in electrical establishments, etc. A very large class of diseases are occupational diseases and the publication of statistics upon such subjects is doing much to enlighten the public in regard to the need of drastic legislation and regulation concerning them.

It would hardly seem necessary to comment upon the influence of density of population upon mortality, so evident is it to anybody who has given it the slightest attention. It is not merely the crowding which induces morbidity and mortality, it is the un-sanitary conditions, bad air and what is almost inseparable from them, ignorance, immorality, intemperance and poverty.

Causes of Death.—These are usually considered from the standpoints of diseases and injuries, but there are many deaths which do not seem to be attributable either to disease or injury, as in the case of those who die in extreme old age, without pain, without sickness or injury, with nothing but a sudden stopping of the machinery, like the running down of a clock.

The classification and record of diseases and injuries as causes of death is very important and is becoming more and more elaborated by boards of health, throughout the country. In preparing statistical tables the causes of death are noted as a ratio of mortality from all causes, or as a definite proportion of the living population.

In census bulletin 109, which has already been referred to, the following rate of mortality is given, from 20 causes, in the order in which the relative number of deaths occurred: (1) Tuberculosis, (2) Organic Diseases of the Heart, (3) Diarrhoea and Enteritis (at all ages), (4) Pneumonia (lobar and undefined), (5) Acute Nephritis, (6) Accidents, (7) Cancer and other Malignant Tumors, (8) Cerebral Hemorrhage, (9) Broncho-pneumonia, (10) Premature Birth, (11) Congenital Deafness, (12) Old Age, (13) Typhoid Fever, (14) Bronchitis, (15) Diseases of the Arteries, (16) Diphtheria and Group, (17) Suicide, (18) The Puerperal State, (19) Other Diseases of the Stomach excepting Cancer, (20) Diabetes. This table is not very complete, but it may give to the public at large a general idea of the relative mortality from these particular causes.

Climate and temperature have much to do with the death rate. Thus it has long been observed that the lowest mortality is that which occurs in the beautiful month of June, while the highest is in blistering March, when so many people, especially among the aged, are enticed as the result of the severities of the winter.

Disease.—An important part of the statistics of boards of health is the registration of infectious disease. Beginning, as it did years ago, with the registration of cholera, quickly followed by the registration of the diseases which are known as Zymotic, including those which are so common during childhood, measles, mumps, scarlet fever, diphtheria, whooping cough and chicken pox.

The necessity for enforcing the law in regard to reporting and recording these diseases is quite as great as the necessity for a rigid quarantine. Personal feeling or prejudice should play no part in a matter like this which has so great an influence on the health and well-being of the entire community.

Public Health Nursing.—This is an occupation but recently established. It means that the trained nurse goes into the homes of the poor, the ignorant and the dirty where vital statistics of importance are constantly available, and statistics also which have a decided bearing upon the welfare of the entire community. It would seem especially desirable that those who are engaged in this work should have them blanks for the collection of such important data. They could certainly gather many important facts which otherwise would be lost, including legitimate and
Illegitimate births, infectious diseases, remained on account of birth, deaths especially among infants and stillbirths. Both in large and small cities and villages where this service has been established should this plan be carried out. It would be a great assistance to doctors and in many instances would provide the necessary correction for their defective returns.

Life Tables. Life tables are prepared for the purpose of estimating the probabilities of life and death. They are of importance in all interests in which it is necessary to forecast the future of large numbers of people for commercial or other purposes. They are indispensable for life insurance companies since they enable them to fix their insurance rates upon a basis which has been found to be sufficiently accurate for business success, during a long series of years, and with constant observation and study.

In constructing a life table the factors which are necessary are the population, the age and sex distribution, the returns of death for a year or a series of years, arranged according to sex and age at death, and certain mathematical formulae.

These tables, together with certain necessary corrections, permit the determination of the following propositions: (1) The mean lifetime. This is the sum of the ages at death, in a given community, divided by the number of deaths. It becomes reliable only when the constitution of the population is uniform and the observations are carried over a long period. (2) The probable duration of life. This is the age at which one-half of any number of children who have been born will have died, so that they will have an equal chance of dying before and after that age. It is also called the equation of life. (3) The mean duration of life. This is the probable duration of life from the date of birth. (4) The expectation of life, or the mean after-lifetime. This is the average of years which an individual of any given age will live, as shown by a life table.

Andrew F. Curnier, M.D., Associate Surgeon, New York Woman's Hospital.

Vitascope. See Biograph.

Vitebsk, Béé-téébék, West Russia, (1) the capital of a province of the same name, on both sides of the Dvina, 70 miles north-west of Smolensk, and 380 miles south of Petrograd.

It has more than 30 churches, including six Roman Catholic, two synagogues, an old palace, a theatre, a gymnasium and a hospital, manufactures of mead and leather, and an active transit trade. Pop. (1918 est.) 112,000. (2) A western province surrounded by Pskov, Smolensk, Mogilev, Minsk, Vilna, Kovno, Courland and Livonia; area, 16,983 square miles. The surface is in general hilly; in the depressions are numerous marshes and more than 2,500 lakes, of which the largest are Luhahan, Rasno, Nevel, Sebehe and Osva. The chief rivers are the Dvina, Mesha, Kasplja, Ulla, Drissa and Evst. The soil is far from fertile, and the harvests, except under the most favorable conditions, are insufficient for the wants of the population. The principal occupations are agriculture, cattle rearing, hunting and fishing, besides tanning, weaving, and the manufacture of brandy and tobacco. Flax, flaxseed, hides, building timber and fancy wares are exported. Pop. 2,000,000.

Vitelius, vi-tel'-i-üs, Anius, Roman emperor: b. Rome, 24 Sept. 15 a.d.; d. there, 22 Dec. 69 A.D. He gained the favor of Tiberius, Caligula, Claudius and Nero in turn, though he was possessed of neither ability nor ambition, being a man of profligate character and a glutton. In 68 he was sent by Galba to command the legions in Germany, was proclaimed emperor in January 69 by his troops, who murdered Galba, and in July 69 he entered Rome as emperor. He was noted for gluttony and other excesses, spending enormous sums for these purposes, and made no preparation to meet the forces of Vespasian, who had been proclaimed emperor by the troops in the East and was advancing upon Rome. His army proved indifferent to his fate, he was dragged from the palace by a common soldier, and put to death in the Forum.

Vitellos (Latin vitellus), the yolk of an egg. In the domestic fowl the egg yolk consists of casein (forming 14 per cent), albumen (about 3 per cent), fats, some of which contain phosphorus (about 30 per cent), a little water-soluble and mineral constituents (about 1.5 per cent), in which there is great preponderance of potassium compounds and phosphates. Of the pigments of the yolk we know only that there is both a yellow and red pigment, and that one of them at least contains iron. As a food, the yolk is one of the most highly concentrated forms of nourishment. In pharmacy it is employed for administering substances insoluble in water (e.g. the oils and resins in form of emulsions): See Ecce.

Viterbo, vé-tér-bó, Italy, an episcopal city in a beautiful and fertile valley in the province of Rome, 42 miles northwest of the city of Rome. The chief edifices are a Gothic cathedral containing the tombs of four popes, and numerous fine paintings; an ancient and dilapidated episcopal palace; the Palazzo Publico, etc. The trade is chiefly in sulphur and iron. About two miles from the city are the celebrated sulphur baths of Viterbo which was the chief town of the imperial possessions of the Countess Matilda, which were given by her to the popes, and formed part of the patrimony of Saint Peter. Pop. about 20,000. There are manufactories of paper, playing cards, leather and textiles.
VITET, vē′ta, Ludovic, French author; b. Paris, 18 Oct. 1802; d. there, 5 June 1873. He became a journalist and littératus and in 1830-51 also held various posts in the French civil service. From 1871 he was representative of Seine-Inférieure in the National Assembly, being elected vice-president of the assembly in Feb. 1871. In 1845 he was selected to the Acad. He published four dramatic poems dealing with French history, 'Les Barricades' (1829); 'Les États et le peuple' (1837); 'La Mort de Henri III' (1829); and 'La Ligue' (1844). But his chief works are in prose, and largely historical in character. Among them are 'Fragment et Mélanges' (1846); 'Essais Historiques et Littéraires' (1853); 'Études sur l'histoire et l'art' (1864); 'Études sur le Siège de Paris' (1871); 'Études Philosophiques et Littéraires' (1874); and 'Le Comte D'Uchateau' (1875). Consult the notice by Guizot in the posthumous 'Études Philosophiques et Littéraires' (1874).

VITEX, a genus of trees or shrubs belonging to the Verbenaee and widely distributed in warm climates. The leaves are opposite and are usually palmately compound with three to seven leaflets. The flowers are of medium size, with a short tube and oblique, five-lobed limb, which is sometimes slightly bilobed. They are arranged in more or less dense, branched cymes and are purple, blue, white or yellowish. The handsome, deciduous shrub, Vitex agnus-castus, native to the shores of the Mediterranean, has many popular names, such as Abraham's balm, or monk's pepper-tree, but is particularly known as the chastetree, or agnus-castus, from its supposed virtues in the way of dispelling love and preserving virtue. Its leaves are aromatic, its sap is said to be poisonous and it is much cultivated on account of the paniculate cymes of bright, bluish-purple flowers; it is not hardy, however, north of Philadelphia.

Several species of Vitex produce valuable wood, as, for instance, the lignum-vite of Queensland (V. lignum-vite) and the puriri, or New Zealand tea (V. littoralis). This last is a robust tree, sometimes five feet in diameter, yielding short lengths, often curved, of excellent durable timber, suitable for shipbuilding and for other purposes, and considered to be imperishable in water. The flowers on its spreading branches are nearly an inch long and are hairy and dull-red in color. V. cubensis, the evergreen, and V. umbrosa, of the West Indies, are known respectively as the tree-vitex and as the boxwood or fiddle-wood. V. inofolius is known in India as a wild pepper-tree and yields a sweet, greenish medicinal oil. The aromatic leaves of V. negundo, of the same country, are believed to alleviate headache, and a vapor bath is prepared from them for the benefit of fever and rheumatism; while its ashes are largely employed as an alkali in dyeing.

VITICULTURE, or VINE-GROWING. The vine is any climbing plant, especially if shrubby, as the hop-vine, the vines of melons; but the name particularly belongs to a plant of the genus Vitis of the natural order Vitaceae, having pentameric opening flowers (five-toothed calyx, five petals, five stamens), and the petals united into a kind of hood, and deciduous. The most important species is the grapevine (Vitis vinifera), from the fruit of which wine and raisins are made. Until the ravages of the Phylloxera made it important to secure a more vigorous stock, this was the only species planted, to any extent in Europe. Owing either to inherent weakness of the plant or to lack of suitable climatic conditions, varieties of this species do not thrive in the United States except in California and possibly a limited area in the South. The grapevine has large, shallow, toothed, and more or less hairy leaves. The stems are numerous and branching, very long, and of rapid growth, with many thorny joints, the outer bark readily splitting and peeling off, the woody tissue abounding with vessels of large size, from which, at the seasons of active vegetation, if the branch is wounded or cut across, the sap pours in prodigious quantity. The fruit-stalks, much branched, are opposite to the upper leaves, or in their stead are tendrils. The flowers are small, greenish white, and fragrant. The fruit is a round or oval berry, two-celled and four-seeded, varying much in size and color—in the small Corinth or currant grape, about one-fourth of an inch in diameter, in the largest varieties, more than half an inch; green, yellow, red, purple and sometimes variegated, but the color is entirely in the outer skin, the juice being always colorless, and while the pulp of the grape is wholesome, nourishing, and gently laxative, the skin is astringent and indigestible. Some of the ovoids are often abortive, or even all of them in the fruit of old vines of some varieties, e.g., the seedless Ascalon or Sultane raisins. The vine attains large size, the stem being sometimes 18 inches in diameter (a vine in California is said to have a diameter of 36 inches), so that the wood, which is very hard and durable, has been used for making furniture, statues, etc. It attains very great age, continuing fruitful for at least 300 or 400 years.

The grape is one of the most valuable of fruits, not only for its use in the manufacture of wine, and as the source from which brandy, vinegar and tincture of wine are obtained, but because, both in a fresh and dried state, it forms not a mere article of luxury, but a great part of the food of the inhabitants of some countries. Dried grapes, under the names raisins and currants, are a commodity of the highest value of commerce. Fresh grapes are commonly eaten with bread in Syria, and some other countries in which they abound. The usefulness of some varieties of the grape is increased by its ability to keep fresh for many weeks if stored in a cool airy place. The number of varieties described in works on the culture of the grape and in the catalogues of nurserymen is already among the thousands, and many new kinds, obtained from seed and by hybridization, are introduced every year. Under the name Ampelography (Gr. amfelo, a vine), this subject has been elevated by German writers almost to the rank of a science.

It is doubted of what country the grapevine is a native, nor is it known what time—certainly very remote—its cultivation was first introduced into southern Europe. It is now found wild in parts of Europe, but is rather naturalized than truly native. It seems probable that it is indigenous in the Zilly countries...
south of the Caspian Sea, where it is very abundant and luxuriant, climbing to the tops of the loftiest trees and producing large bunches of delicious fruit.

The cultivation of the grape and the making of wine are of most remote antiquity, as appears from the Scripture history of Noah and from many passages of the most ancient authors. The mythological fable of the marches of Bacchus relates to the extension of the culture of the vine from Asia into Europe. The earliest records of the manner of cultivating the vine are by the Roman authors Virgil and Columella. The wine was introduced into southern France probably as early as into Italy; it is said to have been brought to Marseilles by the Phœcians, about B.C. 600, and its cultivation was early coextensive with civilization in all the countries near the Mediterranean. In Italy, so much of the land was occupied by vineyards that Emperor Domitian, fearing a scarcity of corn, issued a restrictive or prohibitory edict, A.D. 81, which continued long in force, through fear that the abundance of fine wine might tempt the barbarians of the north to invade the country. The wine was introduced into Gaul about the B.C. 3rd century. Augustus preferred the Rhetian wine to all others. The first vineyards on the Rhine and Moselle were planted by the Emperor Probus (A.D. 281). Under the Merovingsians, the culture of the vine extended greatly in France and Germany. Charlemagne derived considerable revenue from the vineyards even of the northern parts of his empire. The Huns who remained in a number of settlements on the Rhine after the expedition of Attila into Gaul in 451, brought thither from Pannonia the arts of cultivating the grape and of making wine, and Hunnish grapes and Hunnish wine were long in high repute. In the Middle Ages, the monks were the first to plant vineyards and to make wine in many parts of Europe.

The cultivation of the vine was introduced into England by the Romans. At the time of the Norman Conquest there seem to have been vineyards in southern and southwestern England. They seem to have disappeared temporarily, but successful attempts were occasionally made to re-establish them; and one at Arundel Castle in Sussex yielded about the middle of the 18th century large quantities of wine. Of late years, the cultivation of the vine has much increased in southern England, in gardens, on the walls of suburban villas and of cottages, but chiefly for the fresh fruit, though wine of moderately good quality is made in small quantities for domestic use.

The vine is a hardy plant, so far as endurance of severe winter frosts is concerned; but it requires for the ripening of its wood, as well as of its fruit, a considerable summer heat continued for several months. A very much temperate climate is unsuitable. It produces abundant fruit in warm climates, such as India; but the juice passes too rapidly into acetous fermentation to be used for making wine.

In Europe the cultivation of the vine forms an important industry, as far north as Coblenz on the Rhine; but in some countries, particularly Greece and the Ionian Islands, raisins are the chief part of the produce of the vineyards.

The cultivation of the vine was early introduced by the Spanish and Portuguese into the Azores, the Madeira and Canary Isles and America. The first vines were carried to the Cape of Good Hope by the Dutch in 1650; but while the vines of Madeira and those of the limited district of Constantia at the Cape of Good Hope have long had high celebrity, and those of Canary and Teneriffe have been imported in considerable quantities into Europe, it is only of late that much attention has been given to the cultivation of the grape in the other parts of South Africa.

The early settlers of the northern portion of the United States found grapes growing wild, but for a long time little attention was given to their cultivation. From about 1620 in Virginia and 1653 in Pennsylvania, many efforts, which resulted in failure, were made to grow European varieties; but about 1771 the cultivation of these sorts was successfully established on the Pacific Coast. With two exceptions the American varieties now under cultivation have been originated since 1820, and as late as 1850 there were only six or eight varieties supposed suitable for general cultivation. The first marked success was with the Catawba, which came into notice about 1820, and which, though lacking in hardness, was extensively planted. Nearly all the varieties now grown have been originated since 1860.

Besides V. vinifera, produced in California, the species of grapes grown in the United States are as follows: V. labrusca, the northern Fox grape, native of the Alleghany Mountain region and found from Canada to South Carolina — the source of more cultivated varieties than any other native species; among these are the Catawba, Concord, Hartford, Prolific and other popular sorts: the foxy flavor of the original largely disappears when varieties are brought under cultivation; V. riparia (with which V. cordifolia is often confounded), the Frost grape, from which we have the Elvira, Clinton and Taylor; V. aestivalis, the Summer grape, from which have come the Cynthia, Herbetmont and Norton's Virginia; V. labrusca, the northern Fox grape, native of the Alleghany grape and Sugar grape, or V. copiosa, the southern Fox grape, from which have come the several varieties of the Scuppernong. A large number of hybrid varieties, many of great value, have been originated. Some varieties succeed over a large area and under widely differing conditions of soil and climate; but many sorts valuable in certain circumscribed localities do not thrive elsewhere. There is, however, little difficulty in finding kinds of good quality and a sufficient degree of hardness for any portion of the United States. The following are among the most popular varieties: Black Grapes — Concord, Hartford, Prolific, Moore's Early, Wilder and Worden; Red Grapes — Agawam, Brighton, Catawba, Delaware, Salem and Vergennes; White Grapes — Diamond, Lady, Martha and Niagara; Foreign Grapes — Black Hamburg, Flaming Tokay and White Frontignan.

As seedlings do not reproduce the parent variety, but often differ widely from it, they are grown only to procure new sorts or to obtain hardy stocks on which to graft the more delicate European kinds. Propagation is effected by cleft-grafting (see GRAFTING), layers or cuttings. Grafting is to be done just before
cold weather sets in, and at a few inches below
the surface of the ground. The soil is to be
pressed around the graft to its upper bud, and
a small inverted flower-pot placed over it so
that the scion may not be loosened when the soil
which must be piled around and upon it
in sufficient quantities to prevent freezing, is
removed in the spring. This method often
fails, but when successful it secures vigorous
growth and very early fruitage. It is valuable
particularly for testing any new sorts and for using
strong bearing vines which yield a poor
quality of fruit. In Europe whip-grafting of
varieties of V. vinifera upon roots or cuttings
of American sorts — principally varieties of
Vitis riparia, which are not liable to injury by
the Phylloxera — is very extensively practised.
In America large quantities of vines are grown
from layers. In spring the cane from which
plants are to be grown is fastened to the bot-
tom of a trench six inches deep. A new plant
soon springs from each bud. When these plants
have made a growth of eight to 10 inches the
trench is carefully filled with soil. In autumn
the cane is cut between the shoots and the latter
can be transplanted. Somewhat inferior plants
can be obtained by laying off the shoots of the same season's growth and covering at
once with soil. The most common method of
propagation of the vine is by cuttings. These
are made in the fall from well-ripened wood
of the season's growth; cut into pieces six to
eight inches long (each having two or three
buds), cut off smooth close to the lower bud
and one inch above the upper one. In the
spring these cuttings are planted, three inches
apart, in a trench with a sloping side, against
which they are placed. The soil must be firmly
packed in the lower portion of the trench, which
is then to be filled more loosely as high as the
upper bed of the cutting, which should be a
little below the surface of the ground. After
the shoots are a few inches high the trench is
to be filled completely. The Delaware and a
few other varieties will not grow well in this
way, but can be started from cuttings only
two or three inches long, each having but one
bud. These cuttings are rooted in sand by the
aid of artificial heat.

Though the vine will grow in a great variety
of soils it thrives best in soil rather light and
dry. A granite or limestone formation is de-
sirable; and gently-sloping hillsides, especially
if they face the south or southwest, are more
favorable than valleys or level fields. In a wet
location the land should be thoroughly under-
drained. Deep plowing is essential, and sub-
soiling is desirable. Moderate quantities of
well-rotted stable manure should be incorpo-
rated with the soil and ground bones and fer-
tilizers rich in potash will tend to promote
vigorous and healthy growth of the vines.
Planting may be either in spring or in fall.
For the fruit garden many growers prefer vines
two years old, but where planting is on an
extensive scale those one year old are con-
sidered best. The distance apart of the vines
varies with the character of the variety, from
six to eight feet for the small-grape sort or
10 by 10 feet for the more vigorous kinds.
At the time of planting the tops of the vines should
be cut back to two or three buds, and it is often
desirable to shorten the roots. Planting should
be carefully done, and during the first two
seasons low growing crops, as beans or po-
tatoes, may be grown between the rows; but
fertilizers must be liberally used or the other
plants will retard the growth of the vines.
Whether any other crop is grown or not, suffi-
cient cultivation must be given to keep the
soil mellow and prevent growth of weeds and
grass. In the fall of the first year the top of
the vine should be cut to a single cane with
three buds. The second season this cane should
be tied to a stake at least feet high, the lateral
shoots pinched off when about five inches long,
also the end of the vine when the top of the
stake is reached. The third season, a trellis upon
which the vines can be trained, is requisite: this
may be made of posts, reaching six feet above
ground, 20 feet apart, on which are fastened
four lines of galvanized wire. The fruit borne
this season will be on branches from the main
stem; but in later years the laterals must be cut
back to three buds, after the leaves have fallen
in autumn, from which will grow the new wood
on which fruit will be borne the next season.
Summer pruning consists in pinching back the
young shoots on which fruit has started, but
which are not intended for bearing canes the
next year. In July, shoots made the preceding
year but not bearing fruit should be removed.
It is important to leave foliage enough to shade
the fruit and fully to elaborate the sap. If the vine
shows tendency to overbear, the fruit should be
thinned when it is quite small, care being taken
to remove from each small cluster one or two
perfect clusters. Girdling the vine consists in
removing from the bearing canes, near the base,
a ring of bark three-sixteenths to three-eighths
of an inch wide. It is done, at the north, early in
July, and hastens the ripening of the fruit about
10 days. The fruit is rendered somewhat softer,
and seems more liable to crack; but the size is
considerably increased and the flavor is
fully maintained. It is to be practised only on
canes which are to be removed the next season.
If the best quality is to be secured, the fruit
must remain on the vine till it is fully ripe.
When the fruit is gathered, the stems should be
cut rather than broken. Only the varieties
with thick skins can be safely sent to distant
markets, and shipments should be sent in
baskets or boxes of thoroughly seasoned wood.
In cold regions it is necessary to give the vine
protection during the winter. Some varieties
require less than others, but where the cold is
severe it is well to at least lay the vines on the
ground at the approach of winter. Evergreen
boughs are useful for covering. Where these
cannot be had, two or three inches of soil may
be thrown over the tops. Gravel or sand an-
swers better for covering than clay or other
compact soils.

The principal diseases of the American vine
are mildew and black-rot. The causes of mil-
dew are supposed to be certain peculiar condi-
tions of the atmosphere, neglect of pruning,
lack of mineral elements in the soil, and lack
of constitutional vigor of the plant. Dusting
the affected foliage every two weeks with flow-
ers of sulphur, when the leaves are wet, is a
common remedy. To prevent the leaf spot the
leaves may be sprayed every 10 days, during
the growing season, with the Bordeaux mixture
as used for preventing the potato-rot. A pre-
ventive of both mildew and black-rot, which is
rapidly growing in favor, is the use of paper
bags, which are put over the clusters when the
fruit is quite small, and fastened around the stems with common pins: the two-pound size is generally used. This method is useful also in preventing injury to the fruit by bees and other insects. The chief enemy of the European vine-grower is the Phyloxera (v.q.v.), which has caused immense losses. The remedies consist in submerging the ground with water seven or eight weeks each winter, or the application of chemical insecticides, e.g., sulphur, carbonate of potash, or bisulphide of carbon, in sufficient quantities to reach the infested roots; but these are far too costly for general use. Preventive measures are the planting in soil containing 60 per cent of sand (an expensive method which can be employed in but few localities), and the grafting of the European varieties on hardy American sorts. The principal enemy of the vine-grower in this country is the rose-hug, which often proves very destructive by eating the flowers. Hand-picking and dusting with pyrethrum powder are the leading remedies. The juice of ripe grapes contains considerable grape-sugar (see SUGAR), small quantities of a glutinous, substance, and of extractive, bitartrate of potash, tartrate of lime, a little mannite, and other ingredients, suspended or dissolved in water. The rapidity with which it passes into a state of fermentation after being expressed from the fruit is remarkable.

For the making of wine, the wine-trade, the qualities and uses of wines, the different kinds of wine, etc., see Wine and Wine-Making. Concerning the other commercial products of the grape, see BRANDY; VINEGAR; TARTRIC ACID; RAISIN; CURRANT.

VITIOLA, vë-too-rë-ä, Spain, an episcopal see, capital of the province of Alava, situated on a height overlooking an extensive plain watered by the Zadorra, 30 miles south of Bilbao. The old parts of the town are poorly built, but the new town is well laid out in spacious streets and squares and is electrically lighted. The principal buildings and establishments are the 12th century fortress-cathedral, three other churches, one of them adorned with a fine altar-piece by Velasquez, a handsome modern palace of deputes, an academy of music, the university, and a museum. The manufactures are furniture, candles and articles in leather. There is a brisk trade, especially in steel and iron, grain and wine, as well as in the manufactures mentioned. It was the scene of two battles, the first fought in 1367, in which the Black Prince gained a victory for Pedro the Cruel; the second on 21 June 1813, in which the Duke of Wellington concluded his series of great Peninsular victories, defeating the French under King Joseph and Marshal Jourdan. Pop. (1918 est.) 35,000.

VITREOUS ROCKS, volcanic rocks with a glassy texture, due to rapid cooling which prevented the crystallization of the magma. They are comparable to the glassy slag of furnaces. They break with a conchoidal fracture and are dark undercrossed nicks. The chief volcanic glasses are obsidian, perlite and pitchstone (q.v.). Pumice is a cellular variety which is represented by the frothy slag of blast furnaces.

VITRIFIED FORTS, the name given to certain prehistoric hill fortresses principally found in Scotland and formed of stones heaped together. The materials of which they are constructed are perfectly or partially vitrified or rendered glasslike by the action of heat. It is now generally believed that the vitrification was intentional, being effected by means of piled-up fuel.

VITRINGA, Campegius, eminent Dutch divine and commentator b. at Leeuwarden, in Friesland, 16 May 1659; d. 31 March 1722. He studied at Franeker and Leyden, at which last place he received the degree D.D. in his 20th year. In 1681 he was appointed professor of Oriental languages; and two years later received the chair of theology in the University of Franeker, where he died. Vitringa is regarded as one of the most learned and laborious divines of his age, and has left many excellent and erudite works, chiefly commentaries on portions of the Scriptures, nearly all in Latin; among his works are 'Commentarius in Iesuam'; 'Anacrisis Apocalypses Johannis Apostoli'; 'Commentarius in Jeremian'; 'Commentarius in Zechariam'; 'Vetus Synagoga'; 'Disserationes Sacrae'; 'Typus Theologiae Propheticae', etc.

VITRIL, a common name for ordinary commercial sulphuric acid and for certain salts derived from it. Ordinary concentrated sulphuric acid is more specifically known as oil of vitriol; sulphate of iron or copperas is green vitriol; sulphate of copper or blue stone is blue vitriol; sulphate of zinc, white vitriol. A dilute sweet aromatic solution of pure sulphuric acid is known in medicine as elixir of vitriol.

VITRILINE, Oil of, or VITRILIC ACID, a name once applied to sulphuric acid (q.v.).

VITRUVIUS, Pollio, vl-tro-o-vü-s pöl-l-i, Marcus, Roman architect and military engineer, supposed to have flourished in the time of Julius Caesar and Augustus, but of whose parentage and place of nativity no certain knowledge is obtainable. The most probable opinion is, that he was born at Formia, a city of Campania, now called Mola di Gaeta. The Veronese, however, claim him as a fellow citizen and have erected a monument to his memory. He appears to have been liberally educated; and that he traveled for information and improvement we learn from his writings. The only public edifice which he mentions as constructed from his designs is a basilica at Pannon Fortuna (now Fano) in Umbria. He wrote at an advanced age his work 'De Architectura Libri Decem,' dedicated to the emperor (without doubt, Augustus, although he is not named). This treatise, valuable as a compendium of those of numerous Greek architects, was first printed at Rome about 1480; and among modern editions, the most valuable are those of Schneider (1808); Stratton (1825-30); and Rose and Müller-Streußing (1867), with index by Nohl (1876). An English translation, with commentary by William Newton, appeared in 1771, republished 1791, and a new translation by W. Wilkins, with an Introduction, containing an Historical View of the Rise and Progress of Architecture among the Greeks, in 1812-17. This was reprinted in Cambridge in 1914.

VITTORIA COLONNA, vë-to rê-ä kö-lo'n-na. See COLONNA VITTORIA.
VITTORIO, vit-tö-ré-ö, Italy, a city of the province of Treviso, formed in 1879 by the incorporation of the episcopal see of Ceneda and the town of Serravalle, situated at the entrance of Santa Croce Valley about 22 miles north of Treviso. The chief features are an ancient citadel and a cathedral. Mineral springs make Vittorio a favorite health resort. It has silk industries and manufactures of textiles, paper, etc. Pop. 12,500.

VITUS, Saint, a name which appears in the martyrlogies as belonging to a certain Christian who suffered under Diocletian. He owed his conversion to the teaching of a pious nurse Crescentia and her husband, Modestus. His festival is set in the Roman calendar on 15 June. As a saint of succor he is invoked for protection against sudden death, and against many diseases and distempers, notably chorea, which is commonly known as Saint Vitus's dance.

VIVANDIÈRE, vee-vahn-deh-ar, in the French army, a girl or woman whose services are attached. The dress of the vivandières is generally a modification of that of the regiment to which they are attached.

VIVARINI, ve-vah-rehn-eh, Antonio, styled also Antonio da Murano, Italian painter: b. Murano about 1410; d. about 1470. He painted between 1440 and 1446 with Johannes Alemannus, and their work is signed 'Joannes et Antonius de Muriano fecerunt.' After 1469 Antonio painted with his brother Bartolommeo, and an altar-piece designed by them is in the Pinacoteca at Bologna. One of Antonio's finest works is an altar-piece, dated 1446, and now in the Venetian Academy. At the Lateran in Rome is an altar-piece, the work of Antonio alone, and the Berlin Museum contains his 'Adoration of the Kings.'

VIVARINI, Bartolommeo, bar-toh-loh-mah-oh, Italian painter, brother of Antonio Vivarini: b. Murano; d. after 1499, the date of his latest picture. He painted religious pictures in tempera with brilliancy and power equaling the effects of oil, and his 'Saint Augustine Enthroned' (in the gallery of the Academy of Venice), is a majestic figure distinguished by grandeur of conception and powerful execution. There is a 'Madonna and Child' of his in the London National Gallery, and his 'Death of the Virgin' was sold in London for $1,100 in 1886.

VIVERRIDE, the family of the civets (q.v.).

VIVIAN, iv-yi-ehn, Herbert, English author: b. England, 3 April 1865. He was graduated from Trinity College, Cambridge, in 1886, has traveled extensively, was editor of the Whirlwind in 1889, special correspondent of the London Morning Post in 1898-99, of the Daily Express in 1899-1900, and in 1901 revived the Rambler. He has published 'Servia, the Potter King's Paradise,' 'Tunisia and Modern Barbary Pirates,' 'Abyssinia,' 'The Servian Tragedy,' 'Italy at War,' etc.

VIVIAN, Thomas Jodric, American author: b. Cornwall, England, 3 Aug. 1855. He was educated in France, came to the United States in 1868 and for a time in teaching, and since 1886 has been engaged in editorial work. His writings include 'Seven Smiles and a Few Fibs,' 'Everything about Our New Possessions,' 'Luther Strong,' translation from Catulle Mendes 'The Fairy Spinning-wheel,' etc.

VIVIAN GREY, a novel by Benjamin Disraeli, published in 1828-29. It was his earliest essay in fiction, and despite serious faults of construction and character delineation, achieved great success, its unusual representation of the hero as a man-of-the-world no doubt having a great deal to do with its popularity.

VIVIANI, vee-vye-ee-nay, René, French statesman: b. Sidi-bel-Abbes, Algeria, 8 Nov. 1863. He was an associate worker on the Petite République, becoming Socialist Deputy for Paris. In 1893 he was appointed Minister of Agriculture in the Clémenceau Cabinet. With the creation of the Ministry of Labor by M. Clémenceau, M. Viviani received the post. With the construction of the Briand Cabinet he was also a member. June 14, 1914 he was elected Prime Minister of the 5th ministry of the Republic taking the portfolio of Minister of Foreign Affairs, which (Aug. 29) he passed over to M. Théophile Delcassé.

VIVIANITE, a mineral having the composition of a hydrous phosphate of ferrous iron, Fe₂(PO₄)₂·8H₂O; sometimes called Prussian blue. It often occurs in globular masses showing stellate-foliated structure, also earthy, or as an incrustation. Distinct crystals are comparatively rare. They are monoclinic prisms, usually transparent, and of metallic pearly to vitreous lustre. They exhibit strong pleochroism and green, steel-blue to indigo-blue colors. The cleavage parallel to theclinic pinacoid is highly developed. The hardness of vivianite is 1.5 to 2 and its specific gravity is about 2.63. It is often associated with pyrite, pyrrhotite or limonite and is also found in the clay beds, peat bogs and the green-sand formations. Many curious occurrences are noted in mineralogical books. The original locality in Cornwall, England, has produced many fine specimens, also Australia, Allentown and Mullica Hill, N. J.

VIVIEN DE SAINT-MARTIN, ve-vi-an de san mar-tahn, Louis, French geographer and author: b. Saint-Martin-de-Fontenoy, France, 17 May 1802; d. Paris, 3 Jan. 1897. He early devoted himself to geography, his first work 'Carte Electorale' appearing in 1823. He founded and conducted in 1825-30 Bibliomappe, a geographical journal, and subsequently was engaged for many years in various labors of translation and editing. He was one of the founders of the Paris Geographical Society, and in 1863-76 he edited the 'Année géographique,' a post which he resigned to assume direction of the 'Nouveau Dictionnaire de géographie universelle.' His works include 'Description de l'Asie Mineure' (2 vols., 1845); 'Etude sur la géographie grecque et latine de l'Inde' (1848-60); 'Atlas universel de géographie moderne, ancienne, et du moyen age' (1877), etc.

VIVIPAROUS ANIMALS, those animals which bring forth their young alive; distinguished from oviparous eggs. Properly speaking, the name should be limited to that form of reproduction seen in Mammalia alone, in which the young during
VIVISECTION—VIZETELLY

the whole course of their development are contained within the parent body, and bear to the parent the same relation as the fruit of the same tree does to the tree itself. Thus in Mammalia the young animal is contained within a special cavity, the uterus or womb, and is nourished by the blood of the parent during its development, while only at birth does it pass from the body of the parent to the outer world. Viviparous is sometimes applied to botany to plants that germinate from a seed or bud while retained on the parent plant. See MANGROVE; ANATOMY, Conduct of Professional.

VIVISECTION, the dissection of an animal while alive; physiological experiments on living animals. It is practised with the view (1) of increasing physiological knowledge; (2) of confirming known facts; (3) of giving dexterity in operative surgery. Strictly, vivisection implies only cutting, but the term is now extended to include all kinds of experiments on living animals. The practice of vivisection can be traced back almost to the earliest periods of medicine and surgery, and was in vogue in the ancient school. In recent years much opposition has been excited against it, and those adverse to the practice, the so-called antivivisectionists, have endeavored to restrict or wholly abolish vivisection by harsh measures. It is alleged that animal experimenters practise much needless cruelty, but even apart from this, some have taken the extreme view that any experiments on living animals, with the object of advancing medical and surgical knowledge, are, on moral grounds, unjustifiable. Those who advocate vivisection point to the gains which have accrued to physiology, and also directly to the healing art, by experiments on living animals. The circulation of the blood, and the existence of the lacteals, were thus established; and nearly all our present knowledge of the functions of the nervous system has been thus obtained, and could never have been afforded by the most minute anatomical research. In consequence of the knowledge thus obtained we no longer divide a motor nerve, and thus paralyze the face, in the hope of relieving tic douloureux, while we now see our way to a more rational mode of treating epilepsy, various obscure forms of paralysis, etc. Without vivisection we could never have clearly understood the causes of the sounds of the heart, and without the knowledge of these the stethoscope would have been useless in the diagnosis of cardiac diseases; nor should we without vivisection have known anything of the true nature of many mysterious diseases. The Hunterian treatment of aneurism by ligation, which has saved hundreds of human lives, was worked out by experiments on living animals, and so have been the improved methods of the transfusion of blood. The study of anaesthetics, which, after prolonged investigation, led to the introduction of chloroform, was unquestionably accompanied by the suffocation of many animals; but the vast amount of suffering spared to humanity by the general introduction of anaesthetics into surgery and midwifery practice more than counterbalances the pain inflicted in the experiments. The discovery of the healing power of diphtheria antitoxin, whereby countless lives of infants and children suffering from this disease have been cured, is a direct outcome of animal experiments. If vivisection were abolished the manufacture of antitoxin would perforce cease. The lower animals themselves have shared in the benefit, for (to mention only one instance) the discovery of the cause of anthrax in sheep made by means of vivisection has resulted in not only saving the lives of vast numbers of these animals (an enormous economic gain), but in preventing the sufferings of sheep attacked by the disease. By experiments on living animals must be sought the solution of such questions as the best means of restoring to life persons apparently drowned; why chloroform sometimes kills, and how those suffering under apparently fatal effects can be best recovered. These and similar considerations lead the advocates of vivisection to the conclusion that experiments on living animals performed—always with care to avoid needless pain—with the object of advancing medical, surgical or toxicological knowledge, and of thereby relieving human and animal suffering, or prolonging human life, are not only justifiable, but are a matter of duty. The Vivisection Act of 1876 regulates and restricts to a certain degree the practice of vivisection in England.

The literature on the subject is extensive. Consult ‘Vivisection,’ 500 prize essays (Boston 1898); pamphlets issued by the Research Bureau of the American Medical Association (Chicago 1909–13); ‘Reports’ of the American Humane Association (Chicago 1895–); ‘Reports’ of the Royal Commission (London 1907–12); Keen, W. W., ‘Animal Experimentation and Medical Progress’ (Boston 1914), the best work on the subject. The American antivivisectionists publish the Journal of Zoöphylly (Philadelphia), the Open Door (New York) and the National Humane Review (Albany).

VIZAGAPATAM, vě-za-ga-pa-tam, India, a town, capital of a district of the same name, in the Madras Presidency, on the Bengal coast, about 180 miles northeast of Masulipatam. It is a military station and has a good harbor, a modern water supply, sanitary garbage, hemp manufactures, and an export trade in rice and sugar. Pop. about 50,000.

VIZCAINO, vě-thा-kě-nŏ, Sebastian, Spanish navigator: b. Huelva, about 1550; d. Acapulco, Mexico, about 1615. After being prominent in Mexico he headed exploring expeditions from Acapulco to Lower California, 1596–97, and in 1602–03 along the California coast to latitude 43°, discovering the bay which he called Monterey, and sent a vessel which appears to have reached the mouth of the Columbia. He also sailed to Manila and Japan, 1611–14, carrying Franciscan missionaries to Japan, and was the earliest to attempt to establish commercial relations between Spain and Japan. His reports of his voyages to California were printed in Forquemada’s ‘Monarquía Indiana’ (1615), and are greater sources of history; his narratives, including that of his voyage to Manila, was included in De Navarrete’s ‘Colección de Viajes y Descubrimientos’ (1625–29).

VIZETELLY, viz-ě-tĕl’l, Edward Henry (‘Bertie Clare’), English journalist and war correspondent, son of H. R. Vizetelly (q.v.):
VIZEBELLY

b. Chiswick, England, 1 Jan. 1847; d. London, 13 April 1903. He was educated at the Imperial Lyceum, Saint Omer, France. At the outbreak of the Franco-Prussian War he became special correspondent for the New York Times and the London Daily News, served as orderly officer on the staff of General Dreyfus at Dijon and at Langres; subsequently he engaged in the Kabylie insurrection of 1871, served in the Russo-Turkish War of 1877-78 and in the Greek insurrection of the latter year. He founded the Cyperus Times in 1880 and the Times of Egypt at Alexandria in 1882. At the bombardment of Alexandria on 11–12 July 1882 he was the only Englishman in the city, and during the firing sent half-hourly dispatches to London. In 1888 he commanded the New York Herald relief expedition sent in search of Stanley in Africa, and met him in East Africa in 1889. He was the author of 'Reminiscences of Basho Baxoul'; 'From Cyprus to Zanzibar, the Warrior Woman'; 'His Highness Edward is a member of the First Central Ontario regiment on active service in France (1918).

VIZEBELLY, Ernest Alfred, English author, translator and war correspondent; Chevalier of the Legion of Honor; France medal of the War of 1870-71; b. 29 Nov. 1853; son of H. R. Vizeelly. He was educated at Lycée impérial Bonaparte, now Condorcet, Paris. During the Franco-German War (1870) he became a newspaper correspondent (youngest on record) and artist for Daily News, Pall Mall Gazette, and Illustrated London News; was in Paris during part of the German siege; passed out, joined the Army of the Loire, attached to Staff of Third Division 21st Army Corps; was in Paris throughout the Commune; continued acting in a journalistic capacity on the Continent until about 1886 he became an editor and reader to Vizeelly and Company, publishers. After the liquidation of that business, consequent upon a prosecution for publishing translations of some of Zola's novels, Mr. Vizeelly reverted to journalism; but in later years prepared or edited English versions of most of Zola's works besides producing 'The Hyperbolæ of English Bibliophiles' edition, 5 vols., 1894); 'The True Story of the Chevalier d'Eon' (1895); 'With Zola in England' (1899); 'Bluebeard, Comoror the Cursed and Gilles de Rais' (1902); 'Emile Zola, Novelist and Reformer' (1904); 'Anarchism, their Creed and Record' (1911); also 'The Scorpion, a romance of Spain' (1894); 'A Path of Thorns, a story of French Life' (1901); 'The Lover's Progress' (1902); 'Le Petit Homme Rousse: The Court of the Troubadours' (1906); 'The Favourites of Henry of Navarre' (1910); 'The Favourites of Louis XIV' (1912); 'Republican France (1870-1912)' (1912); 'My Days of Adventure' (1914); 'My Adventures in the Commune of Paris' (1914); 'In Seven Lands' (1916).

VIZEBELLY, Frank (Francis) Horace, American lexicographer, author, editor, encyclopedist; b. Kensington, London, 2 April 1864, educated in schools of the Christian Brothers, Saint Servan, Normandy (1870); Lycée Baudard ('école couronnée'), Nogent-sur-Marne, France (1871-75); d.o.d Arnold College, Eastbourne, England (1876-80); Litt.D., Oriental University, Washington, D. C.; LL.D., Saint John's College of the University of Maryland. In the fall of 1882 entered the firm of Vizeelly and Company, publishers, where he served as apprentice under George W. Redway. On the withdrawal and dispersal of the business he assumed management of the wholesale and export department—a position he held until February 1891. From 1880 to 1890 he contributed articles on cycling to The Cyclist, Coventry, and Wheeling, London. In 1910 he investigated the conditions prevailing in the detention camps of the Boer prisoners of war, at Bermuda, the only civilian accorded that privilege by the British authorities, and published his report in the leading American and English newspapers. Owing to the prosecution of his father, and the heavy losses entailed thereby, he left the business in the hands of his elder half-brother, Arthur (died April 1916), and sailed for York City, 22 Feb. 1899. He joined the editorial staff of Funk and Wagnalls Company 6 April 1891; assistant editor of the 'Standard Dictionary' (1891-95); associate editor of same, new edition, 1903; managing editor, 1905; managing editor Funk and Wagnalls' 'New Standard Dictionary' (1896); general editor, 1913—; associate editor of the 'Standard Dictionary' abridgments, student edition, 1897; Comprehensive, 1898; Concise, 1901, and Vest Pocket, 1906, and supervising editor of the new editions, 1913-18; office editor of more than 100 miscellaneous publications on English public speaking, medicine, history, social reform, travel, etc.; managing editor 'Columbian Encyclopedia' (40 vols., 1898); revising editor of the 'Cyclopedia of Classified Dates' (1899); contributor to 'Appleton's Annual Encyclopedias'; 'The New International Encyclopedia' (1905); secretary of editorial board and manager editorial department of the 'Jewish Encyclopedia' (12 vols., 1901-05); editor of 'The Lexicographer and the Scholar' (The Literary Digest), 1904-09, 1912—; and editor-in-chief of the Standard Reference Bureau, 1913—; also of departments of pronunciation and typography on the 'New Schaff-Herzog Encyclopedia of Religious Knowledge' (12 vols., 1905-11); editor of Department of Pronunciation of 'Standard Bible Dictionary' (1908-09). Elected Fellow of the Royal Society of Arts, London, 1903; and various other societies. Publications: 'The Preparation of Manuscripts for a Printer'; 'A Desk Book of Errors in English'; 'The Development of the Dictionary of the English Language'; 'Essentials of English Speech and Literature'; 'A Desk Book of 25,000 Words Frequently Mispronounced'; 'A Dictionary of Spelling'; 'The Soldier's Service Dictionary'; 'A Desk Book of Satire, Sarcasm, Cynicism and Irony'; 'English Idioms and Idiotisms'; 'A Desk Book of Prefixes, Suffixes, Bases and Stems,' and many miscellaneous articles and reviews to the periodical press.

VIZEBELLY, Henry Richard, English newspaper proprietor, editor, publisher and
VIZIER—VLADIMIR 159

writer; b. London, 30 July 1820; d. Tilford, near Farnham, England, 1 Jan. 1894. He came of a family of printers and publishers, was educated at Clapham and at Chislehurst and was later apprenticed to a wood-engraver, an art in which he became proficient, his most notable work as an engraver being a series of illustrations drawn by Birger Fosler for Long-fellow's 'Evangeline.' He took a prominent part in founding The Illustrated London News in 1842, and was one of the founders of the Pictorial Times in 1843, a pioneer enterprise in illustrated journalism; published the first English edition of 'Uncle Tom's Cabin' in 1853; established the Illustrated Times in 1855; the Welcome Guest in 1858; and in 1865–66 was correspondent of the Illustrated London News at Paris and at Berlin. He was appointed representative of the British government on wines at the Vienna Exposition in 1873 and at Paris in 1878, and for his labors at the former was created by the Austrian emperor hereditary Chevalier of Franz-Joseph of Austria. In 1880, with the aid of his sons Arthur (1881) and Frank (1882), he established a publishing house in London and engaged in issuing translations of the works of foreign literature. He published Russian and French books and in 1884 began to publish translations of the works of Emile Zola. The literal translations of the works of the novels of the French realist, however, aroused a storm of protest, and in 1888 he was indicted on the charge of publishing obscene libels, and, on the advice of counsel, pleaded guilty and agreed to withdraw the edition of Zola's works. Thereupon he was fined £100 ($500) and required to enter into his own recognizances to be of good behavior for a period of six months. In 1889, in harmony with his understanding of the undertaking given, he decided to issue an expurgated edition of the works of Zola. Notwithstanding the deletion of all the passages to which objection had been raised, he was indicted a second time, and, being then 71 and broken in health, he, following advice of counsel, again pleaded guilty, and was sentenced to three months' imprisonment as a first-class misdemeanor. He occupied the time of arrest and detention in writing his reminiscences to the year 1870. His writings include a series of monographs on wines, entitled 'Wines of the World' (1875); 'Facts about Sherry' (1876); 'Facts about Champagne' (1879); 'Facts about Port and Madeira' (1880); 'The Story of the Diamond Necklace' (2 vols., 1867); 'Berlin under the New Empire' (2 vols., 1879); 'Paris in Peril' (3 vols., 1882); and two volumes of literary reminiscences, 'Glances Back through Seventy Years' (1893), etc.

VIZIER, vi-zë-ér', a title given to high political officers in the Turkish Empire and other Mohammedan states. In Turkey, the title is given to the heads of the various ministerial departments into which the Divan or Ministerial Council is divided. The president of the Divan or Prime Minister is known as Grand Vizier.

VLADIKAVKAZ, vi-lë-dë-këv-käz', Russia, a fortified town in Caucasus, capital of Terek district, situated on an elevated plane at the northern base of the Caucasus, about 90 miles north of Tiflis, with which it is connected by a military road through the Dariel gorge. It is connected by rail with Rostov and with Petrovsk on the Caspian, and is rapidly developing as a commercial centre. Pop. about 79,343.

VLADIMIR I, v'l-dë-mir or v'l-dë-mir, Saint, "the Great," Russian emperor, son of the Grand Duke Staretov; d. Beresnyx, Russia, 15 July 1015. He received the cross from his father in 972, the government of Novgorod, notwithstanding its illegitimacy, and the remainder of the empire was divided between the lawful heirs, Jaropolk and Oleg. Jaropolk killed Oleg in a quarrel in 977, and Vladimir escaped a similar fate only by flight. In 980, Vladimir returned with an army, overthrew and caused the assassination of Jaropolk and became sole ruler of the empire. He then extended his boundaries from the Black Sea to the Baltic, and founded his capital at Kiev. While besieging the Christian city of Cherson in the Crimea he decided to demand the hand of Anna Romanovna, sister of Constantine IX, the Byzantine emperor, in return for a cessation of hostilities. The demand was granted; and after this princess, Vladimir was converted to Christianity. The Greek Church was established in Russia and Vladimir's subjects willingly embraced the new faith. The character of the emperor seems completely changed after his conversion. He built churches and monasteries, abolished capital punishment, and in his private life substituted charity for the former licentiousness. He divided his empire among his 12 sons, and after his death was canonized in the Greek Church, and in 1782 the 'Vladimir Order' was founded by Catherine II. Consult Karamzin, History of Russia' (1816).

VLADIMIR II, Monomachus, Russian emperor, great-grandson of Vladimir I: b. 1052; d. Kiev, Russia, 19 May 1126. Contrary to the Slavonic law, he succeeded to the throne in 1113. He possessed both valor and ability, and under his wise rule, Russia enjoyed a period of great prosperity. He married Gida, daughter of Harold of England, and the famous Valdemar of Denmark was his grandson. He wrote a 'Testament,' which is valuable as a picture of the manners and opinions of the day. Consult Rambeau, 'History of Russia' (1860).

VLADIMIR, Russia, (1) a town, capital of the government of same name, on a lofty and wooded bank above the Klyazma, 105 miles northeast of Moscow. It is one of the oldest towns in Russia; and has a 12th century cathedral, a theological seminary, considerable manufactures and a trade in fruit, particularly cherries. From 1157 to 1328 it was the residence of the Russian grand princes. It was twice sacked in 1238 and 1410 by the Tatars. Pop. about 43,522. (2) The government has an area of 18,864 square miles. It has an undulating surface with a general slope to the east, and is not very fertile. The drainage is all carried to the Volga by the Oka and its tributary, the Klyazma. The province is rich in archaeological remains of the Paleolithic and subsequent ages. There are manufactures of linens and woolens and several blast-furnaces. Before the war the production of textiles was about $125,000,000 annually. Pop. about 2,225,000.
VLADIVOSTOK, vlä-dé-vö-stöök', Asiatic Russia, a fortified seaport town of eastern Siberia, on the harbor of the Golden Horn in the Gulf of Peter the Great, Japan Sea. It was founded in 1861, and is an important naval station of Russia, and the eastern terminus of the Trans-Siberian Railway, the first sod of which was cut at Vladivostok, 24 May 1891, the line being opened in December 1901. The harbor is surrounded by hills which are well fortified. It has large dry docks, waterworks, electric street railways and street lighting plants, two large shipbuilding yards and 60 new mechanical shops. Vladivostok is an open port and has lines of steamers running to Japanese and Korean ports, and a line opened in 1900 to Seattle, Wash. Ice-breaking steamers keep the harbor open in the winter months. A Japanese squadron bombarded Vladivostok early during the Russo-Japanese war of 1904, but without inflicting any serious damage. During the World War the supplies sent from the United States for the Russian armies were mostly landed at Vladivostok. Pop. about 91,404, including soldiers and numerous Chinese, Japanese and Koreans. See TRANS-SIBERIAN RAILWAY.

VOCATIONAL EDUCATION. Vocational education is that education whose chief aim is to fit for productive capacity. That vocational education which is specialized to the preparation of lawyers, physicians and teachers is called professional; that which is designated to train the bookkeeper, clerk, stenographer or clerical traveler, including business leadership, is called commercial; that which is organized with reference to the needs of the bricklayer, the machinist, the shoemaker, the metal worker, the factory hand and higher manufacturing pursuits is called industrial; that which conveys skill and knowledge looking to the tillage of the soil and the management of domestic animals is called agricultural; and that which teaches the girl dressmaking, cooking and the management of the home is called education in the household arts or homemaking.

The term vocational education has come to be applied somewhat loosely to cover the field of industrial, agricultural and homemaking education; particularly has it come to mean industrial education of less than college grade for boys and girls, and other persons, over 14 years of age.

The early American colonists appreciated the importance of industrial training for children and in some cases provided for it by law. A Massachusetts law of 1642 provided for the putting forth by the towns as "apprentices the children of such as shall not be able and fit to employ and bring them up... and they are to take care that such as are set to keep cattle be set to some other employment withal, as spinning up on the rock, knitting, weaving, tape, etc. They are also to provide that sufficient quantity of materials, as hemp, flax, etc., may be raised in their several towns, and tools and implements provided for working out the same." Virginia in 1646 advanced an elaborate plan for industrial education for poor children who were to be sent up to James City to be employed in the public flaxhouses under such master and mistresses as shall be appointed in carding, knitting and spinning. These and other laws seem to be reproductions of antecedent English laws of the same nature.

Between 1824, when the House of Refuge for delinquent boys was established in New York City, and 1875 American reformatories for juvenile delinquents provided industrial work which, while at first not of an educative character, gradually became so by the substitution of the domestic industries of the institution, farming, gardening, carpentering, blacksmithing, plumbing, painting, furniture making and printing for the contract work originally provided. For many years the reformatories for juvenile delinquents were almost the only institutions providing trade training for pupils 14 years of age and over.

The modern system of industrial education may be traced in part for its origin to the manual training movement. Calvin M. Woodward and John Daniel Runkle were closely connected with the beginning and growth of manual training in America. Woodward was a professor of applied science and mathematics at Washington University, Saint Louis, and Runkle who was a professor of mathematics at Massachusetts Institute of Technology, saw the exhibit of the Imperial School of Moscow, Russia, at the Centennial Exhibition in 1876 and became interested in the form of manual training developed by Victor Della Vos. The idea of Della Vos was that of pure manual training, not to make a productive worker in certain tool processes. Woodward founded the first manual training school in America in Saint Louis in 1880.

Between 1890 and 1905 manual training was introduced into approximately 200 cities of over 8,000 population. About 1905 there began a strong tendency to criticize manual training. This criticism assumes two forms: (1) that manual training courses as phases of general education should have more real educative value than the formal schemes of exercises that have prevailed in the past; (2) a demand for the substitution of actual special trade training for those intending to become industrial workers. Manual training in consequence giving place to (1) industrial arts courses in the grade schools and higher schools; and (2) trade preparatory courses in industrial schools.

Little or no attention was given by the public school systems to industrial education up to 1900. The first work was undertaken by private enterprises and philanthropy about 1850 in the direction of special industrial education when Cooper Union and the Mechanics Institute of Philadelphia, the Ohio Mechanics Institute of Cincinnati and the Virginia Mechanics Institute began to offer instruction at night in drawing, mathematics and mechanics for the benefit of those employed in industrial occupations during the day time. The first forms of industrial education in America open to the general public, but under private supervision and control, thus were supplemental or related courses. Later on shop was offered on a trade extension basis.

The private trade school for boys over 16 years of age represents the first attempt to deal with the problem of industrial training in day school. In 1881 the New York Trade School offered four-month courses in the building
trades to young men between the ages of 17 and 24. During the next 20 years a few such schools were founded, such as the Williamson Free School of Mechanical Trades, near Philadelphia, the Baron de Hirsch Trade School of New York City and the Milwaukee School of Trades, all under private control.

The report of the Massachusetts Commission on Industrial and Technical Education issued in 1906 pointed out that large numbers of boys and girls were leaving school at the age of 14 and before graduation from the elementary school, and that such children made little economic progress during the two or three years following. The first trade preparatory schools for children from 14 to 16 years of age were founded in Rochester, N. Y., and Albany, N. Y., in 1908 and 1909. Many of these trade preparatory schools have been organized in New York, Massachusetts, Connecticut and other States. Special State aid for this type of education was furnished by several States, including New York, Massachusetts, Pennsylvania, Indiana, Wisconsin and Connecticut.

As a result of a long campaign on the part of the National Society for the Promotion of Industrial Education, now called the National Society for Vocational Education, a Federal act called the Smith-Hughes Act was in February 1917 passed by Congress and approved by President Wilson. This act provides for the promotion of vocational education in secondary schools, in trade schools and industries and homemaking; it also provides for the encouragement of teacher training courses for the preparation of teachers of those subjects. The act provides for extensive annual appropriations to aid the States in this work under a co-operative plan.

The terms of the Smith-Hughes Act will determine the course of vocational education in the United States for many years. Under this act the Federal government does not propose to undertake organization or supervision of vocational training in the States, but does agree to make from year to year substantial contribution to its support. It undertakes also to pay over to the States annually certain sums not in any way contingent on the increase in fostering and promoting vocational training and the training of vocational teachers.

The Federal government bases its reasons for co-operation with the States upon four fundamental ideas: (1) that vocational education being essential to the national welfare it is a function of the national government to stimulate the States to undertake this new and needed form of service; (2) that Federal funds are necessary in order to equalize the burden of carrying on the work among the States; (3) that since the Federal government is vitally interested in the success of vocational education, it should purchase a degree of participation in this work; and (4) that only by creating a demand for vocational education can the Federal and local governments can proper standards of educational efficiency be set up.

The terms of the Smith-Hughes Act are administered by the Federal Board of Vocational Education of Washington, D. C. This board is also charged with the importance of the vocational rehabilitation of injured soldiers and sailors who served in the World War. Every State in the Union has accepted the provisions of the Smith-Hughes Act.

There are four types of trade or industrial schools or classes recognized by the Smith-Hughes Law: (1) Evening industrial; (2) part-time or continuation; (3) unit trade preparatory schools; and (4) general industrial schools in cities under 25,000. The evening industrial schools give instruction supplemental to the day employment of persons 16 years of age or over who have entered upon a particular trade or industrial pursuit. These schools are important and popular everywhere. The unit trade preparatory schools provide trade instruction to children 14 years of age and over preparatory to entrance to a specific trade or industrial occupation. The general industrial school in cities of 25,000 and under provides instruction in closely allied industry groups, as the metal trades, the building trades, the printing trades for the preparation of those who wish to prepare themselves for useful employment; these schools will be as near like the trade preparatory schools as it is possible to have in the small community. The various part-time classes will furnish appropriate instruction to children over 14 years of age who have entered upon employment. This instruction may be trade extension, or supplementary, or general education, and must be given during regular working hours, 8 A.M., and 5 P.M., and for not less than 144 hours per year. A large number of States have compulsory continuation school laws, including Wisconsin, Pennsylvania, New York, New Jersey.

LEWIS A. WILSON,
Director, Division of Agricultural and Industrial Education, New York State Department of Education.

VOCATIONAL GUIDANCE. Vocational guidance is interpreted as the effort of teachers, or others entrusted with work connected with teaching, to study the aptitudes and capacities of young people in school or college, or elsewhere, with a view to placing them in the trades or professions for which they seem best adapted. Those who do this work are not necessarily teachers of these trades or professions, but they must be familiar with the general character of them and the opportunities which they offer. They must also be in close touch with those who are doing the actual teaching, or giving the vocational training, which is of course to be distinguished from vocational guidance.

The importance of guiding youth wisely in the selection of a career has been recognized in all ages, but as an organized system, worked in connection with schools, it is of comparatively recent growth. The Germans may, perhaps, be said to have begun systematic work with it. The horizontal stratification of society over there, where following in the footsteps of one's father is the usual thing, made the task simpler than in the United States. In view of the vertical stratification, and the ideal of all is to rise to the top. In the struggle to get up which ensues the usual idea is to get away from the trammels of ancestral tradition, and to try to find success in far different fields. Under such a system where every youth is given a free choice and where the ideal of a Lincoln, or an Edison, or a Carnegie, is constantly held...
up as a possibility, it is but natural that thousands should enter the struggle to rise higher, and that but few would succeed. Young people try to enter trades and professions for which they are ill-adapted and have no capacity, or which are already crowded by competition. The result is that by way of contrast, Germany, by guiding, if not virtually dictating, the trades and the walk of life into which the youth should go, presents cases of fewer misfits, less wreckage and a larger number of skilled workmen. In spite of the fact that the opponents of the German system point out that it is essentially undemocratic, that it cramps freedom of choice and opportunity, and is a contributing factor to the deadening grind which seemingly leads to a greater number of suicides among young people, this is felt to be a lesser evil than the lack of skilled workmen and the frightful number of failures which result from the free-for-all policy of America which permits so many thousands to enter trades and professions for which they are not fitted.

As early as 1881, Lysander S. Richards published a book on guidance entitled 'Vacophy.' After a lapse of some time the subject was again taken up, and with increasing vigor, during the first two decades of the 20th century. A bureau for vocational guidance was established in Boston in 1908. In other places similar efforts were made by teachers and others, particularly in the schools.

Closely following the vocational guidance movement came one paralleling it and calling for vocational teaching and training, so that the two have worked hand in hand. School boards, special committees in colleges, business and industrial firms and organizations, clubs and religious associations gave the subject their attention. Legislatures of many States appropriated considerable sums for its promotion.

Advocates of vocational guidance maintain that it should begin in the lowest school and continue through college, and even into the business and professional world. The teacher should seek to find and develop the aptitudes of pupils and develop them to the end that the best along such lines in a pupil should be developed. The student should be guided in an intelligent choice of elective studies. As the pupil progresses the work of guidance should go into the hands of a counsellor or group of counsellors who make a business of guiding students and of studying the qualities required by and the opportunities in the various trades and professions.

The work of the professional counsellors does not end there. They follow up the work of the student when placed to see that the proper progress is made and if any possible errors in placement have been made. Not less important, perhaps, is their obligation to study the actual surroundings into which the young workers are called upon to go. If they are found to be bad, the counsellor works in cooperation with the employer for improvement. A greater part of the co-operation is to try to guide to the employer the kind of worker that is needed and to keep such worker in the continuation classes in school or college, which will improve his knowledge and skill.

The colleges have been less quick to take up with vocational guidance than the schools and outside agencies. There has been a tendency on their part to let the student 'find himself' by himself, but this has not been true of all of our higher institutions.

The difficulties encountered in vocational guidance in America have arisen from the ambition of the student of the community, sometimes one and sometimes both, to prepare for a trade or profession for which he is obviously unhitted. Even the foreigners, who come to this country and are accustomed to the idea of careful guidance, are sometimes against any restriction on perfect freedom of choice, regardless of what may be said of their aptitudes and capacities. A truth often expressed is that they came to America to get free from the very restrictions which the advocates of vocational guidance would place upon them. They would rather have a chance at the highest and fail than never have had any chance at all. They do not care for the wreckage of too ambitiously chosen careers and even less for the effect of such on our industrial community. The hope springs eternal in their breasts that they will succeed where others failed.

In addition to the above the most serious problems before the counsellor in vocational guidance to-day are: (1) to develop the most accurate system possible for estimating the aptitudes and capacities of those to be guided; (2) to avoid that kind of vocational guidance, which, because of the financial and social position of the youth, would place him in a horizontal stratification, such as is common in European countries, and deny to him the opportunity which democracy offers of rising to the top.

Bibliography.—Brewer, 'The Vocational Guidance Movement' (1918); Sullivan, 'A Bibliography Concerning Vocations' (1916). In the above two practically all of the important books on the subject will be found listed.

JAMES SULLIVAN, Director of the Division of Archives and History of the University of State of New York.

VODKA, a Russian intoxicating liquor, distilled from potatoes and other natural resources; much used by the peasants. Early in the World War its use was prohibited by the tsar. This cut off the government revenue, which was considerable. During the chaos that followed, vodka was manufactured in an irregular way almost as fully as before the war.

VOGDES, Israel, American soldier: b. Wiliston, Pa.; 4 Aug. 1816; d. New York, 7 Dec. 1889. He was graduated at West Point and served in Florida against the Seminole Indians in 1849-56. He was captured by the Confederates 9 Oct. 1861 while repelling their attack on Santa Rosa Island, Fla.; released in August 1862; and as brigadier-general of volunteers commanded Folly Island, S. C., in April-July 1863. He was promoted colonel, United States army, 1 Aug. 1864; commanded the defenses at Portsmouth and Norfolk in 1864-65; was brevetted brigadier-general, United States army, in April of the year last named; and was retired at his own request in January 1881.

VOGEL, Toigél, Eduard, German explorer: b. Crefeld, Prussia, 7 March 1829; d. Wara, Wadi, about 8 Feb. 1856. He was educated at Leipzig and at Berlin, making a special study of astronomy and natural science. In 1851-53
he assisted Hind at Bishop's Observatory in London, and in the latter year was selected by the English government to conduct an expedition of that of Sir James Barrie and Overweg in central Africa. He sailed from England, 20 Feb. 1853, and on 13 Jan. 1854 reached Kuka, the capital of Bornu. From this point he made several expeditions into the surrounding country, and on 1 Dec. 1854 met Barrib near Zinder. He penetrated south to Yacobi and the Benue, and on 1 Dec. 1855 returned to Kuka. From this time his notes of his explorations cease, but subsequent information discloses that he set out to the east on 1 Jan. 1856, reached Wara in Wadai, and was there assassinated. For his notes consult Erinnerungen an einen Verschollenen, by his sister, Elise Polko (1863); also Pahe, Der Afrikaforscher Eduard Vogel (1889).

VÖGEL, Hermann Wilhelm, German photometer and spectrum-analyst: b. Dobrilug, Lower Lusatia, Prussia, 26 March 1834; d. Berlin, 17 Dec. 1898. He studied at the Royal Industrial Institute of Berlin, 1860–65 and was an assistant in the mineralogical museum of the University of Berlin, and from 1866 was director of the photo-technical laboratory of the Technical Institute there. He twice visited the United States (1870, 1883). His studies were directed in particular to the processes of photo-chemistry, the absorption-spectrum and the spectra of oxygen, nitrogen and hydrogen. His silver-tester, photometer for pigment-printing and heliotype-printing, and universal spectroscope were introduced into general use. Among his writings was a Handbuch der Photographie, of which numerous editions appeared. His Das Photographische Pigmentverfahren was also frequently reprinted.

VÖGEL, Sir Julius, Australasian statesman: b. London, 24 Feb. 1835; d. near there, 12 March 1899. He was educated at the London University College School and at the Royal School of Mines, and in 1851, attracted by the discoveries of gold in Australia, went to Melbourne. He engaged in journalism, and in 1853-56 Otago, New Zealand, the Daily Times, the first and still the leading morning newspaper in that colony. In 1863 he entered the New Zealand House of Representatives and in 1869 he was appointed colonial treasurer, and subsequently was postmaster-general, commissioner of customs and prime minister. He resigned the latter office in 1876 and was agent-general for New Zealand in London in 1876–81. In 1884 he re-entered New Zealand politics, was elected to Parliament and again appointed treasurer, but in 1888 resigned and returned to England. He was afterward engaged under the New Zealand government in London until his death. He greatly furthered immigration to New Zealand, was instrumental in building railways, was active in bringing about the Australian federation, and secured the passage of a law for inscribing colonial stocks. He was knighted in 1875. His writings include Great Britain and Her Colonies (1855) and Official Handbook of New Zealand (1875); A.D. 2000, a novel, etc.

VOGEL VON FAULKENSTEIN, fôjgêl fon fâl'kên-shîn, Eduard, German army officer: b. Breslau, 1797; d. 1885. After a preliminary education he entered the military service in 1813 and in the following year won distinction at the battle of Montmirail. For the next 30 years he lived in Breslau, advancing from grade to grade, becoming lieutenant-general in 1858, in which year also he was placed in command of the Fifth Army corps. In the war with Denmark, in 1864, he served as chief of staff and in the war with Austria, two years later, he was given an army to suppress the Hanoverians, Bavarians, Hessians and other allies of Austria among the small German states. He defeated the troops of these states in succession at Langensalza, Kissingen and Frankfort. Soon after peace was declared he was given command of the First corps. He was a member of the North German Reichstag in 1867–70 and in the latter year was in command of troops on the Baltic front. He retired three years later. Consult Wengen, General Vogel von Falkenstein und der hannoversche Feldzug, 1866 (Gotha 1886).

VOCHERA, Italy, city, province of Pavia, on a fertile elevated plain, in a district rich in vineyards, orchards and cornfields, 24 miles east-northeast of Alessandria by railway. The Via Emilia passes through the town and divides it into two parts. There are several handsome squares, of which that of the Duomo is the chief; the streets are adorned with porticos and there is an old castle, built by Galeazzo Visconti 1372. Silks, linens, canvas and leather are manufactured. Pop. 14,651.

VOGLER, fôgler, Georg Joseph, German musician and composer, known as the "Abbé Vogler": b. Würzburg, 15 June 1749; d. Darmstadt, 6 May 1814. He studied at Bamberg, Mannheim, Bologna and Padua; was ordained priest at Rome 1773; and made Knight of the Golden Spur and prothonotary apostolic and chamberlain to the Pope. Returning to Mannheim in 1775 he established there his first school of music. From 1786 to 1799 he was nominally resident at Stockhelm, where he conducted another Tonschule; but he was constantly touring Europe as a performer on the organ. In 1807 he settled at Darmstadt as kapellmeister, and there conducted his most successful school, at times giving concerts in German cities. Vogler made a great stir in his time as theorist and organist, not being excelled on the instrument. He attempted revolutions in organ-building. He is known as the subject of Browning's "Abt Vogler."

VOOT, fôkt, Karl, Swiss naturalist: b. Giessen, Germany, 5 July 1817; d. Geneva, Switzerland, 5 May 1895. He was graduated from the University of Bern in 1833 and was associated with Agassiz in the preparation of L'Histoire naturelle des poissons d'eau douce de l'Europe centrale in 1839. He was appointed professor at Giessen in 1847, whereas his political opinions soon caused his dismissal, but in 1852 he was chosen to the chair of geology at Geneva, which position he occupied until his death. He led an expedition to the Cape of Good Hope in 1861 and in 1878 was elected a member of the Swiss National Assembly. He was an advocate of Darwinism and a strict materialist. His works include Physiologische
Briefe' (1845-56); 'Ocean und Mittelmeer' (1848); 'Die Säugethiere in Wort und Bild' (1883), etc.

VOGUÉ, vō-gū-ā, Charles Jean Melchior, Marquis de, French archaeologist: b. Paris, 18 Oct. 1829; d. 1914. He was a student of Oriental religious and languages and art, traveled in Syria and Palestine in 1833-34 and 1861-62, was Ambassador at Constantinople in 1871-75, and from then until 1879 occupied that office at Vienna. He became commander of the Grand Legion of Honor in 1879, was elected to the French Academy in 1901 and was president of the Agricultural Society of France. His publications include 'Les Eglises de la Terre-Sainte' (1859); 'L'architecture civile et religieuse dans la Syrie Centrale' (1863-77); 'Inscriptions Sémitiques' (1869-77); 'Mémoires de Villars' (1889); 'Le Duc de Burgoyne et le Duc de Beaufours' (1900); 'Le Maître de la Mer' (1904); 'Une Famille Vivaraise' (1912), etc.

VOGUÉ, Eugène Marie Melchior, Vicomte de, French critic and historian, cousin of J. M. Vogüé: b. Nice, France, 25 Feb. 1848; d. 1910. He was educated at Paris, served in the Franco-Prussian war, entered the government service in the Department of Foreign Affairs in 1871, was attached at Constantinople in 1873, secretary of the legation at Saint Petersburg in 1876, and in 1882 resigned to enter upon a literary career. He was elected to the Academy in 1888 and in 1893-98 was député de l'Ardèche. His publications include 'Syrie, Palestine, Mont Athos' (1876); 'Les portraits du siècle' (1888); 'Le Roman russe' (1886); 'Ceurs russes' (1894); 'Jean d'Agrène' (1898); 'Le rappel des ombres' (1900); 'Trois Drames l'Histoire de Russie' (1911), etc.

VOICE, the Human, the sound that proceeds from the mouth when the air is driven through the windpipe, as modified by the vibrations of the vocal cords. These cords are ligaments in the larynx, attached to the hyoid bone. It is not speech (q.v.), that word describing the formation of arbitrary combinations of sounds to express ideas. The voice is usually heard in speech, but it may also be used in yelling or other inarticulate noises. When the voice is reduced to a mere breath, it is called a whisper. Most dumb men have voices, but like animals they cannot form words or use intelligent speech. Domestic animals all understand more or less speech, and usually will obey commands, yet they cannot talk. However, the voice of the dog and cat are familiar in every locality, but they do not speak nor sing. The register or scale of the human voice is about two and a half octaves on the average, or nearly six octaves in the extremes of bass and soprano, and this permits its use in singing. See Voice and Voice Culture.

The loudness of the voice is dependent upon the force and intensity of the blast of air coming through the glottis, assisted by free movement of the vocal cords. The pitch of the voice depends on the rapidity of the vibrations, this being accomplished by the tension of the cords, altering their length, thickness and elasticity. Modulation of the voice is accomplished through the action of the lips, tongue, teeth, etc. There is very little air pressure in the voicing of a whisper. It has been likened to or compared with the pressure of a mercury column of 35 millimeters, while a whisper represents a pressure on the mercury column of 175 millimeters, and the highest pitch of the human voice about 900 to 990 millimeters. The larynx (q.v.) is the organ of the voice. The two vocal cords or bands of cartilage in the larynx are much like two rubber bands, subject to variable tension, and positioned so that the air forced through the lungs tends to separate or stretch them. The individual learns to play upon these two strings automatically, sounding high and low notes, and varying the effects in all the ways characteristic of the human voice. Man may be said to possess an interior orchestra, the lungs being the organ bellows, the cords the violin strings, the mouth the horn, the cheeks the sounding boards, the throat the pipe, the lips the pipe-valve, and so on. The hyoid bone and the glottis and epiglottis also play an important part in the mechanism operating the vocal cords, as may be understood by consulting the article on Anatomy; Laryngoscope, the instrument used for examining the glottis and larynx.

The voices of children are high-pitched or treble. When the boy attains puberty, there is a change in the larynx, and he sounds lower, usually bass notes. The lower, middle and upper registers of the voice involve a shifting of the laryngeal positions, and this is why a slight conscious effort is required of a singer in going from the natural voice to the falsetto. In regard to the highest development of the human voice in song, the action of the three hollow spaces, nasal, oral and laryngeal, has much to do with the modification and modulation of the singer's voice. These spaces are to the vocal bands what the violin is to the strings; and for every tone and vowel the mucous membrane of the spaces named must be drawn into a special position (including the position of the larynx) before the air in the spaces can be brought into vibration by the action of the vocal bands. But the vibration of the cords alone is never sufficient. The surfaces of the mucous membranes are drawn into different shapes, particularly fit to produce tone waves or to disturb them, and to produce in such tone-waves not only fundamental tones, but overtones. The tongue is a large and direct agent in formation, in the middle or oral space, as it is connected with the upper part of the larynx, its derangement in action being alone sufficient to utterly destroy tone, or, on the contrary, when well adjusted and hanging normally in relation to the other voice parts, to give what is termed the silvery quality to the voice. These spaces are as important in producing the modification and modifications of the singing voice as are the vocal cords and intrinsic muscles of the larynx; there being no doubt, that the movements of the larynx depend upon and are controlled by the muscles and movements outside that organ. The control of the motive power, the breath, is of the utmost importance in maintaining the fixation and control of the vocal mechanism. Consult 'Sound and Speech Waves as Revealed by the Phonograph' (Proceedings,
VOICE AND VOICE CULTURE

The art of singing was developed to meet the demands of modern music. That which we understand as the science of voice culture, or the means of cultivating the singing voice that it may be used as a musical instrument, came into being after music had shaped itself to express strong emotional sentiment. In the closing years of the 16th century the attempt to restore Grecian art in its several branches led to the invention of new forms of musical expression. Previous to that time, little, if any, music was written for the solo voice. There was no demand, therefore, for special training for singing. The new forms given to music were (1) the opera, in which dramatic action was united to musical setting of the story. The story was given out by single voices, by two in dialogue, by three, four or more in unison or harmony. The plot of the opera was, from the beginning, in comedy or tragedy and secular in nature; (2) oratorio, which certainly at first was much like the opera, except that the story was from sacred writ. A form of composition invented at this time was recitative which was, and ever has been, for the single voice. Advances in these forms of composition have exacted more and more of singers. Invention of modern music created the need of special training of the singing voice and advance into larger forms of musical expression and has kept the demand for greater skill on the part of vocalists ever increasing. A modern music came into recognition in Italy (in Florence, about the year 1600) the first definite system of voice culture began there. It was devised by the composers that their operas and oratorios might be sung as they wished them sung. There was no definite plan accepted for general use during the 1st century of modern music.

Every composer sought some means by which to have his compositions well sung, and each followed his own course. In 1686 was born one destined to establish a semblance of order. Nicolo Porpora, born at Naples, became a composer. His operas were very florid and none were found among singers able to cope with them. His earnestness for his own interests made him, an educated man for his age, devise a better system of vocal training than had ever been used. And for the first time was established a vocal method. It was the beginning of the Old Italian method, some form of which was continued to our own time. Unfortunately, Porpora left no record of his manner of teaching. We must judge what he did from the demand his music made. His writing for solo voices called for great flexibility and range of voice and his phrases were of great length. We must suppose from this that his pupils were taught to sustain the breath a long time, to sing their parts in a steady and steady voice, to touch with delicacy and lightness the notes in the extremes of the voice. Probably his personality was commanding and that he curbed with masterful hand all attempts on the part of his pupils to depart into anything outside these few requirements. Farinelli, one of his greatest pupils, departed from the simplicity of Porpora's rules, but not until after Porpora passed away. It is known that Porpora kept his pupils many years at work on the simplest exercises. It is related that Caflarilli, one of his most noted pupils, studied a single page of exercises for seven years and when he finally became restless, the master said: "You may go now; you are the greatest singer in Europe." Perhaps one reason why so little is known of Porpora's vocal method is because he did not remain long enough in one place to found a school which could preserve records. He wished for fame as a composer and went from city to city to make his works known. His pupils followed. That, on the other hand, spread the good vocal teaching. In every large city of Italy and in many Austrian and German places the effect of his good teaching was felt. Porpora lived till 1767 and will ever have the honor of establishing vocal method. It was not, so far as we know, scientific, yet it was definite and could be understood. His pupils who continued at Naples maintained his traditions conscientiously for a century. Others who were attracted to London and Vienna kept up a form of Porpora's vocal method. Farinelli, after a wonderful career as singer and politician (having been the power behind the throne of Philip V of Spain), retired to Bologna where he spent the last 24 years of his life. Bologna had the honor of establishing the first great music school (which began in 1482 and was the musical centre of the day. Farinelli did not become a singing teacher by making it his profession, but he trained many of the singers who were connected with the theatre. In this way, he more than any other, handed down the Porpora method. Nearly all the composers of the day came into contact with that method and for the first time in the history of music, vocal method influenced composition. Mozart had singing lessons with pupils of Porpora. Haydn was acquainted to Porpora for three years. Rossini was born into the Bologna life. Bellini, Donizetti and Mercadante were all educated at Naples where the traditions were most rigorously preserved.

Into our own day the influence of the Old Italian method has been projected through two distinct lines: that of Francesco Lamperti and of Manuel Garcia. Each has, perhaps, departed from the old rules, necessitated by the changed conditions of music. Before considering the work and vocal methods of these two men it is well to see if in the remark of Mancini, himself a great singing teacher and a pupil of Farinelli, we may gain a little more definite knowledge of the principles of Porpora. Mancini says regarding Farinelli, "The art of taking and keeping the breath, so softly and easily that no one could perceive it, is his special excellence. The qualities in which he excelled were the evenness of his voice, the art of swelling its sound, the Portamento, the union of the registers, a surprising agility, a graceful and pathetic style and a shade of sweetness which is rare." So far as known there is no more complete description of vocal method of that day. Lamperti, judging from his pupils who are very well known, kept most closely to that method. He was born in 1813 and when seven
years of age entered the Conservatory at Milan for the study of piano and composition. He was ambitious to manage opera companies when he became a man and shaped his training for the theatre. He associated himself, eventually, with the management of the small theatre at Lodi. That seems to have been his only venture in theatrical management, but it served to shape his life in an unexpected manner. Financial resources being small he was forced to train the local singers for the solo parts. He was so successful that many of those young artists attracted attention and were engaged for the theatres of London, Paris, Saint Petersburg and other European cities. It makes the most striking example in history of the power of one man to create a school of singing. Their successes led many great artists to visit Lamperti at Lodi, and his popularity caused the government to make him professor of singing at the Milan Conservatory in 1850. For the next 25 years many of the greatest singers studied with Lamperti and this made Milan the centre of the operatic world. In 1875, Lamperti was retired on a pension, but continued as a private teacher until his death in 1893. Even after Lamperti did not instruct me in vocal methods, Mr. Griffith, one of his earnest pupils, gathered slips of paper on which he wrote comments for his pupils and from them has given us a little idea of the method. One remark by Mr. Griffith is that his pupils were instructed in the study of respiration, the taking and retention of the breath by means of the abdominal muscles alone, and the just emission of the voice, he thoroughly grounded his pupils in the production of pure tone. That is not unlike the remark of Mancini about Farinelli's method. If the Old Italian method has come into our day in any degree of purity it has come through the adherence of Lamperti to those principles of breath control.

Manuel Garcia, Sr., was born eight years after Popora died. In 1812, when 37 years of age, he studied at Naples under Anzani, who was particularly zealous in preserving traditions. Garcia, too, was to be an impresario and his thought was given to the training of singers for his own companies. But, with these duties, he saw the advantage of having a school at London. This was established in 1823. His own children were trained by him and three of them became celebrated. Maria, known as Madame Malibran, was one of the greatest singers of any age but lived to be but 28 years of age. Madame Viardot-Garcia (1821-1910), served as accompanist for her father and learned his method more from absorption than from actual lessons. She grew up in the highest musical life of the day. Manuel Garcia, Jr. (1805-1906), became one of the most important men in connection with vocal method. He sang for a few years in his father's companies, but elected to adopt teaching as a profession. He was one of the first men to become a vocal teacher who did not have special interest in producing his own operas or in preparing singers for his own companies. It is possible that he had the honor of establishing the vocation of voice teaching on professional lines. Whether that be so or not he made scientific investigation of the voice on which he established a distinct vocal method. He invented the laryngoscope, a device for examining the throat, including the vocal chords and larynx. This has become universally adopted by physicians. Garcia was able, with his examinations, to announce definite facts about the action of the throat in singing. Action had been observed, but specifically the knowledge and because it had manifested itself through the outer flesh. It is worthy of remark that although earlier teachers were obliged to walk by faith rather than by sight they had not gone far from correct ways. Nor did Garcia's discoveries immediately permit him and his followers to move with greater certainty. It led to the formation of vocal method on the idea of tone-placement. The registers of the voice assumed more definite position as factors in method. Whether Garcia became so interested in the scientific action of tone production and its reflection in chambers of resonance, as to obscure his views of respiration, or whether he became convinced that respiration was not important, does not appear. But he ignored very thoroughly that which was fundamental in Lamperti's work. He established a method with new basic principles, and that method sprung into popularity. At that time there were two distinct systems: one based on empiricism; the other on science. The first took into account the sound of the tone and judged what would make it good; the other explained the scientific action which would produce good tone. As each method has produced many noted artists there need be no comment on the merits of either. The advocates of both schools have held quite closely to the tenets of the two great leaders, although modifications, as well as additions, have been made. Modern music continues its greater demands and discoveries in science compel further adjustment of deductions based on scientific vocal research.

In 1845, Mathilde Graumann, now Madame Marchesi, became the pupil of Garcia, the inventor of the laryngoscope. For a time she acted as assistant to Garcia and, as it was just the time of Garcia's deep study which led to the establishment of his theory of vocal method, it is reasonable to suppose that she was influenced by that in forming her own. Her husband, Salvator Marchesi, was also a pupil of Garcia. The *Marchesi* method is more often mentioned than any other to-day and it has had Garcia principles for its foundation. Many of the great opera singers have been guided in their education by Madame Marchesi. It is, however, a matter of comment that these artists differ radically in vocal method, and probably the teacher has considered the individuality of her students more than she has adherence to vocal method. Nor would this necessitate departure from Garcia's principles, for such is the subtlety of the mind in dealing with vocal machinery, there is always room for adaptation of method to traits of mind which are individual. And that ability so to adapt may constitute the *Marchesi* method. It may be even the establishment of a new method.

Italy, ever the home of opera, has adopted vocal method which more dramatic music demands. Language is a factor in creating or changing vocal method. The flowing tone of the Italian, with every word ending in a vowel
or liquid consonant and with guttural and harsh consonantal combinations almost eliminated, does not lend itself well to the tone placement of the Garcia school. Nor is the method of Lamperti sufficiently vigorous to meet dramatic demand. A compromise seems to have been effected. Breathing is the basis of it, and it is the breathing of the upper chest, with the abdominal muscles held inward with great firmness. This enables its voce to and over certain extent the scientific tone placement of Garcia. The combination leads to tone production with a degree of harshness which was foreign to the older Italian method. Few professional singers have become prominent under its leading.

Opera demanding extremely dramatic voice has found favor in Germany, and vocal method has been devised on lines which are not part of either of the older schools. Nor is it possible to make explanation of the German method on scientific grounds. The voice is used explosively and with less attempt to sustain the smooth flow of tone which has ever been deemed essential. Nor is it the public has learned to enjoy German singing, which is most convincing proof that there is reason for it. Wagner, it is said, did not hope that his operas would ever be sung well nor seem they be given in any school of voice training which existed when they were written. In the German method of training the voice is found a way by which the operas can be sung. And this class of music is the only one to which that method can be applied. Explosive tone is quite out of place in the music of song writers even among Germans.

Language has influenced the formation of a method in vogue among the French singers. The nasal consonants of the French language call for decided nasal resonance, and the vocal teachers of Paris seek to obtain such resonance as the predominating factor in tone production. In the department of breathing they exact high chest breath control. With this as foundation and with exaggerated nasal resonance there is thrill of tone expansion. The difference between French method and modern Italian lies in the point of resonance of tone. The Italian places the tone in the forward part of the mouth, and the French in the nasal chambers, while both use high chest breath control as foundation.

The other nations have no distinctive vocal methods. England and America have been content to follow the lead of other peoples. Many individual teachers have, through their strong personality, made reputations as teachers, and the public has accredited them with vocal methods quite their own. Thus, William Shakespeare made international reputation as having a vocal method. In some particulars it is individual, but it is based on that of Francesco Lamperti which was as nearly as can be the Old Italian method.

One system which had no special home but which has scientific basis and has many advocates is the "overtone" method. This claims that every musical tone is compound in that it consists of the vibration of the tone-producing organ as a whole for the initial tone and the vibration of its aliquot parts as added tone. For example, the tone made by the stroke of the hammer on the piano string vibrates the string its whole length, its half length, quarter length and eighth length. Also, the divisions at the third, fifth, sixth and seventh of the string vibrate. Sensitive ears can detect the lower multiples of the rate of vibration of the note struck. Using the piano string one can demonstrate the truth of this theory. The tones added to initial tone have been called "harmonics," "upper partials" and "overtones.

Some teachers believe the vocal chords have action which corresponds to that of the piano string and have constructed a vocal method which seeks to incorporate upon the initial tone an abundance of "harmonics." Other teachers of the overtone method claim that every part of the resonance chamber of the throat and mouth is a point of birth of "harmonics." They then seek to make junction of these voices with the initial tone made by the vocal chords. One ingenious scientist has shown this theory can be illustrated by a series of flames which register what vibration of aliquot parts is given each tone. Photographs are made of the flame. It makes a visible record of something that a man of sufficient intelligence to direct his practice.

In the studios of vocal teachers' open and closed tone method is often spoken of, but it is doubtful if a distinct vocal method has ever been built on this idea. Garcia advocated using open tone in the low voice and closed in the upper. Lamperti advised open tone throughout the voice, at least in practice on exercises and vocalizes. It would seem as if "open and closed tone" method is a varying adjunct of several methods, rather than distinct vocal method by itself.

In the last few years a theory has been advanced which may serve as ground for a new method. It is, that tone is primordial substance, present in everything, as is electricity; that by stimulating vibration in the vocal machinery at the proper rate to make audible the tone which is present, our musical tone is produced. Voice culture, in this system, consists of stimulating the sounding machinery at just the right degree of vibration, soliciting a balance of effort that the act of singing is unfelt and the appearance of effort hidden. This method further contemplates that transmission of tone is made amplification of the vibration of the vocal machinery.

Examination of all methods of training the voice in vogue emphasizes the belief that none can have universal endorsement. This comes about because there are so many views of music and of the requirements for singing modern music. All unite in saying that singing should be without effort; but such is the difference in perception of sensation that what seems effortless to one appears charged with effort to another. The latter fact points out the need of some scientific measure by which test may be made of this important element in singing. A barometer or thermometer would establish a vocal method. The one to invent such an instrument has not been found. Garcia opened the way for scientific examination of the voice, but no one has advanced in the science and Garcia's discoveries did not create a method generally endorsed. Among vocal teachers it is common saying that there are two vocal methods, the good and the bad. Each believes
188 VOICE AND VOICE CULTURE

his to be good, but as they differ very much all cannot be good. All know that breath must be used to create vocal tone; that tone emission must be with comfortable action in the throat; that transmission of tone must be generous and the tone given be vibrant. The way to secure these is the vocal method. Each method has its own way by which to attain these desirable ends, and the individuality prevents general acceptance of any one system. Again, vocal teachers who depend on their individuality are little likely to invent any scientific testing machine. Method which can have universal acceptance and application will come only from deductions made by practical teachers working out the suggestions which scientific men make, which will come from invention. The telephone came near showing new forms of transmission and reception of tone. It supplied the idea that tone is awakened into audible vibration and endorsed the teachers of the Primordial method. Nor is it certain but that further experiments in telephone transmission may prove past with supply views on which to base vocal method. It is a subject of vast importance. In this, vocal methods for singing have been considered because training the voice for that art is supposed to be the most important and extended training the voice can have. When we think of the large number of actors, elocutionists and public speakers and recall that each needs to use true principles of voice culture, the importance of forming a definite and universally applicable vocal method seems almost imperative. When we realize that the constantly used conversational voice would be an infinitely more valuable implement of communication between human beings were it cultivated as it might be, the need of perfect (and universal) vocal method assumes large proportions. If, as many believe, voice culture is one of the most valuable prophylactic and therapeutic agents known, such need is absolutely imperative.

Schools of music have been established in all large cities, and of course the study of singing has been made prominent. It has not, as a rule, been the chief study. It has been forced to fourth place, composition, piano and instrumental playing having been given precedence. When the study of voice begins to assume special prominence it has attracted more students to the school and has made more lasting impression on music. Thus, Lamperiti made Milan with its conservatory, noted. The Royal Academy at London has, since the day of Han-del, had a large number of great vocal teachers and that has given power to the school. The New England Conservatory and the Chicago College of Music have produced many excellent singers, but the fact remains that no one has advocated special vocal method. Training has been on lines widely separated and left entirely to the judgment of individual teachers. As all have produced results, although using means so different, it is evident that training the voice for singing modern music can be had through the personality of the teacher developing the musical nature of the student. This has taken the place of method. Many teachers, in later years, have written treatises on singing and which are in circulation, although frequently not so claimed, be descriptions of vocal methods. Garcia's method was described in a book issued about 1865. It has since been revised and simplified. Madame Seiler, Madame Marchesi and Messrs. Randegger, Behnke and Alberto Bach have described their methods in print. Nor must we forget some very excellent works by American writers, Frederic Root, D. A. Clippinger and Edmund J. Myers. In this method, it is interesting to note that individuality is the keynote on vocal methods. As their works are the latest and they are men grown into the strong thought of present activity, their writings have definiteness which was lacking in many earlier works. There is a growing belief that American teachers are taking the most advanced position with regard to certainty in method, and that study of singing can best be prosecuted with such teachers. That which is most evident in their work is that they combine scientific with empirical teaching, and they bind the whole together with directing power of intellect and soul. At no time has it been possible to ensure that anyone possessing any degree of vocal resources shall become an acceptable singer as it is now. This is true in spite of the fact that never before has music demanded so much of singers.

Judging from methods of the past and present we may believe that the voice for singing can best be trained on the following general lines, allowing, of course, that individual natures demand departures and special applications.

There are three general departments: physical, intellectual and spiritual. The latter refers to the intuitional and emotional action of the spirit of man. The physical training has in it the development of respiration, freedom of the throat and reverberation of tone. Respiration demands that muscles of inspiration and expiration shall be made free and strong and made to balance their action so as to deliver breath pressure to the vocal chords, which make initial tone, in such way that tone is made without apparent effort. This corresponds to the way of the Old Italian method. It seems a simple thing, but the old singers evidently found it necessary to study and practise it every day for years and perhaps for a lifetime. Freedom of the throat means that tone of every gradation of power, from softest to loudest, shall be emitted in purity; that elasticity of muscles shall permit constant and instantaneous changes in the larynx; that singing has been given to the school and students to the school and has made more lasting impression on music. Thus, Lamperiti made Milan with its conservatory, noted. The Royal Academy at London has, since the day of Handel, had a large number of great vocal teachers and that has given power to the school. The New England Conservatory and the Chicago College of Music have produced many excellent singers, but the fact remains that no one has advocated special vocal method. Training has been on lines widely separated and left entirely to the judgment of individual teachers. As all have produced results, although using means so different, it is evident that training the voice for singing modern music can be had through the personality of the teacher developing the musical nature of the student. This has taken the place of method. Many teachers, in later years, have written treatises on singing and which are in circulation, although frequently not so claimed, be descriptions of vocal methods. Garcia's method was described in a book issued about
Intuitional influence in modern method is not left to chance, as it has been before. A real student of our times is led to understand his relation to the controlling force of the universe and to utilize the power he may obtain through what is often termed "higher thought." But it is not left to be expressed "intuitively." That is, the student learns what imagination, sentiment, will and the like are, and then, through his objective mind (intellectual department) directs their influence upon the physical parts. For it is now known that, however carefully, correctly and thoroughly the machinery of voice is used, there is a voice better and more beautiful than such machinery can, by itself, produce. The development of vocal method, thus very briefly outlined, is engaging the serious attention of the best American teachers who make teaching a profession, and there is evidence that such study is making a new vocal method.

FRANK H. TUBBS.

VOICING. See Reed, Flute, and Stringed Instruments, Care of.

VOIRE DIRE (Latin veritatem dicere), in law, preliminary examination of a juror as to his competency. When a juror is supposed liable to objection for incompetency or otherwise, he is sworn first, not in the cause, but on the voire dire — that is, to answer questions relating to his incompetency; and if it thus becomes apparent that he is incompetent, he is discharged without further examination.

VOIT, foit, Karl von, German physiologist: b. Amberg, Bavaria, 31 Oct. 1831; d. 1908. He was educated at Munich, Würzburg, and at Göttingen, and in 1863 became professor of physiology at the University of Munich. He was early engaged in scientific researches, his first as of importance occurring in 1854, when he proved the presence of urea in the muscular tissues of cholera patients. He subsequently made a specialty of questions of digestion and assimilation. His works are numerous, and among them are included: "Physiologie des chemischen Untersuchungen" (1857); "Ueber die Kost in öffentlichen Anstalten" (1876); "Untersuchung der Kost in einigen öffentlichen Anstalten" (1877). He also contributed to Hermann’s "Handbuch der Physiologie" (1881).

VOITURE, vwa-tuur', Vincent, French poet and letter-writer: b. Amiens, France, 1998; d. 26 May 1648. He made his literary studies in Paris, then entered the service of Gaston, Duke of Orleans, and with him made a tour in Spain. He won the friendship of Cardinal Richelieu by his epistle on the taking of Corbie, esteemed his chef-d’œuvre. He was made chamberlain by the king 1638. His poems mostly are chansons and rondeaux. More famous than his verses are his letters, in which French prose style was brought to a degree of finish never before reached. The first edition of Voiture’s "Œuvres" appeared at Paris 1650; new revised editions with annotations have been issued by Roux, 1856, and by Ubicini, 1856; a separate revised edition of the "Lettres" was to follow. Vincent Voiture, E. "Voiture" (Paris 1911); Rahstede, "Wanderungen durch die französische Literatur, Vincent Voiture" (Oppeln 1891; Sainte-Beuve, "Causeries du lundi" (XI, Paris 1851-62).

VOLAPUK, vô-là-p'ek', a proposed universal language invented about 1879 by Johann Martin Schleyer, of Constance, Germany. The name means "world-speech," being based on English world and speak, and a number of the vocabulars are modified English words, the total number in the language being about 14,000, some 1,300 being root-words. In structure the language is simple and exact, and the orthography is entirely phonetic, the words being pronounced as they are written, and vice versa. Its alphabet comprises 27 letters, namely the vowels a, e, i, o, u, ä, ö, ü, and these 17 consonants, b, p, h, y, g, k, l, r, m, n, s, f, c, x, z. The acute accent is added as in English, except that é is always /ɛ/, è is always sharp /ɛ/, and ts is equal to /ts/. There are 10 other consonant signs for sounds peculiar to various languages: there are no silent letters and no diphthongs. About 40 per cent of the root words of Volapük, which usually are nouns, are from English, the rest are chiefly from German, French and Latin. In choosing root words the desiderata were brevity, clearness and ease of utterance; every root word consists of one syllable, a vowel between two consonant sounds; man is mun, dom is house (Lat. domus), tim is time; and root words are formed from ordinary words either (1) by substituting a consonant for a final vowel: Eng. pay becomes pel; Fr. mer (sea) becomes mel; or (2) consonants and vowels are dropped: Lat. ponts (bridge) becomes pon, Eng. state becomes tat; or (3) the most important syllable alone is retained: Lat. sapientia (wisdom) becomes sap. Examples of root words from different languages: From Eng. gift, giv, lady, lad, woman, vom; from Lat. fuis (end) comes fim, flumen (river) flum, tensio (stretching) ten. From these root words, which are nearly all nouns, are formed the other parts of speech — verbs, adjectives, adverbs — by proper prefixes and suffixes. Nouns have four cases, namely, nominative, genitive, dative and accusative. The nominative is the unmodified root, for example, vol, world, is in the nominative case. The genitive adds a, sola, of the world; sola, piel, world’s speech. The dative and accusative respectively add e and i to the root; vole, to the world, voli, the world (objective case). The pronouns I, thou, he, she, it, are are ob, al, om, of and os, and they are declined like nouns; oba, of me, ote, me; ala, of thee, ale, to thee; and so on. The tenses of verbs, except the present, are formed by prefixing the vowels a, e, i, o, and u to the root; thus ləfob (ləf, love, ob, I) is love, ləfob, I had loved, ləfob, I shall love, ləfob, I shall have loved; by putting al. thou, om, he,
Oils of Almonds.—Prepared by distilling the pulp that is left after the fixed oil contained in the almonds has been expressed by pressure. As at first prepared it contains a considerable quantity of prussic acid, and in this stage it is very poisonous. After it has been freed from the prussic acid it is known, commercially, as Oil of bitter almond, S. P. A. (without prussic acid). When thus purified the oil consists mainly of benzaldehyde, C₇H₇CHO, and boils at 179°C.

Oil of Bergamot.—Prepared from the unripe fruit of Citrus bergamia, by squeezing the rind by hand and wiping the expressed oil off with a sponge, the sponge being squeezed at intervals into a collecting vessel. It contains a considerable quantity of the hydrocarbon citrene, C₁₆H₃₀, together with other compounds whose precise nature has not yet been thoroughly investigated. The oil is extensively used in perfumery. Oil of bergamot is also made synthetically.

Oil of Cloves.—Obtained by distilling the flower buds of Caryophyllus aromaticus. It consists of a mixture of sesquiterpene and eugenol and is heavier than water.

Oil of Eucalyptus.—Prepared by distilling the leaves of the eucalyptus tree. It is pale yellow in color and is used in medicine and in perfumery. Its chief constituent is eucalyptol or cineol, C₁₀H₁₆O.

Oil of Lavender.—Prepared by the distillation of lavender flowers, the best quality being made from Lavandula vera. Oil of spike is an inferior variety, prepared from Lavandula spica. Oil of lavender is used in perfumery and oil of spike is extensively employed in porcelain painting.

Oil of Lemon.—Prepared from scarcely ripe lemon rinds by the sponge method, described above under Oil of Bergamot. An inferior variety is also prepared by distilling the residues remaining from this process. Oil of lemon consists chiefly of limonene, C₁₀H₁₆, a hydrocarbon which resembles the citrene oil of bergamot, but which differs from it in certain particulars. Oil of lemon is used in confectionery and perfumery.

Oil of Origanum, Oil of Thyme, or Marjoram Oil.—Obtained by distillation from certain species of marjoram.

Oil of Peppermint.—Prepared by distilling the herb Mentha piperita. It consists chiefly of a solution of menthol in various terpenes and is used in medicine and as a flavoring, especially in confectionery.

Attar (or Otto) of Roses.—Prepared by the distillation of certain species of roses and especially from Rosa damascena, which is cultivated in Turkey. It is used extensively in perfumery and, on account of its high commercial value, is often (and perhaps always) adulterated. The most common adulterant is geranium oil, which is manufactured expressly for adulterating attar of roses, by distilling a species of grass that grows in India.

Oil of tartar is obtained by distilling the resinous exudations from certain species of pine trees. American oil of turpentine is prepared chiefly from Pinus australis and consists mainly of dextro-pinene, a hydrocarbon having the formula C₇H₁₄, and boiling at 156°C.

Allan D. Risteen.
VOLBORTHITE. A vanadium ore, a hydrous vanadate of copper barium and calcium, occurring in Arizona and Colorado.

VOLCANIC ASH. See PYROCLASTIC; also TUFF.

VOLCANIC BOMBS. See PYROCLASTIC.

VOLCANIC NECK, or PLUG, the hard igneous plug filling the throat of an old volcano. Such volcanic necks often resist erosion and stand out as buttes as in the Mount Taylor region of New Mexico or in the Puy region of France.

VOLCANIC ROCKS. Those igneous or pyrogenic rocks which have reached the surface through volcanic necks or through fissure eruptions. Volcanic rocks were formed in all ages of the earth's history, but were generally more or less restricted geographically. Contrasted with them are the rocks which cooled beneath the surface to which the name plutonic is generally applied. Extrusive (effusive) and intrusive, or on its surface, extrusive. The plutonic. At best this distinction is only one of convenience, and has no great scientific value. Among the more important rocks of this type may be mentioned obsidian, pumice, rhyolite, trachyte, felsite, andesite and basalt (q.v.). See section on IGNEOUS ROCKS in article on Rocks.

VOLCANISM, a term used to describe all the phenomena dependent on the movement of fluid or molten rock, whether within the earth, intrusive, or on its surface, extrusive. The latter is the popular conception of volcanism and is manifested through the activity of volcanoes. See BATHOLITH; VOLCANO; LACCOLITH, etc.; also the section on VOLCANISM in the article on GEOLOGY.

VOLCANO (Ital. vulcanus; from Lat. Vulcans, the god of fire; originally the vol-cano of Etna, the table abode of the god), an opening in the crust of the earth from which proceeds heated gases, volumes of steam, eruptions of ashes mixed with scoriae and large stones and molten rock called lava. The phenomenon is chiefly limited to certain regions in different parts of the earth, known as volcanic districts; and in these districts established and permanent vents may continue constantly sending forth steam and other vapors, like Stromboli on one of the Lipari Islands in the Mediterranean; or eruptions of more severe character may take place at irregular intervals. The matter thrown out from volcanoes generally accumulates around the openings or craters till they build up a hill, or even a mountain several thousand feet high; but the vent may continue for a long time at a low level, and is even formed beneath the sea, sometimes without rising above the surface. Instances have occurred of a volcanic eruption suddenly forming an island in the midst of the sea. Other volcanoes that have been suddenly raised up have remained permanently in the form of mountains. Such is the volcano of Jorullo (q.v.) in Mexico. The greatest volcanic mountains, as Etna, Hecla and Vesuvius, are produced by accumulations of volcanic matter, as ashes and scoriae, sometimes intermingled with beds deposited beneath the sea charged with the vestiges of marine animals, the collection of which must have occupied long periods of time. The form of the cone depends on the nature and material of the eruption. Ash forms steep slopes; fluid lava, low that cones. Volcanoes sometimes remain inactive so long as to lose their peculiar character; but they may at any time break forth again. Vesuvius was not known to the ancients as a volcano, though it was apparent from the form of the mountain and the materials of which it was composed that such must have been its character at some former period. Volcanoes which show outbursts of more or less frequency are called active. Those known to have been active in historic times, but long quiescent, are called dormant. Ancient volcanic activity took place in Hungary, central France, eastern United States, the eastern Rocky Mountains, the British Isles and other places, of whose eruptions no record exists. Such are termed extinct volcanoes, but many so-called extinct vents become active again. The Mississippi Valley is almost without evidence of volcanism since very early geologic times. Probably the most general understanding of a volcano is of a conical hill or mountain. There is, however, no limitation as to height, some comparatively low volcanoes, such as Pelée and Soufrière, manifesting violent and disastrous eruptions, while, on the other hand, such lofty peaks as Kilimanjaro, Cotopaxi and Popocatapetl are of a volcanic character.

As generally considered, a volcano is divided into three fundamental parts—the base, the middle and the summit proper; the cone, rising steeply from the base; and the crater, the depression occurring at the summit of the cone. These parts are not invariably present in distinct form in all volcanoes; in many, eruption takes place without any crater. Nor do eruptions always proceed from the crater, when present; the crater being located at the summit of the cone, while activity is in many cases exhibited independent of the crater by supplementary craters in additional cones, broken out on the slopes of the mountain. These are known as parasitic cones and craters. Craters of course vary greatly in size and sustain no proportional relation to the mountain or elevation. Haleakla (island of Maui, Hawaii), 10,000 feet, has a crater of 20 miles circumference; but the crater of Orizaba (Mexico, on the boundary between the states of Vera Cruz and Puebla), three and one-half miles high, has a crater with a diameter of less than 1,000 feet.

The causes of volcanic action are still much obscured, though various explanatory theories have been advanced. In early times, the rising cloud of dust attending an eruption, lit by the glow of the lava, came readily to be regarded as mingled smoke and flame, and blacksmiths were thought to have their forges in the subterranean regions. At the present time many believe that volcanic lavas are made up of still uncooled portions of a once molten earth squeezed out by compression. Geologists, however, no longer believe that the earth was ever a molten mass. These latter account for lava in various ways. Some believe that the rocks are hot enough to melt, if not prevented from doing so by the crust, so that whenever cooling produces an arch or anticline the pressure is removed from the
VOLCK

rocks below and they at once become fluid. Others hold that heat is generated by friction during great crustal movements, causing the rocks to melt. Other and more complicated views are held, but they are all little more than speculation, and the problem is still unsolved. Volcanoes are, in general, to be found in areas where the earth's crust is of an inferior strength. These areas are naturally ocean-basins, the territory bordering on such basins, or the ranges of mountains marking the outlines of the continents. With the possible exception of Wrangel (Alaska) no active volcano exists far inland save in a district which is either the scene of a comparatively recent displacement or is marked by an instability in the earth's crust. One of the chief lines of distribution surrounds the Pacific Ocean, running along the western coast of South, Central and North America; the Aleutian Islands, Kamchatka and the Kurile group; Japan, Formosa, the Philippines, the Moluccas, the North Hebrides, New Zealand and South Victoria Land. Included within this line are numerous other volcanoes, such as Krakatau, Mauna Loa and Mauna Kea (Hawaii) and the Polynesian Islands. In the Atlantic section are the Antilles, the Canaries, the Azores, the Cape Verdes, Iceland, Madeira, etc. The European line follows the Mediterranean and is continued into eastern Asia, about the Caspian. It includes the Lipari Islands, the Aegean Islands, Etna, Vesuvius, Ararat and Demavend. J. W. Judd (Vulcanoes 1881) estimated that there are from 300 to 350 vents of customary activity. There are perhaps about an equal number whose latest activity was at a date comparatively recent. Submarine volcanoes are known at many points.

The phenomena of volcanic activity are numerous and varied. A great portion of the material upheaved in an eruption is lava. The kind of rock varies greatly, but it is usually basaltic or andesitic and the lava flows in a more or less thick layer. The vapors rising from the earth are mixed with the water vapor of the atmosphere, forming steam, and together they form the volcanic cloud. It is through the action of the earth's heat that the metallic elements are changed to volatiles, which are then transported by the medium of the steam. The lava flows to the sea, where it cools and hardens into rock, and the ash and cinders are blown away by the wind. The volcanic cloud ascends and is broken up by the wind, and the cinders and ash are scattered over a wide area, while the steam is cooled by the air and condensed into water. The volcanic cloud is often accompanied by earthquakes and lightning, and the atmosphere is filled with a<br>the Lipari Islands is in almost constant eruption but vessels passing do not fear danger. There are also numerous accessory phenomena, such as earthquakes (see EARTHQUAKE); electric and magnetic disturbances and various acoustic manifestations. The explanation of these phenomena have not yet been satisfactorily reached. One of the most remarkable examples was the disturbance of the magnetic field throughout the world which accompanied the Pelée eruption of St. Vincent. Contrary currents of air also occur, some advancing before the clouds of the eruption, others moving toward the volcano, apparently into vacua caused by the abrupt explosion of steam. The geysers of Yellowstone Park, the solfataras (vents from which proceed sulphurous fumes) of Italy, etc., are signs of a decreasing volcanic activity in the areas where they occur. VOLCK, folk, Aladbert J., American artist. Connoisseur; b. Augsburg, Ger., April 4, 1828, a scion of the famous Strakonit family of Poland; d. 26 March, 1912. His youth was spent at Hamburg, Nuremberg, Munich, and he frequented the studios of the masters there assembled. Becoming involved in the Revolution of 1848 he was obliged to flee the country and made his way to America. After visiting a number of the American states he settled in Baltimore and thenceforward devoted the greatest portion of his time and immense energy to the varied forms of art. About the year 1859 he established himself in the suburbs of Catonsville and when the Civil War broke out shortly afterward he espoused the Southern cause and soon became a special agent of the Confederate government, thowing away and frequently running the blockade into Virginia as the carrier of despatches. With General Butler on 15 March 1861 seized Baltimore, Dr. Volck's artistic were roused and he began making a series of cartoons of the Northern leaders, which have come to fame as the years have passed. Published surreptitiously at first by the artist himself, they have since been republished a number of times. He was a personal friend of President and Mrs. Jefferson Davis and had the good fortune to sketch a portrait of Stonewall Jackson on the field not long after his second battle of Bull Run. Another phase of Dr. Volck's many sided artistic career was his notable connection with amateur theatricals in Baltimore shortly after
the close of the Civil War. The success of his artistic efforts on the stage was truly astonishing and will long be remembered by theatrical spectators. The closing years of his long life were spent in the midst of his own artistic creations with which his name in Baltimore was literally filled. The last important piece of silversmithing executed by the artist was a memorial shield to Southern women made in the year 1909. It was dedicated by the venerable craftsman to the women of the South "as a continual reminder to those of the present generation of the splendid example of self-sacrifice, endurance and womanly virtues displayed during the war between the States, and which still exists as an important factor in making the New South greater and more prosperous than ever."

These are his own words in explanation of the thought that inspired him while at work on this beautiful creation of the imagination.

A fuller account of his life and work may be found in George C. Keidel's "Catonsville Biographies" (1915).

**VOLBE, a small rodent, belonging to the muridae family, distinguished by the enamel of the rootless molar teeth being folded in the form of a double series of alternating triangles. The name is of British origin, and while used in Canada and Australia is seldom heard in the United States. The ears are very short and rounded, and the soles of the feet are hairless and tuberculate, while the tail is relatively short. The body is stout and heavy, the legs short and the movements clumsy. The voles and their immediate allies form a sub-family (Micromys) of the Muridae, the meadow-mice (q.v.). Consult Miller, N. A. Fauna No. 12, United States Department of Agriculture; Bailey, id. No. 17; and Stone and Cram, "American Animals," New York, 1902.

**VOLGA, völ'ga, a river in Russia, the longest in Europe. It rises among marshes and small lakes beside the Valdai Hills, in the government of Tver, at an elevation of about 590 feet above sea-level, and falls into the Caspian Sea by many mouths, at Astrakhan. Its basin has about 563,300 square miles, and its entire course, including windings, is about 2,400 miles in length, while its fall from source to embouchure is only 630 feet. It flows at first southeast about 90 miles to Zhlobzof, thence generally northeast past Tver to Mologa, thence east by south past Yaroslavl, Kostroma and Nijni-Novgorod, to the vicinity of Kazan. Here it turns south, flows circuitously south-southwest, past Simbirsk and Saratof to Tsarsitsyn and Saratza, making a marked eastward bend at Samara, and thence southeast to the Caspian. At Tsarsitsyn it sends off a branch, the Akiuta, which flows parallel to the main part of the river, and is connected with it by many cross branches. Its principal affluents are the Oka and Kama, the one joining it from the south, the other from the northeast. Some geographers have held that the Oka is really the main stream, being larger and having a greater drainage area than the Volga above the junction. The Volga is navigable almost from its source and below Nijni-Novgorod it floats quite large vessels; but its navigation is impeded by shallows and sand-hanks, and in winter by ice. Passenger steamers similar to those of American rivers ply upon it. The most important river ports, in the order of traffic, are Novgorod, Tsarsitsyn, Kybinsk and Astrakhan. Before the war vessels annually passed into the river mouth. By a judicious system of canals it communicates with the Caspian, Baltic, Black and White seas. It has a large delta of eight large and 190 smaller streams, spreading to an extreme width of 75 miles. The principal channel is on the southwest side of the delta, and is normally about four miles wide at the mouth. Several of the delta streams flow approximately parallel to the main channel for 150 miles from the discharge in the Caspian. The short railway from Tsarsitsyn to the river Don has diverted much of the traffic from the lower Volga and the Caspian to the lower Don and the Sea of Azov. The banks of the Volga are fertile, and often well-timbered. The river abounds in fish, particularly sturgeon, carp and pike of extraordinary size.

**VOLHNIA, völ-h'in-t'a, Russia, a southwest government, bounded north by Grodno and Minsk, east by Kief, south by Podolia, and west by Austrian Galicia and Poland. It has 21,000 square miles. The capital is Zhitomir; the people are mostly Slavs. It was a part of Poland before its absorption by Russia in 1794. In the south there are spurs of the Carpathians, but the north is low. The whole drainage is carried to the Dnieper by numerous small streams. The Western Bug is the largest river. The climate is mild, equable and in general healthful. Immense forests cover a large area of the northern section; the southern portion is mainly agricultural. The soil is tolerably fertile, producing abundant crops of all kinds of grain, particularly wheat of excellent quality. Beets and tobacco are important crops. The products exported are mainly timber, grain, cattle and wool. Pop. about 4,241,800.

**VOLITION. See Will.

**VOLK, Douglas, American artist: b. Pittsfield, Mass., 23 Feb. 1850. He acquired his art by study at Rome, Italy, and with Corot in Paris (1873-78). He exhibited at the Paris Salon in 1875. He was instructor at Cooper Institute, New York (1879-94; 1908-12); instructor of the Art Students' League; organized the Minneapolis School of Fine Arts (1896) and has been instructor in the National Academy of Design, New York, since 1910. He has won innumerable medals and is a member of many societies. Good examples of his work are found in most American collections, e.g., in the Carnegie Museum, Pittsburgh, Pa.; in the Corcoran Gallery at Washington, D.C.; in the Pittsfield Museum; in the Minnesota Capitol; in the National Museum at Washington; in the Montclair (N.J.) Art Museum; in the Metropolitan Museum of Art, New York; in the National Arts Club; in the Rochester Memorial Art Gallery; in the Muskegon, Mich., Art Museum; in the Omaha Art Museum and in the Portland, Me., Art Society, etc.

**VOLK, Leonard Wells, American sculptor: b. Wellstown, N. Y., 7 Nov. 1828; d. Ocoee, Wis., 19 Aug. 1895. He was employed as a marble cutter in his father's shop and devoted his spare time to modeling, producing a bust of Henry Clay among his first pieces of work.
Later he studied art in Italy (1855-57) under the patronage of Stephen A. Douglas, and on his return established himself in Chicago, where he modeled a bust of Douglas. He produced many works, including the life-size statues of Douglas and Lincoln (1870) in the Illinois State capitol.

VOELKMANN, fôlk'mann, Alfred Wilhelm, German physiologist; b. Leipzig, Germany, 1 June 1801; d. Halle, Germany, 21 April 1877. He was educated in Leipzig, London and Paris, was appointed professor of physiology at Dorpat in 1837, and in 1843 accepted the chair of physiology and anatomy at the University of Halle. He made a specialty of the study of the nervous and optic systems. His writings include 'Anatomy of Animals' (1831-33); 'The Independence of the Sympathetic System of Nerves' (1842); 'Elasticity of Muscles' (1856); 'Physiological Researches in the Department of Optics' (1863-64), etc.

VOELKMANN, Richard von ("RICHARD LEANDER"), German surgeon and author, son of Alfred Wilhelm Volkmann (q.v.); b. Leipzig, Germany, 17 Aug., 1830; d. Jena, Germany, 28 Nov. 1889. He was educated at Halle, Giessen and Berlin, in 1857-67 was private-docent of surgery at Halle, becoming professor of surgery and chief of the hospital at that university in 1867. He was a surgeon in the army during the wars of 1866 and 1870-71, becoming surgeon-general in the latter war. He was eminent as a lecturer, made many important investigations in surgery and pathology, and wrote among the pioneers in introducing the surgical methods of Lister into Germany. He wrote 'Traumerien aus franzosischer Kameradschaft' (1871; 24th ed., 1894); 'Aus der Burschenschaft' (1876); 'Gedichte' (1877); and while among his professional writings are 'Beiträge zur Chirurgie' (1875); 'Be merkungen über einige vom Krebs zu tretender Geschwülste' (1858), etc.

VOELKMAN, Wilhelm Fridolin, Ritter von Volkmann, German philosopher: b. 1821; d. 1877. He was born and educated at Prague, where he later became professor of philosophy. He is probably the most conspicuous expounder of the general principles of Herbert's psychology. These are set forth in his 'Lehrbuch der Psychologie' (3d ed., by Cornelius, 1884-85).

VOLON, vo-lô, Antoine, French painter: b. Lyons, 20 April 1833; d. 1900. He studied at Lyons and Paris, and exhibited for the first time at the Salon in 1864. At the following year's exhibition he received a medal, also at the salons of 1868 and 1869. He was remarkable for his technique and although he painted figures and landscapes excelled in the delineation of still-life. Among his pictures of this kind are 'Armoiries'; 'Curiosités'; 'Sea Fish,' and 'The Pumpkin,' this last being in the collection of William Schaus, New York.

VOLNEY, vo-nil (Fr. vo-nil), Constantin Francois, de, Corr. mem. of French author: b. Craon, Anjou, 3 Feb., 1757; d. Paris, 25 April 1820. He traveled in Egypt and Syria, and urged upon France the conquest of the former in his 'Considérations sur la guerre séculière des Turcs avec les Russes' (1783). Elected to the National Assembly in 1789, he was imprisoned for opposition to the Terror, and on his release made a tour of the United States, described in 'Tableau du climat et du sol des Etats-Unis d'Amérique' (1803). After his return he became senator. His best known work is 'Le rues ou méditations sur les révolutions des Empires' (1791), a vision of a historico-philosophic sort, in which the ruins of Palmyra, representatives of all civilizations and faiths pass by and are reviewed. Consult Berger, 'Etudes sur Volney' (1832); Barni, 'Les moralistes Francains' (1872).

VOLGOGRADA, vôl-gôg-dá, Russia, (1) a town, capital of the government of the same name, on the Volgoda, in the southwest of the government, in a beautiful district extensively occupied with gardens, 35 miles east-southeast of Petrograd. It consists chiefly of old wooden houses, with a few stone buildings in the modern style in the chief square, and has manufactures of linen, lace, soap, candles, glass, leather, etc. Pop. about 41,600. (2) The government of Volgoda in the northeast of Russia is bounded north by the government of Archangel; east by the Ural Mountains; south by Perm, Viatka, Kostroma and Yaroslavf; and west by Novgorod and Olonetz; area, 155,265 square miles. The surface consists generally of a plateau covered with woods, lakes, and morasses. The drainage almost wholly belongs to the basin of the Northern Ocean, most of the rivers being tributaries of the Dvina. The great wealth of the government consists in its forests, which furnish timber and charcoal. Pop. 1,772,200.

VOLPONE, or THE FOX. Jonson was a colossus. An autocrat, a scholastic, a rider of hobbies, a combatant, he overstrides the ordinary men who swarm about his ankles and snap at his shins. 'Volpone, or The Fox' was the play with which Jonson's most fortunate period began. In 1598 he had introduced the comedy of humors, and in 1605-06 returned to this form with 'Volpone.' It is significant of Jonson that 'Volpone' should have been produced in college halls and not dedicated to the "two famous universities." Not a college man himself, Jonson's plays served to reconcile the universities with the popular drama after their long alienation. Jonson sought to apply to popular drama the academical rules for which the learned had been contending. He tells us in the prologue that the play was done in five weeks without collaborator and that no eggs or custards are broken for comedy.

In spite of his assumption to check up his fancy by reference to rules of the ancients, the play is quite loose in construction. It violates theunities of place and action. It has a vaguely moving underplot revolving around Sir Politick Would-be and his talkative wife. After the first act the plot resolves itself into a succession of stage tricks, the changing of disguises and identities, the farce of confusion and doors. When the plot concludes on the morass of running out, Volpone disguises himself as Barabas had done in 'The Jew of Malta' and goes forth to seek new complications.

The author's purpose of moral censure is revealed in the title. Volpone is the Fox who starts out to best the Vulture, Kite,
Raven and Gorbrow. More than a miser he is a wily villain who serves his turn by putting knave against knave. But Volpone himself is dwarfed by his familiar servant Mosca. Mosca, the parasite of Latin comedy, becomes in this play the purest example of malevolence in English drama. Lago had the charm of heroism; Bosola of The Duchess of Malfi is given moments of doubt. Not so with Mosca. "I fear I shall begin to grow in love with my dear self," she says. In the end he proves that there is no honor even among thieves of his ilk. These two are the chief figures. All the others are dupes or fools, with the exception of Celia, the passages of whose tragic story seem torn from another and more elevated type of play.

Volpone' was played at the Globe Theatre in 1609, and later at the universities. It was printed in quarto in 1607. After the Restoration it was revived, and according to Downes "proved very satisfactory to the town." It was last done, unsuccessfully, by the elder Colman, a century later at the Haymarket. Coleridge praised the play for "fertility and vigor of invention, character and language."

THOMAS H. DICKINSON.

VOLSCI, vōl'sē, an ancient Italian tribe dwelling in Latium, on both sides of the river Liris (called the Ticino by the Romans). They had a republican government. Their principal city was Corioli, from which Coriolanus derived his surname. After having several times endangered the Roman state, they were conquered and absorbed in the Romans, and thus disappeared from history as a distinct people, like the other tribes of Latium (338 B.C.).

VOLSK, vōl'sk, or VOLJSK, Russia, a town in the province of Saratov, on the Volga, 80 miles northeast of Saratov. It has a technical school, normal school, etc., ironworks and tanneries. Large quays extend along the river, and trade is carried on in tallow and skins with Petrograd, in fruit with Nijni Novgorod, and in corn with Astrakhan and Rybinsk.

VOLSUNGS, vōl'soongs, a heroic race celebrated in old German legend. Volsung or Val- sung, the centaur of Odin, stands forth as the original ancestor. The most interesting and romantic figure in this line of heroes is Vol- sung's son, Sigmund. Sigfrid or Sigurd, hero of the 'Nibelungenlied,' is the same race. The old Icelandic Volsungasaga, a which has been followed by William Morris in his 'Story of Sigurd the Volsung' contains the original legend.

VOLT. See ELECTRICITY; VOLTA, ALESSAN- DRO.

VOLTA, vōl'ta, Alessandro, Italian physicist and pioneer in electrical discovery; b. Como, 18 Feb. 1745; d. there, 5 March 1827. In 1777 he paid a visit to Switzerland, where he became personally acquainted with Haller at Bern, Voltaire at Ferney and De Saussure at Geneva. Two treatises, published in 1769 and 1771, which he gave a descriptive proof of a new electrical machine, laid the foundation of his fame. In 1774 Volta became rector of the gymnasium in Como and professor of physics. In 1779 he was transferred from Como to Pavia to fill the chair of natural philosophy in the university of that city. Here he occupied himself entirely with electrical researches. He had previously (1777) invented the electrophorus (q.v.), and his invention of the electroscope (q.v.) (also 1777), was an important improvement. His observations upon the bubbles which arise from stagnant water led him also to some valuable discoveries in regard to gases. The electrical pistol, theKeppel, the lamp with inflammable air, the electrical condenser and other inventions, are among his claims to re-nown. He next turned his attention to some of the atmospheric phenomena, such as the nature of hail, and subsequently increased his reputation by the invention of the Voltiac pile (1800). In 1782 he had made a tour through France, Germany, England and Holland. In 1794 he received the Copleian medal from the Royal Society of London, for his paper upon the condenser; and in 1801 his electric apparatus attracted so much notice in France that Napoleon invited him to give an account of his invention before a commission of the Institute, and when the commissioners made their report, proposed that a gold medal should be awarded the inventor in recognition of his services to science. He was also decorated with the cross of the Legion of Honor and the order of the Iron Crown, and was raised to the dignity of senator of Italy, with the title of count. In 1804 he resigned his professional duties. Antinori edited a collection of his works (1816). Consult Mocchetti, 'Vita del Conte Volta' (1839).

VOLTA, West Africa, a river of Upper Guinea, which, rising in the Kong Mountains or highlands behind the Ashanti country, runs south between Ashanti and Dahomey, and reaches the Bight of Benin through the east part of the British Gold Coast at Adda. To left and right of its mouth it forms great lagoons, and on the bar across the mouth a heavy surf runs. With its chief tributary the Black Volta its total length is about 850 miles, 250 of which are navigable in the flood season.

VOLTA BUREAU, The, Washington, D.C., for the increase and diffusion of knowledge relating to the deaf, was founded and endowed by Alexander Graham Bell (q.v.) in 1887. It was the outgrowth of extensive researches he engaged in during the years 1878-83, to determine the causes of deafness and to what extent the human race is susceptible of variation by selection. The bureau derives its name and its endowment from the fact that the Volta prize, created by Napoleon, was conferred by France upon Dr. Bell for the invention of the speaking telephone. The 50,000 francs received was invested in laboratory equipment and experiments that resulted in the invention of the phonograph-graphophone. From his share of the amount received from the sale of the fundamental patents of the talking-machine industry, and for discovering and giving Graphic art commercial practicability, he set aside the sum of $100,000 as an endowment fund *for the increase and diffusion of knowledge relating to the deaf.* Housed in a building of classical architecture, the Volta Bureau was the property of its trus-tee, Alexander Melville Bell, and his successor, Charles J. Bell, from 27 June 1887, until 1909, when, at the suggestion of its founder, it was presented with other property to The American
Voltaic Batteries—Voltaire

Association to Promote the Teaching of Speech to the Deaf, an association founded and endowed by Dr. Bell in 1890. In furtherance of its primary purpose, the Volta Bureau has printed, or reprinted, and freely distributed, in the form of leaflets, pamphlets or books, several hundred thousand contributions to knowledge in the hope that such a work would serve to broaden views concerning the deaf. It has published a few books that it sells at cost or less. It maintains a fireproof reference library, and is endeavoring to include in its unique collection of literature relating to the deaf a copy of every book, periodical, pamphlet and leaflet relating to any phase of deafness and published in any part of the world during any period. Among its other functions, the Volta Bureau serves as a world's clearing-house, or medium of exchange, between the schools and the various associations of the deaf in all parts of the world. It distributes among foreign schools and associations the reports and literature of American schools and associations and vice versa. It also serves as a bureau of information for parents and friends of deaf children, for physicians, otologists, the clergy, and all who desire available information concerning any phase of deafness. For the benefit of its members the association maintains a teachers' agency at the Volta Bureau, where parents, school officials and others who are members may secure names and addresses of available teachers, free of charge. The Volta Bureau publishes The Volta Review: The Speech and Reading Magazine, an illustrated monthly periodical presenting helpful essays on live subjects of vital interest to thinking men and women working to promote the welfare of the deaf and for the betterment of humanity.

Voltaic Batteries. See Electric Batteries.

Voltaic Cell. See Electric Batteries.

Voltaic Pile, the galvanic pile as first devised by Volta. See Electricity.

Voltaire, vol-tär, Jean François Marie Arouet, French author and free-thinker: b. Paris, 21 Nov. 1694; d. there, 30 May 1778. He was destined for the legal profession, but his inclination was so decided that he never seriously entered upon it, and the success of his first tragedy (Edipe), brought out in 1718, decided him. It is traditionally recorded that this play was finished, and that two cantos of his 'Henriade' were written in the Bastille, where he was confined (May 1717 to April 1718), on account of certain satirical verses on the regent, the authorship of which was ascribed to him. The success of his tragedy at once made him the fashionable poet of the day, and for the next eight years he resided mainly at Paris. It was about the beginning of this period that he changed his paternal name of Arouet into Voltaire, which latter name is most probably explained as an anagram of Arouet (j.e jeune—the younger, he having an elder brother). Voltaire suffered a second imprisonment in the Bastille in 1726, the occasion of which was his sending a challenge to the Chevalier Rohan, by whom he had been insulted. This imprisonment lasted but a month, and on being liberated Voltaire determined to seek greater liberty in England, which he had been invited by Lord Bolingbrooke. His residence in England lasted till 1729, and there he acquired some knowledge of English literature (Shakespeare, Pope, Swift, Addison), and made himself acquainted with the writings of the English freethinkers, Tolland, Tindal, Collins, Shaftesbury and others. After his return he lived chiefly at Paris till 1734. In the course of his second Parisian residence he raised himself from very moderate circumstances to a condition of affluence, not by literary labor, but by monetary enterprises in connection with a government lottery, the corn-trade and army contracts. From 1734 to 1749 his principal place of residence was at Cirey, in Lorraine, where he lived with the Marchioness due Châtelet, with whom he had become intimate in July 1733. The death of the marchioness in 1749 deprived him of his retreat, and in the following year he accepted the often repeated invitation of Frederick the Great to come to his court. Here he was received with the greatest honor, but the good understanding with the king did not last long, and in 1753, after numerous unpleasant scenes, Voltaire quitted the Prussian court. Before returning to France he visited one or two of the minor courts of his kingdom. At Frankfort, Frederick caused him to be detained in order to recover from him a collection of poems by the king containing a number of satires on several princes, some of which Voltaire had maliciously exhibited at the courts he had visited. Early in 1755 he removed to Geneva, and for the remainder of his life lived mainly either in Switzerland or close to its borders. About 1758 he fixed his residence with his niece, Madame Denis at Ferney, in the Pays de Gex, a district that at one time belonged to the counts of Geneva, and from this time this was his sole place of abode. Under his care the village of Ferney, which in 1758 was a part of an estate he acquired, contained only 49 peasants in a miserably poor condition, and became a thriving place, and in 1778 numbered 1,200 inhabitants, among whom Voltaire lived almost as a sovereign prince. In his retirement he became known to all Europe as the Patriarch of Ferney, and received a constant succession of visits from persons of rank and fame, and kept up an immense correspondence, which included in its range most of the crowned heads of Europe. In February 1778, impelled by the desire of hearing once more the applause of multitudes, he went up to Paris, where he was hailed by all classes with boundless enthusiasm. But the sudden change in his manner of life was too great a strain on his strength and he soon collapsed. He was buried at the Abbey of Sceillières, between Gent and Troyes, of which his nephew, the Abbé Mignot, was commissary. At the revolution his remains were transferred to the Panthéon (1791).

During his whole life Voltaire was an indefatigable writer. The long list of his productions embraces works in almost every branch of literature: in poetry, the drama, romance, history, philosophy, criticism and even science. Nearly all his works are strongly animated by a spirit of hostility to the Christian religion and its representatives. This brought him into conflict with the religious element and the gov-
VOLTAISM—VOLUME

ment, and a great part of his later years
was spent in exile on account of his extreme
rudes criticism of religious thought and belief.
It was mainly in order to be out of reach of
the government that he lived so much at a
distance from Paris on the frontiers of
France, whence he could easily make his
escape for a while, when he thought it ad-
visable, into Holland or Switzerland. At Cirey
and Ferney he could be more outspoken than
he had dared to be when he lived chiefly at
Paris. From Ferney he issued all his most
direct attacks upon Christianity and Cathol-
cism, the 'Sermon des Cinqante,' 'Extrait des
Sentiments de Jean Meslier,' 'La Bible enfin
Expliquée.' At the same time he was a chief
contributor to the 'Encyclopédie,' and indeed
its leading spirit. Yet he had no sympathy
with the atheistical views that are found ex-
pressed in some parts of that work. He upheld
thesism with as much zeal as he denounced
Christianity and priestcraft, and even came to
be looked upon as reactionary by the atheistical
spirit of the time. It ought to be mentioned
also that his hatred of fanaticism, although
often the cause of violence and injustice on
his part, was the mainspring of some of the
most honorable years of his life, as in the
case of the Calas family. See CALAS, JEAN.

The works of Voltaire on which his literary
fame is now generally held to rest, are his philo-
osophical novels such as 'Zadig,' 'Candide,'
'L'Ingénuité,' his histories ('Histoire de Louis
XIV,' 'Histoire de Charles XII'), his corre-
cspondence, and more than all, perhaps, his
poetical epistles, satires and occasional poems
of a light character, in which the typical
Frenchman is exhibited in his most complete
manifestation, full of wit, gaiety, vivacity, ease
and grace. Several of his tragedies, among
which may be mentioned 'Zaïre' (usually
reckoned his masterpiece in the dramatic art),
'Alzire,' 'Mérope,' 'Mahomet' (translated into
German by Goethe), and 'Rome Saurée,' had
great success in their own day, but the French
do not assign to them a high place in their
literature. Voltaire attempted comedy also, but
in his he was still less successful. He seems to
have been deficient in a sense of humor. The
best of his comedies is 'L'Enfant Prodigue.'
We should not omit to mention that Voltaire
was always a great lover of the drama, and
that wherever he settled for any length of
time one of his first aims was to get a theatre
established in the place, sometimes in his own
house. Occasionally he acted himself. The
'Henriades,' an epic poem, with Henry IV of
France as hero, is another work of his, which,
though not highly esteemed now, had great suc-
cess, and exercised a powerful influence when
it first appeared. (See CANDIDE.) Some of
the numerous editions of the works of Voltaire,
the best are those of Beaumarchais, with introduc-
tions by Condorcet (1784-90), Beuchot (1828 et seq.),
and Moland (1877-85). The chief biographies
are those by Desnoyres-Terres, 'Voltaire et la Société Française au
XVIIe Siècle' (2d ed. 1889); M. Menenb, 'Voltaire: Leben und Werke' (1885);
'Life of Voltaire' (1881); Hamley, 'Voltaire' (1877);
Ballantyne, 'Voltaire's Visit to England' (1893); and Espinasse, 'Voltaire' (1892).

1911); Tallentire, G. S., 'Voltaire in his
Letters' (New York 1891).

VOLTAISM, a term early applied to gal-
vanism, from the fact that Volta's explanations
of Galvani's experiments on frogs led to the
correct appreciation of the sources of the
electricity generated.

VOLTAMETER. See COULOMETER.

VOLterra, völ-tér'a, Daniele da (Ric-
ciarelli, Daniele) Italian painter: b. Volterra,
Italy, 1509; d. Rome, April 1566. He studied
painting at Siena, and afterward went to Rome,
where he gained the friendship of Michelangelo,
who not only instructed him, but gave him des-
crises on a series of frescoes in the church of
La Trinita de' Monti, Rome; and of those of
the 'Descent from the Cross' is well known by
Toschi's engraving. He was employed by Paul
IV to da e the figures in Michelangelo's 'Last
judgment' and thus earned for himself the
soubriquet of 'Il Braghettoni' (The Breeches-
maker). In the latter part of his life he ap-
plied himself also to sculpture.

VOLterra, Italy, town situated in the
province of Pisa, on a table-land about 1,600
feet above sea-level, 51 miles by rail east-south-
east of Leghorn. It is surrounded by cyclo-
pean walls, in better preservation than any
other structures of the kind in Italy. The gate
called Farco, and the remains of baths and of
an amphitheatre, are interesting vestiges of an-
tiquity; the cathedral, municipal palace and
Pietro are monuments of the Middle Ages;
and the Mastio, a prison, is a modern edifice.
Volterra contains a college, numerous schools
and a library of 120,000 volumes. Wine, oil,
corn and mulberry-trees are grown in the lands
belonging to the town, which also possesses
considerable mineral wealth. Pop. 16,784.
Volterra, anc. Volaterna, was one of the
most powerful and important of the Etruscan
cities and came into the possession of Rome
474 A.C.; after the fall of the empire it suffered
much from the invasion of barbarians.

VOLTURNO, völ-toor'nö, Italy, a river
which rises in the province of Campobasso,
flows southeast to its junction with the Calore,
and then west past Capua into the Mediterr-
anean, 20 miles southeast of Gaeta, after a
course of 112 miles. Garibaldi won a victory
over the army of the king of Naples on its
banks in 1860.

VOLUME, the bulk occupied by a body;
the amount of space a thing occupies, as the
volume of water in a pond, or of air in a room.
The volume of a body is the product of its
length, breadth and thickness, or length, width
and depth, as the case may be, and is called
the geometric volume. The volume of a cube
is the cube of its edge; that of a sphere the
cube of its diameter divided by 6. The volume
of a prism is the product of the base and the
height, and of the cylinder the product of the
base and the altitude. All the above volumes
are called solids. The surface of a solid is the
area of its bounding surface, and the volume
of a solid is the area of its bounding surface
multiplied by a thickness of one unit. The
volume of a solid is equal to the area of its
base multiplied by its altitude or height.

VOLZ, VOLF, WOLF, WOLF.
within an imaginary surface which just takes
in the body, interstices and all. The "apparent
volume" of a heap of coal, for example, in-clud-ing
the "real volume" of each separate
fragment of the coal, and also the empty spaces
between these fragments, as they lie in the pile.
See MENSURATION; WEIGHTS AND MEASURES;
METRIC SYSTEM; UNITS.

VOLUMETRIC ANALYSIS, in chemis-
try, analysis consisting in submitting the sub-
stance to be analyzed to certain characteristic
reactions — the chemist employing for such re-
actions liquids of known strength, and, from
the quantity of liquid employed to induce the
reaction, determining the weight of the sub-
tance to be estimated by means of the laws of
equivalence. The idea of this method sug-
ggested itself first to Gay-Lussac in considering
how most readily to determine the amount of
silver in an alloy of silver and copper; but the
method itself did not come into general use
until a considerable time afterward. The liquid
reagents of known strength are called standard
solutions; and the amount employed may be es-
imated either by weight or by volume, but the
latter being the easiest of application, is uni-
versally employed — hence the name Volum-
etric Analysis. In order that a reaction may
be applicable in Volumetric Analysis, it must
satisfy these two conditions: (1) It must not
occupy much time; (2) the termination of the
reaction must be easily recognized and unmis-
takable to the eye. These conditions limit the
number of volumetric processes. In addition
to the ordinary chemical apparatus, Volumetric
Analysis requires graduated glass vessels of
different kinds for measurement of the stand-
ard solutions. Of these the most essential are:
(1) Pipettes, glass vessels of the form of Figs.
1 and 2, intended for the delivery of the stand-
ard solution: Fig. 1 shows a vessel provided
with a single mark upon the neck, while Fig. 2
shows one divided and graduated through its
whole length in cubic centimetres (c.c.), ac-
cording to French scale; (2) flasks graduated
for the contents in various sizes from one-
tenth of a litre to five litres, and used for pre-
paration of standard solutions; (3) burettes or
graduated tubes for measuring liquids used in
an analysis. The best burette for general pur-
poses is known as Mohr's burette (see Fig. 3);
and its lower part is attached to an India-rub-
er tube and spring-clamp or clip (Quetsch-
Hahn). Its principal advantages over other
forms are, that its constant upright position en-
ables the operator at once to read off the num-
ber of degrees of standard (or test) solution
used for any analysis, while the quantity of
fluid to be delivered can be most accurately
regulated by the pressure of the thumb and
finger on the clamp; moreover, as it is not held
in the hand, no error is likely to arise in the
measurement from the heat of the operator's
hand. Its greatest drawback is that it cannot
be used for those test-solutions which decom-
pose India-rubber.

The standard solutions, known also as test
or titrated solutions (from French titrage, which
signifies the standard of a coin), may be divided
into: (1) Such as are immediately prepared
by the addition of known composition
solving it, and diluting it to the required vol-
ume; (2) such as are prepared by approximate
mixture and subsequent exact analysis. The
greatest care is indispensable regarding both
the graduation of the measuring instruments
and the strength and purity of the standard
solutions, which must be protected from evap-
oration and other hurtful influences by being
kept in bottles of one or two litres capacity,
provided with well-ground stoppers.

Volumetric methods are usually classified as
follows, according to the principles on which
they are based: (1) Analysis by saturation,
when the quantity of a base or an acid is meas-
ured by the quantity of acid or base required
for exact saturation — a point to be determined
by test-papers, tincture of litmus, etc. (2)
Analysis by oxidation and reduction, when the
quantity of the substance to be determined is
found by the quantity of chlorine, bromine, io-
dine or oxygen to which it is equivalent (re-
garded as oxidant); or by the quantity of chlo-
rine, bromine, iodine or oxygen which it requires
to pass from a lower to a higher stage of oxida-
tion: the chief oxidizing agents are permangan-
ate of potash and bichromate of potash; while
the reducing agents chiefly used are protocate-
chic acid and hyposulphite of soda. (3) Analysis
by precipitation, when the determination of a

*Fig. 2.—A Pipette, containing 20 c.c., divided through
its whole length in c.c., being thus graduated for measuring
the delivery of fluids.*

*Fig. 3.—a, the India-rubber; b, the slips made of brass
wire, by which the India-rubber tube can be closed at will.*

---

The substance is effected by precipitating it in some
insoluble and definite combination. We have
space for an example of only one of these three
forms; and, selecting the last for its historic in-
terest in its application to the determination of
silver, we give Sutton's account of the process:
"Suppose it is desired to know the quantity
of pure silver contained in a coin. The coin is
first dissolved in nitric acid, by which means a
VOLUMETER—VOLUNTARYISM 179

blush solution containing silver, copper, and probably other metals, is obtained. It is a known fact that chlorine combines with silver in the presence of other metals to form chloride of silver, which is insoluble in nitric acid. The proportions in which the combination takes place are 35.5 of chlorine to every 108 of silver; consequently, if in a standard solution of pure chloride of sodium is prepared by dissolving 58.5 grains of the salt—i.e., 1 eq. sodium (=23) plus 1 eq. chlorine (=35.5) or 1 eq. chloride of sodium—in so much distilled water as will exactly make up 1,000 grains by measure, every single grain of this solution will combine with 0.0108 of a grain of pure silver to form chloride of silver, which precipitates to the bottom of the vessel in which the mixture is made. In the process of adding the salt, solution to the silver, drop by drop, a point is at last reached when the precipitate ceases to form. Here the process must stop. On looking carefully at the graduated vessel from which the standard solution has been used, the operator sees at once the number of grains that have been necessary to produce the complete decomposition. For instance, suppose the quantity used was 520 grains; all that is necessary to be done is to multiply 0.0108 grain by 520, which shows the amount of pure silver present to be 56.16 grains. By volumetric analysis as compared with ordinary analysis, much time, labor and expense are saved; at the loss, however, of due accuracy, unless the greatest care is taken to be sure that the solids, to be analysed, are the proper strength, and the instruments accurately graduated. An analysis can thus be completed in 15 minutes that would formerly have occupied a day or more. Independently of its application to pure chemistry, it facilitates to a great extent the chemical analysis of wine, of waters, of manures, soils, etc. Consult Mohr, "Lehrbuch der Chemischen-Titriermethode"; Rieh, "Volumetrische Analyse" and other handbooks of analytical chemistry.

VOLUMETER, an instrument for determining the specific gravity of a solid by measuring the amount of water or other liquid displaced by it. A simple form is a flask having a long narrow neck, and an opening at the side through which the solid may be introduced. The neck is graduated from the bottom upward. In using, the flask is filled to the zero mark with a fluid; on turning it on its side the stopper can be removed and the solid introduced; when turned back to an upright position, the liquid is forced up the stem and the volume reading is the amount of liquid displaced by the solid. From this the specific gravity can be easily calculated.

VOLUNTARY CONTROVERSY, a controversy begun in Scotland in 1780, and which continued obscurely until 1813, when it began to be generally known through the length and extent of the Scottish Presbyterian Church, and to that remarkable action, by which, as a protest against state interference, on Tuesday, 23 May 1843, 396 ministers and professors renounced all claim to the benefices they had held in connection with the Established Church, declaring them to be vacant and consenting that they should be dealt with as such. By this memorable act of self-sacrifice in obedience to principle these ministers and teachers gave up an annual income amounting to at least $500,000. See Free Church.

VOLUNTARY CONVEYANCE, in law, transfer of property, real or personal, without any valuable consideration. Voluntary conveyance comes into question mostly in cases of bankruptcy, when a debtor's estate is insufficient to meet the claims of creditors. The first English statutes regarding voluntary conveyance were 13 Elizabeth, c. 5, for the protection of creditors, and 27 Elizabeth, ch. 4, for the protection of subsequent purchasers: the law as determined in Elizabeth's time is accepted generally throughout the United States even where it has not been re-enacted in statutes. At one time a voluntary conveyance made when the maker of it was a debtor, even if he possessed many times the amount of the debt, was held fraudulent within the intent of 13 Elizabeth, ch. 5; but if all of the debt to the whole estate is taken into account and voluntary conveyance is not regarded as prima facie fraudulent unless the property conveyed constitutes a large ratio of the debtor's estate.

VOLUNTARISM, or THE VOLUNTARY SYSTEM, a term applied to the support of ministers of religion and their churches by the voluntary contributions of the people, as opposed to the connection of church and state, and the support of the ministry from tithes or general taxation. Whenever the clergy receive stipends from the state, it is evident that the taxpayer, in addition to the voluntary support, if any, which he gives to some particular church contributes through taxation to the support of an established church or of state-recognized churches in general.

In ancient times state and church were inseparable, and opposition to the church was regarded as treason to the state. This relation existed throughout the Middle Ages, and until a comparatively recent period, under the papacy, with the important difference that the state was regarded and treated as subordinate to the church, and as bound to obey its decrees. In the countries which accepted the Protestant doctrines in one form or another the relations of church and state were reversed, and the state, as represented by the sovereign, assumed control of the church, a fact which had much to do with the spread of the Reformation. While the conditions of the connection were changed, however, the tie between church and state became, in Protestant countries, even stronger than before, an ever-present and jealous monarch unity in his own person the hereditary civil power of the Crown and the secular authority which had formerly been exercised by a distant pope. Dissenters from the established church became rebels, whereas before they had only been heretics, and the devastating civil wars of the 16th and 17th centuries were the outcome, in a large, if not a principal degree, of this new relation.

The dissentee from a church establishment did not seek to put a voluntary system in its place. If he triumphed in England or immigrated to America, his aim was to treat the established church of his own, and doom to state or scaffold any intruder who disagreed with him. The colonies of Rhode Island and Maryland, the former founded by Protestants,
the latter by Roman Catholics, were framed on the plan, then novel to the world, of toleration in matters of conscience, accompanied by its correlate, the voluntary system.

While the world has made admirable progress toward complete liberty of conscience, while the prison and scaffold no longer menace dissenters from an established creed, and men can be friends, and acknowledge each other's good qualities although differing pole-wide—to use Whittier's expression—in religious opinions, the voluntary system is still almost confined to the United States, Mexico and the leading British colonies. State-supported churches are the rule, even in France and Germany, where all creeds are on an equal footing, in Switzerland, where absolute liberty of conscience is decreed by law, the magistrates keep a certain degree of supervision over religion, and Brazil, while providing in her Constitution for absolute separation of Church and State, still supports the ecclesiastics who were in receipt of state support when the new religion came into force.

In the United States, saving the fact that church property is usually exempt from taxation, the voluntary system prevails everywhere, and only chaplains in the army and navy, and those who say prayers before public bodies, as at the opening of the United States Senate, receive pay from the public treasury. This universal voluntaryism did not come about with independence, or even with the adoption of the Federal Constitution. The first amendment to the Constitution of the United States provided that Congress should make no law respecting an establishment of religion, or prohibiting the free exercise thereof. This, of course, did not affect the power of the several States to create or continue church establishments. The convention which framed a constitution for Massachusetts provided in the "Bill of Rights," that "the legislature shall authorize and require the several towns, parishes and precincts to make suitable provision for the public support of piety, religion and morality, in all cases where such provision shall not be made voluntarily." Officers andendiemen were appointed to collect the dues, and if a taxpayer defaulted, distress and even imprisonment followed. This system amounted to State support of the Congregational Church, and it was not until 1815 that dissenters from the prevailing creed were released from paying taxes to maintain the ministers of the majority. The involuntary system was abolished altogether in Massachusetts in 1833. In Connecticut the constitution of 1818, while giving every society of Christians power to tax the members of such society, permitted any member to escape this obligation by giving notice of withdrawal in writing. And now, as for many years past, without any provision of the Federal Constitution to coerce the States, and the threat of public opinion, voluntaryism in the maintenance of ministers and churches prevails everywhere throughout the republic, and in no country in the world is religion better supported, while the clergy also, conscious of their freedom from State control, are self-respecting in their personal attitude, and devoted to the service of God and of their flocks.

VOLUNTEER STATE. A name given to the State of Tennessee.

VOLUNTEERS, Persons who enter military service of their own free will and not by constraint or compulsion. In the United States, especially during the Civil War, volunteers included solders of all bodies other than the regular army, but practically governed by the same laws when in service. In general the army of volunteers comprises to all intents and purposes, (1) the regular unpaid forces of the State militia which when called into actual service receive pay from the government and are subject to the rules and articles of war, and (2) that class of troops which may from time to time be raised by Congress on occasions of national emergency. In the United States, by act of Congress, in 1914 the volunteer forces are raised, organized and maintained only during the existence of war, or while war is imminent, and only after Congress have authorized the President to raise such a force. The term of enlistment in the volunteer forces is the same as that for the regular army, exclusive of reserve periods, and all officers and enlisted men composing such volunteer forces are mustered out of the service of the United States as soon as practicable after the President shall have issued a proclamation announcing the termination of the war or the passing of the imminence thereof. When volunteer forces are to be raised the President issues his proclamation, stating the number of men desired for each arm, corps and department, within such limits as may be fixed by law, and he prescribes such rules and regulations as may be necessary for the purpose of examining, organizing and receiving into the service, the men called for. The power to organize volunteer forces includes the power to provide, within such limits as are or may be prescribed by law, and such regulations as must be prescribed by law and maintained by order of the President or the Secretary of War. When the volunteer forces are called into the service of the United States, the volunteers are considered as belonging to the volunteer force in whose service they are at the time they come into the service, or in any other volunteer force in which they may be organized in their own State. In addition, the officers of the volunteer force may be appointed by the President or the Secretary of War from the eligible list of officers, and the officers of the volunteer forces may be appointed by order of the President or the Secretary of War, and the officers of the volunteer forces are subject to the same regulations as the regular army forces.
the several States and Territories and the District of Columbia in proportion to the respective populations thereof. When the raising of a volunteer force has been authorized by Congress and after the organized land militia of such States or districts has been called into the military service of the United States, volunteers of that particular arm or class may be raised and accepted into said service regardless of the extent to which other arms or classes of said militia have been called into said service. The volunteer forces are subject to the laws, orders and regulations governing the regular army in so far as such laws, orders and regulations are applicable to officers or enlisted men whose permanent retention in the military service, either on the active list or on the retired list, is not contemplated by existing law, and no distinction is made between the regular army, the organized militia while in the military service of the United States, and the volunteer forces. Acts in respect to the promotion or to the conferring upon officers or enlisted men of brevet rank, medals of honor, certificates of merit or other rewards for distinguished service, nor in respect to the eligibility of any militia of the said army, into said service, of volunteer forces for service upon any court-martial, court of inquiry or military commission. The organization of all units of the line and of the signal troops of the volunteer forces is the same as that prescribed by law and regulations for the corresponding units of the regular army. When military conditions so require, the President may organize the land forces of the United States into brigades and divisions and such higher units as he may deem necessary, and the composition of units higher than the regimental is as he may prescribe. To each regiment of infantry, cavalry and artillery and to each battalion of engineers and signal corps troops, there is attached the same personnel of the Medical Department as are attached to like organizations of the regular army. The organization of the coast defense, of machine-gun detachments, establishments of the Medical Department, remount depots, military trains, secret-service agencies, military prisons, lines of communication and other adjuncts that may be necessary in the prosecution of war and the organization of which is not otherwise provided for by law, is as the President may from time to time direct. Except as otherwise provided the President, in the advice and consent of the Senate, to appoint all volunteer officers required, but the number and grade of such officers does not exceed the number and grade of like officers provided for a like force of the regular army. All appointments below the grade of brigadier-general in the line of the volunteer forces are by commission in an arm of the service and not by commission in any particular regiment, and officers in each arm of the service are assigned to organizations of that arm from one organization to another in that arm, as the interests of the service may require, by orders from the Secretary of War. To provide the staff officers necessary in the various staff corps and departments of the regular army, and that are not otherwise provided for, the President is authorized to appoint, by and with the advice and consent of the Senate, such number of volunteer staff officers of grades authorized by law for the regular army as he may find necessary for such corps and departments. The total number of such staff officers so appointed, including all officers from the regular militia called into the military service of the United States, does not exceed the ratio of one officer to 200 enlisted men for all militia and volunteer forces called into the military service of the United States. The number of volunteer staff officers appointed in any grade in the various staff corps and departments does not exceed in any staff corps or department the proportionate strength of regular officers of the corresponding grade as established by law for the corresponding staff corps or department of the regular army. The President may appoint, by and with the advice and consent of the Senate, volunteer chaplains at the rate of one for each regiment of volunteer infantry, cavalry and field artillery, and one for every companies of volunteer coast artillery raised, with rank corresponding to that established by law for chaplains in the regular army. In appointing the volunteer officers the President may select officers from the volunteer army, from those duly qualified and registered pursuant to section 23 of the Act of Congress, approved 21 Jan. 1903, from the country at large, from the organized land militia of the District of Columbia and, upon the recommendation of the various governors, from the organized land militia of the several States and Territories in proportion, as far as practicable, to their respective populations, and, as far as compatible with the interests of the military service, from the localities from which the troops with which the officers appointed upon said recommendation are to serve have been recruited. In appointments from the country at large preference is given those who shall have had honorable service in the regular army, the national guard or the volunteer forces, or who have been graduated from educational institutions in which military instruction is compulsory. At the same time, not to exceed one regular army officer may hold a volunteer commission in any one battalion of volunteer engineers or signal troops, or in one battalion of volunteer field artillery, and not to exceed four regular army officers may, at the same time, hold commissions in any one regiment of volunteer cavalry, field artillery or infantry, or in any 12 companies of coast artillery, including their field and staff. Regular army officers appointed as officers of volunteers do not thereby vacate their regular army commissions nor are they prejudiced in their relative or lineal standing thereafter by reason of their service under their volunteer commissions. The temporary vacancies created in any grade not above that of colonel among the commissioned personnel of any arm, staff corps or department of the regular army, through appointments of officers thereof to higher volunteer rank, are filled by temporary promotions, according to seniority in rank of officers holding commissions in the next lower grade in said arm, staff corps or department, and all temporary promotions are in like manner filled from, and thus create temporary vacancies in,
the next lower grade, and the vacancies that remain thereafter in said arm, staff corps or department, that cannot be filled by temporary promotions, may be filled by the temporary appointment of officers of such number and grade or grades as maintain said arm, corps or department at the full commissioned strength authorized by law. In the staff corps and departments subject to the provisions of sections 26 and 27 of the Act of Congress, approved 2 Feb. 1901, and acts amendatory thereof, temporary vacancies that cannot be filled by temporary promotions are filled by temporary details made in the manner prescribed in said sections 26 and 27 and acts amendatory thereof, and the resulting temporary vacancies in the branches of the army from which the details are so made are filled as herebefore in this section prescribed. Officers temporarily promoted to the grade of colonel are so promoted or appointed by the President, by and with the advice and consent of the Senate, for terms that do not extend beyond the termination of the war or, if war shall not occur, beyond the passing of the imminence thereof, as defined by the act of the United States, and upon the expiration of said terms said officers are discharged from the positions held by them under their temporary promotions or appointments. Officers temporarily promoted under the provisions of this section do not vacate their permanent commissions, nor are they prejudiced in their lineal or relative standing in the regular army under permanent commissions, by reason of their services under temporary commissions.

All returns and muster-rolls of organizations of the volunteer forces and of militia organizations while in the service of the United States are rendered to the adjutant-general of the army, and upon the muster out of such organizations the records pertaining to them are transferred to and filed in the adjutant-general's office. Out-regimental and out-military officers serving with volunteer troops or with militia organizations in the service of the United States, in the field or elsewhere, are required to keep a daily record of all soldiers reported sick or wounded, as shown by the morning calls or reports, and deposit such reports, with other reports, in the adjutant-general's office.

In time of war or while war is imminent all organizations of the military forces in the military service of the United States are recruited and maintained as near their prescribed strength as practicable. For this purpose the necessary rendezvous and depots are established by the Secretary of War for the enrollment and training of all recruits, and in order that officers may be available for recruiting duty the President is authorized, by and with the advice and consent of the Senate, to appoint officers of volunteers of the proper arm of the service, in numbers not to exceed at the rate of one major, four captains, five first lieutenants and five second lieutenants for each organized regiment of cavalry, field artillery or infantry, each three battalions of engineers or each 12 companies of coast artillery. In the instruction and discipline, troops at recruit depots may be organized into companies and battalions, at the discretion of the Secretary of War, with non-commissioned officers and privates of such grades and numbers as may be prescribed by the President. The recruit rendezvous and recruit depots are under the direct control of the Secretary of War, and render their reports and returns to the adjutant-general of the army. To maintain the organized land militia organizations in the military service of the United States at their maximum strength the recruiting rendezvous and depots in any State or Territory must be maintained by the agent of the governor thereof, enlist and train recruits for the organized land militia organizations in the service of the United States from said State or Territory. In the organization of a recruiting system, after Congress shall have authorized the raising of volunteer forces, the President is authorized to employ retired officers, non-commissioned officers and privates of the regular army, either with their rank on or they retired list or, in the case of enlisted men, with increased non-commissioned rank, or he may, by and with the advice and consent of the Senate, appoint and employ retired officers below the grade of colonel, with increased volunteer commissioned rank, not to exceed in rank that held by him upon the retired list, or enlisted men with volunteer commissioned rank not above that held by him upon the retired list, or enlisted men with volunteer commissioned rank not above grade of first lieutenant. Retired officers and enlisted men while thus employed are not eligible for transfer to the field units, but receive the full pay and allowances of the respective grades in which they are serving, whether volunteer or regular, in lieu of their retired pay and allowances. Upon the termination of the duty or, in case of those given volunteer rank, upon muster out as volunteers said retired officers and enlisted men revert to their retired status.

Except as otherwise specifically prescribed by law, all officers are subject to such assignments of duty and such transfers as the President may direct. Medical officers of volunteers when detailed as consulting surgeons do not exercise command over the hospitals to which they may be assigned for duty, except by virtue of their commissions they may command all enlisted men. Medical inspectors are detailed for duty with each army, field army or army corps and division, and for the base and lines of communications, and no officer is detailed for duty as a medical inspector except he be experienced in military sanitation. All officers and enlisted men of the volunteer forces are in all respects on the same footing as to pay, allowances and pensions as officers and enlisted men of corresponding grades in the regular arm.

In accordance with a proper military policy for the United States as prepared by the War College Division, general staff corps in addition to any forces that may be maintained and trained in time of peace, provision must be made for vastly increasing such forces in time of war. These must come from the untrained body of citizens and provision for raising them is contained in the Act of Congress approved 25 April 1914. This act meets the military needs for purposes so far as concerns the enlisted personnel, except in two particulars: first, that under the existing laws certain organizations of the militia, with numbers far below the full strength, can
VOLUNTEERS OF AMERICA—VOMITING

enter the volunteer force in advance of other similar volunteer organizations from the same State; and second, no volunteers of any arm or branch can be raised until all the militia of that particular arm or branch have been called into the service of the United States.

EDWARD S. FARROW, Consulting Military Engineer.

VOLUNTEERS OF AMERICA. The, a religious body organized from former members of the Salvation Army (q.v.) in 1896 by Commander and Mrs. Ballington Booth and consisting of six regiments, embracing nine companies or central societies and nearly 100 self-supporting posts, not including outposts. The chief official is elected by the members as commander-in-chief, and by the directors as president. There are headquarters in New York City and branches in the principal cities of the United States. The minor councils of officials throughout the country are represented by a Grand Field Council. They give an immense number of free lodgings and meals to those out of work and all principal institutions. Their Volunteer Hospital in New York has treated in one year 22,000 old and 12,000 new cases. Homes are maintained for friendless young women, and there is a branch for child protection. The Prison League is an important department of volunteer activity. It maintains leagues in 30 States and records over 70 per cent of criminals returned to honest living. There is an aggregate annual attendance of 150,000 persons at the ball meetings and 2,000,000 at the open-air meetings.

VOLUSENUS, Florentius. See Wilson, Florence.

VOLUTE, a spiral scroll used in Ionic, Corinthian and Composite capitals, of which it is a principal ornament. The number of volutes in the Ionic order is four. In the Corinthian and Composite they are more numerous, in the former being accompanied by smaller ones, called helices. See Architecture.

VOLUTE WHEEL, a volute-shaped wheel that in rotating presents its open mouth to the air, which is thus gathered into the tube and discharged through the hollow axis. It is a common and effective sort of blower. Also, a water-wheel with radial or curved buckets, in which the periphery of the wheel is surrounded by a volute-shaped casing or scroll.

VOLVOX, a minute aquatic plant (Volvox globator), in the form of a pale green globule floating about in the water. Under the microscope it is seen to be a spherical membranous sac, studded with innumerable green points giving exit to cilia, which enable it to roll over and over in the water. Within the sac are various dense globules, generally green in summer, but often of an orange color in autumn and early winter. They are zoospore-like bodies, each sending a pair of cilia through separate orifices. There is a reddish-brown spot and a contractile vacuole.

VOLVULUS, vol'vŭ-lŭs (Latin volvō, I roll or twist); in medicine, term denoting a twisting of the intestine, producing obstruction to the passage of its contents. A disorder of a different kind, but with similar symptoms and often similar results, is Intussusception (q.v.). There are three distinct varieties of rotatory movement capable of giving rise to volvulus—

1. A portion of intestine may have become twisted on its own axis, and in such semi-rotation brings the intestinal walls into contact, so as to close the passage: this is a rare condition, occurring only in the ascending colon.
2. The mesentery (q.v.), or a part of it, may be twisted into a coil of intestine with it; the mesentery being the axis, and the intestine being rolled up on it; this form occurs in the small intestine.
3. A single portion or a coil of intestine may afford the axis round which another portion with its mesentery is thrown, so as to compress it, and close the passage. A coil of small intestine, the sigmoid flexure or the cæcum (see Digestion), may form the axis. All these varieties occur chiefly in advanced life, and their seat is commonly toward the posterior unyielding wall of the abdominal cavity, the smoothness and yielding nature of the parts anteriorly rendering such an event almost impossible. The symptoms of twisting of the intestine, especially of the sigmoid flexure, the most common seat of the affection, are usually distinctly marked from the beginning. Great pain is suddenly experienced in a small circumscribed spot of the abdomen, obstinate constipation usually setting in from that date. If the sigmoid flexure, which lies just above the rectum, is the seat of the twisting, the abdomen soon becomes distended, especially on the left side, the distention being much more marked than when the twist is in the small intestine, as might physiologically have been expected. Vomiting, often constant and copious, is usually present. These cases are so desperate in their nature that it is needless to enlarge on their treatment. Attempts to remove the displacement by injecting water or air into the intestine through a long tube have often been made, but with slight success. Operations for relief of this and other intestinal obstructions, e.g., intussusception, have until recently been very often fatal, but of late the progress of surgery, especially in connection with antiseptics—has greatly reduced the ratio of fatal results. Intestinal obstructions produced either by Volvulus or by other causes have been successfully treated by surgical means; diseased portions of the intestine (e.g., the appendix vermiformis) have been cut out and the separated parts reunited by sewing (enterorrhaphia). In the treatment a few rules are universally applicable, viz., wherever symptoms such as above described occur, aperients should be given only by the rectum, while opium should be freely given by the mouth. Leeches and hot fomentations should be applied to the seat of pain, and all solid food should be prohibited, the nourishment being given solely in fluid form.

VOMER, one of the bones of the skull. See Head; Skull.

VOMITING, the ejection of the stomach's contents through the mouth, mainly by spasmodic contraction of the abdominal muscles, assisted by the active co-operation of the muscular walls of the stomach; the diaphragm remains fixed, affording a firm surface against which the stomach is pressed by the abdominal muscles. Relaxation of the sphincter at the cardiac orifice of the stomach is necessary, as its contraction will resist the power of all the
expulsor muscles combined, explaining the vio-
lent and vain efforts to vomit, often seen and
experienced; the act is preceded by a deep in-
spiration, the glottis being spasmodically closed
during the paroxysm. It may be produced by
irritating substances applied to the mucous
membrane of the stomach, the impression being
conveyed by the pneumo-gastric nerves and the
motor nerves of expiration, as after taking
common emetics; by irritation in other parts of
the body, and excited by reflex nervous ac-
dition, as in strangulated hernia, the passage of
calculi and during gestation; and by impressions
received through the sensorial centres, whether
emotional or sensational, as from tickling the
fauces, disgusting sights or odors and in sea-
sickness; even the recollection of these sensa-
tions may cause vomiting in very impression-
able persons. It is a common symptom of many
diseases of the stomach and intestines, and
arises from symphysis, irritation of the pyloric
nerve and various narcotics, creosote, chloroform
and ether. In many birds and some mammals, the
contents of the stomach are ejected as a means
of offense, as in the petrels and vultures, and
the lambs. Vomiting is in many cases entirely
salutary, and in such cases is to be encouraged and
assisted. By concentrating on the desired object
many persons are able to vomit at will and thus
rid themselves quickly of fermenting food that
has failed to digest in the normal manner.

VON DROSTE-HÜLSHOF, drōset-'hülsh-fof, Annette Elisabeth, German poetess: b. Münster, Westphalia, 10 Jan. 1797; d. Meers-
burg on Lake Constance, 24 May 1848. She en-
joyed the advantage of association and friend-
ship with many noted men of letters, exhibiting
always a decided distaste for so-called feminine
occupations and devoting herself altogether to
intellectual pursuits, especially such as gave
stimulus to her lively imagination. Thus while
still a young girl she contributed to the Kinder-
und Hausmärchen of the brothers Grimm. Her
formal education, too, was carried further than
was usual for a girl of her day. A devout
Catholic, her collection of religious lyrics 'Das
geistliche Jahr,' of which the first half was
written in 1830 and the second in 1839, makes
a very substantial contribution to this branch of
religious poetry of the 19th century. In 1825 she
made her first journey to Cologne and the
Rhine country, where she made the acquaintance
of A. W. Schlegel, Karl Simrock, and later of
Adèle Schopenhauer, the sister of the philoso-
pher. In the following year her father died and
in 1829 her brother Ferdinand. With the
unimportant exception of two trips to the
Rhine in 1828 and 1830 and a visit to her sister
Jenny, who had married Baron Josef von Lass-
berg, Switzerland, she lived in quiet seclusion
first in her birthplace, and from 1841 to her
death with the Lassbergs in Meersburg on the
shores of Lake Constance. Here an old ac-
quaintance with Levin Schücking, 17 years her
junior, whom the baron called to Meersburg in
1841 to catalogue his library, deepened into some-
thing like an unrequited passion, and in that
year she produced an entire volume of lyrics.
Since 1814 she had been in delicate health and
now began visibly to decline. She died in the
year of the revolution, 1848, and is buried in
Meersburg. Levin Schücking became her most
appreciative biographer. Her best non-religious
lyrics are 'Häklebilder,' in which wise and deli-
crate appreciation of nature she pictures the
lonely moods of her native Westphalia. For
her ballads, in which she is even more success-
ful, the gloomy legends of this district are her
favorite subjects. She also wrote a number of
longer epic poems, among them 'Das Hospiz'
and 'Die Schlacht im Loener Bruch.' One of
the very best German novelists is 'Die Juden-
buch.' The softer notes of sentiment are lack-
ing in her work. Levin Schücking says that
Droste-Hülshoff's verse, which is pervaded through-
out by an earnestness, a chastity and selflessness
which frequently borders upon acerbity, even in
form and diction. She is generally regarded as
Germany's great poet and in her own time was
titled from a large bibliography are the fol-
lowing: 'Collected Works,' edited by Levin
Schücking (3 vols., Stuttgart 1879); id., by
Elizabeth von Droste-Hülshoff ('Paderborn
1884-87'), 'Biography and Correspondence;
'Letters of Annette von Droste-Hülshoff and
Levin Schücking,' edited by Theo Schücking
(Leipzig 1843); Schücking, Levin, 'Annette
von Droste, ein Lebensbild' (Hanover 1862);
Busse, Karl, 'Annette von Droste' (1903).

WILHELM ALFRED BRAUN.

VON EMMICH, ēm’tch, Otto, German army
officer: b. Minden, Westphalia, 1848; d.
1915. He became a lieutenant (1868), took part
in the campaign of 1871, was promoted to colonel
(1897) and became commander of an infantry
brigade (1903). He was raised to the rank of
general of infantry (1909) and during the early
days of the World War commanded the Ger-
man army of the Meuse and laid siege to Liége.
Afterward he won distinction in the Galician
campaign and in East Prussia. In 1913 he was
elevated to the nobility.

VON HOLST, vōn hölst, Hermann Edu-
ard. See Holst, Hermann Edu-
ard.

VON MANNLICHER, fōn mânl’ih-ēr,
Ferdinand. See Mannlicher, Ferdinand von.

VONDEL, vōn’dēl, Joost van den, Dutch
dramatic poet: b. Cologne, 17 Nov. 1587; d.
Amsterdam, 3 Feb. 1679. His parents, who
were Anabaptists, removed to Holland while he
was a child, and had him baptized as a child
in the Arminian faith, but finally died in the bosom
of the Roman Catholic Church. Nature had
endowed him with extraordinary talents, and
he derived little aid from education. Devoting
himself entirely to the cultivation of Dutch
poetry, Vondel first learned Latin and French
in the 30th year of his age. His works display
genius and elevated imagination, and embrace
lyric and didactic poems, satires, an epic and
some 30 tragedies, some of which are founded
on Biblical subjects and bear such titles as
'Lucifer,' 'Noah,' 'Jephtha,' etc. These enjoy
a high reputation in Holland, and the inter-
spersed choruses may be regarded as the finest
VOONNOH—VORARLBERG

lyrical productions of the Dutch muse. The best collective editions of his works are those by Jan van Lennep (1859-69) and Unger (1890 onward). The dramatic poem 'Lucifer' (1854) is his best and most popular work. Voronov is supposed to be the source of the inspiration of Milton's 'Paradise Lost,' but this may reasonably be doubted. English translations of Vondel's 'Lucifer' (1898); 'Samson' (1903); and 'Adam' (1811) have been made by C. V. Monnep. Consult 'Lives' by Baumgartner (1882); Haack (1890); Looten, 'Etude littéraire sur Vondel' (1889); Müller, 'Über Miltons Abhängigkeit' (1891).

VOONNOH, vŏn'noh, Bessie Potter, American artist: b. Saint Louis, Mo., 17 Aug. 1872. She studied in Italy and Paris and was awarded medals at the Paris Exhibition (1900) and the Saint Louis Exposition (1904) at San Francisco. Among her works are 'The Young Mother' (Metropolitan Museum, New York). She is an associate of the National Academy. She is represented in the Metropolitan Museum of Art, the Chicago Art Institute, the Corcoran Art Gallery at Washington and the Brooklyn Museum. Besides the picture which hangs in the Metropolitan Museum she has produced 'Mother and Child' (1905); 'A Modern Madonna' (1905); 'Beatrice' (1906) and others.

VOONNOH, Robert William, American artist: b. Hartford, Conn., 17 Sept. 1858. He studied at the Massachusetts Normal Art School, Boston, 1875-79; was instructor there in painting and drawing, 1879-81; in 1881-83, and again from 1886 to 1891, studied in Paris, teaching in the interval at the Museum of Fine Arts, Boston. He acquired a manner in which realism and impressionism are emphasized by dramatic effects and boldness of treatment in light, color, etc. Whether in portrait, figure or landscape painting his work has individuality and interest, and his success particularly as a portrait-painter has been marked. From 1891 to 1896 he was principal instructor in portrait and figure painting at the Pennsylvania Academy of the Fine Arts. He has exhibited much in this country and in Europe. Among his works are 'Sad News'; 'Miss Mildred Blair'; 'Little Louise.'

VOODOO. See Voodoo.

VOOREEES, voor', Daniel Wolsey, American legislator: b. Liberty, Ohio, 26 Sept. 1827; d. Washington, D. C., 10 April 1897. He was graduated from Indiana Asbury (now De Pauw) University in 1849, admitted to the bar in 1851 and engaged in law practice at Covington, Ind. In 1855-56 he was United States district attorney for Indiana, and he was appointed for the defense of John E. Cook during the latter's trial for participation in John Brown's raid. He was member of Congress in 1861-66 and in 1869-71, and from 1877 to a few months before his death sat as United States senator from Indiana. He was a member of the Finance Committee throughout his entire career in the Senate, and an advocate of free and unlimited coinage of silver until 1893 when he cast his vote to repeal the silver-purchase clause of the Sherman Act. He was largely instrumental in securing the erection of the Congressional Library building, and was noted as an orator.

VOOREEES, Edward Burnett, American agricultural chemist: b. Mine Brook, N. J., 22 June 1856; d. 1911. He was educated at Rutgers College and became director of the New Jersey Agricultural Experiment Station, and served as president of the State Board of Agriculture (1902) and the New Jersey Conservation Commission (1909). He headed the association of agricultural chemists in 1894. He was the author of various valuable papers and received the Nichols research medal in 1902. His publications include 'First Principles of Agriculture' (1896); 'Fertilizers' (1898; 9th ed., 1907); 'Forage Crops' (1907; 2d ed., 1911).

VOOREEES, Philip Falkerson, American naval officer: b. New Brunswick, N. J., 1792; d. Annapolis, Md., 26 Feb. 1862. He was appointed midshipman in the navy in 1809, served in the War of 1812, participated in the capture of the Macedonian and the Epervier, and received a Congressional medal of honor for his services. He attained rank as captain in 1838 and was assigned to command the Congress, in which capacity he captured, in 1844, an Argentine squadron and an allied cruiser which had fired on an American ship. His action was commended in home and foreign diplomatic circles, but he was tried by court-martial. His course was vindicated, and in 1847 he was assigned to command the East Indian squadron, a position equal to the rank of rear-admiral, which had not then been established in the United States navy.

VOORSANGER, foo'rance, Jacob, American rabbi and educator: b. Amsterdam, Holland, 13 Nov. 1852. Taught at the theological seminary of his native city, he came to the United States about 1870, and was rabbi at Philadelphia (1873-76), Washington, D. C. (1876-77), Providence, R. I. (1877-79), and Houston, Texas. (1878-86). Since 1886 he has been rabbi of Temple Emanu El, San Francisco, Cal. He edited The Sabbath Visitor for three years, besides making numerous contributions to leading Jewish weekly papers. In 1884 he was elected professor of Semitic languages at the University of California. He has written 'Moses Mendelssohn, Life and Works'; 'Chronicles of Emanu El.' He founded in 1895 a weekly, Emanu El.

VOPADEVA, vo-pá-dá've, celebrated grammarian of India whose date, given by some as the 12th century, is, according to Burnouf's investigation, the second half of the 13th century. He wrote a grammar entitled 'Mugdhabodha,' held in high repute, especially in Bengal; it was commented on by Durgadāsa (text and commentary edition at Calcutta 1861). It differs from the great work of Pāṇini in arrangement and terminology, and is of far less value, though very serviceable in giving many later Sanskrit formations. Vopadeva composed other works, and a general though doubtful tradition makes him author of the 'Bhāgavata-Purāṇa.'

VORARLBERG, för-år'lĕr' (the land in front of Arlberg, a mountain in the Alpau Alpine system): district administratively united with the Tyrol, but retaining part of its ancient autonomous institutions. It lies east of the Austrian Alps and south by the Swiss canton Graubünden, west by the principality of Liechtenstein and the canton of Saint Gall, north by Bavaria, 1,005
square miles. Where the land approaches the Lake of Constance and the Rhine and in the valley of the Ill, the country is a fertile plain; the Alps help up the rear. The surface is forest (Bregenzer Wald). Cattle and timber are the chief products. The manufacture of cotton fabrics is a considerable industry in Vorarlberg; employing 180,000 spindles and 4,000 power-loomers; a home industry for the women is the manufacture of embroidery for insertions, edgings, etc. Bregenz, the capital, is a centre for manufacture of wooden-wares. Vorarlberg has, as a reminiscence of its ancient condition as an independent state, its own assembly or Landtag, consisting of 19 members, one representing the chamber of commerce, four the towns and 14 the parishes. Pop. 145,794.

VORONEZH, vo-ro-nězh, Russia, (1) The capital of a government of same name, on a height above the Voronezh, near its confluence with the Don, 290 miles south-southeast of Moscow. It consists of a high town, a low town and three extensive suburbs—is well built and has a cathedral, an episcopal palace, town-house, gymnasium, diocesan seminary, arsenal, hospital and poorhouse, manufactures of woolen and linen cloth, soap and vitriol, numerous tanneries, a considerable trade in corn and tallow, and important fairs and markets. Voronezh was founded in 1589 and has interesting associations of Peter the Great, and of the poets Nekitin and Koltsoff. It suffered three disastrous fires in the 18th century, but was rebuilt on each occasion. Pop. about 94,800. (2) The southern government of Voronezh has an area of 25,443 square miles. It is intersected by the Don, which receives the whole of the drainage, partly through its tributaries, the Voronezh and Khoper. The soil is generally fertile, and large creps of grain, tobacco and sugar beets are raised. The breeding of horses and sheep is an important industry. Manufactures are considerable and there is an extensive trade. Pop. about 3,687,000.

VOROSMARTY, vo-rô-sh-mart-y, Michael, Hungarian poet; b. Nyék, comitat of Stuhlweissenburg, 1796; d. Budapest, 19 Nov. 1855. He studied in Pest, practised for a time as an advocate, in 1848 was a member of the National Assembly and was twice imprisoned for political reasons by the Austrian government. A memorial to him was placed at Stuhlweissenburg in 1866. Among his poems and dramas were 'King Solomon' (1821); 'The Victory of Faithfulness' (1823); 'Zalán's Flight' (1825); 'Cserholom' (1826); 'Erku' (1828); 'Gongor and Tünde' (1831); 'Banus Maró' (1838). Gyulai prepared a collective edition (1864; 2d ed., 1884) and a biography (1864; 4th ed., 1896).

VORPARLAMENT. A preliminary gathering of several hundred Liberal leaders who met at Graz, 1 March 1848, to provide means to call a national Parliament to deal with the demand for a reorganization of the political system. They decided on an assembly elected directly by the people without distinction as to rank, religion or property, to meet at Frankfort to draw up a constitution. There was much agreement between the monarchial and republican factions and the latter seceded from the meeting and attempted to start an insurrection which was promptly suppressed. After the dissolution of the Vorparlament its work was continued by committees until the national Parliament assembled. See GERMANY.—HISTORY.

VORSE, Albert White, American editor; b. Littleton, Mass., 18 Aug. 1866. He was graduated from Harvard in 1889, was connected with the Philadelphia Press, 1891-93, the New York Mail and Express, 1894-96 and subsequently with the Illustrated London News and the Criterion, 1899-1901. He has published 'The Laughter of the Sphinx' (1900).

VORTEX, a whirlpool or eddy; any fluid rotating around an axis; specifically that portion of a fluid mass that is in a whirl. The name is applied to pools, waterspouts, whirlpools, and on a larger scale in cyclones and storms generally. Descartes supposed certain vortices to exist in the ether of space endowed with a rapid rotary motion and filling all space, and by these he accounted for the motions of the universe.

VORTEX ATOM, an atom assumed to be a vortex ring in a non-frictional ether. See VORTEX MOTION.

VORTEX MOTION, the motion of a fluid in a closed curve; it is unequal, that is, the fluid does not rotate as a mass. If two vortices of unequal size approach, the smaller floats through the larger one. One of the most striking examples of vortex motion is seen in smoke rings emitted occasionally by locomotives and other high pressure steam-engines when exhausting slowly. Similar and more definite rings are easily produced also by devices now common in physical laboratories. Helmholtz, who was the first to investigate the theory of vortex motion, showed that vortex rings and filaments, or combinations thereof, in a perfect liquid (which has no friction) can be in a state of equilibrium and are indestructible. Extending this idea to perfect fluids, Lord Kelvin suggested that the atoms and molecules may be vortex rings or filaments, or combinations thereof, in the ether. The motion of a mass of fluid is known if the motion of every infinitesimal portion, or particle, of the mass is known. The motion of a particle is investigated by referring the successive positions it occupies in its journey to a set of three straight lines, or axes, which pass through the same point and are mutually rectangular. With respect to these axes the motion of the particle may assume either one of two characteristic types. It may move without rotation about either of the axes, or it may move with rotation about one or more of the axes. The former type is called irrotational motion, and the latter type is called rotational motion, or vortex motion. The vortex type of motion is by far the more common in nature and manifests itself in an infinite variety of ways. For the theory of vortex motion and references to the literature of the subject, consult Lamb, 'Hydrodynamics.'

VORTEX RING. See VORTEX MOTION.

VORTECELLA, vôr-te-sèl-là, type of a family (Vorticellidae) of attached or free forms of peritrichous ciliates (animalcule), in which the oral and cirrioral zone of a cilia forms a right spiral (dextrotropic), while a secondary circket of cilia near the aboral end may be either permanent or transient. The true vor-
ticulars, represented well by the common bell-animalcule, are without a permanent second circle of cilia, and the peristome may be completely included in a peristomial chamber which contracts sphincter-like about it. The stem is either firm and constant in length, or flexible and capable of being contracted suddenly when it becomes a short close spiral. The individuals also are mounted on a single unbranched stalk or grouped on a common branching stalk in colonial existence. The simplest type of reproduction is longitudinal division, which may result in producing two individuals in a branched stalk, or one of the two may become detached and, propelled by a newly-formed circle of cilia near the basal end, lead a free existence for a time. Soon the free form settles down and develops a stalk. Conjugation has been observed and always takes place between a stalked form and a free swimming form produced by budding. The bell-animalcule has long been a favorite object of microscopic study from its abundance and easily observed structure and activities. Ehrenberg (1838) made an extensive study of these organisms and maintained that they possessed the complete organ systems of higher forms. The demonstration of their unicellular nature necessitated the abandonment of this view. The group is rich in number and variety of species. They are found in all sorts of aquatic environments but are exceptionally abundant in some types of polluted streams.

HENRY B. WARD,
University of Illinois.

VORTIGERN, vör-ti-gérn, a semi-mythical British king of the 5th century, who, according to Gildas, Bede, Ethelweard and the 'Old English Chronicle,' invited Hengist (q.v.) and Horsa to assist him against his enemies, the Picts and Scots. Whether invited by Vortigern or not, the newcomers are said to have turned against him and wrested from him the Kentish territory. There is something like unanimity in the chroniclers regarding Vortigern's character. They make him tyrannical and licentious, and of course he came to a violent end in conflict.

VOS, vöös, Geerhardus, American Presbyterian theologian: b. Heerenveen, Holland, 14 March 1862. He was educated at the seminary of the Holland Christian Reformed Church at Amsterdam and at Princeton Seminary and was professor of theology in the former institution 1888-94 and since the year last named has held a similar post at Princeton. He has published 'The Mosaic Origin of the Penta- teuchal Codes' (1886); 'De Verbondsleer in de Gereformeerde Theologie' (1881); 'The Teaching of Jesus' (1903), etc.

VOS, Maarten de, Flemish painter: b. Antwerp, 1532; d. there, 1603. He studied in Antwerp under his father, Pieter de Vos, and De Vriendt, and at Venice under Tintoretto, established a school of painting in his native city. He was one of the most popular artists of his day, hundreds of engravings of his paintings and drawings being made. Among his works are 'The Triumph of Christ'; 'Cæsar's Penny'; 'The Marriage at Cana,' in the cathedral at Antwerp; 'Saint Luke Painting the Portrait of the Virgin.' He is sometimes styled 'the Elder,' in distinction from his son Maarten (b. 1576; d. 1613), also an artist.

VOSE, George Leonard, American civil engineer: b. Augusta, Me., 19 April 1831; d. 1910. He was educated at home and at Salem, Mass., studied at the Lawrence Scientific School at Harvard and began his career as assistant engineer on the Kennebec and Portland Railroad. He was associate editor of the American Railway Times in Boston (1859-63), removed to Paris, Me. (1866) where he was engaged in railroad projects, was professor of engineering in Bowdoin College (1872-81) and held a similar chair in the Massachusetts Institute of Technology (1881-86). He was the author of several standard works on professional subjects, notably 'Bridge Disasters in America: The Cause and the Remedy' (1887).

VOSGES, vòzh, a European chain of mountains about 100 miles long, partly on the frontiers of France and Alsace, partly in Alsace, extending from north-northeast to south-southwest, nearly parallel with the Rhine, and apparently a continuation of the Jura Mountains, which separate France from Switzerland; the breadth varies from 20 to 45 miles. The highest summit, Ballon-de-Guebwiller (the summits are generally called balls), has an elevation of 4,685 feet above the surface of the sea. The existence of this ridge, averaging 3,000 feet in height, forms a natural barrier, and confined the German attacks in the World War to the northern area of France. The Vosges Mountains have a gentle declivity and on the eastern and southern sides are covered with vineyards. Great part of the Vosges is densely wooded, and, besides abounding in game, they possess great mineral wealth, including silver, copper, iron, lead, coal and anthracite. They also contain excellent pasturage and the inhabitants breed many cattle. The Ill, Lauter, Moselle, Meurthe, Saar and Saône rise in this chain of mountains.

VOSGES, France, an eastern department bounded on the north by the departments of Meuse and Meurthe, on the east by Alsace, on the south by the departments of Haute-Saône and on the west by Haute-Marne; area, 2,303 square miles; capital, Epinal. The department derives its name from the mountain range which bounds it on the east, and sends out ramifications over the greater part of its surface. Its south portion is traversed east to west by the chain of the Fauçilles. In the lower grounds, on an elevated but tolerably flat tract, grain, hemp, flax and potatoes are extensively raised. The wine produced is indifferent, but the department has long been famous for its kirschwasser made from the produce of extensive cherry-plantations. The principal rivers are the Meuse, Mouzon, Madon, Moselle, Saône and Meurthe; but none of them are navigable within the department. The minerals include argentiferous lead, copper, iron, antimony, cobalt, marble, millstones, slate, kaolin and fine agates. The chief manufactures are the famous Gersome or Munster cheese, cotton and linen cloth, lace, musical instruments, woodware, nails, iron, steel and iron ware, paper, leather, pottery and glass. Pop. 433,914.

VOSS, fös, Johann Heinrich, German poet and translator: b. Saarbrücken, 20 Feb. 1751; d. Heidelberg, 29 March 1826. He early began to write verses and some of these contributed to the 'Göttingen
VOSSIUS.—VOTE, VOTERS, VOTING

Musealmanchach led to a correspondence with Boie, upon whose invitation he went in 1772 to Amsterdam. He had learned the classical and modern languages and was one of the founders of the Göttinger Dichterbund. The editorship of the 'Musealmanchach' was handed over to him by Boie in 1775; in 1778 he was made rector of Gnadenhaus in Hanover, in 1782 at Erfurt; and in 1781, after the publication of several treatises, he produced his German 'Odyssey,' a work which has rendered this grand poem national with the Germans (new ed. by Bernays, 1881). This has been called the most perfect rendering of Homer into a modern tongue. In 1793 appeared his translation of the 'Iliad,' and of that of the 'Odyssey,' in a new form, in which, however, it did not please so much as before, the former displaying greater truth and naturalness. He published in 1795 an idyl in the epic form called 'Lusie,' printed first in 1783, but now produced with improvements. His translation of the whole of 'Vergil' (1799) was revised for the edition of 1821. In 1803 he went as professor to Heidelberg, where he remained till his death. Voss rendered good service to the study of classical antiquity and threw fresh light upon many subjects. As a translator he exhibited wonderful command of language and great skill in the handling of metres. Among his translations of Homer's works is undoubtedly the greatest; we may also mention, in addition to his 'Vergil,' his 'Hesiod' (1806); 'Horace' (1806); 'Theocritus, Bion and Moschus' (1808); 'Aristophanes' (1820); 'Tibullus' (1810); 'Propertius' (1830) and selections from 'Ovid' (1798). He also undertook, with his sons, a translation of Shakespeare which was completed in nine volumes in 1829, but this translation cannot stand a comparison with Schlegel's. Consult lives by Paulus (1826); by Herbst (1872-76); Frutz, 'Der Göttinger Dichterbund' (1841).

VOSSIUS, Gerardus Johannes, Dutch classical scholar and theologian; b. near Heidelberg, 1577; d. 17 March 1649. In 1578 the family returned to Holland and settled at Dordrecht, where Gerardus entered school. He distinguished himself at the University of Leyden, and at the age of 22 returned to Dordrecht, to become principal of the high school. He was a most assiduous and indefatigable student. While principal of the theological college of Leyden 1614-19, he published a work on Pelagianism, 'Historia Pelagiana,' in which he spoke of the Arminians in an apologetic tone, and thereby brought upon himself the wrath of the Calvinistic Dutch clergy; which caused him to be deprived of his office in the theological college. In 1622 he was appointed professor of rhetoric and chronology, and afterward of Greek, in the University of Leyden. In 1626 he was invited to England; but accepted only a prebend (from Archbishop Laud) in Canterbury Cathedral, of the value of $500 per annum, without being required to live out of Holland. He was also made L.L.D. of Oxford. In his book 'De Historicis Latinis' (1627) he retraced at least some of his former expressions of opinion, and in 1632 he was appointed professor of history in the new university at Amsterdam, where he seems to have completed the great works on which his fame rests. Among the most important not mentioned above were 'Aristarchus, sive de Arte Grammatica, Libri VII'; 'De Historici Graeci, Libri II'; 'Cuarorum Rhetoricorum, sive Oratoriae Institutiones, Libri II.' In 1649, as he was climbing the ladder of his library, it broke; he fell under the shelves and books and died of his injuries. Vossius' children were rewarded for his accomplishments and learning. Grotius said of him, in epigrammatic Latin, that it was doubtful whether by his books or his children he had contributed most to adorn the age. Five of his sons, Denis, Francis, Gerard, Mathew and Isaac, are known as authors.

VOSSIUS, Isaac, Dutch classical scholar: b. Leyden, 1618; d. February 1669, the only son of Gerard Vossius, who survived him. He was carefully educated by his father and at the age of 21 he undertook the translation of the 'Periplus' of Scylax, the Greek geographer, with Latin translation and notes. He afterward traveled in Italy, collecting valuable manuscripts. In 1648 he took up his abode at the court of Queen Christian of Sweden, from whom he taught Greek; but in 1658, in consequence of a quarrel with Salmiasius he returned to Holland. In 1670 he came to England, procuring favor through his father's merits, and was made L.L.D. of Oxford, and, though he had become an open scoffer at religion he was appointed by Charles II a canon of Windsor 1673, and had apartments assigned him in the castle, where he died. His works are numerous, and though marred by his levity and lack of judgment, some of them have been of value in ancient history.

VOTE, VOTERS, VOTING. As defined by legal authorities the word vote, as commonly used, has three meanings: (1) A ballot; (2) the expression of wish, or choice, or preference, to the exclusion of the means by which, or method through which, that result was accomplished; the suffrage, voice, or opinion of a person in some matter which is commonly to be determined by a majority of voices or opinions of persons who are empowered to give them; the formal expression of a will, preference, or choice contrary to any measure, any law, or the election of any person to office, or in regard to any measure proposed, in which the person voting has an interest in common with others, either in electing a person to fill a certain situation or office; or in passing laws, rules and regulations; (3) the expression of choice by or through a ballot, or by outcry, or any other means by which the choice of the voter may be lawfully made, known, communicated to others in the given instance; the wish of an individual in regard to any question, measure or choice, expressed by word of mouth, by ballot or otherwise; that by which the will, preference or opinion of a person is expressed. (Cyclopedia of Law and Procedure, Vol. XL, pp. 222-224, New York 1912.)

Considered by itself, courts have ruled that the ballot is 'nothing but a written note or communication from an elector addressed to the government, expressing the will of the elector, but which has not as yet been delivered'; and again, as regards the election of public officials, the ballot has always meant 'a paper so prepared by printing or writing thereon
VOTE, VOTERS, VOTING

as to show the voter's choice, and 'vote by ballot' [has always meant] the deposit of such paper in a box in such a way as to conceal the voter's choice if he so desires. Hence as the terms 'vote' and 'ballot' are sometimes confused, the courts have always distinguished between the two, regarding the ballot, under one form of voting, as the instrument by which the voter expresses his choice between two candidates or two propositions, whereas the vote is his choice or election between the two as expressed by his ballot. Illegal ballots do not constitute votes and are not counted in determining the result. See BALLOT.

Mode of Expression.—Since the vote merely expresses the will of the voter, the choice may be made either viva voce, by the use of the ballot, by a show of hands, by a division of the house or meeting, etc. The machinery or means through which the choice is expressed is termed an election. From the earliest times the term voting by ballot has been used to describe such public voting as secret voting. Most of the States require that all votes shall be by ballot and courts have decided that the voting by ballot signifies a mode of designating an elector's choice of a person for an office. The deposit of a ticket, bearing the name of such person, in a receptacle provided for the purpose, in such a way as to secure to the elector the privilege of complete and inviolable secrecy in regard to the person voted for. If secrecy in voting be required, then the only method is by ballot, and a ballot that does not secure secrecy of the vote is not a ballot within the meaning of the law. A Virginia court has ruled: 'The vote by ballot ex vi termini implies a secret ballot. The secrecy of the ballot is a right which inures in the voter and of which he cannot against his will be lawfully deprived. It must be, however, in some degree subordinate to the right to vote by ballot, of which it is but a part; and the main object, which is the right to vote, must not be defeated by a too rigid observance of the incidental right, which is that of secrecy.' See ELECTIONS; PRIMARY, DIRECT; PRIMARY, PRESIDENTIAL PREFERENCE; CORRUPT PRACTICES ACTS; MINORITY AND PROPORTIONAL REPRESENTATION.

Voters.—The word voter is commonly used in the senses: (1) A person who casts a ballot at an election; an elector who actually votes; (2) a qualified voter; a person possessing the necessary qualifications entitled him to vote. The possession of political rights is not essential to citizenship . . . ; women and minors may be citizens; 'citizen' is not synonymous with 'elector' or 'voter' although the word is sometimes used in statutes, constitutions, and city charters. ('Corpus Juris,' Vol. XI, pp. 774-75, article "Citizens"). A person may be a citizen and not an elector and an elector may not be a voter. One court has ruled: 'There is a difference between an elector, or person legally qualified to vote, and a voter. In common parlance they may be used indiscriminately, but strictly speaking they are not the same. The voter is the elector who votes — the elector in the exercise of his franchise or right to vote — not necessarily the voter as such or as the one who casts a vote that is not an actual vote. 

The vote of the people means only those people who are qualified electors of voters. See ELECTORAL QUALIFICATIONS; WOMAN SUFFRAGE; ALIENS; NATURALIZATION; CITIZENSHIP AND EDUCATION; UNITED STATES — SUFFRAGE; ELECTORAL FRAUDS AND SAFEGUARDS AGAINST . . .

Classification of Voters.—Many terms have been applied to voters or to certain elements of the population who often vote in racial or social groups. Supposedly the voters of these groups influence party action or are an asset to a particular political party. Thus we have the 'Irish vote,' the 'German vote,' the 'Negro vote;' the 'labor vote,' the Catholic and Mormon votes, the 'venal vote' (the vote that can be bought in the 'open market'), the rural and city votes (the struggle between which has sometimes resulted in distinct breaks with old party organizations — such as the Grangers and the Populist party, q.v.), the 'regular' vote, the 'independent' vote, etc.

The Independent Vote.—This term is used to distinguish the vote cast by the independent or "regular" or partisan candidate. Under the popular conception of "regularity" all the members of a party must vote the straight party ticket at all times and everywhere, irrespective of conditions or candidates. Independent movements seldom capture the "straight-out" party man who makes "regularity" the chief article of his political creed. Sometimes the independent vote results in disciplining the party, since it comes with it a warning to party managers that public opinion has ceased to favor the policies advocated or the candidates presented by them. Often the independent vote purges the party of its vicious elements by inflicting defeat at the polls and thus discrediting the party leaders (which is especially noticeable in municipal contests) but a scientious attitude always tends to preserve party purity. Politicians have recognized its influence and generally seek to gain its adherence, as in Iowa, where the Republican platform for many years contained a so-called "dead-man plank," under which members of the Republican party pledged themselves to vote against any unworthy candidate nominated by
any party. This independence of a portion of a party constituency has sometimes played havoc with the "regular" party and has often resulted in the formation of independent parties, usually known as third parties. Since the firm establishment of the Democratic and Republican parties, more than 20 of these minor parties have been organized, but most of them have disappeared after conducting one campaign, their members being reabsorbed into the regular parties or passing from public notice. Only one (the Prohibition party, q.v.) has remained continuously active since 1852, with organizations in nearly every State. The formation of this party and also of the Socialist, Granger, Farmers' Alliance, Populist, Greenback and other parties (q.v.) was not due entirely to independent movements within certain political organizations but resulted primarily from advocacy of economic principles or reform theories, the adherents of these propositions creating their own parties to obtain wider recognition for their doctrines by entering the political field, thus making them partisan issues. While only one of these parties has ever been represented in the electoral college (the Populist in 1892), still they have exerted a great influence on political policies subsequently appropriated by one of the "regular" parties which could secure their adoption by legislative bodies but (as in the case of Prohibitionists) also in the daily lives of the people through legislation passed either at their instigation or under their pressure. The labor vote also has influenced the passage, by old-line parties, of remedial legislation which has benefited all classes, but some of which undoubtedly has been enacted purely as a "catch-penny" scheme. As examples of wholly independent movements or what might be termed "parties of protest" may be mentioned the Radical Republicans of 1864 who nominated Fremont; the "Straight-out" Democrats of 1872; the "Gold Democrats"; the "Silver Republicans"; the "Independent Party" of 1908; the fusion movements in New York City against Tammany Hall, and the Progressives, the last named being formed in 1912 as a reaction against the "smoke-roller" methods of the Republican National Committee (which represented the regular or "stand-pat" element of the party) in deciding contests over delegations pledged to Taft and Roosevelt. Reform movements seldom succeed themselves and the warning and holding of a city or State on the bare proposition that one organization is better than another rarely occurs; in order to hold their positions against experienced machine politicians an equally efficient organization must be created and the "smoke-roller" methods and the machine especially emphasizes orthodoxy and places a ban on the liberty of dissent. On the other hand the independent vote has compelled the adoption of many measures that are not purely party matters, the progressive elements in both or all parties overstepping party lines and by union forcing the party bosses to accept their dictum. As instances of such movements may be cited the initiative, referendum, the initiative petition, the recall, civil service reform, woman suffrage, direct election of senators, direct primaries, child labor and liquor legislation, etc. (q.v.). See also American Political Issues; United States—Beginnings of Party Organization; United States—The New Democracy and the Spoils System.

The Popular Vote.—In the United States the expression "popular vote" is subject to several interpretations but is commonly used to denote the expression of the public will by the voters of the land as distinguished from the votes of legislative bodies or of the electoral college (q.v.). The term is a misnomer, however, since millions of women have not yet secured full suffrage and nowhere can any election be complete since various classes of the population (prisoners, mental defectives, minors, in some States paupers and vagrants, etc.) are denied the elective franchise. (See Electoral Qualifications). Under the Constitution members of the lower House of Congress are elected by popular vote but the Constitution provided in the Seventeenth Amendment to the Constitution (q.v.) in 1913. Now senators may be designated in only one of two ways—either by popular vote of the whole State or by a temporary appointment by the governor to fill a vacancy in such States where the statutes permit such appointments. (2) The Presidential electors were to be chosen in whatever way the States might designate and in some States for many years the legislatures chose these electors. Whether chosen by popular vote or by the legislature, the electors were intermediary in the election of the President and thus no votes were ever cast direct for Presidential or Vice-Presidential candidates. See also Primary, Direct; Primary, Presidential Preference.

Preferential Voting.—The prevalence of the direct primary idea (q.v.) has resulted in the enactment of legislation which practically eliminates nominations by bare pluralities when there are a sufficient number of candidates. In a few States and a few cities have adopted what is called preferential voting, the voter being allowed to designate one or more choices for each office. In Idaho, candidates must receive a majority to be nominated and the voters may indicate one choice only or first and second choices. If a majority of the first choice votes for any office are not cast for one person, both the first and second choices are counted for that office. In the Washington direct primary system, the voter indicates the first choice for an office if his party has less than four candidates, but if there be four or more candidates the voter may designate both first and second choices. If a party has four or more candidates and no one obtains 40 per cent of the first choice votes, the second choice votes are added to the first. In Minnesota and Wisconsin the designation of second choices is permitted, but should no one receive the first choice votes required for nomination, the last number of first choice votes is eliminated and his votes are divided among the candidates whom the votes had indicated as their second
choice. This process of elimination is continued until one candidate has the required number of votes. In Oregon, first, second, third and other choices for two State offices are permitted. A majority on first choices, the second choices are added and third choices also if this be necessary to give one candidate a majority. In 1917 Newark, N. J., adopted the commission form of government, with five commissioners. In the election of November 1917, the Republicans and Democrats each put forward five candidates, besides which 70 others entered the contest for the commissionerships. Each voter cast his ballot for any five candidates, he was permitted to vote for one or more of the men bracketed together and then to vote for the remaining numbers of his five outside the brackets; but to vote in the brackets for all five party choices he must vote for each man separately. After expressing his preference for his first two, the voter might express a second choice for five others; then for five others as his third choice; and then for five others as his other choice, which in reality was his fourth choice. The names of the voters to be placed in the order as above indicated. See also PRIMARY, PRESIDENTIAL PREFERENCE; ELECTIONS.

Compulsory Voting.—The abstention of voters from the polls is a recognized evil for which the remedy commonly proposed is compulsory voting, secured by imposing penalties for failure to vote. If more than a fourth of the electorate abstain from voting, a very inadequate expression of public opinion is obtained and oftentimes the result of an election would have been entirely different had the stay-at-homes voted, since a mere plurality of those voting decides most contests in the United States. A large portion of those not voting do not remain away from the polls either voluntarily or from unworthy motives. Many are deterred by tax qualifications; others are kept away by a change of residence shortly before election, or by reason of their employment (such as sailors, railroad employees, traveling men, students, etc.); and more than 300,000 negroes are disfranchised as insane, paupers, prisoners or deficient in the educational tests required by some States. Sickness, accident and the infirmities of age account for the absence of thousands, since over 600,000 voters are over 70 years of age, while errors in registering or in casting ballots deprived many of votes. In the South thousands of negroes and many whites have been deprived of their votes by laws enacted with that one object in view. Hence some estimate that not more than 20 per cent of the absentee fail, to cast a ballot through negligence. Nevertheless, various remedies have been tried both in this country and in Europe. In Belgium, Switzerland and some other European countries punishments are inflicted on non-voters. In Belgium, for the first offense, the culprit is at once cited to appear before a justice, who reprimands or fines him; the second offense is more severely punished, and the name of the refractory citizen is published by the mayor in the presence of the town hall. The man who, without excuse, has abstained from voting four times in 10 years is considered unworthy of citizenship; his name is stricken from the poll lists, and for 10 subsequent years he is debarred from holding any public office. In 1636 the general court of the Plymouth colony provided that "for default in the case of appearance at the polls on election day, each delinquent to be amerced 3s. ster."

The custom continued certainly beyond 1671, for in the revision of the laws then published the fine was put at 10 shillings. Other colonies had similar laws. Virginia, maintaining her predecessor, had a law which in 1705 made the fine 100 pounds of tobacco, and in 1662 this was increased to 200 pounds. Some of the New England towns fined free men who came late to the town meeting. None of the States have revived the colonial idea of a money fine, probably because the evil is diminishing, rather than increasing. Some of the States (as Illinois) have attempted to penalize persons who fail to vote by requiring that the property of jurors be satisfied by the jurors in presenting their taxes and that a fine be imposed upon the jurors who fail to vote. This would benefit the suffrage more than the jury system because those neglecting one civic duty could not be considered exceptionally eligible for the paid performance of the more responsible public services. The penalty proposed is the disfranchisement of the voter who once omits to vote until he shall have purged himself by paying a fine. But this would work no hardship to most of the apathetic citizens and to a large number of non-voters would do an injustice since they stay away through no fault or choice of their own. Furthermore, many abstain from voting as an effective rebuke to party leaders because they consider the party candidate unworthy and are unwilling to vote for the candidate of any other party. The most effective remedy appears to be in educating the voter to his civic responsibilities, in rendering the voting process easy, in presenting live, vital and interesting issues, and in persuading the individual voter that his ballot is of the utmost importance. To a considerable extent interest in elections has been quickened in those States which have direct legislation and direct primaries.

Cumulative Voting.—See MINORITY AND PROPORTIONAL REPRESENTATION; the following.

IRVING E. RINES, Editor of 'History of the United States.'

VOITING MACHINE. The wave of ballot reform which swept over the United States of America immediately after the year 1898 firmly established the Australian or blank ballot as a factor in the election of practically all the States of the United States of America. This ballot was intended to encourage freedom of choice on the part of the voters and while it seemingly makes it easy to split the ticket (or to cast an independent ticket) it oftentimes disfranchises the voter because of his mistake in marking it. The introduction of the Australian ballot opened the way for voting machines and demonstrated the need of them. The voting machine is a mechanical Australian ballot, having for its object the correcting and preventing of the abuses to which the Australian ballot system is susceptible and expediting the returns. It accords to each voter his full voting privilege; it prevents him from making mistakes that would take his ballot out of compliance with the law, and makes it unnecessary for the judges to inspect the ballot to determine its legality. The machine counts the ballot for each candidate at once, making it a part of the total vote. When a vote is cast, the operating devices are automatically reset and the machine is again ready for operation by another voter. Machines include safeguards against frauds by election officers. They make it more easy for the voter to accomplish his work and prevent him, to a great extent, from making a partial or complete failure in voting. The use of them compels secrecy, reduces the amount of labor involved on the part of election boards, secures greater economy in the expenses of election and gives the returns at once on the closing of the polls.

The Right to Vote and Legal Voting Machine.—A voting machine must enable a voter to cast his vote in secret; that is, so that no one can see or know for whom he has voted. The method of voting must be simple and within the comprehension of all classes; so that illiterate or blind persons, after receiving instruction, can vote without assistance. It must be convenient in its operation. It must permit a voter to vote for all the candidates nominated by any party, or to vote in part for the candidates of one party and in part for the candidates of other parties and provide for voting for persons who are not nominated by any party for any office. It must give the voter perfect freedom in his selection from any of the candidates without regard to their position on the machine. For some offices, but one candidate is to be voted for, or for others two or more may be nominated by each party. It must be beyond the power of the voter to vote for more persons than he is entitled to vote for, or to vote twice. It must permit a voter to change his vote or correct a mistake, while he is in the booth; to split his electoral vote; voting on questions; limited or restricted voters (females or others) to exercise their rights under the law, but not to exceed them, either for candidates or questions. It must count, positively and accurately, every vote cast. It must prevent defacing the ballots and the counters should be so placed that they can be conveniently examined before and after the election. All the moving parts should be controlled by locks, so that the register of the vote shown on the counters cannot be changed, thus maintaining a permanent record during the time prescribed by law. The voting machine must so constructed that it cannot be unlawfully manipulated by anyone, under conditions that prevail in elections legally conducted. It must be able to bear the most rigid scrutiny of expert mechanics and others qualified to judge of the merits of such mechanism. There must be simple and positive action of the working parts, which must be so related that if misplaced by the voter either by accident or design, no injury will result from the further operation of the machine.

The first voting machine built and actually used in an election was the invention of Jacob H. Myers; it was used in the town of Lockport, N. Y., in 1892 and attained considerable use elsewhere in that State. This machine was legalized in the State of New York, as well as the States of Connecticut and Michigan. Afterward improved machines began to make their appearance. The inventions of Sylvanus E. Davis and Alfred J. Gillespie resulted in the Standard and United States Standard Voting Machines, which have attained the greatest use and perhaps the greatest celebrity in the voting-machine art. These machines are used extensively in the States of New York, Connecticut, Wisconsin, Michigan, Indiana, New Jersey and California. The election for the entire city of Rochester, N. Y., in 1898 was held by 73 of these machines and the election was the first complete and convincing demonstration of the practicability of using voting machines on a large scale. In Buffalo, N. Y., these machines have been used in the elections since 1899; the returns from one of the 108 election districts with over 60,000 voters have been received and tabulated at the city hall in 35 minutes and papers sold on the streets within one hour after the closing of the polls, although
the ticket was of considerable size, containing some 150 candidates.

The United States Standard Voting Machine has an upright keyboard, on which the party rows of candidates and keys thereto are arranged in horizontal lines with the lines of the opposite party therewith. At the end of each party row, a lever is provided by means of which all of the keys of that party row may be moved together to a voting position over the names of the candidates nominated by that party; or the keys may be moved separately to a voting position over the names of the candidates for which the voter desires to vote. Before the voter can arrange his ticket he must enter the booth by closing the curtain around him to shield himself from the public, after which he pulls either a party lever for straight ticket voting or a releasing lever, to unlock the keys to enable him to prepare his ballot independently. The machine affords the voter an opportunity to cast a straight party ticket, to split his ticket, to vote for candidates not in nomination and gives him all facilities to cast only a legal vote, which is sure to be counted as he indicates. If constitutional amendments or questions are submitted to the people, they can be voted on, provisions being made to vote "yes" or "no" on all such questions or amendments. By opening the curtain the voter counts his vote and sets the machine for the next voter. The total vote for each candidate and question is given at once at the close of the election. The machine is also equipped with lockouts which are operated by the election officers to prevent particular voters from voting for offices or on questions on which they are not entitled to vote.

The machine is provided with a protective counter which counts up to 1,000,000 and cannot be reset, and reliably indicates whether the machine has been operated or changed after it has been prepared for an election, or after the close of an election.

The Abbott machine has had some use in the State of Michigan, being legalized by the laws of that State. It has all of the candidates for one office mounted on a slide, which can be adjusted according to the wishes of the voter. He can make the machine go to the right or to the left, so as to bring the name of the candidate desired into line with the operating bar, by the operation of which the vote is registered on counters. The machine is limited, however, in that it cannot group; that is, provide for two or more candidates on one office line, which is always necessary when two or more candidates are to be elected to an office.

The Barlow machine, which has been used to a limited extent, has the candidates arranged in office lines and party rows. When the voter enters the booth, he is furnished with a key which he inserts in the key-hole belonging to the candidate he wants to vote for and turns it halfway around. This counts a vote for that candidate, and the other candidates on the same office from receiving a vote, and by repeating this operation on other office rows, the voter is enabled to cast his vote as he desires for the whole ticket. In case he has made a mistake in making a vote for the wrong candidate, he can withdraw this vote by again inserting the key in its key-hole and turning it backward. Straight party tickets are counted on separate counters, the operation of which, by the voter, locks the balance of the counters against operation, but the total of the counters must be added to the counters of the candidates of that party at the end of the election. The machine is so arranged that it is impossible for two persons to vote at the same time or for a second voter to vote before the preceding voter has left the booth by the opposite direction from which he entered it. Consult Cleveland, F. A., "Organized Democracy" (New York 1913); Luddington, A. C., "American Ballot Laws" (Albany 1911); National Municipal League, "Conference for Good City Government" (New York 1919).

VOTIVE CROWNS. See Crowns and Coronets.

VOUCHER, in law. (1) a book, document or other instrument verifying the truth of accounts, showing the payment of a debt or the like. Any instrument which strengthens oral evidence or may be used in its place has been held to be a voucher. (2) Formerly, a person summoned into court to defend the title of a tenant on a general warranty against another claiming title; also, the proceeding in such suit.

VOUDO0, or Voodoo, certain superstitious rites and beliefs brought originally from West Africa. There it was characterized by serpent worship and incoherent and licentious dances and sometimes by human sacrifices. In the Southern States, before the Civil War, voodooism was generally practised among the slaves, and voodoo doctors were common. Many of these doctors were skilful poisoners, and while the great mass of their professed art was a rank imposture, still they possessed enough of a devilish skill to render them objects of wholesome dread. Their services were more often invoked in destructive than in curative offices. If a negro desired to destroy an enemy, he sought the aid of the voodoo, who, in many cases, would undertake to remove the one and the removal was generally accomplished through the medium of poison. No doubt exists that in many cases the victim of a voodoo died from sheer fright, for whenever a negro had reason to think that he was possessed by the spell of the voodoo, he at once gave up all hope, thus hastening the accomplishment of the end toward which the energies of the sorcerer were directed. Their incantations and spell workings were always conducted with the greatest secrecy, no one being allowed to witness the more occult and potent portion of their ritual.

VOUET, voo-ë, Simon, French painter: b. Paris, 9 Jan. 1552; d. there, 30 June 1649. At 14 he went to London where he was already able to make a living by his art, and going to Constantinople in 1611 obtained many commissions there. The next year he studied the works of Paul Veronese at Venice and was later made president of the Roman Academy. But he was presently recalled to Paris and made court painter by Louis XIII. The progress of French
VOUSSOIR, voo-swar', in architecture, one of the stones which form an arch of a bridge, vault, etc., always cut more or less in the shape of a reversed truncated pyramid or wedge. The under sides of the voussoirs form the inner curve of the arch and the upper sides the extrados. The middle voussoir is the keystone of the arch. See ARCHITECTURE.

VOW, a solemn promise made to perform some act or to follow out some line of conduct, confirmed by an appeal to the Supreme Being, or supernatural power, to favor or to punish the maker of the promise according as he fulfills or breaks such promise. Some vows bind those who make them to perform a certain act out of gratitude for a particular favor, as in the case of Jephthah; others comprehend the performance of certain limited duties during a whole life-time, as the marriage-vow and a sovereign's coronation oath, and others, again, give a particular form to the entire character of a man's life, as the monastic and priestly vows. Among Roman Catholics vows are divided into two kinds: solemn, those taken in the face of the Church; and simple, those made in private. Bishops are considered to have the power of releasing from simple vows generally; but the power of dispensing in important simple, and in all solemn vows rests with the Pope; the vows specially reserved for papal dispensation were: that of absolute and perpetual chastity, entering into a religious order, making a pilgrimage to Rome or Compostella, or of setting out on a crusade. See ORDERS, RELIGIOUS.

VOWEL (from the French voyelle; Latin, vocale), a simple articulate sound, which is produced merely by breathing, accompanied by a constriction in the larynx, a greater or less elevation or depression, expansion or contraction of the tongue and contraction or expansion of the lips. The vowel sounds of the English alphabet are imperfectly represented by five letters, a, e, i, o, u (and sometimes w and y); the deficiency of our alphabet is, therefore, apparent when it is remembered that there are at least 13 distinct shades of vowel-quality in the spoken language as heard in the words ale, an, ask, ah, all; ell, err; eel, ill; old, ore; pull, ooze. The long sound of i, as in ire, and of y, as in by, although represented by one letter, are really compound vowel sounds or diphthongs. The French simple vowel sounds u and eu, and the German o and u, are not heard in the English language. See the articles under the several letters.

VOYAGEUR, vyo-yah-zher', a French-Canadian term for traveler. It was specifically applied to a class of men employed by the fur companies in transporting goods by the rivers and across the land to and from the remote stations of the Northwest. They were nearly all French-Canadians or half-breeds.

VOYNICH, voi'nich, Ethel Lillian Boole, English novelist: b. 1864. She was a daughter of G. Boole (q.v.), and was married to W. M. Voynich, a Polish writer in England. She is the author of 'Russian Humor'; "Stories from Garshin"; 'The Gadfly'; a very striking story which excited much attention (1897); 'Jack Raymond' (1901); 'Olive Latham' (1904); 'Six Lyrics' (1911).

VOYSEY, voi'zè, Charles, English theistic clergyman: b. London, 18 March 1828; d. 1912. He was graduated from Oxford in 1851, took Anglican orders and was curate of Hessle, Yorkshire, 1852-59, of Creighton, Saint Andrews, Jamaica, 1860-61, and of Saint Marks, Whitechapel, London, 1861, but lost the last position on account of a sermon of his against endless punishment. He was vicar of Hales, Yorkshire, 1864-71. A figure which published in 1865 sermons declared to be opposed to the Bible and the 39 articles, he was prosecuted in the Chancellor court and the case being taken to the judicial committee of the Privy Council he was deprived of his living and forced to pay the costs in 1871. He subsequently founded the Theistic Church in Swallow Saint Piccadilly, London, the church being supported by the "Voysey establishment fund." Among his published works are 'The Sing and the Stone' (1872-93); 'Theism as a Religion of Common Sense' (1884); 'Theism as a Science of Natural Theology and National Religion' (1895); 'Testimony of the Four Gospels concerning Jesus Christ' (1895); 'Testimony of the Four Gospels' (1907).

VRAS, vrah, Stanko (also known as Jacob FRAS), Serbo-Croatian poet: b. Zerovec, Styria, 1810; d. 1851. After studying at Grazt, he became editor of the magazine Kolo. At that time a number of literary men were interested in combining the Serbo-Croatian language with the Slovene into a common tongue called the Illyrian. In this medium, Vras wrote many poems of no mean merit. The vivid local coloring of his works makes him the most prominent figure of the poets of his nationality. His writings and letters were collected under the title 'Djela' (4 vols., Agram 1863-64, the fifth volume in 1877).

VREDENBURG, Edric Walcott, English novelist: b. Para, Brazil, 29 March 1860. He was educated at Tonbridge School, Kent, entered the army and was a lieutenant in an Essex regiment. He has since given his attention to writing novels as well as stories and verse for children. Among his works may be cited 'The Haunted House in Berkeley Square'; 'A Bitter Inheritance'; 'At the World's Mercy'; 'By the Queen's Command.'

VREELAND, Herbert Harold, American railway president: b. Glen, Montgomery County, N. Y., 28 Oct. 1856. He received a common school education and worked his way upward from a humble position to that of railway president. In 1893 he became president and general manager of the New York Metropolitan Street Railway Company and was prominent in the consolidations which subsequently placed all surface railways on Manhattan Island under one management.

VRIENDT, frent, Frans de. See DE VRIENDT, FRANS.

VRIESLAND, freu'slan. See FRIESLAND.

VRIHASPATI, vri-ha-sap-ta', or, as in Vedic works, B'rt'HASPATI (from Skt. brah, probably hymn, prayer, and pati, protector, lord): in Vedic mythology, the guardian of the
hymns or prayers addressed by the pious to the god; therefore, considered as mainly instrumental in insuring the efficacy of the sacrifice. He is "the first-born in the highest heaven of supreme light," because the prayers reach him first; he is "seven-faced," because his faces are those of Vedic deities, and he is "attended by all the companies of gods," or "represents all gods," when the sacrifice is performed. Being to that of a priest and spiritual teacher, he is sometimes also identified with Agni. His function of guardian of the hymns being similar to that of a priest and spiritual teacher, he is further represented as a priest of the gods, who himself "celebrates worship," and as imparting "virtuous instruction." In the epic and Purânic mythology, five figures especially as preceptor of the gods and Rishis, as such causing them to perform sacrifices.

VRYHEID, fri'tiid, South Africa, a town of Natal, prior to the South African War, 1899–1902, belonging to the Transvaal Republic. It is about 280 miles north of Durban by the railway through Pietermaritzburg, Ladysmith and Dundee, the centre of a district containing coal, gold and other minerals. It has Dutch Reformed, Anglican, Wesleyan and other churches, a masonic temple, schools and mineral springs. The district of Vryheid was ceded to a party of Boers by Dinizulu, a Zulu chief, in 1844 and was constituted a separate state under the title of the New Republic. In 1888 it was incorporated in the Transvaal. The white population of the district is about 5,800; of the town, 2,400.

VUG, VUGG, or VUGH, a small cavity in a rock mass. The term is sometimes used in the same sense as geode (q.v.), but by many it is restricted to minute cavities produced by shrinkage in the process of replacement.

VUILLAUME, vu'e-yöm, Jean Baptiste, French violin maker: b. Mirecourt, 7 Oct. 1798; d. Paris, 19 Feb. 1875. He settled in Paris in 1815, and imitated the instruments of Stradivarius, the Amatis and Maggini. He came to stand with Lupot at the head of French musical instrument makers of the 19th century. Long journeys were made by him after special kinds of wood were often used, and he constantly experimented toward improvements. He received many distinctions. In the Paris Exposition in 1867 he was ranked above competition.

VULCAN, the Roman god of fire and patron of metallic handicrafts; the son of Jupiter and Juno, and identical with the Greek Hephaestus. According to mythology, Vulcan was ugly and deformed, and Juno, ashamed to own such a child, dropped him from heaven, when the infant god, falling into the sea, was rescued and adopted by Themis, who kept him till nine years of age. He was then restored to his parents. On his return to Olympus, Vulcan took his mother's part in one of the quarrels between husband and wife; Jupiter, enraged at Vulcan's audacity, flung him from heaven. The youth alighted on the island of Lemnos, broke his ankle in the fall; hence he raised forges and workshops, and became the chief of artificers. Some poets, however, fix his workshop on Olympus, another on Etna, where Cyclops was his chief assistant. He fashioned Pandora, and had Venus given him for his wife; by whom he was father of Cupid. Vulcan is represented bearded, covered with dust and soot, and toiling hard at his forge. Consult Gayley, C. M., 'Classic Myths, in English Literature?' (Boston 1911).

VULCAN, in astronomy, the name of an assumed planet between the Sun and Mercury. In 1839 M. Lescarbault, a village physician of Orgères, France, saw a small dark planet-like body pass across the sun's disc. The planet was called by anticipation Vulcan, but its existence still remains unconfirmed, though M. Porro and M. Wolf of Zürich reported seeing its transit in 1876.

VULCANISM. See VOLCANISM.

VULCANIST, the name applied to an old school of geologists at the end of the 18th and the beginning of the 19th centuries, who held that most rocks, but particularly the basalt, were due to volcanic or igneous agencies. They were opposed by the Neptunists led by Werner, who believed that the rock in common with most others was the product of crystallization from water.

VULCANITE, the harder of the two forms of vulcanized caoutchouc (see Vulcanization). It is differentiated from the softer product (soft rubber) in containing a larger quantity of sulphur and being cured at high temperatures. In color it is dark brown, almost black, but it may be made jet-black by litharge or red by vermilion. It is not affected by the caoutchouc solvents, or by the mineral acids and alkalies. It is much used for the plates of electrical machines. The other applications of it are, of course, very numerous. Ebonite is a rarer name for it. See India-Rubber; Rubber Manufacturers, American.

VULCANIZATION, a method of so treating caoutchouc (q.v.) with some form of sulphur as to effect certain definite changes in its properties and obtain a softer or harder product. The former is known as soft rubber, the latter as vulcanite (q.v.). The method of preparation of soft rubber goods is followed largely, but an increased use of sulphur in combination with high heat renders the product hard. The process of vulcanization was invented by Charles Goodyear (q.v.), who obtained his first patent in connection with it in 1844. See India-Rubber; Rubber Industry in the United States.

VULCANO, vôl-ká'nô, or VOLCANO, vôl-kô:nô: most southern of the Lipari Islands (q.v.), in the Mediterranean, 12 miles from the north coast of Sicily, about seven miles long and three miles wide. Near the centre is a crater one-fourth of a mile in circumference, which constantly emits smoke and vapors. The highest point of this crater, which is also the highest point of the island, is 1,601 feet. Only the south part of the island is fertile. The products are grapes, wine, fruit, corn and flax.

VULCANOLOGY, that branch of geology that treats of the process of vulcanisation, or the movements of molten rock in or on the earth. See Volcano; Mountains; section on Igneous Rocks in article on Rocks, and section on Volcanism in article on Geology.

VULGATE, The, is the Latin translation of the Bible, due mostly to Saint Jerome (q.v.),
which has been adopted as the authorized Bible of the Roman Catholic Church. The name, vulgata bibliorum editio, which means common or current edition of the Scriptures, was first applied to the Septuagint, then the Old Latin Version derived from it; but after Saint Jerome's new translation came into common use, it inherited the name. Some scholars still speak of the Old Latin Vulgate or the Greek Vulgate; but the term, used without its qualification, properly applies only to the official Roman Catholic Bible.

Place in History.—Neglected for a long time, the Vulgate has during the last few decades won back from scholars a recognition of its intrinsic excellence, its importance for the study of the Bible text, and its place in history. In English-speaking countries, this is due mainly to the labors of Anglican divines, such as Westcott, Wordsworth, White, Scriven er and Burkitt. Westcott, for instance, regards it as "not only the most venerable, but also the most precious monument of Latin Christianity." Its great antiquity and the exceptional qualities of its translator make it a most valuable aid toward the recovery of the original text. Its New Testament, in its revised form, is contemporary with the oldest Greek manuscripts and embodies a much earlier text. The Old Testament antedates by several centuries the oldest Hebrew manuscripts. Almost from the time of its publication, the Vulgate has had a very great influence upon the religion and civilization of Europe. It gradually became the Bible of Europe; it has been called the Bible of the Middle Ages. Latin then was the language of the educated and the Vulgate their Bible. From it was derived the theological language of Europe and much of its thought. Hebrew idioms came through it to enrich our daily speech. National literatures took their rise in ventures to translate it: its text called forth the most beautiful work of the illuminators of manuscripts. Poetry, painting and music owed it much of its inspiration and grandeur. It was the real parent, says Westcott, directly or indirectly, of all the vernacular versions of western Europe, except the Gothic of Ulphilas. The translators of the Protestant versions had it constantly in mind, though it was "the guide rather than the source of their work." Upon English Bibles, its influence is very marked, particularly upon the Authorized Version. The Psalter of the Prayer Book, still used in worship, is a translation of the Vulgate: such naturally, too, are all modern Roman Catholic versions, like the English Douai Bible.

Latin Bible Before Saint Jerome.—The Vulgate, we have implied, was preceded by an earlier Latin Bible, and its history cannot be properly evaluated apart from it. It was the real forerunner. Throughout the 4th century, this Old Latin Version, as it is called, was read in all the churches of northern Africa and western Europe, but the tradition of its origin seems to have perpetuated itself. It was based not on the original Hebrew, but upon the Greek of the Septuagint. This is its most notable difference from the Vulgate. It can be traced back with certainty to the middle of the 3rd century and, with great probability, even to the latter part of the 1st. Its place of origin is unknown; nor even can we determine whether there were several distinct translations, made in different times and countries, or originally but one. The Old Testament has survived in a few books and many fragments, but these do not show light on their origin; and the many manuscripts of the New Testament furnish to scholars no satisfactory solution. The old Latin Version is historically important by reason of its influence upon the Vulgate; moreover, its use without its veneration, properly applies only to the official Roman Catholic Bible.

Saint Jerome (Eusebius Hieronymus, as he was called) was born of Christian parents at Stridon, on the borders of Dalmatia and Pannonia, now Szalad in Hungary, probably between 347 and 348. The young Jerome was a man of education and means, perceived the ability of the boy and sent him to Rome, at an early age, to complete his studies. There he awoke to the love of literature and, despite some aberration in his love of religion—the two impulses which dominated his life and have left their impress on western Europe. Unconsciously, he was all along preparing himself for his great task, the translation of the Bible. He acquired a firm grasp of the Latin idioms through his deep study of its literature, and laid the foundations
of his subsequent thorough knowledge of Greek; at the same time, he was fostering that religious spirit which later caused him to devote himself to sacred rather than secular studies. He was baptized in Rome about 366. Not long after, he removed to Trier, in Gaul, and later (370) to Aquileia in North Italy where in the company of other young men of talent and piety, he vigorously pursued the study of theology. The motives of his journeying up in 373, Jerome traveled in the East, visiting Greece, Asia Minor and Syria. At Antioch, in Syria, a dream decided the work of his life: Christ, in an apparition, reproached him with being a Ciceronian and no Christian. Henceforth he gave himself to sacred studies and religious practices; in his old age, however, he was able to reconcile with them the reading and teaching of pagan literature. In the summer of 374, he retired to the desert of Chalcis, east of Antioch, where he spent five years in study and prayer. During this period, under the instruction of a Jewish rabbi, he made a diligent study of Hebrew; at this time, too, he began a long correspondence with his pupil Damasus, which led later to such happy results. Jerome was ordained priest at Antioch, in 379, though he appears never to have exercised the functions of his office. In 380, we find him in Constantinople, the capital of the empire, where he fell under the spell of the winning and cultivated Saint Gregory Nazianzen. At length, in 381 or 382, he returned to Rome. He was soon admitted into the closest intimacy with Damasus, which lasted till the Pope’s death, in December 384. It was during this period (in 383) that Jerome, at the request of the Pope, revised the Old Latin Version of the gospels and shortly after, of the remaining books of the New Testament. His Roman Psalter was also published about this time. Jerome had great popularity and influence at Rome under Damasus, and, naturally, had made some enemies; their opposition increased after his patron’s death and caused him to leave Rome forever, in August 385. He returned again to the East; his eager, inquisitive mind and his spirit of piety both impelled him to visit all the holy places of Palestine and to study its topography, cities and traditions. Finally, in the autumn of 386, he settled at Bethlehem, near the cave of the Nativity, and built a monastery, over which he henceforth presided. In this retreat, during the last 34 years of his life, he composed the most important and famous epistles, his commentaries and controversial writings, but above all in his translations of the Sacred Books. In his work on the Hebrew text, he was almost constantly associated with his friend Rabbula. Revisions of Old Latin Version.—New Testament.—Jerome’s work as a reviser and translator began with the gospels (383). These books were the most important and familiar, and were translated with their translation, the most corrupt in text. The task which Damasus committed to him was not a new translation, but merely a revision of the familiar text. For this, Jerome collected and consulted the best Greek manuscripts of the 4th to 6th centuries, with their subsequent corrections and additions, and from the Greek the passages of Daniel and Esther, which are not found in the Hebrew

VULGATE

197

the New Testament was corrected in the same way, though more slightly, it appears. All this work became part of the Vulgate: Jerome never made a fresh translation of the New as he did of the Old Testament.

Old Testament.—The Psalter, the prayer-book of the Church in daily worship, was the first book retouched by Saint Jerome. In the course of his life, he published three editions of the Psalter, it will be noticed here, for clearness sake, to speak of all three. The first or Roman Psalter, published at Rome in 383, was adopted there for public services and continued in use till the time of Pius V (1566). For this revision, Jerome had recourse only to the Greek text. It never became part of the Vulgate and has gone out of use, except that the invitatary psalm (94) in the Breviary (q.v.) and the quotations from the Psalter in the Missal are taken from it. This revision itself becoming corrupt, through the errors of copyists, a second revision was called for. This, published at Bethlehem in 387, is the Gallican Psalter, so called, because it was adopted for the worship of the churches of Gaul. It was based likewise upon the Greek text, but is a more critical recension than its predecessor. It is now used throughout the Latin Church and has been incorporated in the Vulgate; yet is not Jerome’s last edition of the Psalter. This is conceded to be his third or Hebrew Psalter, a new translation made directly from the Hebrew (probably 392).

Other books of the Old Testament were revised by Jerome according to the Septuagint (q.v.): he himself mentions Job, Proverbs, Canticle of Canticles and Chronicles by name, but it is believed, from his words, that he revised all the books of the Septuagint which are contained in the Hebrew Canon. All, however, have perished except Psalms, mentioned above, and Job.

Translations from the Hebrew.—Jerome’s work as a reviser made him thoroughly acquainted with the Septuagint text and threw him back, more and more, upon the Hebrew as the one standard. There, thanks to the watchfulness of the rabbis, he found instead of the confusing variety of the Septuagint an almost perfect agreement in the manuscripts. The controversy with the Jews, who taunted Christians with using a corrupt text, had great weight in determining Jerome to translate the Hebrew Bible. His friends, too, were repeatedly urging the task upon him, so he finally set about it, not following any set plan (he began with Samuel and ended with Esther), but translating such books as his friends requested. This translation, therefore, it appears, contrary to the impression of many, was not undertaken as an official work for public services. He intended it primarily for the eyes of his friends and desired them, out of a fear of controversy, to keep it private. For about 15 years, from 390 to 405, he labored at this great task and succeeded not only in translating all the books of the Hebrew Canon (same as the Protestant Canon). Of the remaining books of the Old Testament, which are accepted as inspired by the Roman Catholic Church, he translated Tobit and Judith, and his Commentary on the Minor Prophets, and from the Greek the passages of Daniel and Esther, which are not found in the Hebrew
VULGATE

(Dan. iii, 24-90, xiii-xiv; Esther x, 4-xvi, 24). There is ground for believing that he translated or revised the books of Maccabeas, Wisdom, and Ecclesiasticus he left untouched, and passed over Baruch.

Reception of the New Translation.—Jerome's friends could not keep their good things to themselves; his translations, eagerly sought and copied, and soon widely circulated, raised a storm of opposition. The gospels, indeed, though sanctioned by the authority of Pope Damasus, had been bitterly attacked by many; but when his Old Testament was published and the extent of its variations from the Old Latin rendering of the Septuagint became known, Jerome found enemies in every quarter. The Septuagint was popularly regarded as an inspired translation, according to the well-known legend; to vary from it was to corrupt the word of God. So Jerome was sacrilegious and presumptuous in daring to correct the venerable text: he was disturbing the faith of the people. Even the great Augustine at first did not approve of his translation. Jerome defended himself with more than his usual warmth, especially against the charge of disrespect toward the Septuagint: for had he not spent years of his life rendering it faithfully into Latin? Gradually the storm subsided; part of his work won favor and public recognition; the bitter attacks were passed—he died in peace and was recognized as a Saint and Doctor of the Church.

Date During the Middle Ages.—It was long centuries, however, before the translation of Jerome became the Vulgate or official version. Old memories and affections were entwined around the ancient text and the new was looked upon as an intruder; just as in our own day, the Revised Version has thus far made no advance in public favor. At Rome, Jerome had great prestige because of his many friends there, his reputation as a scholar, and the patronage extended to him by Damasus. Many of the eleventh- and twelfth-century manuscripts in the Vatican are the old corrected Vulgate, and even in later times the example of Rome was followed in different parts of Europe. The remote provinces, like Britain and Africa, clung to the old. In the 6th century we see the new translation current already everywhere except in Africa; yet Pope Gregory the Great, who saw the beginning of the next century and died (604) just 200 years after Jerome had completed his translation, did not enforce its usage. His marked preference for it, however, turned the tide in its favor and it spread rapidly all over Europe. In the 9th century it was used throughout the Church; yet it is a curious fact that the Old Latin survived till the 13th century wherever the heresy of the Albigenses prevailed, and even, in Bohemia, till the 15th century (Berger, p. 74).

Corruption.—The Old Bible did not die without leaving traces of itself upon its successful rival. It must be remembered that in the early Middle Ages the Bible circulated, not in separate books, but in a composite volume. When this happened, then, that a new manuscript was copied, according to the books at hand, partly from the old, partly from the new translation. Many readings of the Old Version, too, found their way into the new, as we have handled in our prefatory notes to the gospels and epistles, where the familiar text, dwelling in the memory of the scribe, displaced Jerome's corrected text. In the synoptic gospels, containing so many parallel passages, the text of one gospel was often substituted for the text of another. Or, occasionally, though not frequently, a phrase was altered to give clearer expression to a dogma. Other sources of error existed, but the chief of all was the perennial one—the carelessness of scribes.

Efforts to correct the downward tendency were undertaken during the Middle Ages. Cassiodorus, Alcuin, Lanfranc, Stephen Harding and many others are mentioned as strenuous laborers in this field. Roger Bacon, we are told, spent nearly 40 years correcting and explaining the sacred text. Schools even were established for the purpose of recovering, diffusing and handing down to posterity the pure text of God's word. Often the supposed corrections were themselves mistakes; yet they were perpetuated in many manuscripts, with the chance of being accompanied by new errors in every new copy. Their importance, however, must not be exaggerated. The many manuscripts of the Vulgate which we inherited from the Middle Ages show, so far as they have been examined, that these mistakes are seldom serious from a dogmatic or devotional point of view. Only the printing press seemed capable of preventing their multiplication, for the scholars of that time, as White says, had used all the remedies that could be applied before the invention of printing.

Printed Vulgate.—The press, at first, did little toward the restoration of a pure text. The best texts, it is believed, were in the most handsome manuscripts and these were too costly to be sent to the printing shop. Inferior texts were consequently the first printed and little criticism was applied to correct them. The famous Complutensian Bible made an attempt at a critical edition of the Vulgate, but its success was slight. Stephanus, a French Protestant, was somewhat more successful. The printing press was multiplying Bibles rapidly and mistakes as well, it may be said. According to White, during the first five years after the invention of printing, in 1436, it is computed that 124 editions of the Vulgate were printed; another count, from 1471 to 1599, enumerates 179 editions.

These editions were not mere reproductions, one of another; many different manuscripts had been consulted and many editors were at work, each using his judgment (or his whim) in the correction and choice of texts. To add to the variety, several new Latin translations, by both Catholics and Protestants, were put forth.

Decree of the Council of Trent.—It is easy to see how bewildering must have been this immense variety of old and new translations. A standard text had become imperative. It was necessary, too, since the question of the Canon of Holy Scripture was debated, to determine which books should be included in the Catholic Bible. Accordingly, in 1546, the Council of Trent closed the canon and established it as we have it in the New Testament, and the old in the Old Testament. In the same year the council ordered that the Vulgate be printed in as correct a text as possible and requested the Pope to carry out
the measure. These two important points—the books included in the Vulgate and the text adopted by the Roman Catholic Church—call for separate and somewhat detailed treatment.

**Books Included in Vulgate.**—First, we give a list of the Vulgate books, in their proper order, according to the names which they bear in the usual translations. These names, it will be seen, often differ from those of the Authorized Version; they are derived from the Septuagint through the Latin, while the Protestant names come in part from the same source and in part directly from the Hebrew. We subjoin the latter wherever the difference is notable. The books of the Old Testament are: Genesis, Exodus, Leviticus, Numbers, Deuteronomy, Josue (Joshua), Judges, Ruth, I and II, Kings (I and II, Samuel), III and IV, Kings (I and II Kings), I and II Paralipomenon (Chronicles), I Esdras (Ezra), II Esdras, or Nehemias, Tobias, Judith, Esther, Job, Psalms, Proverbs, Ecclesiastes, Canticle of Canticles (Song of Songs), Wisdom, Ecclesiasticus (Sirach), Isaiah, Jeremiah, Lamentations, Baruch, Ezekiel, Daniel, Osee ( Hosea), Joel, Amos, Abdias (Obadiah), Jonah, Micheas (Micah), Nahum, Habacuc, Sophonias (Zephaniah), Aggeus (Haggai), Zacharias, Malachias, I and II Maccabees. In the New Testament, the books and their names are identical with those of the Authorized Version, except that the last book is called in the one Apocalypse and in the other Revelation. The Vulgate, as finally adopted by the Roman Catholic Church, is a mosaic: it is made up of direct translations from Hebrew, Aramaic and Greek, of revisions of Old Latin, according to the Septuagint and the Greek New Testament, and, lastly, of Old Latin translations unrevised.

**Differences Between Roman Catholic and Protestant Bibles.**—The foregoing list will have made clear the most striking difference between the Vulgate and the ordinary Protestant Bible of to-day—the inclusion of Tobias, Judith, Wisdom, Ecclesiasticus, Baruch and I and II Maccabees among the sacred books of the Bible on an equal footing with the rest. These books were formerly printed in Protestant Bibles, sometimes as integral parts of Scripture, sometimes with an undefined standing, more frequently as being unequal to the other books, but useful, for example of life and instruction of manners. With them may be classed the additions to Esther and Daniel, mentioned in the fifth topic. All these portions of the Vulgate are now generally excluded from English Protestant Bibles but find a place in the Lutheran. They are still used in the public services of the Anglican Church. Subtract these books from the Vulgate list and the order of the books in the two Bibles will be found identical. Many minute differences, which cannot be noticed here, are found in the inner arrangement, but more particularly in the numbering of the contents of several books. Textual differences, naturally, are the most numerous, but the external importance have been greatly exaggerated. The Canon remains the only really great difference.

**Official Text of Vulgate.**—The order of the Council of Trent, promulgated in 1546, that an official text of the Vulgate be printed, remained unfulfilled till the reign of Sixtus V (1585-1590). The attempts of previous pontiffs had led to little result. Sixtus V, by commission of cardinals and scholars and entrusted them with the work; not content with this, he applied himself vigorously to the task with more energy than critical acumen and with no scrupulous deference to the opinions of the commission. The edition, called after him the Sixtine, was completed and published in 1590, a few months before the death of the Pope. It was soon found to contain numerous errors, and all copies of it were recalled two years later by Clement VIII, who published a new and more correct text (1592). The Clementine Vulgate has ever since remained the official Bible of the Roman Catholic Church.

Sixtus V had prefixed a Bull to his edition, declaring that it must be held as the true, lawful, authentic and undoubted version of the Scriptures; he forbade anyone, under penalty of excommunication, to print a different edition of the Vulgate. This prohibition was also contained in the Clementine Bull. The effect of it was to put an end to the intolerable confusion of texts; indirectly, too, it is generally believed to have impeded the recovery of the true text of Saint Jerome. Some writers, Catholic and Protestant, have tried to extract from these Bulls a dogma of textual accuracy; this position is stultified by the action of Pope Clement, who recalled the authentic version of Sixtus and published another authentic version, differing from the former, it is said, in 3,000 places. The popes consider matters of discipline, but not of dogma, as subject to rectification. The action of Clement merely constitutes his edition the official Bible of the Church and guarantees its general trustworthiness and its freedom from doctrinal or moral error. The Clementine Vulgate, claimed to be better than any predecessor, but not to be perfect; it will probably give way itself to a more perfect version when modern scholarship shall have arrived at assured results.

**Value of Vulgate Text.**—Modern scholarship, however, is far from having settled the exact text either of the Old or of the New Testament. Jerome's version remains one of the best witnesses to the originals, though its value is not uniform throughout. His revision of the gospels, to quote Bishop Westcott, represents the received Greek text of the 4th century, and so far claims a respect, speaking roughly, equal to that of a first-class Greek manuscript; Jerome, it should be remembered, sought out the best manuscripts of his day; the type of text he followed corresponds partly to that in greatest favor at present, partly to another now no longer known. His revision of the rest of the New Testament was not so thorough and probably let many inaccuracies remain; he himself in his commentary on the Galatians departs at times from the received Latin text.

In the Old Testament Jerome followed a text almost identical with the Massoretic, and, therefore, of the greatest value. His translation shows him to have been a good, but by no means immaculate, Hebrew scholar. In general, his work was done with the greatest care
and light was constantly sought from learned Jews. Tobias and Judith, however, in whose canonicy he did not believe, were translated hurriedly. Almost all scholars would agree with the judgment of White, who says, in summing up this matter: "We may confidently assert that the general standard of the translation is a very high one. It shows the translators very little. Their merit is of a very high order."

**Literary Qualities.**—The language of the Vulgate was based upon the common conversational Latin of its day, used by all classes of the people; it differed greatly from the literary Latin and contained many words and forms considered archaic or rude. Despite the flavor which this origin frequently gives to the language of the Vulgate, the translation is greatly admired for its simplicity, clearness, flexibility, force and majesty. In the poetical and prophetic books it is unsurpassed. These fine literary qualities may be attributed to the genius of Jerome; yet they are present also in books which he did not touch. The Latin language is peculiarly adapted to render Hebrew thought and feeling; thus the Vulgate has ever been a favorite with literary men who love both the Bible and the language of Cicero, especially in continental Europe.

**English Translations of the Vulgate.**—The first English translation of the entire Vulgate is commonly attributed to Wyclif (d. 1384). The second is the work of Roman Catholic scholars in exile, who published the New Testament at Rheims, in 1582, and the Old at Douai, in 1609. The Rheims-Douai Version has remained ever since the Bible of English-speaking Catholics; passing through numerous editions, it has lost much of its original roughness and Latin phraseology and approached more closely to the King James Version. Scholars acknowledge its "auxiliary fidelity," whether in praise or blame, as well as its very great influence upon the interpretations and vocabulary adopted by the Authorized Version. See Bible, Bible, Versions of the Bible.

**Bibliography.**—White's lengthy article, "Vulgate," in Hastings' Dictionary of the Bible (to which we are particularly indebted); also in same Dictionary, article, "Latin Versions," by Burkitt; Westcott, on Vulgate, in Smith's Dictionary of the Bible; Kutscher, Handbuch zu Textualkritik der Neuausgabe. In Vigourous, Dictionnaire de la Bible, articles, Jerome, Latines Versions; Kaulen, Geschichte der Vulg. For fuller bibliography, consult White; also for list of Vulgate manuscripts. Consult also bibliography appended to article on the Bible.

**VULPIUS,** volp-e-os, Christian August, German, W. Germany, 23 Jan. 1762; d. there, 25 June 1827. He was educated at Jena and at Erlangen, and under the direction of his brother-in-law, Goethe, he was later secretary of the court theatre at Weimar. He was appointed first librarian and overseer of the cabinet of coins in the library at Weimar in 1797, a position he occupied until his death. He wrote numerous plays, romances, etc., which were popular in their day and are scarcely remembered with the exception of "Rinaldo Rinaldini, der Räuberhauptmann" (1797), which has been translated into various languages, and widely imitated. He also edited "Kuriositäten der physisch-literarisch-artistisch-historischen Vor-und Mitwelt" (10 vols., 1810-23), and "Die Vorzeit" (4 vols., 1817-21).

**VULTURE,** any of various birds of prey which habitually feed on carrion. The vultures of the Old and New Worlds are quite distinct, the former constituting a family (Cathartidae) already sufficiently described under the articles CARRION-CROW, CONDOR and TURKEY-BUZZARD; while the latter are much more nearly related to the hawks and eagles (Falconidae), of which they are considered to be a subfamily (Vulturinae) or to form an allied family (Vulturidae). This group is distinguished by the possession of a strongly-hooked compressed bill; by short tarsi covered with reticulated or small polygonal feathers; the middle toe is longer than the tarsus, and the hinder toe is a little elevated. The claws are blunt, but more or less hooked. The head and neck are frequently naked or covered with a light down. A large crop exists and the intestinal caeca and syrinx, wanting in the Cathartidae, are present. There are numerous other differences in skeletal and other parts. The cinereous vulture (Vultur monachus) is distinguished by the presence of a ruff of feathers, and by the crest borne on the back of the head. It inhabits Europe, Asia and Africa, and is common. It may attain a length of three or four feet, and its color is a chocolate-brown with the naked head and neck blue. A long tuft of feathers springs from the base of the wings. The bird inhabits wooded situations and nests in trees as a rule, and appears to content itself with carrion, but rarely ventures to attack living animals.

The genus Ototypos, including the O. calvus, or Pondicherry vulture, and the O. auriculatus or sociable vulture, is distinguished from the preceding genus by having a bare head and neck, with long wattles dependent from just below the head. The social species in South Africa. It is colored a general blackish-brown, and its average length is four feet. The naked head and neck are light red. The Pondicherry vulture inhabits India, and is about three feet in length. Its head and neck are flesh-colored, and the chest bears a tuft of white feathers, the plumage generally being dark or blackish-brown. The genus Gyps is represented by the griffin or fulvous vulture (G. fulvus), and is distinguished by the bill being swollen or distended at the sides, the head and neck being covered with short down, and the neck possessing a ruff of long pointed or downy feathers. The griffin vulture inhabits Europe, Asia and Africa. It attains a length of four feet, and in general is less showy, the tail and wing quills being black and the neck ruff white. The head is covered with white down. It is abundant about the Mediterranean countries, and builds its nest on cliffs. It is noted for its activity and great powers of flight. The Egyptian vulture (Neophron
VYASA—VYSHNY-VOLOTCHEK

Perdix perdix inhabits south Europe, Egypt and Asia. It is white, the quill-feathers of the wings being dark brown or black, and the face, bill and legs chiefly yellow. It is of small size and trim build. This bird is also known under the designations of "Pharaoh's chicken" and "white crow," and is protected by laws from being injured. Besides carrion it devours all kinds of refuse left by the larger vultures and small reptiles, insects, etc. In the weak bill and some other respects the Egyptian vulture somewhat approaches the Cathartidae. The celebrated lammergeier or bearded vulture (Gypaetus barbatus), a genus and species distinguished from the preceding by the head and neck being feathered, and by the cere being concealed by bristly hairs, resembles the eagles in appearance and habits and is now generally considered as the representative of a subfamily (Gypinae) of the Falconidae. (See Lammergeier). Consult Dresser, 'Birds of Europe' (London 1881), and Blandford 'Birds of British India' (London 1895).

VYASA, vyaśā ("the redactor or arranger"), also called Krishna, the author, according to tradition, of the Vedas, the Mahabharata, the Puranas—of all ancient Sanskrit literature. It is evident that in this name is embodied the fact that these works have from time to time undergone recension. The name Homer has exactly the same meaning as Vyasa.

VYATKA, or VIATKA, vē-ā'kā, Russia. (1) a town, capital of the government of same name, advantageously situated near its centre in a beautiful district at the confluence of the Klinovka with the Vyatka, 250 miles west of Perm. Its houses are surrounded by gardens, and there are also public gardens. It has two cathedrals and also monasteries. There is steamer communication with Kazan. Pop. about 60,000. (2) The government is bounded on the north by Vologda, east by Perm, west by Kostroma and south by Kazan, has an area of 59,329 square miles. The chief river is the Vyatka, which joins the Kama, a tributary of the Volga. There are low hills, especially in the north, and forests of fir, oak, elm and birch are extensive. Flax and hemp are important crops and among the chief minerals are iron and copper, which are extracted and smelted. There are manufactures of woolen, linens, potash, leather, firearms, metal goods, etc. Pop. about 4,062,000.

VYAZMA, or VIAZMA, Russia, vē-ā'z'mā, town of the division of Great Russia, government of Smolensk, on the Vyazma, 109 miles east-northeast of the town of Smolensk. It is mentioned first 1239, and, after being controlled successively by the Lithuanians and Poles, it finally became Russian 1634. Vyazma has active trade in grain, flax, hemp-seed, tallow, etc., and is the entrepot for goods exported to Petrograd and Riga. Pop. about 13,000.

VYERNY, vēr'ny, Turkestan, capital of the district of Semiretchensk, formerly in Russian territory. The city is situated at an altitude of about 2,500 feet above sea-level and is 2,700 miles southeast of Moscow. It dates from 1854 when it was founded on the site of an old Kirghiz colony. Earthquakes are frequent and several have proved disastrous especially that of 1887, in which over 330 perished. Pop. 36,400.

VYRNWY, a river of Wales, rising in the northwest of Montgomeryshire, and after a circuitous course of some 35 miles falling into the Severn on the Shropshire border. Lake Vyrnwy, not far from its source, the chief reservoir of the Liverpool waterworks, completed in 1892, was formed by constructing a huge dam across the river valley, a former glacial lake basin, the result being an artificial sheet of water about five miles long with an area of 1,121 acres and an available capacity exceeding 12,000 million gallons. The length of the embankment is 1,260 feet, its height 60, the length of the aqueduct to Liverpool 68 miles.

VYSHNY-VOLOTCHEK, vish'ni-ē vo'lo-tchēk, Russia, capital of a commune in the district of Tver, in the neighborhood of the Tsnâ River Valley and 225 miles south by east of Petrograd. Cotton goods are manufactured to a considerable extent and there is a thriving trade. Pop. 17,500.
W

the 23d letter of the English alphabet. It serves both as consonant and vowel; as consonant when it begins a word or syllable, and as vowel at the end of a word or syllable, where it forms a diphthong with a vowel preceding it, as in how, grew. Its sound is that of a weak-voiced bilabial formed by rounding the lips as for pronouncing oo, then contracting the apertures so that the voice issues with some friction. W is silent in many words and positions; examples: gunwale, sword, two; wrap, wrong, wright. W may be derived from primitive Indo-Germanic *v or *gh. Wh is usually derived from kw. Words beginning with wh are pronounced as though the aspirate preceded, as indeed it did in written Anglo-Saxon: thus whey, what are sounded wrey, heap: but there is a tendency both in Britain and the United States to drop the aspirate in such words or to minimize it, so that when, what, white become wen, wat, wite: nor is this mispronunciation restricted to the vulgar; it may be heard in the speech of the cultivated class; but it is a vice of speech parallel to that found among the lower-class Cockneys early in the 19th century, when they confounded u with w, saying vile for while and wile for vile, warden for warding, and so on. W is silent in the words who, whom. W in whale and in whoop is silent and intrusive, not existing in Anglo-Saxon hal, hol, nor in French hooper. In German w is a consonant only and represents very nearly the sound of the English v, but is bilabial instead of labio-dental: hence the English forename Edward is in German written Eduard. The consonant sound of w in the Gothic languages is generally replaced in the Romance languages by gu: for example, Walter, Guillaume, Guerri. Terminal ow, as in sourrow, is usually of guttural origin. The form (the letter v doubled) and the name of this consonant (double u) were both a true form and a right name in the 7th century when w first came into use. At that time—13th century—and long after, the one character v (V) stood for the consonant v and the vowel sound u (oo), and its name was oo; at the same time it was used as the sign of the consonant now represented only by u: thus, while in form u w is what it is called in French, double oy, or double ve, in sound it is for us what its name in English denotes, that of double u. W in chemistry is the symbol for tungsten. See U; V; ALPHABET.

WAAGEN, vâ'gên, Gustav Friedrich, German art-historian: b. Hamburg, Germany, 11 Feb. 1794; d. Copenhagen, Denmark, 15 July 1868. He was educated at Breslau, Dresden, Heidelberg and Munich, in 1830 was appointed director of the picture gallery at the Museum of Berlin and he accepted the chair of history of art at the University of Berlin in 1844. His publications include: 'Kunstwerke und Künstler in England und Paris' (3 vols., 1837–39); 'Kunstwerke und Künstler in Deutschland' (1843–45); 'Die Gemäldeansammlung der kaiserlichen Eremitage in Saint Petersburg' (1894); 'Die vornehmsten Kunstdenkmäler' (1866–67), etc.

WAHOO, or WAHOOO. (1) A small tree (Ulmus alata) of the southern United States, having small ovate, often falcate, leaves and spreading branches, which form an open, rounded head. The branches have wide, wing-like corky ridges, which have suggested the name winged elm. The tiny samaras are edged with a silky fringe. The tree, while growing naturally in damp places, is a valuable road-side shade-tree, where it is hardy. It has a chocolate-colored fine-grained, heart-wood, which has been used in the South for wheel-hubs. (2) The spindle-tree (q.v.) (Eustomus americanus) is also called wahoo. (3) The burning bush (U. atropurpurea), a laxative American shrub, exhibiting bright scarlet pendulous capsules in the autumn. (4) The bearberry (Rhamnus Purshiana), common on the Pacific Coast of the United States, and the source of cascaria sagrada.

WAAL, wäl, Netherlands, the Dutch name for the lower course of the Rhine, which enters the country a few miles southeast of Arnhem, flows through the province of Gelderland, to its confluence at Gorinchem with the Meuse, and thence continues westward through a many-channeled delta to the North Sea.

WABASH, wâ'bash, Ind., city, county-seat of Wabash County, on the Wabash River and on the Cleveland, Cincinnati, Chicago and Saint Louis, and the Wabash railroads, about 90 miles northeast of Indianapolis and 45 miles west of Fort Wayne. It is in an agricultural and stock-raising region, but it has considerable manufacturing interests. The Big Four railroad shops are located here. The other manufactures are flour, paper, spokes, carriages, automobiles, motor trucks, furniture, tires, woolen goods, machine-shop products, wooden ware, baking powder, shoes and hats. There are railroad repair shops, lumber and coal yards. The principal public buildings are the Soldiers' Memorial Hall, Masonic Temple, Woman's Orphan Home and the county courthouse. There are three parks. The educational institutions are a high school, graded schools, Wabash City library, and a high school library. There are four banks and two daily newspapers. The first settlement was made in 1837 and the same year the town was incorporated. In 1866 it was
chartered as a city. The government is administered under the charter of 1866, which provides for a mayor, who holds office two years, and a council. Pop. about 8,723.

WABASH, a river which has its rise in Mercer County, in the western part of Ohio, flows west into Indiana, where it takes a general southwesterly course to Logansport, then south-southwest to Covington in Fountain County, then nearly south past Terre Haute, to the Ohio River. For about 200 miles of its sinuous lower course it forms the boundary between Indiana and Illinois. The total length is about 600 miles. It is the largest tributary of the Ohio entering it from the north. The Wabash is navigable to Covington, about 300 miles, and when the water is high, to Lafayette. From Terre Haute to Huntington, the river is paralleled by the Wabash and Erie Canal which connects the river with Lake Erie.

WABASH COLLEGE, located at Crawfordsville, Ind. It was established by four Presbyterian missionaries in 1832, was first opened to students in 1833 and obtained a charter from the legislature in 1834; the present site of the college was purchased in 1835. Though affiliated with the Presbyterian Church the college is non-sectarian in control; the board of trustees number 21, of whom four are representatives of the alumni. Wabash is distinctively a small college aiming to give thorough college training but not to do technical or university work. It is not co-educational, in which respect it stands almost alone among the colleges of the West and Middle West. Formerly the college conferred the degrees, A.B., B.Ph. and B.S., requiring a thorough course in Greek for the A.B. degree. All college courses now lead to the single degree of A.B. The course includes 104 hours of prescribed work, and 84 hours elective. Special courses are arranged by which technical and professional courses may be shortened in certain approved schools. There is a fellowship in English, a students' loan fund and many prizes. A summer school under private control is conducted on the college grounds, work in which may count toward a degree. There is also a preparatory course. The college grounds contain 40 acres located in the heart of the city. On this campus are South Hall (occupied by the biological department and the museum), Centre Hall, the gymnasium, Peck Scientific Hall and Yandes Library Hall. The library contains over 51,000 volumes; the average annual attendance of students is 350.

WABASHA, Minn., city, county-seat of Wabasha County, on the Mississippi River, and on the Chicago, Milwaukee and Saint Paul Railroad, about 65 miles southeast of Saint Paul. The southern end of Lake Pepin, an expansion of the Mississippi, is about two miles above the city. Wabasha is in a fertile agricultural region, and has several manufactories, chief of which are flour and oatmeal mills, foundry, railroad shops, lumber mill, soap factory and a church furniture factory. Grain and livestock are shipped by water. There are banks and newspapers. Pop. about 2,622.

WACCAMAW, a tribe of North American Indians who, in the 18th century, lived on Waccamaw River of eastern South Carolina. They are last mentioned in 1755, after which date, it is supposed, they became incorporated with the Catawbas.

WACCAMAW, a river which has its rise in the southeastern part of North Carolina, and is the outlet of Waccamaw Lake. It flows south into South Carolina and joins the delta of the Great Pee Dee on the southern boundary of Horry County. Below the confluence of the rivers, the stream is often called Waccamaw. It enters the ocean through Winyah Bay. From the source of the Waccamaw to the Great Pee Dee is about 130 miles.

WACE, wās, an Anglo-Norman poet: b. Island of Jersey, about 1115; d. about 1184. His Christian name is generally believed to have been Richard or Robert. He was patronized by Henry II of England, who made him a canon of Bayeux, Normandy. Two important works by him remain, the 'Brut d'Angleterre,' and the 'Roman de Rou,' a history of Rollo and the dukes of Normandy, including the conquest of England.

WACE, wās, Henry, English Anglican clergyman: b. London, 10 Dec. 1836. He was educated at Marlborough, Rugby, King's College, London and Brasenose College, Oxford. He served curacies at Saint Luke's, Berwick Street, London, 1861-63, and Saint James', Piccadilly, 1863-69, and Grosvenor Chapel, 1870-72, was chaplain of Lincoln's Inn, 1872-80 and preacher there, 1880-96. He was professor of ecclesiastical history in King's College, 1875-83, in 1881 became a prebendary of Saint Paul's, and in 1883 chaplain to the Archbishop of Canterbury and principal of King's College. He was Boyle lecturer ("Christianity and Morality") (1874-75) and Bampton lecturer ("The Foundations of Faith") (1879), but is best known as joint editor with Sir W. Smith of the great Dictionary of Christian Biography (1877-87), and is himself, the editor of the 'Speaker's Commentary on the Apocalypse' (1886). His latest works are 'Prophecy, Jewish and Christian' (1911); 'Some Questions of the Day' (1914).

WACHSMUTH, Charles, American paleontologist: b. Hanover, Germany, 1829; d. 1896. Abandoning a legal education for ill health, he came to America and settled in Burlington, Iowa (1854). He made important studies among the crinoids of the Burlington limestones. His 'North American Crinoida Camera' (1897), was published posthumously.

WACHSET, wā-chuÁÉs't, Mount, an isolated peak in Worcester County, Mass., seven miles southwest of Fitchburg. The altitude is 2,018 feet, and the view from the summit, embracing a picturesque valley and several small bodies of water, is most beautiful.

WACKE, wā-kā, German miner's term for a soft, earthy variety of trap-rock of grayish-green color, resembling indurated clay, and readily crumbling down when exposed to the weather. It is a sedimentary rock of basaltic or trap material, is often vesicular, and when the cavities are filled it becomes pumiceoid.

WACO, wā'kō, a subtribe of the Wichitas (q.v.). Sometimes written Hueco.

WACO, Tex., city and county-seat of McLennan County, on the Brazos River at the mouth of the Bosque, and on the San Antonio and Aransas Pass, the Missouri, Kansas and
Texas, the International and Great Northern, the Houston and Texas Central, the Texas Central and the Gulf, Colorado and Santa Fe railroads, 60 miles east of the geographical centre of the State, and 94 miles north by east of Austin and 85 miles south by west of Dallas. Waco is in a fertile agricultural region in which cotton and corn are the chief products. The chief manufactures are cotton products, printing plant products, men's clothing, wagons and carriages, watches, foundry and machine-shop products, saddlery and harness and mineral and soda waters. The city is the principal interior cotton market of the State and is the great distributing centre between Austin and Dallas. It is well laid out, with fine broad streets, of which 75 miles are permanently paved, while the others are paved with macadam and gravel. Fourteen hard-surfaced macadam roads connect the city with the smaller neighboring towns. It has an excellent sewage system with over 100 miles of mains. The waterworks are owned by the municipality. There are a number of artesian wells. A tubular well system furnishes daily 2,000,000 gallons of water. There are 12 parks comprising 355 acres of which Cameron Park (130 acres) is the principal and among the most beautiful in Texas. Waco is noted for its healthfulness, cool in summer, mild in winter. Several bridges span the Brazos River. The principal public buildings are the government building, county courthouse, churches, schools, banks the Carnegie library, Masonic temple, the Amicable building, the highest in the Southwest, the Hotel Waco, Hotel Raleigh and the Texas Cotton Palace, wherein is held an annual exhibition of the superior products of agriculture, horticulture, stock-raising, textile industries, etc. The city has hospitals, sanatoriums and an orphans' home.

There are nine banks, five of which are national. The combined capital is $2,663,000 with deposits aggregating $15,000,000. There are 62 churches representing nearly all denominations. The educational institutions are 29 in number, 17 of which are public schools and the remainder private, such as Baylor University, the Academy of the Sacred Heart, Paul Quinn College, Central Texas College, Saint Basil's College, Providence Training School, etc. There are two business colleges, which have a high standing, and several school libraries. The municipal receipts and expenditures are about $500,000. The chief items of expense are the schools and the interest on the bonded and floating debt. The total tax rate (city, county, State, special road) was $2.685\% in 1917 assessed on valuation of 65 per cent in the estate.

The site of Waco was selected, long before the advent of the white man, as a camp-site by local tribes of Indians on account of the abundant springs and the natural protection afforded from storms, cyclones, etc. The Indians named the place Waco, which the whites corrupted to Waco. It was surveyed as a town in 1849 and incorporated in 1850. Its growth in population has been steady and has more than kept pace with the growth in commerce. The rich surpluses raw products sufficient for the support of a large manufacturing and commercial city. Waco has a commission form of government.

In 1917 the McArthur army training camp, covering 15,000 acres, was established to the west and northwestern outskirts of the city, while to the southeast was constructed the Rice Flying Field for the training of army aviators. Pop. 49,289.

WAD, a soft black mineral, consisting chiefly of the oxides of manganese, MnO, and MnO₂, but with varying percentages of one or more other metallic oxides and also water. Several permanent varieties and many minor varieties have been named, thus, while manganese oxide contains iron, silica, alumina and baryta besides the usual much larger percentage of the manganese oxides and water. Asbolite or *earthy cobalt* contains oxide of cobalt up to 32 per cent. Lampadite contains from 4 to 18 per cent of oxide of copper. Wad frequently occurs in loosely aggregated masses which thus seem very light, but its specific gravity rarely falls below 3, and is sometimes as much as 4.26. Though usually so soft as to soil the fingers, its hardness may be as high as 6. It is the amorphous form, reniform masses and incrustations are frequently found, while beautiful arboreal stilpnomelane and quartz and other minerals (see Fig. 12 under MINERALOGY). Wad and reniform and related mineral psilomelane are important ores of manganese and occur abundantly in many localities.

WADAI, wá-dí', or WADAY, French Equatorial Africa, an extensive and semi-civilized negro state in Central Sudan, between Kanem and Bagirmi in the north and Darfur in the east. In 1899 it was recognized within the French sphere of influence, and in 1903 a French protectorate was established. In 1911 a French force occupied Arada, a few miles north of Adeshir, the capital, and in 1913 Ain Galakka. With dependencies its area is estimated at 170,000 square miles and its population at about 1,000,000. It consists principally of an elevated plateau, very fertile in some parts, producing abundantly maize, millet, indigo, cotton, etc. Ivory and slaves are also largely dealt in. The inhabitants were warlike, and exercised tributary rights over several neighboring settlements; their aggressive policy was somewhat checked by the Mahdi who inflicted a crushing defeat on the prelate of Wadai's forces in November 1888. This sultan, Brahim, was deposed in 1901 and succeeded by Sultan Abuzcali. The kingdom of Wadai dates from 1635. The prevailing religion is Mohammedan. Capital, Adeshir, which has caravans with Bengazi, on the coast of Tripoli.

WADDEL, James, Presbyterian clergyman; b. Newry, Ireland, July 1739; d. 17 Sept. 1805. With his parents he settled in Pennsylvania while yet a child. Waddel was educated in Nottingham, Pa.; was licensed to preach 1761, and removing to Virginia was pastor of Prince William County 1762-73, and then became a planter in Louisa County, Va., and conducted a classical school, preaching on occasion. Two years later he became blind, but continued and even multiplied his labors. His fame as a preacher was great and widespread, and he had the advantage of a man's sketch of the man and his manner in 'The British Spy.' President Madison declared that Waddel spoiled him for other preaching.
Patrick Henry named him as one of the two greatest orators he had ever heard.

WADDELL, wød-del', James Iredell, American soldier and statesman; b. N. C., 14 July 1824; d. Annapolis, Md., 15 March 1886. He was appointed midshipman in the United States Navy in 1841, became lieutenant in 1855, and in 1861 resigned his commission in order to join the Confederate navy the next year. He was the impetus of the naval campaign at Drewry's Bluff, James River, Va., was sent to England by the Confederate government in 1863 and in 1864 took command of the Shenandoah, with which he began a piratical cruise against the commerce of the United States which lasted 13 months. He carried the Confederate flag around the world, captured 38 vessels and sailed under the Confederate flag for six months after Lee's surrender. He then turned his ship over to the British government which in turn transferred it to the hands of the United States consul at Liverpool. After residing abroad for several years Waddell returned to the United States and in 1875 became commander in the service of the Pacific Mail Steamship Company.

WADDELL, John Alexander Low, American engineer: b. Port Hope, Ontario, 15 Jan. 1854. He was graduated from Rensselaer Polytechnic Institute in 1875, and in 1876-77 was engaged in engineering work on the Canadian Pacific Railway. He was assistant professor of rational and technical mechanics at the Rensselaer Institute in 1878-88, and in 1882-86 was professor of civil engineering at the Imperial University of Japan. Since 1887 he has been engaged as a consulting bridge engineer. He is a member of various American and foreign societies, and in 1888 was decorated by the emperor of Japan, Knight Commander of the Order of the Rising Sun. He was also decorated by the Granddowress Olga of Russia for his services as principal engineer of the Trans-Alaska-Siberian Railway. He has published 'Designing of Ordinary Iron Highway Bridges' (1884); 'A System of Iron Railway Bridges for Japan' (1886); 'De Pontibus' (1889); 'Specifications for Steel Bridges' (1900); 'Engineering Specifications and Contracts' (1907); 'Nickel Steel for Bridges' (1908); 'Alloy Steel for Bridgework' (1915); 'Bridge Engineering' (2 vols., 1916). With Harrington, J. L., he edited 'Addresses to Engineering Students' (1911), and a compilation of 22 of his professional papers, edited by Harrington, J. L., was published (1900).

WADDING, wød'ing, Luke, Irish Franciscan friar: b. Waterford, Ireland, 16 Oct. 1588; d. Rome, 18 Nov. 1657. After studying theology at the Lisbon Jesuit Seminary he entered the Franciscan Order in 1605, and became professor of divinity in the University of Salamanca. He went to Rome in 1618, where he obtained the degree of Doctor of Canon Law and was appointed to the Irish Franciscan College of Saint Isidore (1625), served as papal councillor in the controversy with the Jansenists, whose tenets he held at first, but presently renounced; and was procurator of his order (1630-34). He wrote 'Annales Ordinis Minorum' (1636-40; new ed., 24 vols. 1731-47); 'Scriptores Ordinis Minorum' (1660; new ed., 1806); and edited Calasio's posthumous 'Biblical Concordance' (1621) and the works of Duns Scotus (1620).

WADINGTON, wød'ing-ton, George, English educator: b. Tutbury, England, 7 Sept. 1793; d. Durham, England, 20 July 1869. He was educated at Trinity College, Cambridge, and received a fellowship there in 1818. He traveled in foreign countries for several years, was appointed commissary and official of the prebend at Masham in 1833; was prebendary of Ferring, Chichester Cathedral, in 1833-41; and from 1840 until his death was dean of Durham. His writings include 'Journal of a Visit to Some Parts of Ethiopia' (1822), 'A Visit to Greece in 1823 and 1824' (1825); 'History of the Church from the Earliest Ages to the Reformation' (1833); 'History of the Reformation on the Continent' (1843), etc.

WADINGTON, Samuel, English poet: b. Boston Spa, Yorkshire, Nov. 1844. He was educated at Brasenose College, Oxford, became a contributor to the leading English journals and reviews, and besides editing several anthologies, such as 'English Sonnets by Living Writers' (1881), and 'Sonnets of Europe' (1886), published also 'A Poet's Monograph' (1883); 'Poems' (1896); and 'Collected Poems' (1902); 'Chapter of My Life' (1909); 'Some Views respecting a Future Life' (1917).

WADDINGTON, Fr. wäd-don-tón, William Henry, French statesman and diplomat: b. Saint Remi-sur-l'Avre, Eure-et-Loir, 11 Dec. 1826; d. Paris, 13 Jan. 1894. He was educated at Trinity College, Cambridge, England, for some years devoted his attention to archaeological research, was admitted in 1853 to the Academie des Inscriptions et Belles-Lettres and did not enter politics until he stood unsuccessfully for the department of the Aisne in 1865 and 1869. Minister of Public Instruction in the extremely short-lived Cabinet of Dufaure, 19-24 May 1873, he was elected senator for the Aisne in 1876 and was again Minister of Public Instruction in 1876-77. In December 1877 he received the portfolio of Foreign Affairs, and in 1878 took a distinguished part in the Congress of Berlin and became Prime Minister. His delay in the matter of needed reforms lost him the support of all parties, and he retired 27 December. He held the London embassy in 1883-93. His writings include editions of the edict of Diocletian (1864) and Le Bas' 'Voyage Archéologique' (1867-77); an essay on 'The Protestant Church in France' (in 'Cambridge Essays' 1856), and 'Mélanges de Numismatique et de Philologie' (1861). Consult Mme. Waddington, 'Letters of a Diplomat's Wife' (1906).

WADE, wäd', Benjamin Franklin, American lawyer and political leader: b. near West Springfield, Mass., 27 Oct. 1800; d. Jefferson, Ohio, 2 March 1878. In 1821 he went to Ohio, where after spending a few years in farming he took up the study of law, was admitted to the bar in 1827, and in 1831 formed a partnership with Joshua R. Giddings (q.v.), and built up a large practice. In 1837 he was elected to the State senate as a Whig, where he procured a resolution against the annexation of Texas; he also opposed the Kentucky Slave Bill, and on this account failed of re-election in 1839; but was again elected in 1841. He took active
part in the campaign of 1840, and in 1847 was elected the presiding judge of the Third Judicial Court of Ohio, where he acquired high standing as a jurist. In 1851 he was elected to the United States Senate, and re-elected in 1857 and in 1863, thus serving throughout the Civil War. He was a most vigorous opponent of slavery, voted to repeal the Fugitive Slave Law and in opposition to the Kansas-Nebraska Bill. As an orator, he was forceful, carrying conviction by his sincerity. After the election of Lincoln in 1860, he opposed any compromise between the North and the South; from 1861–65 was chairman of the joint committee on the conduct of the war, and advocated a vigorous policy and the immediate emancipation of the slaves. In 1864 he opposed the policy of the President and moderate Republicans in regard to Reconciliation, and with Senator Davis issued the Wade-Davis manifesto strongly criticizing the President's policy. He advocated wholesale confiscation of Confederately-owned property in the North, the arming of the blacks and execution of Southern leaders. He was elected president pro tem of the Senate, and was thus acting Vice-President of the United States in 1865, after Lincoln's assassination. He was criticized for voting for Johnson's impeachment, which if accomplished would have resulted in his own elevation to the Presidential office; but after the excitement had subsided, even his opponents were convinced of his disinterestedness. His ability in debate, fearlessness and honesty gave him a leading position in the Senate and commanded the respect of his associates, Consult Riddle, 'Life of Benjamin F. Wade' (1886).

WADE, James Franklin, American officer: b. Jefferson, Ohio, 14 April 1843. Educated in the common schools of his time, he entered the Union army as first lieutenant, Sixth United States Cavalry (14 May 1861), became colonel of the Fifth cavalry (1867) and was major general of volunteers (1898), serving in the war against Spain, and was head of the Cuban evacuation commission. He became military governor of Cuba (1899), was promoted major general of the United States army (1903) and succeeded General Davis in command of the division of the Philippines (1903–04). He became commander of the Atlantic division (1904–07) and in the latter year he retired.

WADE, Sir Thomas Francis, English diplomatist: b. London, 25 Aug. 1818; d. Cambridge, 31 July 1899. He studied at Trinity College, Cambridge; entered the army in 1838; in 1841 was promoted lieutenant in the 98th regiment, detailed for service in China; and was successively interpreter at Hongkong and vice-consul at Shanghai. From 1861 to 1871 he was a member of the British legation at Peking and from 1871 to 1883 Ambassador there. In 1888 he married Amelia, a daughter of Sir John Herschel. In 1888 he was made the first professor of Chinese at Cambridge University. His large and important Chinese library is now in the possession of that institution. He published 'The Peking Syllabary' (1859); 'Yü-yen Tz'ü-chi: A Progressive Course in Colloquial Chinese' (1867); and other standard works on China and the Chinese.

WADELAI, wá-dé-lí, central Africa, a military post in the equatorial province of the Egyptian Sudan, on the Nile not far below the Albert Nyanza. It is on the Uganda telegraph line and was famous as the chief station of Emin Pasha (q.v.), governor of the province, who, after the Mahdist rising, was cut off from civilization and who was relieved by Stanley.

WADESBORO, wádž-bér-o, N. C., town, county-seat of Anson County, on the Sea-board Air Line and the Atlantic Coast Line railroads, about 100 miles southwest of Raleigh and 50 miles southeast of Charlotte. It is in an agricultural region in which the chief products are cotton and tobacco. The principal buildings are the county courthouse, the Anson School Institute, opened in 1854, and the churches and schools for both races. There are two newspapers and two banks. Pop. about 2,376.

WADHAM (wá'dham) COLLEGE, Oxford University, England, was founded in 1610 by Dorothy, widow of Nicholas Wadham of Mayfield, Somersethshire, England, for a warden, 15 fellows, 15 scholars, two chaplains and two clerks. One of the fellowships was diverted in 1857 to the endowment of the experimental philosophy. The scholarships have an annual value of $400 and are tenable for five years; and there are besides 10 Hody exhibitions (six Greek, four Hebrew) of $250, two Wright exhibitions (1874) for scholars of Manchester Grammar Schools, etc. Wadham College presents to 12 livings. The 17th century college buildings and the college garden are attractive features; the library is rich in rare Spanish books. Among Wadham's distinguished alumni are Admiral Blake, Sir Christopher Wren and Frederic Harrison.

WADI, wá'dë, or WADY (Arabian, 'rawine'), in Palestine and Arabia, either a river or river valley, or the basin of a torrent. Renan thinks this word was adopted by the Greeks and corrupted into oasis. It has passed into the Spanish gaudal, with which many of the Spanish river names begin; thus Wadi-l-Bekir (Arab. 'great river') appears as Guadalquivir, Wadi-l-hajarah ('river of stones') as Guadalaxara. The ravines of Malta commonly go by the name of yewed or wied, a corrupted form of wadi.

WADLEY, George Henry, American naval officer: b. New Hampshire, 28 Sept. 1842. He was graduated from the United States Naval Academy in 1863 and was assigned to blockade duty with the West Gulf squadron, serving until the close of the war. He was commissioned master in 1865, commander in 1880, served on the Arctic expedition in search of the Jeannette in 1881, was promoted captain in 1894 and in 1895–97 was in command of the Minneapolis on the coast of Asia Minor, engaged in the protection of American missionaries. He commanded the flag-ship Philadelphia in the Pacific station during the Spanish War and after the conclusion of peace was in command of the Wabash at the Boston Navy-yard. In 1902 he was promoted rear-admiral and was retired the same year.

He studied architecture in Salem and in Boston, Mass., and in 1875-79 was engaged in the practice of that profession in the latter city. He was appointed special agent for the Massachusetts Bureau of Statistics of Labor in 1879 and upon becoming its chief in 1886 abandoned his professional practice. He resigned this position in 1903 to accept the post of librarian at the Boston Public Library, which he has since occupied. He was a member of the Massachusetts legislature in 1884-85, was supervisor of the United States census in 1890 and in 1900 and also of the Massachusetts census of 1895. He has published "Reports on Statistics of Labor of Massachusetts" (14 vols., 1888-1901); "Annual Statistics of Manufactures of Massachusetts" (16 vols., 1888-1901); "Decennial Census of Massachusetts" (7 vols., 1895), etc.

WADSWORTH, wâdz'werth, James, American soldier: b. Durham, Conn., 6 July 1730; d. Sept. 1787. He was graduated at Yale 1748. He was a captain in the Connecticut militia 1776; was commissioned major-general 1777, and ordered to New Haven, there to organize the defense of the coast towns. He was later chosen judge of the Common Pleas of New Haven County; was delegate to the Continental Congress 1783-86, and member of the executive council 1785-90.

WADSWORTH, James, American educator: b. Durham, Conn., 25 April 1768; d. 8 June 1844. He graduated at Yale 1787. In 1790, in company with his brother William, he removed to the Genesee Valley, western New York, and through the rise in value of land, large quantities of which they had purchased, he became one of the richest landholders in the State. He gave much effort and much money to advance popular education, publishing and circulating, at his own expense, works on this subject, and employing lecturers to speak on it. As early as 1811 he recommended the establishment of normal schools, and 1838 procured the enactment of the New York School Library Law. He founded and liberally endowed a library and scientific institution at Geneseo. In selling his lands he always stipulated that at least 125 acres each, in every township, should be given, one for the support of a school and the other for a church. He died at Geneseo.

WADSWORTH, wâdz'werth, James Samuel, American soldier: b. Geneseo, N. Y., 30 Oct. 1807; d. 8 April 1864. He was educated at Hamilton College, Harvard and Yale, though he was not graduated from any one of these institutions; studied law with Daniel Webster, and was admitted to the bar in 1832. He did not, however, practise his profession, his attention being given to the management of his extensive estates in western New York. He enlisted as a volunteer in the Union army early in 1861; was appointed a brigadier-general in August of that year; and became military governor of the District of Columbia in March 1862. In that year also he was the Republican candidate for governor of New York, but was defeated by his opponent, Horatio Seymour (q.v.). He was employed in the business houses of Chancellorsville, Gettysburg and the Wilderness as commander of a division and was mortally wounded in the last-named battle, dying two days later.

WADSWORTH, James Wolcott, Jr., American legislator: b. Geneseo, N. Y., 12 Aug. 1877. He was graduated at Yale in 1898. The Spanish-American War was in progress at the time of his graduation whereupon he enlisted in Battery A, Pennsylvania Light Artillery, which was one of the batteries of General Grant's brigade during his campaign in Porto Rico. On the conclusion of the war Private Wadsworth was discharged from the volunteer army but early in 1899 made a voyage to the Philippines while the war was in progress and later made a tour around the world. He came home and immediately took charge of his father's livestock business at Mount Morris in 1899 and managed a ranch at Paloduro, Tex., 1911-13. He was elected member of assembly from Livingston County (1905-10) and was speaker of the house (1906-10). He was delegate to the National Republican Convention in 1908 and 1916 and was elected United States senator for the term 1915-21, by a handsome majority, receiving 639,112 votes against 571,010 for his Democratic opponent. He is a member of the Order of Merit, the Spanish War Veterans, the Grange and numerous organizations and clubs.

WADSWORTH, Peleg, American revolutionary soldier: b. Hiram, Oxford County, Me., 1748; d. 18 Nov. 1829. Having graduated at Harvard, he was first a schoolmaster, then a merchant. At the outbreak of the Revolutionary War he was made captain of a company of minute-men. He was later appointed adjutant-general for Massachusetts; was present in the battle of Long Island; was commissioned brigadier-general of militia 1777; was second in command in the Penobscot Expedition 1779, and was taken prisoner; after release he was again captured in his house by British soldiers and held prisoner at Castine, Me., February-June 1781, when he escaped. He was elected to the State senate of Maine 1792, and representative in Congress 1793-1807. Congress granted him a large tract of land in Oxford County, Me., in recognition of his military services; he settled on this land after retiring from Congress, and greatly developed its resources.

WADSWORTH, Ohio, village in Medina County, on the New York, Pennsylvania and Ohio Railroad, about 30 miles south of Cleveland and 12 miles southwest of Akron. It was settled in 1816 and in 1865 was incorporated. It is in an agricultural region in which tobacco is one of the important vegetable products. In the vicinity are large beds of coal, valuable sandstone quarries and extensive deposits of fire-clay. There are also deposits of clay and ocher. The chief manufactures are door and window screens, wagons and carriages, steam injectors, flour and machine shop products. There are eight churches, a normal school, graded public schools and a library, two banks and a newspaper. Pop. about 3,073.

WADY-HALFA, wâ'dé-hâl'fâ, Egypt, the capital of a second-class district in the Sudan, on the east bank of the Nile, opposite the second cataract and at the junction of the branch lines of the military railroad to Khartum.
and Kerma. Its notable features are two ancient temples. Pop. with suburbs about 3,200.

WAFER, (1) a thin circular cake of unleavened bread, generally stamped with the Christian monogram, the cross, or other sacred symbol and used in the Roman and several other churches in the administration of the Eucharist. (2) Originally, a small disc of dried paste, now a disc of gummed paper, used for sealing letters, etc.

WAGER, a promise to pay (money or the like), dependent on some event or disputed fact or circumstance; a bet. It is retroactive, working both ways, for the bettor receives in return a promise of a thing esteemed of like value, should his intention prove to be correct. It is that which a man earns with his labor by the law. By statutes of England and the United States, all contracts or agreements, whether by parole or in writing, depending on wages, are null and void, and money due thereon will generally be barred in any court of law. Insurance is not regarded as a wager, however, because it is legitimate in business. See GAMBLING; HORSE-RACING.

WAGER, or WAGERING, POLICY, in insurance law, a pretended insurance, in which the insured possesses no legal interest in the subject matter of the insurance or the risk insured against. Therefore, it is really a wager between insurer and insured that the uncertain event referred to will or will not take place. The "stakes" of the insurer are represented by the sum insured; those of the insured, the paid premium. See INSURANCE.

WAGES. Wages are the remuneration of labor, either mental or physical. This remuneration includes not simply that which is paid by one man to another in the form of wages, but that which a man earns with his labor even when he works for himself. In short, it is that quantity of wealth which comes to one during a given period of time because of the exercise of his own powers, physical and mental. It is not included which comes to him as the result of labor previously performed by himself or others or which comes to him through the ownership of capital or land, though the return which he receives at a given period for capital which he himself had previously accumulated might conceivably be called deferred wages for his previous labor and thrift.

There have been some objections to calling labor a commodity and wages the price of a commodity. Whether labor be a commodity or not, there can scarcely be any doubt that the wages of labor have some features in common with the prices of commodities. A kind of labor which is very intensely desired or needed will generally command a high wage just as a commodity which is intensely desired or needed will command a high price. In both cases, however, the desire or need must be somewhat specific. It is not enough to say that air is very much desired or needed in the sense that we could not get along without it. It sometimes happens that a given class of unskilled labor is not intensely desired or needed in the sense that we do not need any more than we have got, or at least do not need it with any great degree of intensity.

The problem of wages is one of the most acute of our social and economic problems because on this problem depends the problem of poverty. Poverty must, however, be distinguished from dependence, which may result from injury, incapacity or a variety of causes. Poverty in a general sense results only from low wages. There can be said to be poverty in a community when there are considerable numbers of laborers capable of working who cannot sell their labor at a high price or for good wages. Until this situation can be removed no community is free from reproach. Until it can create conditions under which every one who is capable of working can sell his labor at a good price or can command good wages for his labor, it will not have solved the problem of poverty. It may cover up the problem by decreeing high wages, or by taking something from one class of people in order to pay it to another class. This is obviously no cure and is certain in the course of time to bring about worse conditions than those which it is designed to cure. The only real and permanent cure is the creation of such conditions as will enable every normal laborer, without governmental interference or compulsion of any kind, to sell his labor on the open market at a good price, or to command high wages for his labor under the normal operation of the laws of demand and supply. So long as it remains true that an employer of labor need not take any trouble to find help, but can merely take his pick among the numerous applicants for jobs, the forces of demand and supply are working to the disadvantage of that class of labor. The reproach of poverty cannot be removed until the opposite symptoms show themselves, that is, until the average laborer never has to look for a job, but can take his pick among several jobs which are offered. If so, there is little or no need of bringing about this condition. A proper redistribution of human talent which will multiply the number of employers, either actual or potential, and diminish the number of laborers, especially of that class of labor which had previously accumulated might conceivably be called deferred wages for his previous labor and thrift.

There have been some objections to calling labor a commodity and wages the price of a commodity. Whether labor be a commodity or not, there can scarcely be any doubt that the wages of labor have some features in common with the prices of commodities. A kind of labor which is very intensely desired or needed will generally command a high wage just as a commodity which is intensely desired or needed will command a high price. A proper redistribution of human talent which will multiply the number of employers, either actual or potential, and diminish the number of laborers, especially of that class of labor which had previously accumulated might conceivably be called deferred wages for his previous labor and thrift.
WAGNER, 209

ignorance and lack of skill to disappear and with them ignorant and unskilled labor. It should greatly multiply the number of persons capable of those occupations where men and women are now scarce. This in itself would tend to double the number in the employing classes and halve the number in the unskilled classes. However, the beneficent effects of such an educational system might easily be counteracted in any community by the importation of masses of ignorant and unskilled laborers. A very careful selection of immigrants would be absolutely essential as a supplement to the educational system. There should, of course, be no restriction upon immigration of people who are capable of entering those occupations where men and women are scarce. In fact, every encouragement should be offered to immigrants who are capable of entering the employing classes, but there should be an absolute exclusion of those who are only capable of entering the ignorant and unskilled classes.

Even with a beneficent educational system and a selective immigration policy, the beneficent effects on the distribution of talent and of wealth might be in part counteracted as is sometimes called selective birth rate. If the people who regularly enter the more well-paid occupations should continue to marry late and have small families, while the people in the poorly paid occupations marry early and have large families, this itself would tend toward a bad distribution of skill and talent, thinning people out at the top and thickening them at the bottom. This, however, is the most difficult phase of the whole question to handle. It is not difficult to construct an educational system or a selective immigration policy, but the problem of increasing the birth rate among the intellectual classes and decreasing it among the unskilled and ignorant classes seems well-nigh insoluble. Probably nothing except a superior kind of moral teaching which will increase the family-building ambition and diminish the spawning tendency is the only effective remedy.

Thomas N. Carver

WAGNER, Charles, French Protestant leader: b. Wifersville, Alsace, 3 Jan. 1852; d. 12 May 1892. At the age of 14 he was sent to Paris to school; was graduated at the Sorbonne in 1869; and studied theology at Strassburg and Göttingen. He was the pastor of a small parish in the French province of Vosges until 1882, when he went to Paris, and there opened a Sunday-school and later began preaching. The publication of his book 'Jeunesse' ('YOUTH') in 1891 marked him as a leader in the ethical movement in France and his influence continually increased. Besides serving as pastor to a large congregation, he took an active part in many philanthropic and charitable undertakings, and in this work came into cordial relations with men of all shades of religious belief. His other publications translated into English include 'The Soul of the Frenchman'; 'By the Fireside'; 'The Better Way'; 'The Simple Life'; 'On Life's Threshold' (1905). Of these 'The Simple Life' attracted particular interest in the United States and was widely commended by religious and ethical leaders. In the fall of 1904 Pastor Wagner visited the United States, where he made numerous addresses and gained material for 'My Impressions of America' (1906).

WAGNER, vagn'ner, Moritz, German naturalist: b. Baireuth, 3 Oct. 1813; d. Munich, 31 May 1887. He studied at Heidelberg, Munich, and made extensive scientific journeys in 1852-55 through North and Central America and the West Indies; in 1857-60 through the Andes from Panama to Ecuador. He was made professor of geography and ethnology at Munich. Among his writings are 'Travels in Algiers' (1841); 'The Caucasus and the Land of the Cossacks' (1847); 'Journey to Colchis' (1850); 'Journey to Ararat and the Armenian Highlands' (1848); 'Travels in Persia and in the Land of the Kurds' (1851); 'Scientific Travels in Tropical America' (1870); 'The Darwinian Theory and the Law of Migration of Organisms' (1868).

WAGNER, Richard, German composer, creator of the modern music drama: b. Leipzig, 22 May 1813; d. Venice, 13 Feb. 1883. His father, a clerk in the police court, who had been appointed chief of police at Danzig during the French occupation of Leipzig, died when Richard was only six months old; and the widow, left with seven children, married, nine months later, Ludwig Geyer, a well-known actor, playwright and portrait painter, as well as a tenor. His appearances at the opera in Dresden, where he lived, gave young Richard opportunity to become familiar with the operas then in vogue, his favorite being Weber's 'Freischütz,' which made a deep impression on him and determined the direction of his own genius to such a degree that it has been aptly said that it was Weber who wrote the first 'Wagner Operas.' When Geyer died, Richard was eight years old and he had not, up to that time, shown any special talent for music. Indeed, he played the piano so badly that his teacher told him he would never amount to anything. His poetic talent began to manifest itself when he was 11. Shakespeare became his model and at 16 he had completed a tragedy, a sort of compound of Hamlet and Lear, in which he killed off so many of the characters (42) that most of them had to be brought back as ghosts to prevent the play from coming to an untimely end. It was his desire to set this music that first decided him, at 16, to become a musician. He took some lessons and after a few preliminary trials wrote a piece concerning which he himself said afterward that 'Beethoven's ninth symphony appeared like a simple Fleyel sonata by the side of this marvelously complicated overture.' These youthful extravagances were prophetic of the man who was to revolutionize the opera by his bold defiance of all conventions. In 1830 he entered the University of Leipzig as a student of philology and aesthetics, but music claimed most of his attention, and he wrote, and entered for performance the symphony which showed such a remarkable mastery of the methods of classical composition as to indicate that he could have become one of the great masters in the concert field had not the inclination of his genius pointed toward the operatic domain. He wrote his first opera at Würzburg, where he had secured an engagement as chorus master; it was entitled 'The Fairies,' but was not performed till five years after his death at Munich.
WAGNER

His second opera, 'Das Liebesverbot' (based on 'Measure for Measure'), had a deservedly unsuccessful production at Magdeburg. Then he had an appointment as director of the Königberg, where he married a pretty actress, Minna Planer; and in the following year he moved again, to the Russian town of Riga, where he wrote the libretto and the music of the first two acts of 'Rienzi'. This opera was planned on such a big scale that he knew he never could have it properly produced at a provincial theatre, wherefore he boldly resolved to go to the headquarters of spectacular opera - Paris - and try there to rival the popular idol, Meyerbeer, in his own field. With his wife and a huge Newfoundland dog he embarked at Pillau for London; the voyage lasted nearly four weeks; three times the ship was tossed by violent storms and it was during these that Wagner got the realistic 'local color' for his 'Flying Dutchman,' the story of which was engaging his attention at the time. Paris did not prove hospitable to the German musician. He tried in vain to have one of his operas produced; no one cared for the French songs he wrote and which he was finally glad to sell in Germany at $4 an apece; he could not even get a place as chorus singer in a Boulevard theatre. Luckily he found a music publisher, Schlesinger, who paid him for proof-reading and arranging popular melodies and operatic scores for piano and cornet and other instruments. Wagner also wrote some interesting musical essays and novels which were printed and paid for and which contain many autobiographical details. He completed 'Rienzi' and also wrote the music of the 'Flying Dutchman'; but finally after nearly three years of starvation and numberless disappointments, left Paris for Dresden, whence he had received a request for his 'Rienzi'.

With the return to Germany begins the second period in Wagner's life. 'Rienzi' was produced at Dresden 20 Oct. 1842 and proved such a brilliant success that there was a demand for a bold opera of his very own. 'Flying Dutchman', which was given 2 Jan. 1843, only about 10 weeks after 'Rienzi'. This proved to be less of a success; the performance was poor and the audience was puzzled and displeased when in the last act the usual air and processions it formed an opera without arias, duos and dances - an opera so new in form and spirit that few could understand it. Only four performances were given. However, 'Rienzi' had made Wagner the hero of the day; he was appointed royal conductor and kept that position about six years. His next opera, 'Tannhäuser,' departed more widely still from the accepted models. It was produced 19 Oct. 1843, and, to Wagner's chagrin, seemed to give pleasure only in so far as it resembled the old-fashioned operas. However, he persevered in his path of reform and wrote 'Lohengrin.' It was finished in 1848, but he could not even get it accepted for performance. Nor could he get any attention for his plans for reforming the Dresden Opera. He became more and more dissatisfied with his position, and when, in 1849, the Revolution broke out, he foolishly joined the insurgents. The result was that he and his companions were caught and imprisoned, while he succeeded in reaching Weimar where Liszt took care of him and provided him with the means of escape to Switzerland. In that home of political refugees he dwelt during most of the years - more than a decade - that he was exiled from Germany. For six years he composed no music, but spent his time writing essays on musical and dramatic subjects by way of explaining his theories. Little attention was paid to these and he might have starved but for the assistance of Liszt and other friends. All this time the plans for his great 'Nibelungen Tetralogy' were slowly maturing in his mind. In 1852 the poems were finished and printed and 1 Nov. 1853 he began to write the music for 'Rheingold'; it was finished the following year and 'Die Walküre' was completed by March 1856. In the meantime he had unwisely accepted an offer to conduct a series of Philharmonic concerts in London (1855), Queen Victoria and the public were kind to him, but the press treated him shamefully, his music being described as an "inflated display of noise and extravagance," as void of melody, etc. He got only $1,000 for four months' work. Returning to Switzerland, he finished 'Die Walküre' and began the third opera of the Nibelung Tetralogy, 'Siegfried.' When he had finished the first half of the second act, he despaired of ever finishing and producing this great clyc work, and so abandoned it for the time being (in June 1857) and began his 'Tristan und Isolde,' which, being a separate work, would, he hoped, re-establish his connection with the stage. He completed it in 1859, but seven years elapsed before he succeeded in producing it. In 1860 he gave a series of concerts in Paris; they resulted in a large deficit. In the following year Napoleon ordered a performance of 'Tannhäuser.' Wagner was given to understand that he must introduce a ballet in the second act; he refused to do so, and the members of the Jockey Club took their revenge by creating such a disturbance that Wagner declined to allow more than three performances to be given. He thus received only $150 a year for his hard work. Immediately after this disaster he wrote the poem for his only comic or humorous opera, 'Die Meistersinger,' of which he had made a sketch as early as 1845.

It was while composing this opera that the most important event of his life happened. He seldom had much money, but when he had he spent it with artistic lavishness, nor did he hesitate to live beyond his means. The failure, through no fault of his, of a Russian operatic project, left him so deeply in debt in Vienna, that, to escape prison, he had to hide in Germany. On 3 May 1864, he was preparing to disappear in the Subian Alps, there to complete his 'Meistersinger' score, when a message arrived from an "accidental" visitor in Munich, King Ludwig II, who invited him to come to Munich to live there at his expense, to compose operas and produce them. Wagner wept for joy, and promptly proceeded to Munich, where 'Tristan und Isolde' was produced on 10 June 1865 and 'Die Meistersinger' on 21 June 1868. But Wagner's enemies made life so unpleasant for him that he left Munich and took up his abode in a villa on Lake Lucerne, where, after completing his comic opera, he took up 'Siegfried' and finished the third, fourth and last opera of the Tetralogy, 'Götterdämmerung,' was not completed till 1874. His plan of having a special theatre for the Tetralogy built in Munich having failed, notwith-
standing the king’s friendship, he now chose Baireuth as the best place for such a theatre, in which his novel work could be presented in exact accordance with his intentions. To secure the large sum needed, Wagner societies were founded in the cities of Europe and America. In August 1876 three complete performances of the Tetralogy were given, before audiences including two emperors, a king and many musical and other celebrities. But the debt of $37,000 discouraged a repetition of the festival. In 1882, however, after the completion of ‘Parsifal,’ another was held devoted entirely to that work; 20 performances were given in July and August. In the following February, Wagner died at Venice and his remains were taken in a special funeral train to Baireuth. After his death his widow (Cosima, the daughter of Liszt, whom he had married in 1870, four years after the death of his first wife) continued the festival, which his memory and the name of Richard Wagner remained a Baireuth monopoly until 24 Dec. 1903, when Manager Conried produced it at the Metropolitan Opera House, New York, the receipts being over $200,000 for 12 performances. Wagner’s score is based on a story of medium stature; his head was large in proportion to his body, his forehead massive, his chin prominent, his lips refined, his eyes keen yet kindly in expression. His life was full of disappointments, which left their traces in the lines of his face. He was 44 years old before any of his operas were heard in Vienna, Munich or Stuttgart, and 56 before any of them were sung outside of Germany. This, of course, was largely due to the fact that he refused to make any concessions to popular taste, except in ‘Rienzi.’ The next three operas — ‘Flying Dutchman,’ ‘Tannhäuser,’ and ‘Lohengrin’ — created an entirely new style, and by the time the public had become accustomed to that, he made another equally great step forward in his ‘Tristan,’ ‘Meistersinger,’ ‘Nibelung Tetralogy’ and ‘Parsifal.’ These were derisively referred to as music of the future, by way of burlesquing his idea of the art work of the future. This idea was that music, sculpture, poetry, picturing architecture had had their day as separate arts, and that the art work of the future was the music-drama, in which all these arts are united inseparably. His wonderful pictorial imagination is best exemplified in ‘Parsifal.’ Being almost the greatest poet as well as a composer, he always wrote his own libretos, whose theatrical and literary merits place him among the world’s greatest playwrights, although they must not be judged apart from the music any more than the music must be judged apart from the plot, the story and the action. He preferred mythical, supernatural subjects to the historic. His operas are not, like those of his predecessors, a mere mosaic of disconnected arias, duos, choruses and orchestral interludes, but especially in those of the last period, every part is connected with every other part by means of leading motives, or characteristic musical phrases which are associated with a particular person, incident or dramatic emotion, and which recur in the music whenever the person or dramatic idea which they stand for recurs in the play. This practically gives the faculty of definite speech to the orchestra, the beauty and emotional power of which he further enhanced beyond all precedent by an endless variety of new tone colors and expressive harmonies. He also created an entirely new style of dramatic vocalism, which it took the singers years to master, but with which they are now celebrating their greatest triumphs; to-day Wagner’s operas are more popular and profitable than any others. Apart from his operas, the list of Wagner’s works includes some mediocre piano pieces, several good songs, and, for orchestra, the ‘Siegfried Idyll,’ and three marches, the ‘Huldigungsmarch,’ the ‘Kaisermarch’ and the ‘Philadelphia Centennial.’ This last, like his other miscellaneous works, is mediocre. His literary works comprise 10 volumes of dramatic poems and essays on musical and philosophical subjects, some of them wordy and wearisome, others extremely keen and suggestive; English version by Ellis, who is also translator of Glaseann’s most important letters. The letters of Wagner to Liszt and other friends are extremely valuable; full use is made of them in the most elaborate biography in the English language, by Finck (1893). Other biographical and critical books are: Schering (1902), Julien (1886), Tappert (1883), Müncker (1891), Liszt, Wolzogen (1883), Pohl, Nohl, Porges, Hueffer, Chamberlain (1896), Nietzsche, Schür, Kufferath, Oesterlein, Dammreuther (in Grove). Henderson (1911), Krehbiel (1911), Finck (1893), Glaseann (1876–1911), Koch (1907), Wagner, R., ‘Mein Leben’ (1911); thematic guides by Wolzogen, Kobé, Heintz, Freda Winworth.

HENRY T. FINCK,
Musical Critic, New York Evening Post.

WAGNER, Rudolf, German physiologist: b. Baireuth, Bavaria, 30 July 1805; d. Gothenburg, Germany, 13 May 1864. He was educated at Erlangen, Würzburg and at Paris, was appointed professor of zoology at the University of Erlangen in 1833 and in 1840 was called to the chair at the University of Gothenburg, where he remained until his death. He published ‘Lehrbuch der vergleichenden Anatomie’ (2 vols., 1834–35); ‘Handwörterbuch der Physiologie’ (4 vols., 1842–43); ‘Vorstudien zu einer wissenschaftlichen Morphologie des menschlichen Gehirns als Seelenorgan’ (2 vols., 1860–62), etc.

WAGNER, Siegfried, German musical conductor, son of Richard Wagner (q.v.): b. Lucerne, Switzerland, 6 June 1869. He was intended for an architect, but being bent on adopting the profession of his father, he left the Polytechnic school and studied music under Kniese and Humperdinck. He became a musical conductor in 1893, traveling in this capacity on the Continent and in England and in 1896, and again in 1899, conducted the performances of ‘Der Ring des Nibelungen’ at Baireuth. He is the composer of the operas ‘Der Bärenhäusler’ to his own text (1899) and ‘Herzog Wildfang’ (1901), and various orchestral pieces.

WAGON, a four-wheeled vehicle for the transport of goods or passengers, drawn generally by horses. To enable its four wheels to move as quickly and in as little space as possible, the fore pair of wheels are often made smaller.
than the hind pair, and to increase this advantage still further the axle of the fore-wheels is frequently fixed to the bottom of the vehicle by a swivel joint, in which case the shafts are attached to the fore-axle. The framework of the wagon is usually mounted on springs. See CARRIAGE.

WAGONER, Okla., city and county-seat of Wagoner County, on the Missouri, Kansas and Texas, the Santa Fe, Iron Mountain and Southern and the Missouri, Oklahoma and Gulf railroads, 16 miles north of Muskogee. It has a Carnegie library and has adopted the commission form of government. Its leading industries are grain elevators, flour mills, cotton gins, a cotton-seed oil mill, a wagonwood factory, foundry and machine shops. Pop. about 5,000.

WAGRAM, vəˈɡram, Austria, a village on the left bank of the Rossbach, 12 miles northwest of Vienna, famous for the great battle between the French under Napoleon and the Austrians under the Archduke Charles, on 5 and 6 July 1809. Napoleon had obtained reinforcements after the severe loss which he sustained at Aspern and Essling, and was able to summon an army of 150,000, with 550 cannon, across the Danube on 5 July. The Austrians, who occupied a strong position at Wagram, were immediately attacked, but the first day with little success. On the following morning the archduke fell upon the French centre under Masséna, and then upon their left, producing confusion ending in total rout. A successful attack upon the Austrian left and centre by Davoust and MacDonald compelled the archduke to retreat, which he did leisurely and in good order, carrying with him about 7,000 prisoners, but leaving behind him 25,000 dead and wounded on the field, the French loss being probably of equal. On the 12th an armistice was signed at Znaim, and negotiations were commenced for a peace, which was concluded on the 14th October at Schönbrunn, and by which Austria ceded all her seacoast to France; Bavaria and Saxony were enlarged at her expense; part of Poland in Galicia was given to Russia, and Joseph Bonaparte was acknowledged king of Spain.

WAGSTAFF, Blanche Shoemaker, American editor and author; b. New York City, 10 July 1868. She is a daughter of the late Henry F. Shoemaker (b. 28 March 1842; d. 2 July 1918), the pioneer railroad man, who laid out 3,000 miles of western railways and became chairman of the board of directors of the Cincinnati, Hamilton and Dayton. He served in the Civil War as lieutenant of the 27th Pennsylvania Volunteers and subsequently organized the Harrison National Bank and the Trust Company of America. The eldest paternal American ancestor of Mrs. Wagstaff was Peter Shoemaker, killed in the Revolution at Saratoga in 1796. Her mother was Blanche Quiggle, daughter of Col. James William Quiggle, L.L.D., sometime deputy attorney-general of Pennsylvania and state senator. On 20 April 1907 Miss Shoemaker married Alfred Wagstaff, Jr., and has one son, Alfred Wagstaff, 3d. She was educated at the Brearley School and Miss Spence's School, New York. Mrs. Wagstaff is a prominent critic on the New York Times Book Re-

WAGTAIL, a small passerine bird of the family Motacillidae, so called from the habit of jerking the long tail when running or perching. In this family, which also includes the pipits (Anthus), or titlarks (q.v.), the bill is slender, straight, and notched; the lower mandible is very long and slender for a passerine bird; the wing with nine primaries and elongated inner secondaries, and the tail long. About 100 species are known, most of them belonging to the Old World. North America has four species of pipits and three wagtails, one of which (Budgerigar) is abundant in Alaska, the others (Motacilla alba and M. cinerea) are straw-like from Europe and Asia, respectively. The wagtails inhabit meadows, pastures, and frequented pools and streams. They are agile runners, and have an easy, undulating flight. The food consists of insects, worms, snails, etc., especially such as may be found by wading. Their nests, built on the ground, contain from four to six eggs. A well-known European species is the pied wagtail (Motacilla alba), a permanent resident in Great Britain. The white wagtail (M. alba) is a bird in winter in Europe, is widely distributed in Asia and occasionally wanderers to Greenland; it resembles the preceding species, but is rather slender in form, and has the throat and part of the head and neck alone black, the general color of the
upper parts being of a light ash gray. The blue-headed wagtail (*Budorcas flavus*) is about six and one-half inches long, yellowish green above, bright yellow below, the head bluish gray except for the yellow throat and white supernumerary stripe. This species is distributed extensively over Europe and Asia, and breeds plentifully in Alaska. The nest is formed of roots and moss sometimes lined with feathers, and placed in a hollow on the ground. The name of water-wagtail is in the United States often applied to the water-thrush.

**WAH**, the Nepalese name of the panda (q.v.).

**WAHABIES, wā-hā'bēz, WAHABIS, or WAHABITEs, a Mohammedan sect, founded in Arabia about 1745 by Abd-el-Wahab, a merchant as well as an Oriental scholar of high attainments, who could not help observing the corruption both in doctrine and in practice prev-alent at the mosque of Islam, especially the Turk. He deemed it his mission, not to teach a new religion, but to purge the innovations and errors which had crept into the old faith, and to restore the doctrines and observances to strict harmony with the teaching of the Koran and the Sunna.

**WAHKIAKUM** (the name of a former chief). A tribe of the Chinookan stock of North American Indians, formerly living near the mouth of Columbia River, in Washington. They were originally a part of the Chinook tribe, but separated in the latter part of the 18th century, under Chief Wahkiakum, whose name they afterward assumed. They were first noted by Lewis and Clark. A county in south- western Washington bears their name.

**WAHL, William Henry,** American scientist: b. Philadelphia, Pa., 14 Dec. 1848. He was graduated from Dickinson College, Carlisle, Pa., in 1867, studied at the University of Heidelber and subsequently made a special study of mineralogy and chemistry. He was professor of physics and physical geography at the Central High School at Philadelphia in 1873-74; resident secretary at the Franklin Institute and editor of the *Journal of Franklin Institute* in 1870-74; and in 1876 became editor of the Philadelphia Polytechnic. He was associate editor of the *Engineering and Mining Journal* in 1878-80, editor of the *New York Manufacturer and Builder* in 1880-82 and then resumed his former post at the Franklin Institute. He published *Galvanic-Plastic Manipulations* (1883); *Preparations of Metallic Alloys* (1893); *Historical Sketch of the Franklin Institute* (1894), etc.

**WAHOO, wā-hoo*, Neh, city, county-seat of Saunders County, on Cottonwood Creek, and on the Chicago, Burlington and Quincy and the Union Pacific railroads, about 50 miles west of Omaha. It is in a fertile agricultural region in which the principal products are wheat and corn. The chief shipments are wheat, corn and livestock. The principal industry is flour milling and works. There are 11 churches, a high school, elementary schools and a public library. The Luther Academy, under the auspices of the Evangelical Lutheran Church, was chartered in 1883. There are three banks and two newspapers. Pop. about 2,200.

**WAHOO.** See WAHOO.

**WAHOWPUM** ("willow people"), a small tribe of the Shoshoni stock of North American Indians, occupying the village of Hahau on the north bank of Columbia River, near the mouth of Olive Creek, in Klickitat County, Wash. They have never been officially recognized.

**WAHPEKUTE** ("shoot among deciduous trees"), a division of the Santee of the Dakota confederacy of the Siouan stock of North American Indians. They are now officially regarded as "Santies," of whom there are 1,300 under the Santee Agency, Nebraska.

**WAHPETON, wā'pē-ton, N. Dak., city, county-seat of Richland County, in the southeast corner of the State, at the confluence of the Red River of the North and the Sioux Wood River, and on the Great Northern, the Northern Pacific and the Chicago, Milwaukee and Saint Paul railroads, opposite Breckenridge, Minn., and about 43 miles south of Fargo. It was settled in 1872 by M. T. Rich, became a village in 1881 and in 1884 was chartered as a city. The chief industrial establishments are flour mills, cotton mills, machine shops, wagon factories and lumber mills. It has grain elevators and lumber yards. The principal buildings are the county courthouse, churches and schools. There are eight churches. The educational institutions are the Red River Valley University, the State Academy of Science, the Lutheran Bible School and public and parochial schools. The three banks have a combined capital of $160,000. The government is vested in a mayor and a council of six members elected biennially. About one-half the population are Scandinavians, Germans and Bohemians combined, the rest are American-born. Pop. 2,814.

**WAHSATCH MOUNTAINS**, a range in the State of Utah, the eastern boundary of the Great Basin, extending from the north boundary of the State south nearly to the Colorado River. Several peaks are nearly 12,000 feet high; at the base and among the foot-hills are deep canyons. Silver, in large quantities is found in these mountains. See **Rocky Mountains; Utah**.

**WAIAM, wī'ām (so called from their principal village), a small tribe of the Shoshoni stock of North American Indians, also known as Des Chutes, Wyams, etc. Their chief village was on the Columbia River, where Celilo now is. They took part in the Wasco treaty of 1855**
and are now on Warm Springs Reservation, Oregon.

WAAILATPUAN (Wel'k'ayt'poo-an) Indians (Wa'létpu, plural of Wa'ilélet, "one Cayuse man"), a linguistic stock of North American Indians, consisting of the Cayuse and Molala tribes. The former originally occupied the mountain country on the heads of Walla-Walla, Umatilla and Grande Ronde rivers in Oregon and Washington; the Molala resided on Molala Creek, west of the Cascades in Oregon. The former tribe bore a high reputation for intelligence and bravery, but on account of their fighting propensities, which led them to make constant war against the Shoshoni and other tribes to the west, they were never very numerous. In 1838 a Presbyterian mission was established among them by Dr. Marcus Whitman, at the site of the present Whitman, Wash. In 1847 smallpox carried off a large part of the tribe, and the Indians, believing the missionaries to be the cause of it, attacked and destroyed the mission 27 November and killed Whitman and 13 others. In 1854 the Cayuse numbered 126, of whom there were but few pure-bloods, the majority being intermixed with Nez Percés and Wallawallas. Of the 374 so-called Cayuse now on Umatilla Reservation, Oregon (which they share with the Umatillas and Wallawallas) only a few retain their own language. This reservation was set aside in 1855. There are perhaps two dozen survivors of the Molala tribe on Grande Ronde Reservation, Oregon. Consult Mooney, 'Ghost Dance, Religion' (1907, Rep. Bureau American Ethnology, Washington, 1891).

WAIALATO, wai'ka-tö, New Zealand, the principal river of North Island, flows first into Lake Taupo and then out of it north to Manakan Harbor on the west coast with a total course of 170 miles. Mercer, Hamilton and Havelock were the chief towns along its banks. Between the Upper Waialato, Lake Taupo, Mount Ruapehu and the west coast lies the mountainous and picturesque King Country, occupied mainly by Maoris under their king, who till 1884 resolvedly opposed the survey or settlement by Europeans of the lands within their akauti or frontier.

WAINEWRIGHT, wain'rít, Thomas Griffiths, English art critic and forger: b. Chiswick, October 1794; d. Hobart Town, Tasmania, 1852. He studied art in London, wrote art critiques for the London Magazine, on which Lamb, Hood, Cunningham, Hazlitt and De Quincey were at the time (1820-23) collaborators, and exhibited at the Royal Academy in 1821-29. In 1826 he forged an order on the Bank of England for £2,250, in 1837 was sentenced at the Old Bailey, to transportation for life, to Van Diemen's Land (Tasmania). He was also believed to have been concerned in several poisoning cases, to obtain money. He appears as Varney in Bulwer's 'Ludmilla' in Dickens' 'Hunted Down' was based on his career.

WAINEWRIGHT, wain'rít, Jonathan Mayhew, American Protestant Episcopal bishop: b. of American parents, Liverpool, England, 24 Feb. 1793; d. New York, 21 Sept. 1854. He was graduated at Harvard College in 1818, studied theology and took holy orders, and was rector of Grace Church, New York, 1821-34. He was rector of Trinity Church, Boston, 1834-38, and assistant in charge of Saint John's Chapel, New York, from the last-named year till November 1852, when he was consecrated provisional bishop of New York. He was one of the founders of the University of New York, and was considered one of the most eloquent American pulpit orators of his time. His publications include 'Sermons and Religious Education' (1829); 'Lessons on the Church' (1835); 'The Pathway and Abiding Places of Our Lord' (1851); 'The Land of Bondage' (1852), etc.

WAINWRIGHT, Richard, American naval officer: b. Washington, D. C., 17 Dec. 1849. He was graduated from the United States Naval Academy in 1868, was promoted lieutenant in 1873, lieutenant-commander in 1884, and was executive officer on board the battleship Maine at the time of her destruction in Havana Harbor in 1898. In the war which followed he was in command of the 'Vice' for and took part in the naval battle at Santiago, 3 July 1898, in which he destroyed the Spanish torpedo boats Furor and Pluton. He was superintendent of the Naval Academy in 1900-02 and in 1903 was assigned to the 'Newark' in 1907 to the 'Louisiana', and in 1908, commanded a division of the Atlantic fleet. He was retired in 1911.

WAIT, John Cassan, American lawyer and civil engineer: b. Norwich, N. Y., 4 June 1860. He was graduated from Cornell as a civil engineer in 1882, and from the Harvard Law School in 1891. In 1897-98 he was instructor and assistant professor at Harvard and in 1896-97 was in charge of the New York State canal improvements. He was associate editor of the Railroad Gazette in 1894-95, assistant corporation counsel for the city of New York in 1900-43, and published 'Car Builders' Dictionary' (1895); 'Engineering and Architectural Jurisprudence' (1897); 'Law of Contracts' (1901); 'Poems of Industry and Labor'; 'Calendar of Invention and Discovery' (1903), etc.

WAIT, William Bell, American educator of the blind: b. Amsterdam, N. Y., 23 March 1839; d. New York City, 25 Oct. 1916. He was graduated from the Albany Normal College in 1859, and in the same year became a teacher in the New York Institute for the Education of the Blind. Later he studied law, and was also at one time superintendent of schools at Kingston, N. Y., and from 1863-1905, was principal of the Institute for the Education of the Blind. In 1905 he was made emeritus principal, which rank he held until his death. At the beginning of his work for the blind in 1863, Mr. Wait began an exhaustive study of the touch system of writing and reading, his efforts resulting in the famous New York point system. He followed this success by the introduction of 'Lucretia' a system of tangible musical notation. In 1894 he wrote the invention of the kliegograph, a machine for embossing the New York point system on paper, a practical typewriter for the blind now in use. Later he invented the stereograph, a machine for embossing metal plate on glass in a single operation for the blind. His next step was to invent a machine for embossing both sides of the leaf. He also was instrumental in obtaining an annual grant
of $10,000 from Congress for publication of books for the blind.

WAITE, Henry Randall, American editor and clergyman: b. Copenhagen, N. Y., 16 Dec. 1845. He was graduated at Hamilton 1868, then was engaged in journalism till 1870; studied theology in the Union Theological Seminary, New York, and in 1871-74 was pastor of a Presbyterian church in Rome; was editor of the International Review 1870-77, and in the meantime and till 1880 pastor of a Presbyterian church in Pelham, N. Y. In 1891 he became acting pastor of a Congregational church in Brooklyn. Waite was president of the Political Science Association of New York 1876-77; special officer of the United States census 1880-83; editor of the Boston Citizen 1885-86; then editor of Civics in New York. He has published 'The Motive of St. Paul's Life'; 'Illiteracy and the Christian Church'; and 'The Church and the State'.

WAITE, wät, Morison Remick, American jurist, seventh chief justice of the United States: b. Lyme, Conn., 29 Nov. 1816; d. Washington, D. C., 23 March 1888. He was graduated from Yale in 1837; studied law, and in 1843 was admitted to the bar in 1839. He began the practice of his profession in Maumee City, later moving to Toledo. In politics he was at first an active and influential member of the Whig party, and was elected to the Ohio State legislature in 1849; later he took part in the organization of the Republican party; was an ardent supporter of Lincoln; and was nominated for Congress in 1862, but failed of election. His national reputation dates from the time of his appointment by President Grant as one of the counsel to represent the United States before the tribunal for the consideration of the Alabama claims at Geneva; associated with him were Caleb Cushing and William M. Evarts, the latter a college classmate. His reply to Sir Roundell Palmer, establishing Great Britain's liability for permitting the Confederate cruisers to coal in British ports during the Civil War, was considered a model of legal argument in its clear, direct and logical presentation of facts. In 1873 he was chosen by both political parties as a delegate from his county to the convention for revising the State constitution of Ohio, and was made president of that convention. In the same year he was appointed chief justice of the national Supreme Court, the appointment being approved by a unanimous vote of the Senate. Many of the most important subjects of adjudication came before the court during his term of office. The Mormon Problem were the following: The constitutionality of the enforcement act; interpretation of the latest constitutional amendments; rights and powers of the State to control and regulate the charges of railroads; the polygamy cases; federal control over elections; power of the President to remove from office; power of States to prohibit the liquor traffic; repudiation of State debts and the true meaning of the 11th amendment; questions arising out of the violence of the Chicago anarchists; and the exclusion of Chinese. His work was marked by the strictest attention to detail, and by a rigid enforcement of the rules and precedents of practice of the court; it was his custom to keep watch of the docket and acquaint himself in advance with the character of the cases about to be reached. In all questions his decisions were entirely influenced by political considerations; and all parties and sections united in commending his absolute fairness. A prominent lawyer of the South said of him: "He could hold in his steady and equal hand the balance of justice undisturbed."

WAITS, the king's minstrels, who in England and other countries used formerly to guard the streets at night and proclaim the hour. The name was afterward applied to the town's musicians, who, however, did not perform the duties of watchmen, and to private bands, when employed as serenaders. In modern times the waits are musicians who play during the night hours on the approach of the Christmas or New Year seasons, and call at the houses of the inhabitants for donations. While this custom exists to some extent in the United States, the term "waits" is not used here.

WAKAMATSU, wä-kä-mä-tsoo, a city of Japan formerly named Aidzu, for centuries the centre of politics and culture and considered the strategic key of northwestern Japan, with a castle built in the thirteenth century and the seat of a clan ever loyal to the Tokugawa shoguns of Yedo. Around this last stronghold of the already lost cause, the imperial armies gathered in 1868. The great castle sustained a siege of one month, even boys and girls performing prodigies of valor. The doomed garrison surrendered 6 November, ending the civil war. The castle and most of the city were given to the flames leaving a level waste of ashes. Of the defeated clansmen large numbers became active in the Russo-Greek Catholic and other Christian churches, while 1877 hundreds of expert swordsmen, who had old scores to settle with Satsuma, aided powerfully in suppressing Saigo's rebellion. From this disaster of 1868, the city has made recovery largely through the chemical, lacquer, zinc and other industries, until now, it is among the foremost in promise in the empire. Electric lighting is general in houses and factories and the power plant, containing six 10,000 horse-power machines erected in 1915, is the largest in the Orient. Of the chemicals imported, in 1913, before the war, no fewer than 40 are now made at this place. In the Aidzu valley a development of 500,000 horse power is possible. Lake Inawashiro, 1,000 feet higher, or 1,680 feet above sea level, is five miles distant. Close to the rapids of the Nippachi River, three nests of dynamos are planned. Thus the waters, utilized for ages in the work of irrigation, will be freshly utilized for cheap and pure manufactures.

Consult Noss, Tohoku, the Scotland of Japan (1918).

WAKASHAN (wä'kä-shä'n) INDIANS (from Waukash, the Nootka word "good," which, when heard by Captain Cook, was supposed to be the tribal name), a linguistic stock of North American Indians, consisting of the Aht and Haeltsuk divisions with their numerous tribes, occupying the northern half and the western part of the southern half of Vancouver Island, the opposite mainland of British Columbia, and a small area about Cape Flattery inhabited by the Makah, one of the Aht tribes. The stock has also been referred to as Nootka and Nootka-Columbian, the term Nootka being
the first name applied to the Mowachat, an Aht tribe. Of the Aht division there are some 20 tribes, numbering in all about 3,100 individuals, of whom there are 414 Makah under the Neah Bay Agency, Washington, the remaining tribes being under the West Coast Agency of British Columbia. The 17 Haida tribes number in all about 2,500 souls, of whom about 1,900 are under the Kwakwakawack Agency, British Columbia.

WAKATIPU, wá̄kã-tè̄-poo, New Zealand, a picturesque lake in the South Island with an area of 112 acres. Queenstown and Glenorchy, on the borders of the lake, are favorite tourist resorts, on account of the magnificent mountain scenery in the vicinity.

WAKAYAMA, wá̄kã-yã̄-mã̄, Japan, a town on the island of Hondo, situated on the east coast of the channel leading into the eastern end of the Inland Sea, 35 miles by rail southwest of Osaka. It is an important centre of the cotton industry. Its noted features are the princely Kishu palace, and the beautiful temple of Kijimijuda, said to have been founded in 770 A.D. Pop. 77,700.

WAKE, William, English prelate: b. Blandford, Dorsetshire, 26 Jan. 1657; d. Lambeth, 24 Jan. 1737. He was graduated from Oxford, took orders in the Anglican Church in 1680, and in 1688 he became preacher at Gray's Inn. In 1689 he was appointed chaplain in ordinary to William and Mary, and also received a canonry of Christ Church, Oxford. From 1693 to 1705 he was rector of Saint James', Westminster, became canon residuary and dean of Exeter in 1703, from 1705 to 1716 he was bishop of Lincoln. In 1716 he was enthroned archbishop of Canterbury. He took part in negotiations during 1717-20 for the union of the Anglican and the Gallican churches, and in his relations with Nonconformists showed a liberal spirit. His chief works are 'The State of the Church and Clergy of England in their Councils, Synods, Convocations, Conventions, and their other Asssemblys, but specially in Church Discipline' (1693); 'The Genuine Epistles of the Apostolical Fathers' (1693); and 'Principles of the Christian Religion in a Commentary on the Church Catechism.'

WAKE, originally an annual festival held on the anniversary of the day on which a parish church was consecrated and dedicated to a saint, the celebration being begun on the preceding day (the eve or vigil). On the eve of the anniversary the parishioners attended service in the church, the floor of which was strewn with flowers and rushes, and the altar and pulpit were decorated with boughs. Tents were planted in the churchyard to supply the people from surrounding parishes who were expected on the morrow, that day being observed as a holy day. They were degenerated into modern country fairs, and were long characterized by wild riot and licentiousness. Statutes were at various times directed against holding markets in churchyards and showing all goods except necessary refreshments on the great church festival, but they seem to have been little regarded. Country wakes on some saints' festivals are still kept up in certain English parishes.

A lye or liche wake (Anglo-Saxon, liece, a corpse) is the watching of a dead body by night by the relatives and friends of the deceased. The custom arose no doubt from the dread of remaining alone all night in the presence of the dead or from the fear that malignant spirits would interfere with the corpse. The practice, once general, is now confined in the United States to a few localities. The 17th-century poet suggested that the Hottentots, living on the decline with them. Wakes are sometimes attended by scenes of disorder and intoxication, but as a rule they are conducted with decency and show sincere respect for the dead.

WAKE FOREST COLLEGE, located at Wake Forest, N. C., 16 miles northeast of Raleigh. It was chartered in 1833, as the Wake Forest Institute, under the auspices and control of the Baptists of the State; it was first opened to students in 1834, and in 1838 the charter was amended, its privileges enlarged and the name changed to Wake Forest College. The greater part of the endowment was lost during the Civil War, but the college continued its work and regained its financial prosperity. The system of independent "schools" is now an established feature of the college organization; these schools are 15 in number, as follows: Latin, Greek, English, modern languages, mathematics, astronomy, chemistry, biology, physics, moral philosophy, history and political science, the Bible, pedagogy, law and medicine. There are preparatory courses offered in Latin, Greek, mathematics and English. The college confers the degrees of A.B., B.S., LL.B. and A.M. (for graduate work). In the A.B. and B.S. courses a part of the work is elective, the electives being somewhat limited, however, in accordance with the degree to be obtained. For the degree of L.L.B., the full course in the School of Law must be completed, also the course in the School of History and Political Science. Students are admitted to the School of Medicine, either as medical students or as undergraduates, if taking the B.S. course. The completion of the course admits to the third year of any good medical school. With the encouraging Ministerial education, it has been the custom of the college to organize a special class, studying different phases of pastoral work or theology; this is outside the regular work of the School of the Bible, and does not count toward a degree; a pastor's course, which was inaugurated in 1902 for those pastors who could obtain a month's leave of absence from their churches. The college has a pleasing location on high ground; its buildings include the main building, the Heck and Williams Building (library), the Wingate Memorial Building (chapel and audience hall), the Lea Laboratory (chemistry) and the Gymnasium. The productive fund is about $500,000; the library contains over 25,000 volumes, the students average annually 500, and the faculty 48.

WAKE ISLAND, an islet of rock in the Pacific Ocean, lying 1,550 miles northeast of Guam, and 3,000 miles east of Luzon, Philippines. It belongs to the United States as a Pacific outpost. The 17-day-a-month fog is about one square mile in area, and its importance is due to the fact that it is on the cable route between the United States and the Philippines.
WAKE-ROBIN, the first of John Burroughs' collection of essays, which in its charm and character may well stand as an example of all. It is mostly about birds and their ways, but it has also essays and passages that show his wider knowledge and love of nature and the out-door life in general. Burroughs is a great naturalist; one would not exactly say a great scientist, for he rarely puts into scientific form the observations and generalizations that science seems to demand. Yet he is a great naturalist, for his life has been passed in observing nature and learning her secrets. 'Wake-Robin' (the popular name of the white trillium) is an invitation to come and do likewise. It was written mostly in Washington, where in the '60's, Burroughs was a department clerk, but it is made out of recollections of earlier days in the Catskill country where he was born and brought up. It has more in it of birds than of other things, but it is full of the flavor of out-door life. "Look about you," he says, "and see the beautiful and wonderful things all around." In 'Wake-Robin' we have an invitation to the fields and the woods, to the daily pleasures of birds, fish and deer, of the naturalist or the camper. John Burroughs and Henry D. Thoreau are the two chief masters in a form of literature in which America is pre-eminent, the literature of nature; and if one asks what Wake-Robin? (as well as Walden?) one will know why. The book has not only the keen observation that detects every fact, but the humanity that enables one to put the fact so as to be interesting to those of lesser powers.

Edward Everett Hale.

WAKEFIELD, Edward Gibbon, English colonial statesman: b. London, 20 March 1746; d. Wellington, New Zealand, 16 May 1862. Educated at Westminster School and Edinburgh High School, he became associated in a subordinate capacity with the legations at Turin and Paris. About 1826 he turned his attention to colonial affairs and worked out the scheme of colonization usually known by his name. Its cardinal features were the abolition of free grants of land for agricultural pursuits (obtained that no one cared to remain dependent, and laborers were at once transformed into landed proprietors); and the careful control of emigration. His views were first publicly expressed in 'A Letter from Sydney' (1829). The National Colonization Society was founded in 1830 to carry out his ideas, and in the following year his plan was adopted by the government for New South Wales. The South Australian Association was formed in 1834, and included many and under its auspices the colony of South Australia was founded in 1836 on Wakefield's principles. He accompanied Governor-General Lord Durham to Canada in 1838 as adviser, and had an important share in drawing up the report in which Durham embodied his proposals for settling the Canadian difficulty. Wakefield was the moving spirit behind the New Zealand Association of 1837, which forced the British government to annex New Zealand. He was subsequently a prime mover in founding the Anglican settlement in New Zealand, and in 1852 he went to New Zealand and plunged into colonial politics.

After the breakdown of his health in 1854 he lived in retirement till his death. All subsequent English colonial development has followed the ideas formulated by Wakefield. He was equally able as a theorist and a director of practical details. Consult Rusden, 'Histories of New Zealand' (1883); Gisborne, 'New Zealand Rulers and Statesmen' (1892); Garnett, 'Life in Builders of Greater Britain' series (1896).

WAKEFIELD, Gilbert, English clergyman and controversialist: b. Nottingham, 22 Feb. 1756; d. London, 9 Sept. 1801. He was educated at Cambridge, took orders, but renounced the Anglican communion after holding two curacies, was classical tutor in non-conformist academies at Warrington (1779-83), and Hac-haney (1790-91). He was imprisoned two years in Dorchester jail for a so-called seditious libel in answer to Bishop Watson, for which his political friends conspired him with a gift of £5,000. He published editions of Bion and Moschus, Virgil, Horace and Lucan; 'Christian Antiquities of the First Three Centuries on the Person of Christ' (1784), left unfinished; 'Inquiry into the Expediency and Propriety of Social Worship' (1791), the necessity for which he denied; 'An Examination of Pain's Allegro' (1794); 'Silvia Critica,' a collection intended to illustrate the Scriptures from the stones of profane learning (1789-95). He was a man of wide learning, but although very amiable in the ordinary life extremely bitter and controversial. After leaving the Church of England he never attached himself to any other religious society, although practically a Unitarian. Consult his autobiography, entitled 'Memoirs' (1792).

WAKEFIELD, England, an episcopal city, in Yorkshire (West Riding). On the river Calder, nine miles south by east of Leeds. The Cathedral of All Saints, founded 1329, is mainly in the Perpendicular style, with a lofty tower and spire, though including work of earlier and later dates. Saint Mary's Chantry, on the ancient bridge across the river, is a decorated structure of the time of Edward III, restored in 1847. Besides several other places of worship, the chief buildings and institutions of the town include the town-hall, a fine building in French Renaissance style; a large corn exchange; a market-house and an industrial and fine art institution (1890), containing a museum, laboratory and lecture-room. The industrial establishments comprise woolen mills, soap and artificial-manure works, iron-foundries, boiler-works, agricultural implement manufactory, wire-rope works, machine-works, corn-mills, malting-works, breweries, etc. There are many collieries near the town, and market-gardening is carried on in the vicinity. The trade, especially in corn, is very extensive, and is facilitated by railway connections as well as by the river Calder and canals. Wakefield is mentioned in 'Domesday Book.' It was the scene of a Yorkist defeat in the Wars of the Roses, 31 Dec. 1460. In 1657, it was made the seat of a bishopric, formed mostly out of the diocese of Ripon. Pop. 52,300.

WAKEFIELD, Mass., town in Middlesex County, on the Boston and Maine Railroad,
Wakefield — Walbridge

about nine miles north of Boston. It is surrounded by farms, and has about 25 manufactories, chief of which are iron and brass foundries, piano, rattan goods and shoe factories, flour mills, and machine-shops. The annual product of these exceeds $3,600,000. The town contains the villages of Greenfield, Montrose and Wakefield, in each of which are graded schools. There is one high school and a public library containing about 15,000 volumes. There are two banks and two daily newspapers. Pop. about 12,781.

Wakefield, R. I., village in Washington County; at the head of Point Judith Inlet, an arm of the Atlantic Ocean, and on the Narragansett Pier Railroad, about 26 miles south by west of Providence. It is in a part of the State devoted to farming and market gardening. The village has cotton and woollen mills and several small industries. It has a savings bank, trust company and a newspaper. Pop. about 2,200. In 1910 the population was included with that of South Kingston town, which had a total of 5,176.

Wakeley, Joseph Beaumont, American clergyman: b. Danbury, Conn., 1804; d. New York City, 27 April 1876. Apprenticed to a hat maker in his native town, he studied for the ministry and was admitted to the Methodist Episcopal Conference in New York (1828). He settled in Poughkeepsie (1857) and was subsequently appointed to a church in Lexington avenue, New York City. He published a number of works including 'Heroes of Methodism' (1856); 'Lost chapters recovered from the early history of Methodism' (1858); 'Anecdotes of the Wesleys' (1869); 'Portraiture of the Rev. William Cravens' (1869); 'A Prince of Pulpit Orators — Whitefield' (1871); 'The Temperance Cyclopaedia' (1875); 'The Wesleyan Demosthenes: Joseph Beaumont' (1875).

Wakeham, Henry Offley, English historian: b. near Worcester, 25 Sept. 1852; d. Basel, Switzerland, 27 April 1899. He was educated at Christ Church, Oxford, was a Fellow of All Souls from 1877 to his death, and was admitted a barrister of the Inner Temple in 1877. His publications are: 'The History of Religion in England' (1883); 'What Has Christianity Done for England?' (1886); 'The Church, and the Puritans, 1570–1660' (1887); an edition (with Hassall) of a volume of 'Essays Introductory to the Study of English Constitutional History' (1887); 'Europe, 1598–1715' (1894); 'Introduction to the History of the Church of England from the Earliest Time to the Present Day' (1896; 5th ed., 1898).

Wakeham, Thaddeus Burr, American philosopher: b. Greenfield Hill, Conn., 23 Dec. 1834. He was graduated from Princeton in 1854, and was admitted to the bar in 1856. He translated Goethe's religious poems, and made a specialty of the study of positive philosophy. He was president of the Liberal University of Kansas City, and has published 'An Epitome of Positive Philosophy' (1881); 'Liberty and Purity' (1881); 'Evolution or Creation,' etc.

Wakemanites, certain fanatics who were supposed to be harmless until they committed a murder at New Haven, Conn., in 1835. Their leader was an old woman named Rhoda Wakeman, supposed to have been insane. Her followers obeyed her as a prophetess and believed she had been raised from the dead. At her bidding they murdered a farmer, Justus Matthews, who, she said, was possessed by an evil spirit. The authorities prevented further tragedies by taking prompt action against all concerned in the crime, and the sect became extinct.

Waker, Thomas Leonard, Canadian scientist: b. Chinguacousy, Ontario, 30 Dec. 1867. He was graduated at Queen's University with honors in chemistry and mineralogy (1890) and at Leipzig (1893). He was a fellow in chemistry in the school of mines, Kingston (1893–95), assistant superintendent of geological survey of Canada (1890–93), assistant superintendent of geological survey of India (1897–1902), and since 1902 has been professor of mineralogy at Toronto University. He has contributed to many scientific publications.

Wakonda, the term expressing in the Sioux dialect the native abstract idea of the supernatural element of the universe. It is not peculiar to the Sioux alone and is expressed in terms in other languages. Consult Wissler's 'North American Indians' (New York 1912).

Walam Olum, otherwise known as the 'Red Score' of the Lenni Lenape or Delaware Indians, and supposed to be a record of the migrations of the tribes. The word 'Olum' signifies a record, and 'Walam,' painted. Red is the color used. 'Olum' was commonly applied to a notched stick, an engraved piece of wood or bark; but it is not unlikely that the engraved stone gorgets, notched along all their edges, or partly so, are records. The notching is too inconspicuous to be considered as ornamentation, but is so cleanly cut and defined that some serious purpose was evidently in mind in making it. The historic 'Walam Olum,' for which we are indebted to Rafinesque, is declared by Antony, a Delaware Indian, to be a genuine composition of a member of that tribe. This composition or record of events during the wanderings of the people, is supposed by Brevoort to be 'not of foreign origin, but wholly within the Cycle of the most ancient legends of that stock' — the Algonkin. If read aright, it is a record of wanderings from the Labrador region southward and westward, and again, to the Atlantic Coast of the middle United States. As a record of a migration that was possibly more extensive and fateful to these people than any one other of which they had knowledge, much value has been placed upon it. Those ethnologists who have strongly leaned to the extreme modernity of man in America have thought they found evidence therein that the whole Atlantic seaboard, and for many leagues inland, was uninhabited and had so remained for all time until this wandering, described in the Walam Olum, took place. This conclusion does not seem to be supported by the results of geological research. Entirely too much has been made also of the assumption that the migration of the Lenape, supposedly described in the 'Walam Olum,' was their only one.

Walbridge, Hiram, American lawyer: b. Ithaca, N. Y., 2 Feb. 1821; d. 6 Dec. 1870. In childhood he settled with his parents in Ohio,
there received his education and was admitted to the practice of law in 1842. While Texas was still an independent State, Walbridge emigrated thither with the purpose of establishing four newspapers in different quarters for advocacy of annexation to the United States; but before his plan could be executed, the State was annexed. He then returned to law practice in Toledo, Ohio, and removed to New York in 1847. He represented a New York district in Congress 1853-55.

**WALCH, Garnet,** Australian dramatist: b. Broadmarsh, Tasmania, 1 Oct. 1843. He was educated in Tasmania, England, and Germany, and on his return home he joined the staff of the *Sydney Punch* and worked on other papers, after which he founded the *Cumberland Times.* Among his publications are many farces and extravaganzas, burlesque pantomimes and comedies. These include 'Trookilento,' an extravaganza; 'Head Over Heels'; 'On the Cards'; 'A Little Tin Plate'; 'With the Compliments of the Season'; 'Larrakin Jack'; 'Her Evil Spirit'; 'A Little Piece of Albion'; 'Proof Positive,' and 'Robbery Under Arms,' the latter of which ran continuously in Australia for over 10 years.

**WALCHEREN,** wälˈtərən, Netherlands, an island in the province of Zeeland, at the mouth of the Scheldt, approximately circular, about 11 miles in diameter. A bridge connects with South Beveland and a railway to the main land. It is well wooded and fertile and fruit is abundant. It contains the towns of Flushing, Middleburg (the capital) and Veere, and has a population of about 40,000. It is protected from the sea by strong dikes. The island is noted for the Walcheren expedition of 1809, one of the most complete failures in British military history. The second Earl of Chatham, eldest son of the great Chatham, was dispatched to the island in command of a force of about 40,000 for the purpose of capturing Antwerp and destroying Napoleon’s arsenals on the Scheldt. Instead of pressing forward against Antwerp, he persisted in the siege of Flushing, which was not captured before the greater port had been reinforced and strongly fortified by the French. Chatham returned to England with the bulk of his force, leaving a garrison of 15,000 on the island of Walcheren. The garrison was attacked by fevers and other diseases, and when orders were received from the government to destroy Flushing and return home, only a small number were fit for duty.

**WALCENÆR, wälˈkənær,** Charles Mathurin, Baron, French diplomat and author: b. Paris, 25 Dec. 1771; d. there, 27 April 1852. At 17 he went to study at Glasgow and Oxford; served as director of transportation in the army of the Pyrénées in 1793; became mayor of Paris in 1816 and prefect of the department of Nièvre in 1824 and of Aisne in 1826. In 1830 he left the public service, and in 1840 became secretary to the Academy of Inscriptions. He was a voluminous writer. His first publication was an *Essai sur l'Histoire de l'Espèce Humaine* (1798). In 1802 he published *Abrégé des Insectes des Environs de Paris,* and in 1805 *Tableau des Aranéides,* an important contribution to entomology. Among his later works may be cited *Le Monde Maritime* (1819); *Nouvelle Collection des Relations des Voyages* (21 vols., 1836-31); *Analyse Géographique des Itinéraires des Anciens* (1839); *Histoire de la Vie et des Poésies d'Horace* (1840); *Mémoires sur Madame de Sévigné* (1842-52), which he left incomplete.

**WALCOTT, wölˈkɔt,** Charles Doolittle, American geologist: b. New York Mills, N. Y., 31 March 1850. In his youth he took up geology and by 1876 rose to the post of assistant State geologist of New York. He was appointed to a like office in the United States Geological Survey in 1879, became palaeontologist in 1883, chief palaeontologist in 1891 and in 1893 was appointed geologist in charge of geology and palaeontology, and director of the Geological Survey in 1894. He was acting assistant secretary of the Smithsonian Institution in 1897-98, on 23 Jan. 1907 he was elected secretary, and in 1887 he was elected chairman of the board of trustees for the National University founded by Andrew Carnegie. He also served a term as president of the Geological Society of America. He has made a specialty of Cambrian researches, and in 1888 laid the results of his labors before the International Geological Congress in London. His writings include *The Triorbit* (1881); *The Cambrian Faunas of North America* (1885); *The Taconic System of Emmons* (1888); *The Fauna of the Lower Cambrian or Olenellus Zone* (1890); *Correlation Papers Cambrian* (1891); *Cambrian Geology and Palaeontology*; *The Cambrian Fauna of China*; *The Cambrian and its Problems in the Cordilleran Region*; *Evidences of Primitive Life,* etc.

**WALDECK,** vålˈdek or völˈdek, Germany, a principality consisting of Waldeck proper and Pyrmont, whence the title Waldeck-Pyrmont, sometimes given. Waldeck proper, with an area of 407 square miles, is enclosed by the Russian provinces of Westphalia and Holstein-Nassau; and Pyrmont, with an area of 25 square miles, is enclosed by Prussia, Brunswick and Lippe. Both sections are mountainous, and belong to the basin of the river Weser. In the western Upland, it attains an elevation of 2,726 feet. Much of the soil is unsuited for agriculture, but the lower valley of the Eder and the northeast of Waldeck proper, are fertile. The chief industries are agriculture and the rearing of cattle, sheep, pigs, etc. Manufactures are of small extent: the most important are tobacco and cigars (Pyrmont), liqueurs (Arolsen) and machines (Wetterburg). There are iron mines at Adorf. The constitution bears date 17 Aug. 1852. The princely dignity is hereditary according to primogeniture in the male line, but on the extinction of the male line it falls to the female line. The Diet consists of 15 members elected indirectly for three years. By the Treaty of Accession of 1867, renewed in 1877 and 1887, the internal administration is carried on by a Landesdirektor appointed by the Prussian government with the approval of the prince. Its courts of justice are subject to those of Cassel and Hanover, and its troops form a battalion of a Prussian infantry regiment. Arolsen is the capital and residential town. The Reformation was introduced under Count Philip IV in 1526. The imperial field-marshal, George Frederick (1664-92) was the first of its rulers to assume the
Christopher II, was in Bavaria at the death of his father in 1333. In 1340-44 he recovered part of his kingdom in war and obtained some further successes against Sweden in 1353 and 1357; eventually he was glad to obtain peace by large concessions.

WALDEN, wáld’n, John Morgan, American Methodist bishop: b. Lebanon, Ohio, Feb. 1831; d. Daytona, Fla., 21 Jan. 1914. He was graduated from Farmer’s (now Belmont) College, near Cincinnati, in 1852, and afterward engaged in teaching and in journalism. He was a member of the Topeka legislature in 1857 and a delegate to the Leavenworth constitutional convention in 1858, returning in that year to Ohio where he entered the Methodist Conference. He became minister in the Cincinnati Conference Methodist Church in 1858, was one of the publishing agents of the Methodist Book Concern in 1886-84, and in the last-named year was elected bishop. For several years he was elected a member of the Ecumenical Methodist Conference.

WALDEN, Treadwell, American Episcopal clergyman: b. Walden, N. Y., 26 April 1830. He was graduated from General Theological Seminary in 1853, took priest’s orders in the Episcopal Church in 1856 and after holding charges in Newark, N. J., was rector of Christ Church, Norwich, Conn., 1857-63; Saint Clements, Philadelphia, Pa., 1863-68; Saint Paul’s Cathedral, Indianapolis, 1869-72; Saint Paul’s, Boston, 1873-76 and Saint Paul’s, Minneapolis, 1882-85. He published ‘Lays of Lifetide’ (1856); ‘The Sunday School Prayer Book’ (1860); ‘Prayers and Prayers and Prayers of United States Officers and Soldiers in Confederate Prisons’ (1864); ‘Our English Bible and its Ancestors’ (1870); ‘An Undeveloped Chapter in the Life of Christ’ (1882); ‘The Great Meaning of Metanoia’ (1896).

WALDEN, N. Y., village in Orange County, on the Walkill River, and on the New York Central and Hudson River railroad (Walkill Valley branch); 75 miles north by west of New York and 13 miles northwest of Newburgh. The date of the first settlement is uncertain, but it was granted by an English government in 1671 and incorporated in 1855. It was first known as High Falls, owing to the fall of 40 feet in the river at this point. It is in an agricultural region, noted for its dairy products and for a valley famous for its picturesque scenery. It has large cutlery works, woolen mills, a soap factory, engine works, foundries and machine shops. There are two banks, one of which is a national bank. Pop. 5,036.

WALDEN; or, LIFE IN THE WOODS, the record of Henry D. Thoreau’s famous experiment in 1847, when he was famous for his expeditions against the pirates of the Baltic and successful in exacting from Magnus VI, king of Norway, a treaty which secured the pre-eminence of Denmark. Waldemar II (the Victorious), younger son of the preceding, was the cupola Vegesack in 1202. He made warlike expeditions into Sweden, Norway and Germany, raised a powerful navy and revised the laws of his kingdom. He died in 1241. Waldemar III, eldest son of the preceding, was regent from 1219 to 1231. Waldemar IV, third son of
and became very familiar with the wild life of the neighborhood. Birds answered his call and beasts approached him without fear, as in the case of Saint Francis of Assisi. 'Walden' is the record of his experiences and the key to his mental processes during that interesting period. Belonging to the university's rare books are the first editions of many important works in science, and the university's strong emphasis on the study of natural history, botany, and zoology is evident. The work is free from the pedantry of science, its interest is in the subject matter itself, and the author's style is engaging and accessible. The permanent interest of the work, one of the greatest of modern books, is its lasting value as literature.

WALDEN UNIVERSITY, an institution for the education of the colored race, located at Nashville, Tenn. It grew out of a school for adults and children established by the Freedmen's Aid Society; in 1866 it was chartered as Central Tennessee College. It is under the control of the Methodist Episcopal Church.

WALDENSES, wól-dén'seə, a medieval sect that owes its origin and name to Peter Waldo (Walado), a rich citizen of Lyons, although some writers attribute the name to the Walenses as from valleé (valley), and called them Paudois, or dwellers in the valleys, whilst others have traced their origin to the earlier sects of Henricians and Cathari. About 1170 Waldo, moved to repentance for his sins, by the sudden death of a friend, came to the determination to imitate the mode of life of the apostles and primitive Christians, gave his goods to the poor and by his preaching collected numerous followers, chief among the clergymen and artisans, who, from the place of their birth, were denominated Leonits, or the poor of Lyons; Sabalati or Insabalati, on account of their wooden shoes or sandais (sabots). They were characterized by their poverty, humility; and were often confounded with the Cathari, Patarenes, Albigenenses, and others, whose fate they shared. Their chief strongholds were, and still are, in the mountain tract of the Cottian Alps, southwest of Turin. In their fanatical contempt of the ceremonial, and their opposition to the Roman priesthood, the Waldenses resembled other sects of like character in the Middle Ages; but, going beyond the design of their founder, which was merely to preach penance and a life of poverty, they made the Bible alone the rule of their faith, and rejecting whatever was not founded on it as not conformable to apostolic antiquity, they renounced entirely the doctrines, usages and traditions of the Roman Catholic Church and formed a separate religious society. They were, therefore, excommunicated as heretics at the Council of Verona in 1184, but they did not suffer a general persecution until the war against the Albigenenses, whom they closely resembled in the extravagances of their doctrines and customs, after they had spread and established themselves in the south of France, under the protection of the counts of Toulouse and Foix. At that time (1209-30) many Waldenses fled to Aragon, Savoy, and Piamont. In Languedoc they were able to maintain themselves till 1330; in Provence, under severe persecution, till 1545, when the parliament at Aix caused them to be driven out of the country; still longer in Dauphiny; and not until the war of the Cevennes were they last to
expelled from France. In the middle of the 14th century single congregations of this sect went to Calabria and the Abruzzi, where they were soon suppressed; others to Bohemia, where they were called Grubenheimer, because they used to conceal themselves in caverns. They became amalgamated with the Hussites; and from them the Bohemian brethren derived the apostolic consecration of their bishops. Their doctrines rest solely on the Bible, which, with some catechisms, they printed in their old dialect, consisting of a mixture of French and Italian. In this language their worship was performed till their old Barbes (uncles, teachers) became extinct in 1603. They then received preachers from France and since that time their preaching has been in French. These teachers form no distinct priesthood and are supplied from the academies of the Calvinistic churches. Their rites are limited to baptism and the Lord's supper, respecting which they adopt the views of Calvin. The constitution of their congregations, which are chiefly employed in the cultivation of vineyards and in the breeding of cattle, and which are connected by yearly synods, is republican. Each congregation is superintended by a consistory of elders and deacons, under the presidency of the pastor, which maintains the strictest moral discipline and adjusts small differences. After they had entered into a religious communion with the Calvinists, in the 16th century, they were also exposed to the storm which was intended to sweep away Protestantism, and this was the cause of their extinction in France and their checked fate in Piedmont. Those who had settled in the marquisate of Saluzzo were totally suppressed by 1633; and those in the other valleys, under the jurisdiction of the court of Turin, were subjected to severe persecution, often occasioned by their own aggressiveness. Aided by the mediation of the Protestant powers, they finally procured a new, though more limited, ratification of freedom by the treaty concluded at Pinerolo 18 Aug. 1656. The persecution exercised in 1656 through French influence obliged thousands to emigrate into Protestant countries, including the English colonies in North America. In London they united with the French Huguenots; in the Netherlands with the Walloons; in Berlin with the French congregations; and nearly 2,000 went to Switzerland. Some of these returned by force to Piedmont in 1680, and with those who had remained, maintained themselves under many restrictions, to which an end was finally put in 1725 in consequence of Prussian mediation.

The Waldensians were not permitted to enjoy full religious freedom and civil rights until the establishment of the kingdom of Italy, but now they do so not merely in their old valleys of Lavoz, Provenza, and Val d' Aosta, but generally throughout Italy, and they have churches in Turin, Rome, Venice and elsewhere. Their church service is under the direction of a synod. After long negotiations, in the way of which great efforts were thrown by the opposition of the Tübingen theologians, several hundreds of the above-mentioned fugitives settled in Württemberg in 1699, where their descendents now form several parishes. They are next to the Calvinists in the simplicity of their worship and in their ecclesiastical constitution, but in intellectual cultivation are behind the other Reformers (Reformierte Religionssekte). Consult Léger, 'Histoire générale des églises évangéliques des vallées de Piémont ou Vaudoises' (1699); Dieckhoff, 'Die Waldenser im Mittelalter' (1851); Herzog, 'Die reformationszeit der Waldenser' (1854); Malia, 'Origin, Persecution and Doctrines of the Waldenses' (1870); Montet, 'Histoire littéraire des Vaudois du Piémont' (1885); Preger, 'Die Verfassung der französischen Waldenser des älteren Zeit' (1890); Bompiéni, 'Short History of the Italian Waldenses' (1897); Schaff, 'Creeds of Christendom' (1877-78); Lea, H. C., 'History of the Inquisition' (New York 1906).

**WALDENSTROM, Peter, Swedish church reformer:** b. Luleå, Sweden, 20 July 1838. Having passed the high school of theology, but meantime became professor in a high school, which position he held for over a generation. He was ordained minister of the Swedish Lutheran Church in 1864, but never received a pastoral charge; he attained a ministerial rank in the state church in 1882, in order to be free to labor for the "evangelical national institution," a movement for the reform of religion in Sweden. Waldenstrom had for years co-operated with the "institution," and had become one of its strongest leaders, zealously promoting evangelical reform by voice and pen. The movement has ever been called by its Lutheran opponents "Waldenströmmism." After the death of Rosenius, founder of the movement, Waldenstrom became editor of the journal "Pietisten," the organ of the evangelical institution. Later the movement took the name Svenska Missions Förbundet (Swedish Mission Union); in its strong reaction from the ecclesiasticism of the state church, it has organized churches on essentially congregational principles. Dr. Waldenstrom was a man of learning and an impressive public speaker. He visited the United States about 1890. He published a great many books and pamphlets, and in 1883 began a new version of the New Testament with notes.

**WALDERSEE, väldär'zë, Alfred, Count von, German soldier:** b. Potsdam, Prussia, 8 April 1832; d. Hanover, 5 March 1904. He entered the Prussian artillery as the guard in 1850 and in 1866 was assigned to the general staff and promoted major. During the Bohemian campaign he was connected with the general headquarters, after the peace became a member of the staff of the 10th army corps, and in 1871, at the outbreak of the Prussian War, was made chief-of-staff to the Grand Duke of Mecklenburg-Schwerin, commander of one of the divisions. Promoted colonel and commander of the 13th Uhlan, his subsequent advancement was rapid. In 1880 he became a general, in 1882 lieutenant-general, in 1888 general of cavalry. Upon von Moltke's resignation as chief of the general staff (1888), Waldeser was chosen as successor; and it was believed he would follow Bismarck in the chancellorship, for which, however, Count von Caprivi was selected. Waldeser became commander of the ninth army corps in 1891, in 1898 inspector-general, in 1900 field-marshal of the empire.
WALDIS—WALDSEEMÜLLER

He married a New York woman, née Miss Lee. At the time of the Boxer outbreak in China (see Boxers) he was placed in command of the German forces in that country and from 27 Sept. 1900 to 1 Apr. 1901, by approval of the powers, commanded the allied armies there. His activities in China contributed largely to a speedy adjustment of difficulties, while he was at the same time successful in preserving harmony among the allies.

WALDIS, Burkard, völ'dis, German rhyming fabulist; b. about 1400; d. about 1577. He was a Franciscan friar, but on returning from a pilgrimage to Rome, embraced the doctrines of Luther. He wrote a charming drama in Low German, 'The Parable of the Prodigal Son'; translated the 'Psalter' into German verse; and wrote 'Æsopus,' a collection of about 400 rhymed fables and drolleries.

WALDMÜLLER, vold'muhl-ler, Ferdinand George, Aust, painter; b. Vienna, 15 Jan. 1793; d. 23 Aug. 1865. He was very successful as a painter of peasantry life, and also drew much of his inspiration from the life of childhood. Among his principal works are 'Two Tyrolese Huntsmen Resting' (1829); 'Beggar Boy on the Bridge' (1830); 'Soup Day at the Convent' (1838); 'After School' (1841); 'Sunday Afternoon' (1846); 'Palm Sunday' (1855), and 'Evening Prayer' (1864).

WALDMÜLLER, Robert, pseudonym of Charles Eduard Duboc, a German poet and miscellaneous writer; b. Hamburg, 17 Sept. 1822; d. 19 Feb. 1861. His best work is 'Village Idylle' (1859). Other works are 'Travel Studies' (1860); 'Sorrow and Joy,' a romance (1874); 'Bruhnild,' a drama (1874).

WALDO, wól'do, Daniel, American Congregational clergyman; b. Windham, Conn., 10 Sept. 1762; d. Syracuse, N. Y., 30 July 1848. He was drafted as a soldier in the army in 1778 and was arrested and captured by the Tories and carried to New York, where he was confined for two months, and then exchanged. After graduation at Yale in 1788 he studied theology, and in 1792 was ordained pastor of the Congregational Church in West Suffolk, Conn. Here he continued till 1809, when he resigned his charge, having for some time acted as a missionary in the States of Pennsylvania and New York. In 1810-11 he preached at Cambridgeport, Mass., after which he served as a missionary in Rhode Island till 1820, and was settled for 12 years at Exeter, Conn.; and afterward resided in the State of New York, without any stated charge. In 1855 he was made chaplain of the House of Representatives.

WALDO, Frank, American meteorologist; b. Cincinnati, Ohio, 4 Nov. 1857. He was graduated from Marietta College, Ohio, in 1878, subsequently studied at Harvard, and in 1882-83 was in Europe on United States government service. Upon his return to the United States he became instructor in astronomy at Radcliffe College, and was later engaged in teaching meteorology at the Corcoran School of Science, Columbian University. He afterward accepted the position of junior professor in the United States Signal Service, and later became professor of meteorology in the United States naval aviation detachment, Massachusetts Institute of Technology. He published 'Modern Meteorology' (1893); 'Elementary Meteorology' (1896), and is author of numerous memoirs and articles on popular science.

WALDO, Lillian D., American social worker; b. Ohio, 1867. She was educated in private schools, in the New York hospital training school for nurses and in woman's medical college. She founded (1893) and was head of the Henry Street Settlement, organized the district nursing work in connection with it and originated the first municipal school for nursing (1902). She became a noted lecturer at the Columbia Teachers' College, the Boston School of Philanthropy and the Boston School for Social Workers, and the plan of a Federal children's bureau originated with her; she became president of the school halls association and also served on the State committee of immigration (1890). The National Institute of Social Science gave her its gold medal, and Mount Holyoke College gave her the degree of LL.D., in 1912. She wrote 'The House on Henry Street' (1915), and numerous pamphlets and reports bearing on her work.

WALDO, Peter, French merchant; b. in the later half of the 12th century. See Waldenses.

WALDO, Samuel Lovett, American portrait painter; b. Windham, Conn., 6 April 1783; d. New York, 16 Feb. 1861. He had a studio in Charleston, S. C., in 1806, he went to London and painted portraits for many years with success. He returned to New York in 1809 and opened a studio where he became popular as a portrait painter. His works include portraits of Peter Remsen and David Grinn (New York Historical Society).

WALDOBORO, wól'do-bör'ö, Me., town, port of entry. Lincoln County, at the mouth of the Medomak River, and on the Maine Central Railroad, about 26 miles southeast of Augusta, and 12 miles west of Rockland. It was settled in 1749 by a colony of Germans, and in 1773 was incorporated. It is a principal shipping station. The chief manufacturing establishments are a shoe factory, machine shop, men's clothing factory and creameries. Formerly the town was noted for its shipbuilding. The principal public buildings are the United States custom-house, the churches, schools and the bank Pop. about 2,650.

WALDSEEMÜLLER, Martin, the scholar who gave America its name: b. at Freiburg, Germany, about 1480; d. about 1521. He was regarded as an able young geographer by the little group of learned men of his native heath. His 'Cosmographiae Introductio' and his map of the world (the latter prepared as a globe also: "tam in solido quam plano"), both published at Saint Dié in 1507, attracted much attention, and originated the name America. The name confidently proposed for the transatlantic lands, and at the same time actually conferred upon the new "quarta orbis pars," in the little Latin treatise and on the huge wall-map and globe, was so promptly and generally caught up that its originator himself was powerless to recall it. When his 'Carta Marina,' in 1516, he had changed his opinion as to the relative value of the achievements of Columbus and Amerigo Vespucci, for
the word America does not appear on the map of 1516. But it was too late to impose a name less significant and less appropriate. Of the Waldseemüller map of 1507, 1,000 copies were printed, yet all but one were destroyed or lost, and the same fate had overtaken the Carta Itinaria Perrotii of 1511, and the Carta Marina of 1516. The Carta Itinaria was the first to be recovered; the more interesting maps of 1507 and 1516 did not come to light until 1901, when their discovery created a sensation. In *The Geographical Journal* for February 1902 we read: "Ever since Humboldt first called attention to the 'Cosmographie Introductio' no lost maps have ever been sought for so diligently as those of Waldseemüller. It is not too much to say that the honor of being their lucky discoverer has long been considered as the highest possible prize to be obtained among students in the field of ancient cartography. But until the last few months no specimen of either the globe or map has ever been heard of in modern times. A few months ago the geographical world was suddenly startled by a brief announcement that Waldseemüller's long-lost map of 1507, together with another of his of 1516, had been found by Prof. P. Joseph Fischer of Feldkirch, in the library of Prince Waldburg at Wolfegg Castle. In the excellent work by Fischer and Wieser (see below) it is written that 'Johann Schöner had the two Waldseemüller maps bound in a form of an atlas, from which circumstance we owe the preservation of the two precious cartographic monuments, while those copies that were mounted as wall-maps perished—as it seems, without exception—in consequence of their enormous size.' The assertion, so commonly made, that Waldseemüller intended to bestow the name America upon the southern continent only, appears at first sight to find support in the map of 1507, but is disproved by a comparison of the map with the explanatory passages in the 'Introductio.' The Greek form of his own name on the map of 1516 is Ilacomius, showing plainly his preference for that spelling toward the end of his rather short life. The fact that his name does not stand in any form upon the map of 1507 is additional evidence of juvenility. He appears to have been so young that his signature might have made good work seem less authoritative then. He was perhaps 25 years old when he produced a word that was to fill a place in all languages during all later ages. He was canon of Saint Die at his death, which was before 1522.

Bibliography.—Fischer and Wieser, 'Die älteste Karte mit dem Namen America'; Humboldt, 'Kritische Untersuchungen'; d'Avezac, 'Martin Hylacomylus Waldseemüller'; Harrisse, 'Bibliotheca'; Decouverte; Fiske, John, 'The Discovery of America' (Boston 1902); and the copy of the original 'Cosmographie Introductio' in the New York Public Library.

### WALDSTEIN, wält'stin, Sir Charles, English archaeologist: b. New York, 30 March 1856. Educated at Columbia and Heidelberg universities he became university lecturer in practical archaeology at Cambridge, England, 1880-82. He was assistant director of the Fitzwilliam Museum there 1883-89, a Fellow of King's College, Cambridge, 1893, and has been Slade professor of fine arts at same college since 1895. As director of the American School of Classical Studies at Athens (1889-95) and professor (1895-97), he directed excavations with signal success at Platea, Eretria, etc. He was honored with knighthood by George V in 1913. He has written 'Excavations at the Heraion of Aegina;' 'Balance of Emotions and Intellect' (1887); 'Essays on the Art of Phidias' (1885); 'The Word of John Ruskin' (1894); 'The Study of Art in Universities' (1895); 'The Surface of Things' (1899); 'The Jewish Question' (1899); 'The Expansion of Western Ideals and the World's Peace' (1899); 'The Argive Heraeaum' (1902); 'Art in the Nineteenth Century' (1903) (with L. Shoobridge) 'Herculaneum, Past, Present and Future' (1908); 'What may we Read?' (1912); 'Greek Sculpture and Modern Art' (1914); 'Aristocracy' (1916); new ed. (1917); 'What Germany is Fighting For' (1917); 'Patriotism, National and International' (1917).

### WALES, wālz, Prince of, the title given to the eldest son of the English sovereign since the time of Edward I (1301). From that time he also bore the title of Duke of Cornwall, and later those of Earl of Chester and Prince and High Steward of Scotland, Duke of Rothesay, Earl of Carrick, Baron of Renfrew and Lord of the Isles (1707); and Earl of Dublin (1849). Edward Albert, b. 23 June 1854, succeeded to the titles 6 May 1910, when his father George V became king of England.

**WALES**, Great Britain, a former Celtic kingdom in the central western peninsula, now an administrative division of England, and a principality, which gives the title of Prince of Wales to the heir-apparent of the British crown. It has an area of 7,460 square miles, divided into 12 counties. For the names, areas and populations of the counties see the article ENGLAND; and for statistical matter see GREAT BRITAIN.

Wales is composed of a peninsula, with the island of Anglesey at its northern end, joined at the Menai Strait by two remarkable bridges; a number of smaller islands lie chiefly at a short distance from the southwest coast. The peninsula, washed north and west by the Irish Sea, and south by Bristol Channel, and bounded west by the four English counties, Cheshire, Shropshire, Hereford and Monmouth, is 135 miles long; where widest 95 miles, and where narrowest only 35 miles broad. It is very mountainous, particularly in the northern division, where Snowdon, the culminating point of South Britain, rises to the height of 3,571 feet; is intersected by beautiful valleys, traversed by numerous streams, including among others the Severn, which has its source within it; and is rich in minerals, particularly copper in the north, and coal and iron partially there also, but much more extensively in the south. The Silurian formation, so called after the Silures, the ancient inhabitants of the principality, covers more than two-thirds of the whole surface, extending continuously from the mouth of the Conway to the vicinity of Saint David's Head; but is succeeded in the south by the Old Red Sandstone, which lies the mountain limestone and the large veins of coal. Besides the Severn, the principal rivers are
WALES

the Dee, which has part of its lower course in Cheshire; the Clwyd, in Denbigh and Flint; the Conway, forming the boundary between Denbigh and Carnarvon; the Dovey and the united Rheidol and Ystwyth, which have their mouths near the centre of Cardigan Bay; the Teify, separating Cardigan on the north from Carmarthen; the Pendeyrn or Subra as it is sometimes called, on the south; the Cleddy and Cleddu, remarkable chiefly from contributing, by their junction, to form the splendid estuary of Milford Haven; the Towy and Bury, which both fall into Carmarthen Bay; the Ebwy and Taf, which have a common estuary in Bristol Channel; the Romney, which forms part of the boundary between Wales and England; and the Usk and Wye, which, though rising in the principality, have only the earlier part of their course within it. The lakes are numerous, but the largest, Bala, is only four miles long and scarcely one mile broad. The climate is moderate and equable, though somewhat keen in the loftier districts. In all the counties humidity is in excess, the average fall of rain in the principality being 34 inches, while that in England is only 22. Both climate and surface render Wales more adapted for pasture than agriculture. The soil seldom possesses great natural fertility, except the marshes which he had caused to be drained by the Dyfrdwl, or Clwyd in the north, and of Glamorgan in the south, are celebrated for productivity. The latter, rather a plain than a vale, is of some extent and grows excellent wheat. The system of agriculture might be called the Welsh. The mineral products are valuable and the south contains some of the largest coal and iron works in the kingdom, as well as the copper works of Swansea. Of manufactures, the most important are woollens. The principal articles are flannel, for which the principality has long been famous, cloth chiefly of a coarser description and hosiery. The inhabitants are almost purely Celtic, being the descendants of the early Britons, who were able to maintain themselves here when the rest of the island was overrun by the Germanic invaders. One of the most striking native features is the female dress, consisting generally of a plain or checked gown, a mantle, a handkerchief of gay colors around the neck and shoulders. The black cap is brimmed and tapering to the form of a truncated cone. All classes are distinguished by civility and hospitality. Many curious superstitions, handed down by oral tradition, are still retained. The Welsh cherish their Brythonic or Cymric language with great affection. They have transplanted it to America, where it prevails in some districts and is represented by newspapers. In 1891 there were in Wales 598,000 people who knew no English, or at least habitually spoke Welsh. Most of the upper class belong to the Established Church, but the majority are Nonconformists, the most numerous bodies being the Congregationalists, the Calvinistic Methodists and the Baptists. See CELTIC PEOPLES; CYMR; CELTIC LANGUAGES; and also BRITISH EDUCATION, BRITISH FISHERIES, AGRICULTURE SINCE THE 18TH CENTURY AND THE MINING INDUSTRY, GRAY WALLS, 16TH, 17TH, 18TH,

History.—Previous to the Roman occupation, Wales was chiefly inhabited by three British tribes, called the Silures, Dimetae and Ordovices. During the later period of the Roman occupation, perhaps from the reign of Diocletian, the subject part of the island was divided into four provinces, of which one, including the country from the Dee to the Severn, was called Britannia Secunda. It was after the invasion of the Saxons that the country acquired a distinctive national character, as the refuge of the vanquished Britons who were driven from the east by the Jutes and Saxons who overran the west, and many of whom migrated to Britain (q.v.), France, whence the name, and similarity of the Breton language to the Welsh. From this period till the final conquest of the country by Edward I there were incessant petty wars between the rival chiefs or kings into which both countries during a great part of the Saxon period were divided, and some more systematic efforts of the larger monasteries to absorb the smaller. Among the greatest of the Welsh heroes of the early period was Cadwallon. After being defeated by Edwin of Deira, or Northumbria, and compelled to flee to Ireland, he returned and defeated the Saxons in numerous battles, but was at last defeated and slain by Oswald of Northumbria in 635. While the border territories continued to be contested in incessant warfare between the two races, Offa of Mercia built the celebrated dyke (see OFFA'S DYKE) known by his name to guard the country against his foes. In the middle of the 9th century Roderick, or Rhodi Mawr, succeeded in uniting the whole of Wales under one principality, but he divided it among his sons into three principalities, called respectively Gwynedd (or North Wales), Ceredigion and Dyfed (or South Wales), and Powys (composed of parts of the counties of Montgomery, Salop and Radnor). Soon after this the Danes began to invade Wales. The country was again reunited in the 10th century under Howel, sur-named Da, the Good; but as the English monarchy also acquired unity it gradually prevailed over the smaller principality, and Athelstan received tribute as the sovereign of Wales, although his sway in the country was only nominal. The claim of the conqueror being resisted, William invaded the country and compelled the Welsh princes to do homage, but they continued in virtual independence and became troublesome to the succeeding Norman monarchs by allying themselves with their former foes. William and his successors tried to break their spirit by granting fiefs in Wales to Normans and English on condition of conquest, and Henry I introduced into the country a colony of Flemings. Henry I, Henry II, John and Henry III, all made with various success a series of efforts to reduce the Welsh princes to submission. Llewellyn and David, princes of North Wales, successively did homage for that dominion to Henry III. On the death of David, Llewellyn revolted against Edward I, but was defeated by Henry, and in a subsequent revolt was again defeated and slain by the Earl of Mortimer, 1264. His brother David, who followed him in the principality, was taken in 1237. I created his eldest son Prince of Wales, and from this time Wales was united with England.

Wales shows a steady growth in population, gaining nearly 200,000 between 1901 and 1911, when the total was 1,647,290. The estimate for 1918 is 1,805,000.

F., 'Cathedrals of England and Wales' (3 vols., ib. 1906); Stone, Gilbert, 'Wales: Her Origins, Struggles, and Later History, Institutions, and Manners' (London 1915).

WALES, University of (in Welsh, Prifysgol Cymru), a British institution established by charter in 1893, and formed by the union or association of three existing colleges, the University College of Wales, Aberystwyth, founded in 1872; the University College of North Wales, Bangor, founded in 1884; and the University College of South Wales and Monmouthshire, Cardiff, founded in 1883. Each of the colleges has a women's hall of residence, that of the last being known as Aberdare Hall. There are no special university buildings apart from these and the temporary offices at Newport, Monmouth. The university has power to grant degrees in arts or literature, science, law, theology and music; but the constituent colleges do not supply a full course of instruction in each of these subjects, the necessary courses for the degrees of B.A. and B.Sc., being at present those chiefly provided. As regards theology, instruction is furnished by a number of theological colleges in the principality, at which students may qualify for the degree of B.D. The classes are open to persons of either sex above the age of 16 years. The first matriculation examination of the university was held in 1895. The students number about 1,400, though there was a falling off of about 30 per cent during the war.

WALFISH, wál'fish, or WALVISCH, BAY, West Africa, a harbor and small territory belonging to Great Britain since 1878, on the coast of German Southwest Africa, close to the parallel of 23° S. The harbor, frequented by whale fisheries, is a good one, and is formed by a sandy spit of land which projects northward parallel with the coast, and ends in a point known as Pelican Point. It receives the river Khuiseb at its head and just beyond the northern boundary of the territory is the mouth of the river Swakop, where the German authorities constructed a new harbor, known as Swakopmund. The enclave is included in Cape Colony for administrative purposes. There is a tramway line to Rooikop and railway communication since 1915 with Swakopmund 21 miles. The area is 430 square miles and the population 3,076, of whom about 144 are white.

WALFORD, wál'ford, Lucy Bethia Colquhoun, English novelist: b. Portobello, Scotland, 17 April 1845; d. 1915. She was married to A. S. Walford of Cranbrooke Hall, Essex, in 1869. Her first novel, 'Mr Smith,' appeared in 1874, and in certain respects it has not been surpassed by any of her later works, although she gained in ease of dialogue and description. A wholesome underlies all her many novels, among the best of which are 'Cousins' (1879); 'Troublesome Daughters' (1880); 'The Baby's Grandmother' (1885); 'The Arch-deacon' (1889); 'Sir Patrick, the Fuddock' (1900); 'Charlotte' (1901); 'The Enlighten-

WALHALLA, väl-hä'là, VALHAL, or VALHALLA, the great hall of the Scandinavian gods, the warriors' heaven of the Vikings. Here the heroes slain in battle feasted with Odin, drinking mead from the udder of the goat, Heidrun, which was cooked every day, and became whole again after each daily banquet. The hall was lighted by gleaming swords, rooted with shields and the seats covered with coats of mail. Apart from feasting, fighting their battles over again was the favorite pastime of the heroes admitted to Walhalla. See SCANDINAVIAN MYTHOLOGY.

WALKE, wák, Henry, American naval officer: b. near Portsmouth, Va., 24 Dec. 1808; d. Brooklyn, N. Y., 8 March 1896. He was appointed midshipman in 1825 and was promoted lieutenant in 1839 and in the Mexican War was executive officer on the Vincennes, engaged at the capture of Vera Cruz. He was promoted commander in 1855 and in 1861 was assigned to duty with the Mississippi flotilla, receiving rank as captain in 1862. He commanded the squadron of gunboats which assisted Grant at Belmont; was engaged at the battles of Forts Henry and Donelson, Island No. 10 and Fort Pillow; successfully passed the Vicksburg batteries; and in 1863 was transferred to the command of the Sacramento and sent in pursuit of the Alabama. He was promoted commodore in 1866, rear-admiral in 1870 and in 1871 was at his own request placed on the retired list.

WALKEM, George Anthony, Canadian politician: b. Newry, Ireland, 1834; d. 1908. He came to Canada in his youth, was educated at McGill University and was called to the bar in 1859. As a member of the legislative council (1864–70) he played an active part in securing the admission of British Columbia (1870) and was made a member of the provincial legislature. He was a member of the Cabinet (1872–74), was Premier (1874–76) and in 1882 was appointed a puisne judge of the Supreme Court.

WALKER, Amasa, American political economist: b. Woodstock, Conn., 4 May 1799; d. North Brookfield, Mass., 29 Oct. 1875. A prominent merchant of Boston from 1825 to 1840, he was known also as an abolitionist in 1843, and 1849 visited London and Paris respectively to attend the international peace convention of those years, and in 1848 took a leading part in the formation of the Free Soil party. In 1848 he was a representative in the State legislature, in 1849 State senator, in 1851–52 secretary of State, having been elected by the united Free Soil and Democratic vote. He was a member of the House of Representatives in 1862–63, to complete the unexpired term of Goldsmith F. Bailey. From 1842 to 1849 he was professor of political economy in Oberlin College; and he published 'The Nature and Uses of Money and Mixed Currency' (1857) and 'The Science of Wealth:
WALKER

WALKER, ASA, American naval officer: b. Portsmouth, N. H., 13 Nov. 1845; d. 7 March 1916. He was graduated from the United States Naval Academy in 1866, received promotion to lieutenant in 1870 and to commander in 1894. He was on duty at the Naval Academy in 1873-76, 1879-83, 1886-90 and in 1893-97. In the last-named year he was placed in command of the Concord and in 1898 was engaged with her in the battle of Manila Bay. He received the rank of captain in 1899 and was assigned to duty at the Naval War College, Newport, R. I. He was a member of the naval examining board at Washington in 1900-01 and in 1903 took command of the Oregon.

WALKER, Benjamin, American soldier: b. England, 1753; d. 13 Jan. 1818. Arriving at an early age in New York, he there became a merchant; served as captain and as aide to Baron Steuben and General Washington in the Revolution. After the war he was secretary to the governor of New York and later was a broker in New York. He was naval officer there during Washington's administration, and was representative in Congress 1801-03. For many years before his death he was manager of the Earl of Brute's great estates in the centre of the State.

WALKER, Francis Amsa, American economist and soldier: b. Boston, 2 July 1840; d. there, 5 Jan. 1897. He was the son of Amsa Walker (q.v.), was graduated at Amherst College in 1860. He studied law, which he gave up to enlist in the Union army, and served throughout the whole of the Civil War. His rank during the greater part of the war was that of lieutenant-colonel, and in 1863 he was brevetted brigadier-general of volunteers. He taught Greek and Latin at Williston Seminary, Easthampton, Mass., from 1865 to 1868, and in the latter year was connected with the staff of the Springfield Register, after serving as head of the Bureau of Statistics of the Treasury Department, in 1870 he was made superintendent of the ninth census and in 1872 became commissioner of Indian affairs. From 1873 to 1881 he was professor of economics and history in the Sheffield Scientific School at Yale and in 1877-79 was lecturer at Johns Hopkins University. He was the representative of the United States at the International Monetary Conference, Paris, in 1880. In 1880 he was appointed superintendent of the 10th census. Accepting the presidency of the Massachusetts Institute of Technology in 1881, he continued in that position till his death. He was president of the American Statistical Association from 1882 to 1887 and of the American Economic Association in 1885-92. He was an earnest advocate of international bimetallism, was deeply interested in all economic questions, particularly those concerning wages and profits, upon which he wrote with effective clearness and force. His work has exerted a marked influence upon economic study. His writings include 'The Indian Question' (1874); 'The Wages Question' (1876); 'Money' (1878); 'Money in Its Relations to Trade and Industry' (1879); 'Political Economy' (1883); 'Land and its Rent' (1883); 'History of the Second Army Corps' (1886); 'Life of General Hancock' (1894); 'The Making of the Nation' (1895); and 'International Bimetallism' (1896). Consult 'Publications of the American Statistical Association,' Vol. V. (1896-97), for bibliography and biographical notices.

WALKER, Frederick, English painter: b. London, 26 May 1840; d. Saint Fillans, Perthshire, 4 June 1875. After an ordinary school education he worked for a time in an architect's office, and then for a short time had been at the British Museum, in an art academy and in the Royal Academy schools. He became an apprentice to Whymper, the wood engraver, in 1858 and soon afterward began to provide drawings for Good Words, the Cornhill Magazine and other periodicals. He illustrated the 'Adventures of Philip' and the 'Dennis Duval' of Thackeray. He exhibited his first oil picture, 'The Lost Path,' at the Academy in 1863. He was elected an associate of the Old Watercolor Society in 1864 and in 1871 he became an associate of the Royal Academy. His principal pictures in oils were 'Wayfarers' (1866), by some considered his best oil-painting; 'Babylon' (1867); 'Vagrants' (1868); in the National Gallery: 'The Old Gate' (1869); 'The Plough' (1870); 'At the Bar' (1871); 'The Harbour of Refuge' (1872), in the National Gallery; and 'The Right of Way' (1875). Among his more numerous works in water-color the following may be mentioned: 'Philip in Church' (1863); 'The Young Patient'; 'The Shower'; 'The Village School'; 'Jane Eyre'; 'Refreshment'; 'Spring'; 'Autumn' (1865); 'The Bouquet'; (1866); 'The Gondola'; 'In a Perthshire Garden'; 'The Housewife'; 'The Rainbow'; and 'The Fishmonger's Shop.' Consult Marks, 'Life and Letters of Frederick Walker' (1896).

WALKER, George, Irish Anglican clergyman: b. of English parents in County Tyrone 1618; d. Boyne, 1 July 1664. He was educated at Glasgow University, took orders and in 1674 became rector of Donaghmore, near Dungannon. In April 1669 he was made joint governor of the besieged town of Londonderry after the traitorous governor had allowed to escape and did much to inspire the heroic defenders in the siege of 105 days. He received the thanks of the House of Commons, and had honorary degrees conferred upon him by Cambridge and Oxford. He fell at the battle of the Boyne, being at the time of his death bishop-designate of Derry. His 'True Account of the Siege of Londonderry' (1669) and 'Vindication' of it are reprinted in Dwyer's 'Siege of Londonderry' (1893).

WALKER, Henry Oliver, American mural painter: b. Boston, 14 May 1843. He studied art in Paris under Bonnat (1879-82) and then opened a studio in New York city where he became noted for his beautiful figure compositions, notably 'Eros et Musa' and 'Musa Regina' (at the National Gallery, Washington), and 'Morning Vision' (at the Metropolitan Museum, New York). His notable mural decorations may be seen in the library of Congress at Washington; in panels at the Massachusetts State House; in the Essex County Court House, New Jersey; in the
Capitol at Saint Paul, Minn.; and in 'Wisdom Attended by Learning,' in the Appellate Court, New York. He received a gold medal at Charleston in 1902 and was made a member of the National Academy the same year.

WALKER, Horatio, Canadian painter: b. Listowel, Ontario, 1858. He was practically self-taught but studied miniature work in Toronto and then went to New York City (1885) where his work was speedily appreciated. His favorite subjects were taken from the life of the French-Canadian people. His work won gold medals at Buffalo, Saint Louis, The Pennsylvania Academy of Fine Arts, Charleston and The Pan-Pacific Exposition at San Francisco. Among his notable works are 'The Harrower' (Metropolitan Museum, New York), 'Oxen Drinking' and 'Ave Maria' (Corcoran Gallery, Washington), 'Sheep Yard by Moonlight' (National Gallery, Washington), 'Sheepshearing' (Albright Art Gallery, Buffalo), 'The Woodcutter' and 'Milk ing' (Saint Louis Museum). He is a member of the National Academy of Design and of the Royal Institute of Painters in Watercolors of London.

WALKER, Hugh, Scottish author: b. 7 Jan. 1855. He was educated at the universities of Glasgow and Oxford and is professor of English literature at Saint David's College, Lampeter, South Wales. He is the author of 'Three Centuries of Scottish Literature' (1898); 'Greater Victorian Poets' (1895); 'The Age of Tennyson' (1897); 'Biographical Sketch of Lord de Tabley' (1903); 'The Literature of the Victorian Era' (1910); 'Outlines of Victorian Literature' (1913); 'The English Essay and Essayists' (1915). He edited 'The Merry Devil of Edmonton' in 'Temple Dramatists Series,' contributed to 'The Cambridge Modern History' and 'Cambridge History of English Literature,' and to American and English periodicals.

WALKER, James, American college president and Unitarian clergyman: b. Burlington, Vt., 27 April 1834; d. Cambridge, Mass., 23 Dec. 1874. He was graduated from Harvard in 1814, studied for the ministry and was pastor of the Unitarian Church, Charleston, Mass., 1818-39. He was professor of moral and intellectual philosophy at Harvard 1839-53 and president of Harvard University 1853-60. From 1831 to 1839 he edited the Christian Examiner. He edited the works of Dugald Stewart and Thomas Reid, published a 'Memoir of Josiah Quincy' (1867) and delivered lectures on 'Natural Religion' and 'The Philosophy of Religion.' He was famous as a pulpit orator.

WALKER, James, American artist: b. England, 3 June 1819; d. Watsonville, Cal., September 1889. He emigrated to the United States and settled in New York City early in life. In 1834 he went to San Francisco to paint at Gold Rush. It was a French battle-piece and his success was so complete that he became widely known as a painter of military pictures. His principal works are 'The Battle of Lookout Mountain'; 'The Battle of Chapultepec'; and 'The Repulse of Longstreet at Gettysburg.'

WALKER, James Barr, American clergyman: b. Philadelphia, Pa., 29 July 1805; d. Wheaton, Ill., 6 March 1887. He worked at anything to which he could turn his hand for years but finally studied law in Ravenna, Ohio, was graduated at the Western Reserve College (1831) and engaged in editing several religious papers. At last he abandoned everything for the ministry and was licensed by the Chicago presbytery (1841). He became pastor of a church at Sandusky and also was lecturer at Oberlin College and at the Chicago Theological Seminary. His chief writings are 'The Philosophy of Skepticism and Ultrasm' (1857), 'Philosophy of the divine operation in human redemption' (1862), 'Poem' (1862), 'The living question of the Age' (1865) and 'The doctrine of the Holy Spirit' (1870). His writings were translated into many languages.

WALKER, John, English actor and lexicographer: b. Colney Hatch, Middlesex, 18 March 1732; d. London, 1 Aug. 1812. He was for a time engaged by Garrick, Denison and others in translating the plays of the French. He was a member of the company at Crow Street Theatre, Dublin, 1758-62 and was at Covent Garden 1762-67. In 1768 he left the stage, and, after conducting a school at Kensing tong for two years, became engaged in elocution. His published works include, among others, 'A Dictionary of the English Language, answering at once to the Purposes of Rhyming, Spelling and Pronouncing' (1775; latest ed., 1888); 'Elements of Elocution' (1781); 'A Rhetorical Grammar' (1785); 'The Melody of Speaking Delineated' (1789); 'A Critical Pronouncing Dictionary and Expositor of the English Language' (1791), his chief work, which was long regarded as a standard for pronunciation.

WALKER, John Grimes, American rear-admiral: b. Hillsboro, N. H., 20 March 1835; d. York Beach, Me., 16 Sept. 1907. He was graduated from the Naval Academy in 1856 and during the Civil War was employed in the blockading service and in the Mississippi squadron, becoming lieutenant-commander in 1862; in 1866 he was promoted to the rank of commander for gallantry. He was chief of the Bureau of Navigation 1881-88, became commodore in 1889 and was put in command of the squadron of evolution 1889-93. In 1894 he was appointed to protect American interests in the Hawaiian Islands, was commissioned rear-admiral the same year and retired in 1897. From 1899 he was president of the Isthmian Canal Commission.

WALKER, Jonathan, American advocate of abolitionism: b. Cape Cod, Mass., 1799; d. 1 May 1878. In early life he was captain of a fishing-boat; was railroad contractor in Florida 1840; sided slaves to escape thence in an open boat 1844, but the party were taken to Key West by a wrecking-boat, which found them helpless at sea. Walker was carried in irons to Pensacola, held for some time in prison chained to the floor of a dark cell, and on being tried was convicted for conspiracy. Then came a pilory, branded 'S. S.' (slave-stealer) on the right hand, and ordered to be confined in prison till the fine was paid. He was liberated after 11 months' imprisonment on payment of the fine by friends in the North. He then continued years delivered lectures on slavery, and in 1850
settlement in Muskegon, Mich. Walker's history suggested to Whittier the topic of his 'Man With the Branded Hand.'

WALKER, Leroy Pope, Confederate soldier: b. Huntsville, Ala., 8 Feb. 1817; d. there, 21 Aug. 1894. Educated at the universities of Alabama and Virginia, he was admitted to the bar (1837), practised in Moulton, Ala., served as solicitor of his circuit and was a member of the state legislature and speaker of the house. He removed to Huntsville and became leader of the Southern bar. President Davis made him Secretary of War. He resigned (1861) but immediately joined the Southern army only to give up his commission on account of ill health (1863) and to resume his law practice (1865). He was delegate to the Democratic National Convention (1867) and to the Chicago Convention (1894).

WALKER, Mary Edwards, American physiologist and dress reformer: b. Oswego, N. Y., 26 Nov. 1832; d. 22 Feb. 1919. She was notably in advance of her age in her views on dress reform and suffrage and was the only woman expressly given permission by Congress to wear in male attire. At the age of 23 she was a graduate physician, having secured her degree from The Syracuse Medical College and began practice in Columbus, Ohio, but soon returned to Rome, N. Y. When 29 years of age she practically discarded female attire and when commissioned as first lieutenant to serve on the surgical staff she always appeared in male attire. After spending four years on the battlefields she was awarded a Congressional medal of honor for bravery. After the war she became notable for her lectures on dress reform and suffrage and lectured abroad as well as in this country, always appearing in a frock coat or full evening dress. She was a familiar figure in Washington for years. Her death followed sometime after an accident which resulted in a fall on the Capitol steps at Washington and which caused her for a time to remain in the Federal hospital at Fort Ontario.

WALKER, Robert J., American legislator: b. Cumberland County, Pa., 23 July 1801; d. Washington, 11 Nov. 1869. He grew up in the midst of an enlightened community and he was graduated at the University of Pennsylvania, at the head of his class, when he was only 18 years old. A little later he married the granddaughter of Benjamin Franklin, Mary Bache, daughter of Richard Bache and sister of the famous Alexander Bache, one of the founders of the Smithsonian Institution. Walker began the practice of law at Pittsburgh in 1822. Two years later he was an advocate of the election of General Jackson to the presidency and he seems to have exerted considerable influence upon the attitude of Pennsylvania. But the lure of the lower South was too strong for him and he moved to Natchez, Miss., in 1825, where he promptly became one of the leaders of the community. In the land speculations which paralleled the removal of the various tribes of Indians from Mississippi and Alabama, 1830-35, he made what was considered a large fortune. But he was a natural politician and he entered the race for the United States Senate against George Poindexter. It was a spectacular contest which attracted national attention. Walker was successful and once in the Senate, President Jackson promptly made it known that Walker was his friend. From the day of Walker's entrance into national politics, he was a constant and unremitting advocate of the annexation of Texas. In the campaign of 1844, Walker was the chairman of the National Democratic Committee, as we should now say, and he was more responsible than any other man for the nomination and election of Polk. He was Secretary of Treasury in the Polk cabinet and he wrote the tariff of 1846, generally recognized as the best of tariffs before the Civil War. He managed the finances of the government, almost without advice or counsel from the President, during the Mexican War. For the first time in American history, government securities continued to sell at par or above throughout a war. At the close of the Polk cabinet, he returned to Washington, D.C., and became a lawyer and a lobbyist in Washington. He was sent to Europe by the directors of the Illinois Central Railroad to sell bonds and purchase building supplies. He was counsel for certain mining interests from which he received a fortune in the form of a fee, in 1858, amounting to some hundreds of thousands of dollars. But he could not keep aloof from politics and President Buchanan made him territorial governor of Kansas in April 1857. Once in Kansas, Walker endeavored so to arrange the tangled affairs of the war-torn Territory that he was to be returned to the United States Senate. But he failed, more because the President withdrew his support than from any lack of wisdom in dealing with the Kansans. When the President withdrew his support Walker resigned and became a public supporter and advocate of Stephen A. Douglas for the Presidency. That completed the breach between Walker and the South where he had always had influence. When Lincoln, and not Douglas, became President, Walker set up a magazine in New York which he called the Continental Monthly and in which he supported strongly the cause of the Union. When the war was at its most difficult President Lincoln sent Walker as a commissioner of the Treasury to Europe to borrow money on the best terms he could and to discredit the Confederacy in any way he might. Walker succeeded beyond expectation, for he secured loans of $300,000,000 in gold at a time when the government needed gold quite as much as the armies needed men. On the return of Walker to the United States, he became once more a lawyer and lobbyist in Washington and as such had a good deal to do with the passage of the act appropriating the necessary money for the purchase of Alaska. His work and character were not of the kind that enhanced his reputation for integrity. His death was passed almost unnoticed in the press of the country and his burial place has been almost entirely forgotten; but not many men of his generation had more to do with the growth and development of the country. The facts about Walker are to be found only in governmental documents, 'The Diary of James K. Polk,' and contemporary newspapers.

William E. Dodd,
Professor of History, Chicago University.
WALKER, Sears Cook, American mathematician and astronomer: b. Wilmington, Middlesex County, Mass., 28 March 1805; d. Cincinnati, Ohio, 30 Jan. 1853. He was graduated at Harvard College in 1824, taught school near Boston for two years and in 1827 removed to Philadelphia, where also he engaged in teaching. His parallactic tables, first prepared in 1820, the latitude of Philadelphia, reduced the time needed for computing the phases of an occultation to less than half an hour. In 1837 he was invited to prepare a plan for the organization of an observatory in connection with the Philadelphia High School, and from its equipment in 1840 until 1852 he published in the 'Proceedings of the American Philosophical Society' and the American Journal of Science frequent and copious observations and investigations which he had made. In 1841 he published an account on the periodical meteors of August and November. In 1845 he took part in the Washington naval observatory, where on 2 Feb. 1847, four months after the detection of the planet Neptune, he made the discovery that a star observed by Lalanne in May 1795 must in fact have been this planet. By subsequent alternating computations of Pierce and Walker, the former investigating the perturbations and the latter the orbit, the theory of Neptune was at once placed on a footing comparable with that of the other large planets. In 1847 he was invited to take charge of the longitude computations of the United States Coast Survey, an office in which he continued until his last illness. By the joint labors of Walker and Bache the method of telegraphic longitude determinations was developed and successfully carried out as early as 1849, with greater precision than was attained in Europe 10 years later. The introduction of the chronographic method of recording observations belongs to Walker and Bache. The prosecution of the telegraphic method of longitude soon led Walker to the discovery that the time required for the transmission of the galvanic signal was measurable, and the velocity by no means as high as had been supposed.

WALKER, Thomas, American jurist: b. Gloucester County, Va., 25 Jan. 1715; d. 9 Nov. 1794. Having been educated at William and Mary College, he became a physician at Fredericksburg, Va. He made an expedition in 1750 to the region that now is the State of Kentucky—13 years before Daniel Boone entered it from Tennessee. The Walker Mountains in southern Virginia are named after Walker, as commissary general under George Washington in Braddock's army. He was commissioned on behalf of Virginia to treat with the Six Nations at Fort Stanwix, N.Y., 1768; commissioner to treat with the Indians at Fort Pitt (Pittsburgh) 1777. He acquired a great estate by marriage toward the close of his life. His son John Walker served with distinction on General Washington's staff during the Revolution; he was United States senator a few months in 1790.

WALKER, Thomas Leonard, Canadian soldier: b. Lisbon, Portugal, 30 Dec. 1867. He was graduated at Queen's University with honors in chemistry and mineralogy (1890) and from Leipzig (1895). He was assistant in the geological survey of Canada (1890-93), Fellow in chemistry in the school of mines, Kingston (1893-95), assistant superintendent geological survey of Canada 1895-96, and since then has been professor of mineralogy in Toronto University. He has contributed to many scientific publications.

WALKER, Timothy, American clergyman: b. Woburn, Mass., 27 July 1705; d. 1 Sept. 1782. He was graduated at Harvard 1726, and having studied theology became (1730) minister of the Congregational Church at the Penacook plantation (now Concord, N.H.). When, 1740, the title of the Penacook settlers to their land was held by the province of New Hampshire to be null, and new claimants demanded possession, the courts deciding favorably to them, Walker undertook the defense of his people's rights, and thrice visited England to maintain their cause; finally the king in council decided the suit in favor of the people. Walker's theological belief was mildly Calvinistic. In the Revolution he was an ardent patriot. He held the pastorate at Concord 52 years. His daughter married Count Rumford. Walker's son Timothy Walker (b. 26 May 1737; d. 5 May 1822) was graduated at Harvard 1822, and at first was a preacher; then became active in political life of the Revolutionary time and the period subsequent—holding many important offices.

WALKER, Timothy, American jurist: b. Wilmington, Mass., 1 Dec. 1806; d. Cincinnati, Ohio, 15 Jan. 1856. He was graduated from Harvard (1826), taught mathematics in Northampton, Mass., studied at Harvard Law School (1829-31), removed to Cincinnati the latter year and was admitted to the bar. He established the Cincinnati Law School with Judge Wright and had charge of it until 1844. He founded the Western Law Journal in 1843, and was active in his profession until his death. In 1842-43 he was presiding judge of the Hamilton County Court of Common Pleas. His chief work was 'American Introduction to American Law.'

WALKER, William, American adventurer: b. Nashville, Tenn., 11 Aug. 1824; d. Trujillo, Honduras, 12 Sept. 1860. After study of law and medicine, he was a journalist in New Orleans and San Francisco, and practised law in Marysville, Cal. In 1853 he organized a filibustering expedition against Lower California and the Mexican state of Sonora. On 4 November he arrived at La Paz, made the Mexican governor a prisoner and proclaimed a new régime to the inhabitants of Lower California. In a few weeks difficulties arose. Reinforcements did not arrive, desertions greatly reduced his force, and he was obliged to retreat across the border into California and surrender himself and band to a detachment of United States regulars. He was tried (May 1854) at San Francisco, for violation of the neutrality laws, and acquitted. But Walker was soon planning new conquests. Taking advantage of insurrectionary troubles in Nicaragua, and to some extentabetted by American capitalists interested there, he landed at Realejo, Ont., 11 June 1855; and, having with his followers and a few natives won some trifling battles, managed to accomplish a peace which recognized Rivas, leader of the party favored
by Walker, as President and Walker himself as generalissimo. Many Southerners joined him and, according to the War Department, 1,200 troops. The Pierce administration proclaimed the neutrality laws, and made attempts at prosecution, but expeditions sailed with comparative freedom from San Francisco and New Orleans to Walker's aid. Finally, Vizilu, a priest, as the diplomatic representative of what was really the Walker government, was received 14 May 1856, though the North and many conservative Southerners condemned the action. The envoy did not remain long at Washington. Rivas absconded, and in June Walker got himself elected to the Presidency. In September he published a decree repealing all laws against slavery, which had not existed in Nicaragua for 32 years. Undoubtedly he believed that such a procedure would obtain for him valuable support in the slave States. But the United States government declined to recognize him or his ministers, and his arbitrary acts provoked a native insurrection. At last he was held between Lake Nicaragua and the Panamanian isthmus, and on the 15th of October 1856 he was killed by a party of ten. Walker left behind him a vast fortune, and on 1 May 1857 he was elected to the Presidency of the Republic of Nicaragua. In November 1861 he was killed by the United States navy in a battle with the" Walker," a steamer of the Atlantic Blockading Squadron.

WALKER, William Hultz, American industrial chemist: b. Pittsburgh, Pa., 7 April 1869. He was graduated at the Pennsylvania State College (1890) and the University of Gottingen (1892), was professor of industrial chemistry at Harvard (1905-06) and became identified with the production of the "glass art" glass in America. He was president of the American Electro-Chemical Society in 1910 and is an authority on industrial chemistry in the United States.

WALKER, William Johnson, American philanthropist: b. Charlestown, Mass., 15 March 1790; d. 2 April 1865. He was graduated at Harvard 1810, then studied medicine, and practiced as a physician in Charlestown. He became heir to a large estate late in life. His benefactions to colleges and to charitable and benevolent institutions were very liberal, amounting to $1,400,000, of which $740,000 was bestowed during his lifetime.

WALKER, William McCreary, American naval officer: b. Baltimore, Md., 2 Sept. 1813; d. 19 Nov. 1866. He became midshipman in the United States navy 1827; passed midshipman 1833; lieutenant 1838, and while lieutenantcommanded a vessel in Wilkes's exploring expedition. He served on the home station 1843-44, and in the Mediterranean squadron 1844-46; commanded the frigate Constellation 1855-56. He attained the rank of captain 1862; through the Civil War he served with distinction on the steamer De Soto of the Atlantic Coast blockading squadron.

WALKER, William Sidney, English Shakespearean scholar: b. Pembroke, Wales, 4 Dec. 1795; d. 15 Oct. 1846. He was educated at Trinity College, Cambridge, becoming a Fellow of his college in 1820. Unorthodox views regarding the text of Shakespeare, and its Apparent Irregularities explained by Examples from Early and Late English Writers (1854) and 'A Critical Examination of the Text of Shakespeare, with Remarks on his Language and that of his Contemporaries, together with Notes on his Plays and Poems' (1860), which are of the utmost value to students of Shakespeare and Elizabethan literature.

WALKER, Williston, American church historian: b. Portland, Me., 1 July 1860. He was graduated from Amherst College in 1883 and from Hartford Theological Seminary in 1885. He was professor of ecclesiastical history at Amherst College, the latter institution 1889-1901, and since 1901 has held a similar post at Yale University. He has published 'The Creeds and Platforms of Congregationalism' (1893); 'A History of the Congregational Churches in the United States' (1894); 'The Reformation' (1900); 'Ten New England Leaders' (1901); 'John Calvin' (1906); 'French Trans-Geneva' (1909).
WALKER LINE. See Boundaries of the United States.

WALKERTON, wake'r-ton, Canada, capital of Bruce County, Ontario, 65 miles northwest of Guelph, on the Saugeen River, 32 miles south of Owen Sound, and on the Wellington, Grey and Bruce Railroad. It is a thriving and growing town, with extensive water powers, several flour and planing-mills, iron foundry, taneries, furniture and rope factories and other industrial establishments. It has two newspapers and several banks. Pop. about 3,162.

WALKERVILLE, wake'r-vil, Canada, a town of Essex county, Ontario, on the Detroit River, two miles northeast of Windsor, near the outlet of Lake Saint Clair and connected by ferry with Detroit, Mich. It has shipbuilding yards, a distillery, automobile factories, planing-mills, engine and wire works, foundries and other industrial establishments. Pop. about 5,000.

WALKILL RIVER. See Walkill River.

WALKING DELEGATE, an official connected with a trade union, whose duty it is to visit the various places at which members of his craft are employed and personally ascertain that no laws of that particular trade guild are violated by the workmen; also, in cases where an unexpected strike has been ordered by the executive board, it devolves on him to notify men connected with the union to cease work. The term became oppressive and has been largely superseded by business agent. See UNIONISM.

WALKING FISH. See Mud-Skipper; SERPENT HEAD.

WALKING-LEAF. See Ferns and Fern Allies; LEAF-INSECT.

WALKING PURCHASE, The. In 1682 William Penn (q.v.), purchased of the Delaware Indians a tract of land in the present counties of Bucks and Northampton, Pa., bounded on the east by the Delaware River and in the interior at a point as far as a man could walk in ten days. Penn and a party of Indians started on the walk, beginning at the mouth of Neshaming Creek. At the end of a walk of a day and a half Penn concluded that it was as much land as he wanted, and a deed was given to the lands at that point—about 40 miles from the starting place. In 1737, after Penn's death the tract was increased by a party of expert walkers to a point 70 miles in the interior instead of 40 miles. See DELAWARE INDIANS; PENN, WILLIAM.

WALKING STICK, a cane, wand, stick, or rod prepared for use in walking, either as an assistance in supporting and steadying the walker, or for ornament. The habit of using walking-sticks is of great antiquity; and in modern times the supply of such articles constitutes a large branch of trade in the United States, as well as in European countries, especially in Great Britain, France, and Germany. London is a great mart for all kinds of walking-sticks, and over four and one-half million sticks in the raw state, to be afterward dressed and mounted, are annually imported into Great Britain. These consist chiefly of the small stems or canes of certain palms, as the Malacca cane, and others called Whangee and Penang.

Lawyers; the woody stems of some small species of bamboo also are used, besides straight shoots of orange, cinnamon, myrtle and other shrubs; oak, ash, hazel, sycamore, and other native trees and shrubs also are used. The preparation and sale of walking-sticks are extensively carried on in Hamburg, and the finer sorts are richly and tastefully mounted in Paris.

WALKING STICK, or STICK-INSECT, a wingless orthopterous insect of the family Phasmidea, so-called because in its slender, elongated form and greenish-gray hue, it resembles a dry twig so closely as to be mistaken for one when not moving. Those of the eastern United States (Diapheromera femorata) are also called walking bug and walking twig. Some species are several inches long. They are near relatives of the mantids and are natives of sub-tropical and the warmer temperate regions and walk gently among the branches of trees, reposing in the sun, with their long antenna-like legs stretched out in front. They feed upon the green parts of plants, but are rarely numerous enough to do much damage. Consult Howard, "The Insect Book" (New York 1901). See ARALIA.

WALKYRIE, or VALKYR, in Scandinavian mythology, one of a company of nine or more beautiful maidens, attendants of Odin (q.v.), who, clad in brilliant armor and adorned with golden ornaments, ride through the air, order battles, and distribute the death-lots according to Odin's commands. Fertilizing dew drops on the ground from the manes of these horses; light streams from points of their lances, and a flickering brightness announces their arrival in the battle. With their charming glance they rejoice the glazing eye of the hero, and lead him to Valhalla (q.v.), where they act as his cup-bearers. Two Valkyries, Hrist and Mist, are cup-bearers to Odin himself. The name is derived from the Icelandic Valkyria, and means literally "chooser of the slain," from val, the "slain" and kozjara, to "choose." They differ in origin; some spring from Elves and other superhuman beings, some are daughters of princes, who in their lifetime are numbered among the Walkyries, showing all their qualities, and when they die their spirits become Walkyries. They ride generally in companies of three, or of three times three or four times three, and have the gift of changing themselves into swans—hence sometimes called swan-maidens. They often choose noble heroes for lovers. Whoever deprives a Walkyrie of her swan-robe gets her into his hands. But the song of the Walkyries sounds terrible, as sitting on a hill, they weave the fateful battle-web. The Walkyries were frequently confounded with the Norns or Destinies. They were conceived also under the figure of the clouds; thus, Hrist signifies "dark sky," and Mist signifies "quaking." Most of the names of the Walkyries, however, relate to war and battle. The Walkyries were known also as battle-maidens, shield-maidens and wish-maidens.

WALL-CREEPER, a small bird (Tichodroma muraria) of the European Alps, which frequents walls and perpendicular rocks, preference to trees, on whose rough trunks its relatives, the creepers (Certhia), make their living. It is about six inches long; plumage
light gray, with bright crimson on the shoulders, the larger wing coverts and the inner webs of the secondaries; the rest of the wings black; tail black, tipped with white. Called also spicercatcher.

WALL DECORATION. See MURAL PAINTING.

WALL-EYED PIKE, or GLASS-EYE, one of the pike-perch (Stizostedion vitreum) of the central part of the United States, so-called in reference to its large staring eyes; also absurdly called salmon or jack-salmon in some parts of the South. Its body is elongate, back arched, head subconic, long; cheeks, gill-covers and top of head more scaly; dorsal spines high; dark olive, mottled with brassy; sides of head vermiculated; first dorsal fin with a large black patch on the hinder margin. Length one to three feet. It reaches its greatest development and abundance in the Great Lakes region and upper Mississippi, but is also found southward, eastward and northward to Georgia, Pennsylvania and Assiniboia, respectively. In lakes it inhabits, the water is usually about 4 feet deep, and in the latter part of winter the bottom has been scourcd by inflowing streams. In rivers it loves to hide under logs and rocks in the deep holes beneath dams and falls and amid swiftly flowing waters. It is a predacious fish and devours all smaller species. The wall-eyed pike is a prolific spawner and great numbers of the fish congregate on shallow, well-cleaved bottoms for this purpose. Because of the fine quality of its flesh and the large size (10 to 30 pounds) which it attains, this fish is highly valued and in the Great Lakes region ranks next to the white-fish in commercial importance. The smaller sand-pike or sauger (S. canadense) has a similar but less extended distribution and similar habits. Consult Jordan and Evermann, 'American Food and Game Fishes' (New York 1902).

WALL-FLOWER, a cruciferous herb (Cheiranthus cheiri) of southern Europe, where it blooms on rocky cliffs and walls. The plant itself is not handsome, having crowded, twisted, lanceolate leaves, but is cultivated for the sake of its flowers, which are large and in short, head-like, terminal racemes. The petals are four, clawed and spreading, have a velvety surface and range in color through all shades of yellow and orange to a rich mahogany brown. They are frequently variegated with these hues, and might be the 'streaked gilly-flowers, which some call nature's bastards,' scorned by Perdita, of the 'Winter's Tale.' One of their common names is 'gilly-flowers,' or wall-gilly-flowers. Wall-flowers are biennials, blooming from early spring until autumn, and are offered for sale in French and English cities during the winter. They have a strong and delicious odor of violets.

The native wall-flower of Australia is a leguminous plant (Pultenaea daphnoides). In the United States, a cruciferous plant of dry plains, with orange-yellow large flowers, is known as the western wall-flower (Erysimum daphnoides).

WALL PAINTINGS. See MURAL PAINTING.

WALL PAPER, or PAPER HANGINGS, called by the French papier peint, ornamental, decorated or colored paper affixed to the walls of houses as a substitute for the ancient tapestry hangings. The Chinese appear to have employed paper for this use from a time immemorial, and the English claim to have first introduced the practice into Europe. On the other hand, the French assert that printed paper hangings were first made at Rouen as early as 1620 or 1630 by one François, and that the art was perfected in the last quarter of the 18th century by Reveillon in Paris. It has certainly prospered more in France than in any other country; and so much taste and skill have there been developed in the manufacture, that the French papers have been sought for in preference to all others. Some of the Paris factories employed 3,000 or more workmen as early as 1750. Establishments are located in nearly all the large cities of Europe. In the United States the first wall paper factory was established in 1790 by John B. Howell at Albany, N. Y. Paper was at that time made only in sheets, and had to be joined before being printed. Color was then applied by means of a brush to form the background of the design, and the latter was subsequently printed on the paper from wooden blocks, as many blocks being used as there were colors in the pattern, each block having a part of the pattern upon it in one color. One block was printed the whole length of the paper before the next color was applied. It should be stated that this method of printing by means of blocks still prevails, but only in connection with designs which, on account of their dimensions, or through some other peculiarity, cannot readily be done by cylinder-machines that have practically supplanted block or hand work, as it is termed. The method of applying color to the background by means of a handbrush has, however, been done away with altogether. It does not appear that any other factories were established until about the year 1810, at which time a man named Bori-ken was engaged in the business. The Howell firm had meanwhile sold out their Albany business to Lemuel Steel, and, after a short experience in New York and Buffalo, in the year 1820, located at Philadelphia, Pa., where they have been established ever since, the present owners comprising the third and fourth generations engaged in the business. It was not until 1844 that any decided advance was made in the growth of the industry. About that time paper in continuous lengths came into more general use, and the necessity of joining sheets together was obviated. In that year, also, the first machine for printing wall paper was imported from England and introduced into the Howell factory. While very crude, as it printed only a single color, it had a stimulating effect on the business, inasmuch as it enabled goods to be produced at a reduced price, and increased the volume of the business. As near as can be ascertained, the entire production of wall paper in the United States at that time did not exceed $250,000. The second printing apparatus was imported from England in 1846, this one printing six colors. Machines were subsequently built in this country, at first by the machinists connected with wall paper factories, but after a time a specialty of this machine was made by William Waldron of New Brunswick, N. J. The printing machine of to-day is unquestionably a great improvement on that originally
WALL OF SEVERUS—WALL-TREES

imported into this country, although the principle of its operation is practically the same. It is designed to print and register the colors used in all the graphic and cloth-printing machines, with a large central drum or cylinder. The paper passes over the cylinder, the pattern being printed on it by means of rollers on which the design has been placed, each roller representing one of the colors used in the design. These rollers are registered so accurately that the paper, in passing over the rotating cylinder, receives impressions in correct position from each of the surrounding rollers. The paper is hung up by an automatic process as it leaves the machine, and passes into drying-racks which are usually several hundred feet in length, after which it is rolled up in lengths of 8 to 16 yards, and is ready for market.

While the printing-machine is the most prominent mechanism of the business, yet other factors have contributed largely to the progress made by this industry. Among them are the grounding-machines, which furnish the background color to the paper; the bronzing-machines, which apply bronze powders to certain of the surfaces; the embossing-machines, which give various textures to the goods after they have been printed; the pressing-machines, which are used to emboss the design in relief; the contrivance that is used to hang up the paper after it leaves the printing-machine; and a host of similar devices that enable the manufacturer to produce novel effects and manufacture the goods more rapidly than before, and at a lessened expense. It is these contrivances that have led to the tremendous progress achieved by this industry in the last 60 years, and more particularly within the last 30 years (the pace having been accelerated each year), so that the United States has long been independent of foreign manufacturers. The most notable machine improvements follow: (1) Soon after the introduction of the printing machine one McKernan invented a contrivance for festooning the paper automatically as it leaves the printing-machine and passes on to the drying-racks. This was undoubtedly a large stride in the process of making wall paper, as much as the speed of the printing-machine could be increased to the full capacity of the drying-racks connected with it. (2) The single (or continuous) process of making wall paper was introduced about the year 1820. Formerly the ground color had to be applied by one machine, after which the paper was dried and rolled up and passed next through the printing-machine to receive the impressions of the design thereon. In the continuous process the paper passes through the machine in which applying a ground color for the design, and then passes through a drying apparatus that is termed a "hothouse," or into drying-racks, and then automatically passes into the printing-machines which applies the colors of the design, saving a double handling of the goods and involving less waste. (3) The method of applying bronze powders to wall paper automatically was introduced about the year 1872, although, as it was conducted in secret for some time by one or two individuals, it may have been made at an earlier date. This method reduced the cost of making bronze (otherwise termed gold) papers, and led to an increased demand and output for them. (4) The next discovery was the application to wall paper of bronze powders in a suspension, similar to ink, or with an adhesive material (made from potato-starch) of sufficient density to keep the bronze powders in solution without impairing their lustre. This was first placed upon the market about 1882, and as the new process enabled the use of as many different shades of bronze as there were colors in the design, the opportunity was afforded for producing many new and brilliant effects, and for superseding in a large measure bronze or gold goods made by the former method. While the mechanical part of the business has made vast strides, there is yet another feature that outranks it in importance, and that is the artistic element. The American people have a constant craving for something new, and the manufacturer is taxed to the full extent of his powers to satisfy this demand. On no industry does this demand fall more heavily than on wall paper manufacture, and by no occupation has the demand been more fully satisfied.

WALL OF SEVERUS. See HADRIAN'S WALL.

In recent years these corners have been discouraged, as tending to precipitate a general panic.

WALL-TILES. See TILES.

WALL-TREES, fruit-trees trained on walls for better exposure of the fruit to sunshine, and for sake of the heat radiated from the wall. Brick walls are preferred; and have a great advantage in the regularity with which the nailing can be accomplished; but trees are often trained on stone walls also, and sometimes on the walls of houses. Trees are trained on walls in hot houses as well as in the open air. Fluted walls are often used, the fruit being thus partially forced by artificial heat; and screens of various kinds, as of reeds, canvas and oiled paper, are sometimes employed to protect blossoms in spring. Woolen nets also are made and used for this purpose, and a net even with wide meshes affords much protection from spring frosts. Wall-trees intended to occupy the wall permanently are generally trained in the nursery with a dwarf stem only five or six inches in length, so that the branches may cover the whole wall, and no available part of it be lost. It is usual, however, in planting to introduce riders alternately with the permanent wall-tree; the riders are grafted or budded on tall stocks, and occupy part of the wall till the wall-trees have become large enough to require it all. The chief modes of training wall-trees are known as fan training and horizontal training. In fan training the
branches are arranged like the spokes of a fan; in horizontal training a main stem is led up, from which they are spread out horizontally on both sides. Different kinds of trees, and the art of the gardener is shown in keeping to his plan of training and laying in branches, so as to fill the space and make every part of the wall productive. There is a Dutch mode of training, which consists in leading up two chief branches horizontally for different kinds of trees, and the art of the gardener is shown in keeping to his plan of training and laying in branches, so as to fill the space and make every part of the wall productive. There is a Dutch mode of training, which consists in leading up two chief branches horizontally for

WALLA WALLA, wól'a wól'a (* Rushing water*), a tribe of the Shaiaptian stock of North American Indians, formerly occupying the country about the lower Walla Walla River, and along the east bank of the Columbia River from the Snake nearly to the Umatilla, in Washington and Oregon. Their language resembles that of the Nez Perces. By treaty of 1855 they were assigned to the Umatilla reservation in Oregon, where they numbered about 400 in 1917. See SHAHAPTIAN.

WALLA WALLA, Wash., city, county-seat of Walla Walla County, on the Walla Walla River, 28 miles east of the Columbia River, and on branch lines of the Northern Pacific and the Union Pacific railroads, close to the Oregon line, 150 miles southwest of Spokane. A United States fort was established near the site of the city in 1857; and around this fort grew up a trading post and settlement; it was first called Steptoeville, but the town was incorporated in 1859 the name of Walla Walla was adopted. It was incorporated as a city in 1862 and received a second charter in 1884. The city is situated about 15 miles west of the Mountain range, at an altitude of 1,060 feet; it is bordering by the beautiful and fertile Walla Walla Valley, over 100 miles in length, forming a part of the Inland Empire between the Rocky and Cascade ranges, and consisting of a belt of agricultural land, the larger part under cultivation, which yields large crops of wheat, oats and barley, as well as alfalfa, vegetables and fruits. The dairy interests are large. In this valley the city of Walla Walla is the centre of trade. It contains an extensive plant for the manufacture of farm machinery and implements, gas and electric power works, two flourishing mills and lumber mills; and has five banks, of which two are national banks. Among its notable public institutions are the United States Land Office, United States District Court, an Odd Fellows' home for the State of Washington, the Stubblefield home for indigent widows and orphans, with $135,000 of perpetual endowment, and two homes for the aged. Fort Walla Walla joins the city on the west, and six miles to the north the monument to the memory of the martyred pioneer and patriot, Marcus Whitman. Walla Walla is also of importance as an educational centre; it has a public library and an excellent system of public schools, including a large high school, and is the seat of the Whitman College, a Roman Catholic seminary for girls and an academy for boys, and the Saint Paul's seminary for girls (Protestant Episcopal), while Walla Walla College is located two miles outside the city near the fort. There is a handsome Catholic church, a commodious Y. M. C. A. building. The city has an excellent supply of pure water from mountain streams, and a first-class system of waterworks owned and operated by the municipality. The government is vested in a mayor, elected annually, and a council of seven; the city officials are mostly elected by popular vote. There are two daily and several weekly newspapers. Pop. 24,200. Consult Lyman, 'History of Walla Walla County' (1901).

WALLABOUT BAY, a small arm of the East River, extending into Long Island at Brooklyn, opposite the southeast corner of Manhattan Island. It is separated from the river by an island, which, with the land bordering the bay, belongs to the United States, and is the site of the Brooklyn navy yard. During the Revolution the British prison-ships were stationed in Wallabout Bay.

WALLABY, a native name applied to various small kangaroos (q.v.), especially those called brush-kangaroos, which frequent dense scrub-jungle and have great leaping powers. One of the largest species is the red-necked (Macropus ruficollis), which is 40 inches or more long, with a tail 30 inches in length; it is South Australian, and is represented in Tasmania by the smaller Bennett's wallaby. Several other species occur in Australia and Borneo, one of which (M. thésitis) is very common and known to the colonists as pademelon (q.v.).

WALLACE, wól'as, Alfred Russel, English naturalist and philosopher; b. Uisk, Monmouthshire, 3 Jan. 1823; d. 7 Nov. 1913. He was educated at Hertford Grammar School, and afterward articled to a land surveyor and architect. Later when resident at Leicester as English master at the collegiate school he made the acquaintance of Herbert Spencer, by himself an enthusiastic entomologist, and in April 1848 the two sailed from Liverpool on a journey to the Amazon Valley, which marks an epoch in scientific travel. They ascended the Tocantins in August 1848, and in the following year ascended the Amazon. In March 1850 they separated. Wallace taking the basin of the Rio Negro for his ground and Bates that of the Solimoens or upper Amazon. Wallace returned to England in 1852, and in 1853 published 'A Narrative of Travels on the Amazon and Rio Negro.' Another result of this journey was a small work on 'Palm-trees of the Amazon and their Uses' (1853). Of still greater importance to the progress of modern biological geography and philosophy was his eight years' residence (1854-62) in the island of the Malay Archipelago, because it led him to the formulation of his theory of natural selection, and produced that scientific classic, 'The Malay Archipelago, the Land of the Orang-Utan and the Bearded Paradise. A Narrative of Travel, with Studies of Man and Nature' (1867). His natural selection theory
was contained in a paper 'On the Tendency of Varieties to Depart Indefinitely from the Original Type,' which he sent to Mr. Darwin in 1858, and on 4 July of that year it was read at a meeting of the Linnean Society with a statement of the practically identical theory which Darwin had been elaborating independently for many years. His work in Malaysia is fittingly commemorated by the application of his name to the imaginary line (Wallace's Line) between Bali and Lombok, which, as he showed, marked the boundary between an Asiatic and an Australian fauna in the archipelago. In 1870 he published 'Contributions to the Theory of Natural Selection,' and in 1876 issued the first thoroughly scientific treatise on zoogeography, 'The Geographical Distribution of Animals, with a Study of the Relations of Living and Extinct Faunas as elucidating the Past Changes of the Earth's Surface.' This subject was further developed in the more popular work, 'Island Life, or the Phenomena and Causes of Insular Faunas and Floras, including a Revision and attempted Solution of the Problem of Geographical Climatic Zones' (1880). 'Tropical Nature and other Essays' (1878) contains suggestive papers on sexual selection, color in nature and similar subjects, and was reissued, with modifications and additions, in one volume with 'Contributions to the Theory of Natural Selection' in 1891. In 'Darwinism: an Exposition of the Theory of Natural Selection, with some of its Applications' (1889), he gives a final and masterly statement of the theory of organic evolution as he conceives it, with abundant illustrations from his first-hand knowledge of the facts. He stands by pure Darwinism, refusing to admit the additional elements, such as sexual selection, which Darwin himself adopted in his later works. He refuses to extend evolution to the development of mind, and he adopts Weismann's views on heredity. In short, he holds by organic evolution only in so far as it is consistent with or required by a spiritual interpretation of man and nature. His position was, therefore, very much higher than that of Darwin, and went far to remove the barriers between materialism and religion.

Wallace's work was by no means confined to natural history. In 1866 he issued a work on 'The Scientific Aspects of the Supernatural', and in 1875 gave in 'Miracles and Modern Spiritualism', a full statement of his spiritualistic faith. He issued in 1885 a pamphlet entitled 'Fifty-five Years of Registration Statistics, proving Vaccination to be both Useless and Dangerous.' He gave evidence before the recent Royal Commission on the subject, and in 1898 published 'Vaccination a Delusion, its Penal Enforcement a Crime,' in which he endeavored to prove that the majority report of the commission is opposed to the best evidence laid before it. In 'Land Nationalization: its Necessity and its Aims' (1882) he compares the landlord-and-tenant system of land tenure with an occupying tenancy under the state, and shows how a nationalization society, of which he is president, has been formed to disseminate the principles of his book. 'Bad Times: an Essay on the Present Depression of Trade' (1885) is another contribution to this volume. 'Australasia' (1879) in Stanford's 'Compendium of Geography and Travel,' and to the new issue contributed the first two volumes on Australasia, dealing with Australia and New Zealand (1884). These works are 'The Wonderful Century: its Successes and its Failures,' a review of the 19th century (1898); 'Studies, Scientific and Social' (1901); 'Man's Place in the Universe' (1903); 'My Life' (1905); 'Is the Earth Habitable?' (1907); 'World of Life' (1911); 'Social Environment and Social Progress' (1913); and 'The Revolt of Democracy' (1914). He was awarded the Royal Medal of the Royal Society in 1885, the Gold Medal of the Société de Géographie in 1870, the Darwin Medal of the Royal Society in 1890, the Founder's Medal of the Royal Geographical Society and the Gold Medal of the Linnean Society in 1892. Consult Marchant, James, 'Alfred Russel Wallace: Letters and Reminiscences' (London 1916).

WALLACE, Charles William, American teacher of English dramatic literature; b. Hopkins, Mo., 6 Feb. 1865. He was educated at the Western Normal College, the University of Nebraska, where he took his degree in 1888, the University of Chicago, the University of Heidelberg, and took his A.M. and Ph.D. at Heidelberg (1906). He was early known for his Shakespearean studies and (1904-09) did special research work on Shakespeare and the Tudor-Stuart drama in 'European Archives' which he continued on behalf of the University of Nebraska (1909-16). His publications include 'Lyrics for Leisure Moments' (1892); 'The Children of the Chapel at Blackfriars, 1597-1603' (1908); 'Three London Theatres of Shakespeare's Time' (1909); and 'Shakespeare and his London Associates' (1910); 'The Evolution of the English Drama up to Shakespeare' (1912); 'The First London Theatre' (1913).

WALLACE, Sir Donald Mackenzie, English writer; b. 11 Nov. 1841; d. Lymington, 10 Jan. 1919. He was educated at the universities of Edinburgh, Berlin and Heidelberg, and at the Ecole de Droit, Paris. He was private secretary to the viceroy of India in 1884-89, attended the tsar's visit during his tour in India and Ceylon in 1890-91, was director of the foreign department, Le Temps, in 1891-99. He published 'Russia' (1877; new ed., 1905, 1912); 'Egypt and the Egyptian Question' (1883); 'The Web of Empire' (1902), etc.

WALLACE, Henry, American agricultural writer and leader; b. near West Newton, Pa., 19 March 1856; d. Des Moines, 22 Feb. 1916. He was of Scotch-Irish extraction. The first 20 years of his life were spent on his father's farm, in Westmoreland County, Pa. In 1876 he pursued a preparatory course in Geneva Hall, Logan County, Ohio, and, the following year entered the junior class of Jefferson College, Washington, Pa., whence he graduated in 1859. After teaching a year in Columbia College, Kentucky he entered Allegheny Theological Seminary, Allegheny, Pa. Subsequently he continued his theological studies in the United Presbyterians Seminary at Monmouth, Ill. His active service in the ministry was begun in 1863, as pastor of the United Presbyterian congregations of St. Joseph, Independence, and Davenport, Iowa, and was married the same year to Miss Nannie Cantwell, of Mansfield, Ohio. In 1871 he assumed the pastorate of
the United Presbyterian Church at Morning
Sun, Iowa, which he filled until 1876. In 1877, because of failing health, he retired from the
ministry and settled on a farm at Winterset,
Iowa. Within a year he was editing a farm
page on a local paper. In 1879 he bought an
interest in the Winterset Chronicle. In 1883
he became editor of the Iowa Homestead.
In 1895, with his two sons, he founded Wallace's
Farmer at Des Moines, Iowa, of which he re-
mained in editorial control during the rest of
his life. Although this paper was primarily
established as an exponent of Iowa agricul-
tural interests, where it wielded a powerful in-
fluence, it soon had a circulation which ex-
tended far beyond the bounds of that State.
Mr. Wallace was appointed by President Roose-
velt as a member of the Country Life Com-
mision in 1908, and gave his whole time to the
work of that commission for four months.
Incidental to his editorial work, he wrote sev-
eral books which were of practical value, named:
'The How to Make Good Dirt Roads,' 'The Skimmilk Caf,' 'Trusts
And How to Control Them,' and 'Uncle
Henry's Talks with a Farm Boy,' of which the
last mentioned was perhaps the most widely cir-
culated and read. In 1910 he was president of the
National Congress for Women. In 1911 he
was selected as national chairman of the
Men and Religion Movement. In 1913 he was
appointed by Governor Clarke, of Iowa, with
former Secretary of Agriculture James Wilson,
to investigate agricultural conditions in Great
Britain. His death occurred 22 Feb. 1916 in the
First Methodist Episcopal Church of Des
Moines, at a meeting of the Interdenomina-
tional Laymen's Missionary Convention, of
which he was chairman.

WALLACE, Horace Binney, American
Paris, France, 16 Dec. 1856. He was gradu-
ated at Princeton (1833); studied medicine,
chemistry and law but never adopted a profes-
sion and devoted himself to literary pursuits.
He traveled in Europe (1849–52). A mental
disease impelled him to suicide. He was the
author of 'Stanley, or the Recollections of a
Man of the World' (Philadelphia 1838); aided
Griswold in preparing 'Napoleon and the Mar-
shals' (2 vols. 1847); wrote 'Art, Scenery and Philosophy in Europe'
(1855); and, with J. S. Clarke Hare, edited
'American Leading Cases in Law' (2 vols.,
1847); 'Smith's Leading Cases' (2 vols., 1852); and
White and Tudor's 'Leading Cases in
Equity' (2 vols., 1852).

WALLACE, John Findley, American
1832. He was educated at Monmouth College
and the University of Wooster, and in 1869–70
was engaged in railway service. In 1871 he
became assistant engineer of the United States
Engineers, and was appointed county surveyor
and city engineer in 1878. He has been engaged
as chief engineer and superintendent on vari-
sous railroads since 1879, and in 1891 entered
the Illinois Central Railroad, becoming
general manager of the Illinois Central system
in 1902. In 1904 he was appointed chief engi-
eer in charge of building the Panama Canal.
On 29 March 1905 he with the other members
of the commission resigned, was reappointed
on 3 April, but again resigned 24 June 1905.
From 1906 he has been prominently identified
with important corporation work.

WALLACE, Lewis (better known as
'Lew*), American soldier and author: b. Brook-
ville, Franklin County, Ind., 10 April 1827; d.
Crawfordsville, Ind., 15 Feb. 1905. He studied
law; at the beginning of the Civil War he en-
listed as second lieutenant in the First Indiana
Infantry; in 1848 began professional practice,
which he carried on at Covington, Ind., and
Crawfordsville, Ind., and for four years was in
the State Senate. At the outbreak of the Civil
War he was appointed adjutant-general of
Indiana and soon afterward colonel of the
11th Indiana Volunteers; on 3 Sept. 1861 was
made a brigadier-general of volunteers; and
for ability displayed in leading a division at
Fort Donelson (q.v.) was made major-general
of volunteers 21 March 1862. He participated in
the second day's fight at Shiloh, and in the
advance on Corinth; was president of the court of inquiry regarding Don Carlos Buell (Novem-
ber 1862); in 1863 prepared military defences and later was made commander of the Eighth army corps, with headquarters at Balti-
more. At the battle of the Monacacy (9 July
1864) he was defeated, but detained the enemy
until Wright, with reinforcements, could reach Washington before Early. In 1863 he resumed
law practice; in 1878–81 was governor of New
Mexico, and in 1881–85 was Minister to Turkey.
His fame as a writer rests principally upon
'Ben Hur,' a tale of the time of Christ, to which he devoted some seven years. It was
immensely popular. Though his syntax was not
always of the best, Wallace had a most charm-
ing and unique method of enthusing and hold-
ning the reader. The book sold into the hun-
dreds of thousands and has become a standard
classic. He also wrote a 'Life' of Benjamin
Harrison (1888); and 'The Prince of India'
(1893). See Ben Hur.

WALLACE, Sir Richard, British art col-
lector: b. 1818; d. 1880. He is reputed to have
been a natural son of Maria, Marchioness of
Hertford, wife of the 3d marquis, but during
his lifetime he was supposed to have been the
son of the 4th marquis, who was but 18 years
his senior. However, it was under the auspices
of Maria that he was educated at Paris, where he
collected many fine objets d'art, selling these
in 1857 at considerable gain. After this, he
devoted himself to assisting the 4th marquis in
making elaborate art collections. On the death
of the Marquis of Hertford in 1870, Wallace in-
herited his unencumbered property, and thefortune of that lord which included Hertford
House, London, a Paris residence, Irish estates at Lis-
burn and splendid art treasures. During the
siege of Paris (1871) Sir Wallace distinguished
himself by his philanthropic services to the
city, equipping several ambulances, and found-
ing the Hertford British Hospital for the relief
of the sufferers. In recognition of his services,
he was created a baronet (1871). He sat in
Parliament for Lisburn from 1873–85. He was
one of the British commissioners at the Paris
Exposition in 1878; a trustee of the National
Gallery of London, and also of Ireland. He
was made Knight Commander of the Bath and
Commander of the Legion of Honor. On the
death of his wife, the Hertford-Wallace
collection was left to the English nation, which secured Hertford House as its repository.

**WALLACE**, Sir William, Scottish patriot and hero: b. probably Elderslie, Renfrewshire, about 1272; d. London, 24 Aug. 1305. Owing to the want of contemporary Scottish records, the real facts regarding his life and achievements remain in much obscurity, many incidents resting solely on the authority of Blind Harry, who wrote about 200 years later, and can hardly be regarded as a serious historian. Wallace is represented as having been for some years engaged in a partisan war against the English before what is represented by Blind Harry as the turning-point in his career took place, the burning of the town of Lanark and the murder of Hezelrig, the sheriff. This incident is ascribed to May 1297. Soon afterward he attacked Ormesby, the justiciar, while holding a court of justice at Scone, and Bek, bishop of Durham, at Glasgow, whom he put to flight. Among the followers of Wallace about this time was William of Douglas, the representative of a great Border family, which subsequently contributed invaluable aid to the war of independence. Sir Henry Percy and Sir Henry Clifford were sent to repress the Scottish rising. Wallace took most of the northern fortresses, and was besieging the Castle of Dundee, when he heard that the enemy was advancing upon Stirling. He took up a position encompassed by a loop of the Firth in front of the Abbey Craig, a hill near the Abbey of Cambuskenneth. Surrey determined to attack him, and the English crossed the Firth on a manual bridge from early morning till near noon, while the Scots were drawn up as spectators of their passage on the hill (11 Sept. 1297). When Wallace deemed the enemy sufficiently divided he attacked those who had crossed with his whole force, sending at the same time a detachment to secure and hold the head of the bridge. The victory was complete. Cressingham was killed and Surrey fled to Berwick. After this Wallace appears with the title of guardian of the kingdom, which was temporarily cleared of the English, and is found conducting an invasion, or series of organized raids, into England. In 1298 Edward entered Scotland with an army estimated at 7,000 men-at-arms and 80,000 footmen. Wallace retired before him, wasting the country, but was at length overtaken at Falkirk in a position where he was compelled to fight. He drew up his army on an inclined plain with his horsemen, about 1,000, in the rear (22 July 1298). The footmen were arranged in circles, the bowmen in the centre, and the spearmen in the front rank kneeling. In this order they resisted for a time the attacks of the English men-at-arms, but the circles were gradually broken and the army routed. After this Wallace for a time disappears from the scene. The council of regency which succeeded him carried on the war for some time with spirit; but on 9 Feb. 1304 they and their followers were admitted to King Edward’s peace. Wallace was excepted by name. He was then in the country, and was made to secure his apprehension. It was effected through Sir John de Menteith, governor of Dumbarton Castle. He was conveyed to London, through which he was carried on 22 Aug. 1305. He was put on trial at Westminster before a special commission, and was executed for treason and rebellion, though he had never recognized Edward, and the latter explicitly claimed dominion over Scotland as a conqueror only. He appears in literature in Porter’s “Scottish Chiefs” (1822), and Buchanan’s “Wallace: A Tragedy” (1856). Besides the histories of Scotland and others relating to the period consult the biographies by Carrick (3d ed., 1840); Tyler (2d ed., 1845); Moir (1886), and Muirson (1889); the edition of Blind Harry by Jamieson (1842); and Stevenson, “Wallace Papers” (1842).

**WALLACE, William**, American manufacturer: b. England, 1825; d. Washington, 20 May 1904. Early in life he came to the United States with his father and established the firm of Wallace and Sons at Antonio, Conn., which soon became one of the leading manufacturers of copper and brass alloys in the United States. Becoming associated with Moses G. Farmer (q.v.), they began the manufacture of a compound telegraph wire, consisting of a steel core and an electrolytically coppered covering, having conductivity and strength, combined with lightness. In 1876, at the Centennial Exhibition, he brought out the Farmer-Wallace dynamo machine, with which the buildings were successfully lighted, being the earliest general electric lighting in this country. A year or two later he devised a plate arc lamp for use with this machine, by means of which a number of arc lights could be placed in series on the circuit, thus originating the series method of lighting. For several years before his death he was engaged in scientific investigations, especially in work with the microscope.

**WALLACE, William Harvey Lamb**, American soldier: b. Urbana, Ohio, 8 July 1821; d. Savannah, Tenn., 10 April 1862. He removed with his father to Illinois in 1833, studied law and in 1846 was admitted to the bar. At the outbreak of the Mexican War he enlisted as a private, later becoming adjutant, and served at Buena Vista and in other operations until the end of the war, when he returned to his law practice. He became district attorney in 1853 and in 1861 he was appointed colonel of volunteers in the Union army. He commanded a brigade at Fort Donelson, February 1862, was promoted brigadier in the battle of Shiloh commanded Smith’s old division. The brigade withstood an assault of six hours and was last to leave the field, Wallace falling, mortally wounded.

**WALLACE, William Vincent**, Irish musical composer: b. Waterford, July 1939; d. Château de Bagen, in the Pyrenees, France, 12 Oct. 1865. He gave evidence of great musical ability, became a skilful player on several instruments and in 1829 was organist in St. Thurlers Cathedral. His enthusiasm was stimulated by hearing Paganini play in 1831 and in 1834 he played a violin concerto composed by himself. He went to Australia in 1835 and worked at sheep-farming, but soon returned to music and traveled to New Zealand, where he had a romantic escape from assassination by the Maoris. His later travels proved very profitable from a financial point of view. He returned to London in 1845 and toward the end of that year his popular opera of ‘Maritana’ was produced at Drury Lane with great success. ‘Matilda of Hungary’ (1847)
was damaged by an exceedingly bad libretto. After a voyage to America he again settled in England, where he found 'Maritana,' a better work than 'Maritana,' was produced with even greater success at Covent Garden. Other operas were the 'Amber Witch' (1861); 'Love's Triumph' (1862); 'The Desert Flower' (1863); and 'Estrella,' the last left unfinished at his death.

WALLACE, Idaho, city and county-seat of Shoshone County on the Northern Pacific and the Oregon-Washington railroads, 130 miles east of Spokane. It is the centre of the Cœur d'Alène district. In 1892 it was incorporated. Pop. about 3,000.

WALLACELBURG, Canada, town in the province of Ontario, Kent County on the Pierre Marquette, Grand Trunk and Canadian Pacific railways and on the Sydenham River, 17 miles northwest of Chatham. It has flax, glass and lumber manufacturing interests. Pop. about 8,000.

WALLACE'S LINE, an imaginary line, so called in compliment to Alfred Russel Wallace (q.v.), separating the Oriental from the Australian faunas. It passes between the Sulu and Philippine Islands, along the Straits of Macassar and between Lombok and Java. The fauna west of this line is strikingly different from that east of it, although the opposite shores of dividing waters are sometimes only a few miles apart. See Zoography.

WALLACHIA, wô-lăk'kî-ə, southern Europe, a former principality, united with Moldavia in 1861 to form the kingdom of Rumania. See RUMANIA.

WALLACK, wôl'æk, James William, American actor; b. London, 24 Aug. 1795; d. New York, 25 Dec. 1864. He made his first appearance on the stage when a child. In 1812 he began his permanent career, playing as Laertes in 'Hamlet' at Drury Lane. He made his first visit to the United States in 1818 and subsequently for 20 years lived alternately in England and in the United States, playing at different times in all the principal cities of the Union. In 1820 he became stage manager at Drury Lane and in 1827 opened the National Theatre in New York. This was destroyed by fire in 1839 and in 1832 he opened Wallack's Lyceum, rebuilt as Wallack's Theatre in 1861. His career as actor and manager was uniformly successful and in the presentation of comedy he had few equals. As a manager he was greatly aided by his knowledge of stage effects and his artistic adaptation of scenery and costumes. Consult Wallack, Lester, 'Memories of Fifty Years' (1889).

WALLACK, John Lester, American actor, son of James William Wallack (q.v.); b. New York City, 30 Dec. 1820; d. Harvard, Conn., 6 Nov. 1888. He made his debut as an actor in New York in 1847, succeeded his father as manager of Wallack's Theatre, New York, in 1864 and conducted it with great success. He adapted several French comedies to the American stage, and in 1888 retired after having been identified with the American stage as actor and manager for 40 years. He wrote 'Memories of Fifty Years' (1889). Consult Mackay and WinGate, 'Famous American Actors of To-day' (1896).

WALLAS, Graham, English author; b. Sunderland, 31 May 1858. He was educated at Corpus Christi College, Oxford (1877–81), a classical schoolmaster (1881–90), university extension lecturer (since 1890), lecturer London School of Economics (since 1895), professor in political science, London University (1914), member of Royal Commission on Civil Service (1912–15), Lowell lecturer, Boston (1914). He is the author of one of the 'Fabian Essays' (1889); 'Life of Francis Place' (1887); 'Human Nature in Politics' (1908); 'The Great Society' (1914), etc.

WALLASEY, wôl'së, England, an industrial town suburb to Liverpool, Cheshire, two miles northwest of Birkenhead, near the seaward extremity of the Wirral peninsula, protected by the notable Wallasey embankment. The town was destroyed by fire in 1837 and rebuilt. It has a 16th century reorganized grammar school and is noted for its municipal ownership of public utilities, water, gas, electric-lighting, street railways, baths, cottage hospital, etc.

WALLENSTEIN, vá-len'stən or wôl'ên-stîn (or more recently WALLENSTEIN), Albrecht Wenzel Eusebius Von, Duke of Friedland and Mecklenburg, and Prince of Sagan, German soldier; b. Hermanic, Bohemia, 15 Sept. 1583; d. Eger, Bohemia, 25 Feb. 1634. He studied under the Jesuits at Olmütz and after accepting the Catholic faith finished his studies at the universities of Altdorf, Bologna and Padua. In 1617, on assisting the Archduke Ferdinand in the latter's war against Venice, he was raised to the rank of count and made a colonel. When Bohemia revolted, he raised a regiment of cuirassiers for the emperor and fought against Thurn and Bethlen Gabor. When the estates of the vanquished Bohemians were confiscated in 1620 and sold to imperial adherents at nominal prices, he purchased extensive tracts, including the domains of Friedland and Mecklenburg. In 1623 he was made Duke of Friedland and in 1624 his collective estates were elevated to a principality. He now applied himself to the care of these dominions. When the emperor was involved in a war with France, Wallenstein returned to Hungary to join Bethlen Gabor, he followed and brought Bethlen to conclude a truce. In the campaign of 1627 he conquered Silesia, drove the Danish king out of Germany and forced his way into northern Jutland, bought from the emperor the dukedom of Sagan at a price in which his military expenses were reckoned. The estates of Mecklenburg having been forfeited in the war, he was invested with them, first as security for his debts, and then as a regular fief in 1629. The attempt to take Stralsund was wholly unsuccessful (1628). In 1630, owing to the jealousy of the nobles, Wallenstein was deprived of his command.

When Gustavus Adolphus invaded Germany,
WALLENSTEIN

Wallenstein attempted to negotiate with him on his own account, but the distrust of the Swedish hero frustrating his intentions, he listened to the earnest entreaties of the emperor and again took the field, having procured a formal capitulation securing to himself almost absolute power. After some partial successes he encountered the king of Sweden at Lützen, 16 Nov. 1632, in which battle Wallenstein was defeated and Gustavus killed. After the death of the Swedish king he had reopened negotiations with the enemies of the emperor, by whose assistance he hoped to place himself at the head of affairs in Germany. The matter proceeded slowly as his offers were received with much distrust, especially by the German princes; he resumed hostilities to make his value felt, then reopened negotiations. His proceedings were known at the court of Vienna; but he was at the head of an army largely consisting of foreigners, many of whose leaders were personally pledged to him alone. The emperor was not strong enough to remove him and was base enough to have recourse to assassination. On 24 Jan. 1634 he signed a secret pact with the command of the army of Count Gallas, who was instructed to arrest Wallenstein and his associates and throw them into prison. On 18 February an open proclamation was made commanding the army to obey only Count Gallas; but Piccolomini and others named. Wallenstein left Pilsen with some of his confidential associates on the 23d to take refuge in the fortress of Eger, which he reached on the 24th. Here he was assassinated on the evening of the 27th. The plenipotentiary of Saxony and Brandenburg had reached Zwicau and the plenipotentiary of France Frankfort, on their way to Wallenstein's headquarters, when they received word of his death. The emperor openly rewarded the assassins, among whom were two Scotchmen and two Irishmen, Gordon, Leslie, Butler and Devereux. Wallenstein's overtures to the enemies of the empire have been represented by his partisans as "mises de guerre." A serious controversy has been waged over the matter. As an organizer and leader of armies he must be ranked among the great commanders. In a time of excessive confusion he maintained a statesmanlike control of difficult affairs. His career was made the basis of Schiller's trilogy of Wallenstein. Consult the lives by Förster (1834); von Ranke (5th ed., 1895); Arctin (1846); Hurter (1855); Förster's ed. of the "Briele Wallensteins" (1828-29); Schebek, "Die Lösung der Wallensteinfrage" (1881); Bilck, "Beiträge zur Geschichte Wallensteins" (1886); Schulz, "Wallenstein und die Zeit des Dreissigjährigen Krieges" (1898). See Thirty Years' War.

WALLENSTEIN.

This work of Schiller is one of the most original in 10 acts artificially so divided that the first part, called the "Piccolomini," with the introductory poem called "The Camp," is about as long as the second part called "The Death of Wallenstein." It is often wrongly called the tragedy, but it is strictly right to speak of a "Piccolomini" tragedy. Its central theme is the revolt of the imperial general-in-chief against Kaiser Ferdinand II which led to the defection of his troops and his assassination on the night of 28 Feb. 1634. The tragedy was the outgrowth of studies for Schiller's "History of the Thirty Years' War," the first part of which appeared in 1791, but the mass of historical detail was so enormous that it was not completed till 12 Oct. 1798, after two years of intensive work. It is the first, perhaps the greatest, work of the master of German literature, whose study of aesthetic principles and the philosophy of Kant, of Shakespeare's dramas, of which he translated Macbeth, along with the counsel of his new friend Goethe, made him realize in his eminently public-spirited work that strict objectivity is the fundamental law of the highest art. He no longer identifies himself with his favorite character and the hero becomes a stern, though intensely human, inordinately ambitious character of the Napoleonic type, yet lacking the Cossian's impetuous initiative.

Although Schiller was not a scientific historian he divined the nature of the real Wallenstein in spite of prejudiced and defective sources. The general who had conquered Protestant Germany and laid it prostrate at the feet of the Kaiser, only to be supinely dismissed by his weak master, has been recalled from private life to save his Ferdinand's throne from the successful Swedes. He is beaten at Lützen by Gustavus Adolphus, who loses his life. Retiring to Bohemia he wastes valuable time in negotiations pointing to the end of the war, until the emperor, alarmed at the capture of Regensburg, orders and implores his stubborn, perhaps already disloyal, general to drive back the enemy. It is winter and Wallenstein refuses. He summons his generals, who pledge him their support, which action is misrepresented by Vienna. Secret orders relieving them of their obedience are sent to Octavio Piccolomini and amid the general defection Wallenstein flees to Eger, where he is assassinated.

Wallenstein was a realist without faith in the noble side of human nature. For him every man has a price. Originally faithful to the kaiser, he learns to despise him after the disgrace of his dismissal and transfers his allegiance, as Schiller makes it, to an ideal of Germany; but his enemies claimed he sought the crown of Bohemia. His dictator's power and his negotiations with the Protestant states caused him to toy with the idea of treason but he lacked the resolution to cross his Rubicon and vacillate. This Schiller has finely delineated in Wallenstein's devotion to astrology and his waiting for the right conjunction of the stars. He underestimates the power of the ideal to which Schiller gave concrete expression in his creation of the roles of the lovers, Max Piccolomini and the general's daughter, Thelka, neither of whom ever existed. In a certain sense the ideality of these two pure souls destroys Wallenstein at the critical moment when it is thinkable that Max's example would have saved the general. Some have condemned the Max and Thelka scenes, but unjustly, for they represent a part of the moral force by which even the elder Piccolomini was undoubtedly animated even though he too is urged on by his desire for glory and loyalty to his trusting friend, strongly suggestive of Judas Iscariot. However, it would be wrong to regard Piccolomini merely as a stage villain. He is the living representative of the opposition, of those forces which are concretely expressed by Kaiser Ferdinand, his ministers and
the imperial state. Another remarkable creation of Schiller's is the Gräfin Terzky, whose admiration for her brother-in-law is more nearly love and whose intrigues as a sort of female Mephistopheles or Lady Macbeth reveal the amoral and rational side of Wallenstein's character as in a mirror.

The success of the drama was immediate and sustained and the more so because it afforded so many parallels with the rising career of Napoleon through the efforts of his Minister, and its intention of Schiller's. The rimed, corduroyroad\textsuperscript{2} verse of the "Camp\textsuperscript{2}" is followed up by the blank verse of the drama proper, the diction of which is differentiated only in accordance with character, never with mental equipment, as was the classical principle and the stern, forbidding, supposedly taciturn hero displays at times a volubility, which is, to say the least, unexpected. And so it is with all the principal characters, whose speeches are expected to reveal all of what they think and which many keep silent.

There are many English translations of Wallenstein, the most celebrated being by Samuel Taylor Coleridge.

CARL E. EGGERT.

WALLER, wölf'er, Edmund, English poet: b. Coleashill, Hertfordshire (now in Buckinghamshire), 3 March 1606; d. Beaconsfield, 21 Oct. 1687. He was educated at Eton and King's College, Cambridge, and was returned a member of Parliament for Amersham before he was 18. In 1625 he was returned for Chipping Wycombe and he sat for other places in several Parliaments, including the Long Parliament. On the death of his wife in 1634 he courted Lady Dorothea Sydney, whom he celebrated in his verses under the name of 'Sacharissa,' and Lady Sophia Murray, whom he distinguished by the name of 'Aromet,' both without success. In Parliament he at first opposed the court party, but retained his place in the Long Parliament and openly expressed his royalist sentiments after the Civil War began. He was sent as a commissioner from Parliament to the king after Edgehill and soon after this occurred the incident called Waller's plot. Its nature is not clearly understood, though Waller was an object of suspicion of all he knew, including the names of his confederates, some of whom, his near relatives, were put to death. This event in his life is introduced in Beatrice Marshall's story "An Old London Nosegay" (1904). He was imprisoned one year, fined £10,000, and exiled. During this exile the first collection of his poems was published in 1645. In 1653 he obtained permission from Cromwell to return to England and in 1654 he addressed a "Pangyric to the Lord Protector." In 1656 he recommended him in another poem to assume the royal title. Shortly after a poem on the death of the lord protector, he addressed one to the king on his majesty's happy return. The proceedings of Monk apparently had not been anticipated. He again sat in Parliament, at intervals of cessation, till the reign of James II. Burnet says his popularity in Parliament was great, but he did not take pains to understand its business, but only studied to gain applause, being a vain and empty though a witty man. His poetry was celebrated for elegance and polish at a time when these graces had been comparatively little studied, but it is destitute of all great qualities. The one most quoted is "Go, Lovely Rose." Consult Gosse, "17th Century Studies" (1887); and Thorn-Dryne's "Waller's Poetical Works" (with biography, 1893).

WALLER, Frank, American artist and architect: b. New York, 12 June 1842. He was educated at the Free Academy in New York, studied art in Rome (1870-71), and the next year made a sketching tour in Egypt. He was a founder and the first president of the Art Students' League and since 1888 has devoted his attention to architecture. Among his paintings may be noted "Tombs of the Caliphs" (1874); "A Caravan in the Desert" (1878); "Eventide: Venice" (1883); "Hop Picking" (1885). He published "Report on Art Schools" (1879) and a "Report" of the Art Students' League.

WALLER, Thomas McDonald, American politician: b. New York, about 1840. Being an orphan newsboy in New York, he was adopted into the family of a resident of New York, Conn., and assumed the family name instead of his own surname Armstrong. He studied law, was admitted to the Connecticut bar 1861, and quickly reached high rank as an advocate. He was elected as Democrat to the Connecticut legislature 1861-68, 1872-76, and in his last term was speaker of the house. He was Connecticut secretary of State 1870, mayor of New London, 1873, State attorney 1876-83, governor 1882. He was United States Consul General at London 1885-89. He then returned to the practice of law in New London, and repeatedly refused to again hold office.

WALLIN, vá'hén, Johan Olof, Swedish poet and ecclesiastic: b. Dalarna, Sweden, 15 Oct. 1779; d. Upsala, Sweden, 30 June 1839. He studied at Upsala and in 1806 was pastor of the Royal Military Academy. He subsequently held pastorates at Solna, Ulriksdal and Vesteras and in 1837 was made archbishop of Upsala. His hymns and religious songs are in high repute in Sweden and he was called by Tegnér "David's Harp of the North." Among his poems are "The Educator," a didactic poem in Alexandrines; verses on George Washington, "Homesickness" and "The Angel of Death," one of his best-known poems. He was a notable pulpit orator. His collected works in two volumes appeared in 1848.

WALLING, William English, American economic writer: b. Louisville, Ky., 14 March 1877. After graduation at the University of Chicago (1897) he did graduate work in economics and sociology (1899-1900), was factory inspector of Illinois (1900-01) and was resident at the university settlement in New York (1902-05). He is a member of various sociological
societies. His publications include 'Russia's Message' (1908); 'Socialism as It Is' (1912); 'The Larger Aspects of Socialism' (1913); 'Progressivism and After' (1914); 'Socialism and the War' (1915). He edited 'The Socialism of To-Day' (1916) and 'State Socialism Pro and Con' (1917).

WALLINGFORD, wöl'ing-ford. Conn., borough, New Haven County, on the Quinnipiac River and on the New York, New Haven and Hartford Railroad, about 22 miles south of Hartford and 12 miles north of New Haven. The borough has broad, regularly laid-out streets, lined with large elm trees. The chief manufacturing establishments are steeling silver, silver-plate and nickel works, a rubber goods factory and brass goods factories. Britanniia and ironware are among the manufactures. The government census gives the number of industrial establishments of the whole town (which includes two villages, East Wallingford and Yalesville, besides the borough) as 70. The town is one of the oldest settlements in Connecticut; it received its present name in 1670. In it are the villages of the Oneida Community (q.v.) was located here; for some years it prospered and was largely in control of the town, but on the dissolution of the parent body the Wallingford Community disorganized. The present community is now owned by the Free Masons and the State Masonic Home has been erected here. There are two banks and two daily and two weekly newspapers; also six churches, a public high school, the Phelps School for Girls, a number of graded schools and a public library. Pop. 11,155.

WALLINGFORD, Vt, a town in Rutland County, on Otter Creek and the Bennington and Rutland Railway, nine miles south of Rutland, 59 miles southwest of Montpelier and about 11 miles southwest of Killington Peak. Included in it are the villages of Wallingford, South Wallingford and East Wallingford. It has two hotels, four churches, a public high school and manufactures of harness, tinware, coffins and caskets and agricultural implements. Pop. about 719.

WALLING, N. J., borough of Bergen County, almost adjacent to Passaic and nine miles north of Newark. It has lumber mills, chemical works and a handkerchief factory. Pop. about 4,500.

WALLIS, wól'is, John, English mathematician; b. Ashford, Kent, 23 Nov. 1616; d. Oxford, 28 Oct. 1703. He was educated at Emmanuel College, Cambridge, took holy orders and in 1641 became chaplain to a Yorkshire baronet. He was one of the first members of the scientific association which became later the Royal Society and in 1649 was appointed Savilian professor of geometry at Oxford. He was particularly skilful in the art of cryptography, or deciphering; and having by this means been enabled to render considerable service to the public, he was on the restoration of Charles II made one of the royal chaplains. In 1661 he was one of the divines appointed to revise the Book of Common Prayer; and when the Royal Society was founded in 1663 his name was included in the list of the earliest members; he added much to the reputation of that body by valuable contributions to the 'Philosophical Transactions.' Modern algebra owes much of its completeness to his elucidation of the principles. Among his mathematical works the most important are 'Arithmetica Infinitorum'; 'Mathesis Universalis, sive Opus Arithmeticum'; 'Mechanica, sive de Motu Tractatus geometricus'; 'De Sectionibus Conicis Tractatus'; and his 'Algebra.' He also published editions of Archimedes, Ptolemy, Aristarchus and Porphyry. His complete works, including various treatises on theology, were published at Oxford (1692-99).

WALLIS, Sir Provo William Parry, English naval officer; b. Halifax, Nova Scotia, 12 April 1791; d. Puntington, near Chichester, England, 13 Feb. 1892. He entered the British navy as a midshipman in 1804; served against the French and in the War of 1812 with the United States was second lieutenant on the Shannon. He was on board this ship in the fight with the Chesapeake and upon the disablement of the captain and death of the lieutenant, Wallis took command and conducted the prize to Halifax, receiving promotion to commander in recognition of his services. He was aide-decamp to the president of the Oneida Community (q.v.) in 1847-51 and in the same named year was promoted rear-admiral. He became vice-admiral in 1857, admiral of the white in 1863 and of the fleet in 1877. Contrary to the usual rule of retirement at the age of 70 Wallis served on the active list until his death and for many years he was the only surviving flag-officer who had fought in the Napoleonic wars and in the war with America in 1812.

WALLIS, Severn Teackle, American lawyer; b. Baltimore, Md., 8 Sept. 1816; d. there, 11 April 1894. He was graduated from Saint Mary's College, Baltimore, in 1832 and was admitted to the bar in 1837. He became corresponding member of the Royal Academy of History at Madrid in 1843 and in 1849 went to Spain as United States agent to examine the title to public lands in East Florida as affected by the treaty of 1819. He was elected to the Maryland legislature in 1861 and there took a firm stand against action of the North in regard to the Civil War. He was imprisoned by the Federal government for 18 months together with other prominent Marylanders, and then released. He resumed his law practice and in 1870 was elected provost of the University of Maryland. He published 'Glimpses of Spain' (1849); 'A Discourse on the Life and Character of George Peabody' (1870), etc.

WALLIS ARCHIPELAGO, Pacific Ocean, a group of islands northeast of Fiji, with an area of 40 square miles. They were placed under a French protectorate in 1887, have a French resident and are in regular communication with Nouméa. Pop. about 6,000, mostly industrious and peaceable Polynesians.

WALLKILL (wól'kil) RIVER, a river taking its rise in Sussex County, N. J., and flowing north and northeast through Orange and Ulster counties, N. Y. About six miles from the Hudson it joins the Rondout Creek and below the junction the stream is sometimes called the Wallkill. The Wallkill is about 120 miles in length and furnishes considerable water power.

WALLON, vâ-lôn, Henry Alexandre, French historian; b. Valenciennes, France, 23
WALLOONS — WALNUT

Dec. 1812; d. 13 Nov. 1904. He was educated in the Normal School at Paris and in 1840 was appointed to the chair of modern history and geography at the Sorbonne. He was elected to the National Assembly in 1849 but resigned in the following year; became a member of the National Assembly in the year 1871; and in 1875-76 was Minister of Public Instruction. The complete establishment of the republic was largely due to his sumptuous efforts. The "Amérique Wallon," carried 30 Jan. 1875, which subsequently gave him the sobriquet "Father of the Republic." In 1876 he became a member of the Senate. His writings include "De l'Esclavage dans les Colonies" (1847); "Jeanne d'Arc" (2 vols., 1860); "La Vie de Jésus et son Nouvel Historien" (1864); "La Terreur, Études Critiques sur l'Histoire de la Révolution Française" (1872); "Les Représentants du Peuple en Mission" etc. (1873-94; 5 vols., 1888-90), etc.

WALK ONS. Of these descendants of the ancient Gauls, of whom Caesar wrote "horum omnium fortissimis sunt Belgae" (the bravest of all these [tribes] are the Belgians) we write only in their relations to American history. In modern geography, the people speaking the old French, or Romane language, with many added elements, the Walloons (first so-called in Holland Dutch) inhabit the southern half of bi-lingual and di-ethnic Belgium and portions of France, Luxembourg and Rhenish Prussia. The home of the Belgian Walloons being a tract of country which has been the eternal battle ground of Celt or Frank and Teuton, not being militarily defensible, they have suffered from the invasions of Caesar, Alva and the German Emperor William the Third. When in 1578 the Spanish army entered with fire and sword, 100,000 of the Protestant people of the Belgian Netherlands fled to England. An equal or greater number were refugees in the Dutch Republic, - he called the "Walloons" (Walloon); where, besides several regiments of Walloon soldiers, 70 Walloon churches were formed, whose history is known. In Leyden, hundreds of these refugees who spoke French were neighbors of the Pilgrim Fathers of New England. Led by Jesse de Forest, they applied to King James of England for help to settle as a body in Virginia; but could get no encouragement, except as they would agree to scatter. When the Dutch West India Company was formed, a new ship, the "New Netherland," was freighted with seeds, cattle and other things necessary in a colony and Jesse de Forest's company of Walloons, that is, French-speaking refugees from the Belgian Netherlands, took passage across the Atlantic. They were under the protection of the armed ship Mackerel. Besides daily worship, song and prayer, these people had with them an officer of the Reformed Church (his title being "Comforter of the Sick") by whom four couples were joined in wedlock on the ship, which arrived in the Mauritsu (Hudson) River in time to prevent a settlement by and to nullify the claims of the French. On Manhattan, which was named New Avesnes, eight families were left; several had taken the Wallon's Bouch or Cove (the Wallabout), on the East River (Brooklyn); and others at the head of navigation in the Iroquois country (Albany); while the four newly-wedded couples were sent on a yacht around the Boompees Hoek (or Little Tree Corner, now Bombay Hook) into the South, or Delaware River and settled at Gloucester, N. J. These Wallons were the first real colonists or homemakers in the Middle States and the first to till the soil of New Netherland, introducing the peach, pear, quince and the Marguerite, flower or daisy. The first white children born in the country, two, in the four States between Delaware Bay and Canada were their offspring. The Dutch women in New Netherland previous to 1624 were wives or kin of fishermen or fur traders, who were not farmers or settlers; there being no military occupation or civil government in New Netherland until 1624. After the first large company of Dutch immigrants, nearly 300 in number, had arrived, the first of several congregations of the Reformed Church in America was organized on Manhattan, with pastor, consistory and administration of the sacrament, in 1628. During two generations the dominies, or pastors, were required to preach in French as well as Dutch. When New Netherland first received a civil government, in 1624, Peter Minuit, who had been a church officer in the Walloon Church at Wesel, was appointed governor. Then the official name of Nova Belgica, or New Belgium, or what is now the known area of Middle States, then under one administration, was bestowed. In a few generations, the Walloons were swallowed up by intermarriage in the body of the Dutch; or, after 1685, among the Huguenots; but the first homemakers of our four Middle States were the same stock as the Walloons of 1914-18, who fled so numerously to Wales, England and Holland, because of the German invasion. At Amersfoort, in 1918, they erected a handsome edifice as a memorial of gratitude to the Dutch. The first white child born under the flag of the Dutch Republic in America, 6 June 1625, was Sarah, daughter of Simon de Rapallo, or in Dutch Ra- pelje. Thousands of Americans, who imagine themselves descendants of the Huguenots in France, could trace their lineage direct from the Walloon refugees of 1627. In the old Belgian Netherlands and in Belgium almost every one of the movements for reform, or revolution, has been led by the Walloons. In Scott's novels, several of his "Flemings" were, as their language showed, Walloons. Consult Griffis, "The Story of New Netherland" (1909); "Belgium the Land of Art" (new ed., 1919); Leslie's "History of Greater New York" (1898); De Forest, "The De Forests of Avesnes" (1900); and De Forest, "A Walloon Family in America" (2 vols., p. 705); Poujou, D. J., "Histoire et Influence des Eglises Walloones dans les Pays-Bas" (1902).

WILLIAM ELIOT GRIGGS.

WALNUT, a tree of the genus Juglans and of the family Juglandaceae. The species, of which about 10 have been described, are natives of the northern hemisphere, being confined to the temperate parts. In America they are found as far south as Mexico. They are characterized by rough bark, compound leaves, and fragrant flowers in catkins, pistillate flowers in few to
many flowered racemes and followed by large drupes with inedible husks and hard nuts, the kernels of which are valued in some species for food, dessert or the oil they yield upon expression. A majority of the species are prized for park planting because of their hardiness and the graceful form they acquire when well established. For this purpose the most esteemed in America is probably the black walnut (Juglans nigra). It ranges from the New England States to Minnesota and southward to the Gulf States. It is a graceful and imposing tree which often reaches 150 feet in height, has usually an erect trunk and a broad airy crown. It is also valued for its rough hard-shelled nuts which are often seen in the markets. Its wood is one of the most highly prized native woods, being used extensively for furniture making, interior finish of houses where exposed woodwork is desired. A majority of these woods are making rich contrasting effects with other woods. Several other species also furnish nuts found in various markets where the trees are native and the husks of several are used for dyeing and tanning. The species most esteemed for its nuts is, however, the Persian or English walnut (Juglans regia), which is indigenous from China to southeastern Europe. It has been cultivated for centuries in the Mediterranean region where it has been taken to mild climates throughout the world. The tree is only about half as large as the preceding species but is much the same in appearance. Its nuts have smoother, softer shells and usually finer-flavored kernels. This nut is one of the most important in the world. Only during the closing half of the 19th century, however, has it been grown commercially in the United States and here only in California. The crop marketed in 1913 from this State was officially estimated at about 14,300 tons, worth approximately $4,250,000. Besides these home supplies large quantities are imported from the Mediterranean region but these importations will probably dwindle into insignificance when the Californian orchards come into full bearing.

Since the trees seem to be exacting in their demands, the areas in which they can be cultivated are somewhat restricted. They are considered susceptible to frosts after their growth has started though fairly hardy while dormant; they seem to be unable to stand hot weather since the nuts are more or less injured; they seem to fail upon lands in which standing water is nearer the surface than 20 feet, also in soils with hard clay subsoil and in poorly drained soils. They are not particularly hardy and are almost restricted to the deep alluvial soils of the four southern counties of California, but by planting varieties which vegetate late in the spring and by avoiding the conditions mentioned it is believed that the region of success in cultivation may be extended even to northern counties. The seeds are planted about 12 inches asunder in nursery rows four feet apart, cleanly cultivated, irrigated during midsummer and hardened off by withholding the water in autumn. They will reach two feet in height when one year old when they are root-grafted to desirable varieties. The grafts will often grow eight feet during the first year. Either when one year or two years old the plants are set in permanent quarters about 50 feet apart. Little pruning is needed except to correct bad form, the branches being started about four feet from the planted back. Cleanly cultivated throughout the season, the first flowering in spring being at least six inches deep. Irrigation is also given if needed; always during the winter. The trees of even the most precocious varieties rarely produce profitable crops before six years old and 10 years is nearer the average age. Trees reach full bearing when about 20 years old and continue for 30 years or more. Some trees in Europe are said to be than 100 years old. When the nuts begin to fall they are shaken down, gathered by women and children usually and spread on trays for a week to dry. The nuts are then graded into sizes by passing them over sieves after which they are purchased in a bath of sal-soda, chloride of lime and sulphuric acid to bleach the brown shells and give them the ecru tint demanded by the market. After dipping they are rinsed in clear water. Formerly sulphur bicarb was used for the same purpose but it was found to impair the quality of the nuts and has been abandoned. After drying the nuts are again graded into light and dark. The latter with the broken ones are used by confectioners; the former are shipped to market in sacks holding about 110 pounds. Consult United States Department of Agriculture, Division of Pomology, 'Nut Culture in the United States'; University of California Bulletin No. 231.

**WALNUT INSECTS.** The hickory and locust tree borer (Cylleone piceus) is the chief insect preying on the black walnut. The common June beetle, the larva of the luna and the regal moths, several kinds of under-wing moths and altogether 45 species of insects are described as attacking the tree. Consult Packard, A. S., 'Insects Injurious to Forest Trees' (Washington 1890).

**WALPOLE.** See Tusayan.

**WALPOLE, wolpəl, Horace, Earl of Oxford, English wit and letter-writer; b. London, 5 Oct. 1717; d. there, 2 March 1797. He was the fourth son of Sir Robert Walpole (q.v.). He was educated at Eton and King's College, Cambridge, on leaving which (1739) he traveled two years on the Continent. Returning in 1741 he took his seat in the House of Commons as member for Callington, Cornwall, and sat for various constituencies up to his resignation in 1767. He always took a lively but superficial interest in politics, inclining sentimentally to extreme opinions. His parliamentary career requires no particular record, but it may be mentioned that in 1757 he exerted himself earnestly in behalf of Admiral Byng (see Byng, John). In 1747 he purchased Strawbery Hill, near Twickenham, where he erected a Gothic villa, laid out the grounds with minute ingenuity, and made it a principal business of his life to adorn and furnish it according to a fantastic but refined and educated taste, with objects of curiosity and antiquarian interest, rare prints, pictures, books and manuscripts. His maintenance was provided for by some sincere appointments. To his antiquarian taste he added authorship, first in verse and
afterward more extensively in prose, and in 1757 established a private printing-press at Strawberry Hill, at which he printed not only his own works but those of others, his editions often selling at very high prices on account of the small number printed. In 1791 he succeeded to his seat in the House of Lords, and appears to have avoided using his title. His works are numerous. His first publication was a description of Sir Robert Walpole's pictures, printed privately in 1747, under the title of 'Edes Walpolianae.' In 1757 a popular satire appeared called 'A Letter from Xo Ho, a Chinese Philosopher at London, to his Friend Lien-Chi, at Peking.' 'Fugitive Pieces in Verse and Prose,' and 'Catalogue of the Royal and Noble Authors of England,' with lists of their works, appeared in 1758. 'Anecdotes of Painting in England' were published in 1762-71. 'The Castle of Otranto' (1764), a romance, regarded as the prototype of the work of the 'School of Terror,' which subsequently was so popular, is very variously estimated. Praised by Byron and Sir Walter Scott, it is pronounced by Hazlitt dry, meagre and without effect. 'The Mysterious Mother,' a tragedy, and 'Historic Doubts on the Life and Reign of Richard III,' appeared in 1768. The works on which his reputation now chiefly rests are his 'Letters,' of which the best edition is that edited by Peter Cunningham (1851-59), and 'Memoirs' and 'Journal,' a series embracing the reigns of George II and III from 1751 to 1783. Walpole is almost unanimously pronounced the best of English letter-writers, whose unfeigned ease and vivacity in treating of politics, art, foreign affairs and other topics are unlike anything else in English literature. The memoirs are more bitter and cynical, but both are valued as a storehouse of the more evanescent traits of contemporary history, being full of passing topics and occurrences, and often illuminating the literature. Though keen and able, he was not an accurate or impartial observer. Want of depth and earnestness in his own character, his party prejudices, his vanity and love of effect, tempered all he wrote. Few, however, are more uniformly entertaining. Walpole's manners were affected, both personally and as a writer. He was as fastidiously aristocratic in his personal notions as he was sentimentally liberal in his political opinions, and in both he was probably conventional rather than sincere. Of the value of his writings as a chronicle of current events much has been made, but there is a tendency to ascribe to him elegance alone, to the neglect of his substantial literary merits. The complete works appeared in an edition of 1798. Consult Cunningham's edition of the 'Letters' (1857-59); Warburton's of the 'Memoirs' (1827); Rogers's 'Catalogue of the Classic Contents of Strawberry Hill' (1842); Macaulay's essay in the Edinburgh for October 1833; Cobbe, 'Memorials of Twickenham' (1872); Seeley, 'Horace Walpole and His World' (1894); and the 'Life' by Austin Dobson (1889; 2d ed., 1893).

WALPOLE, SIR ROBERT, EARL OF ORFORD, English statesman: b. Houghton, Norfolk, 26 Aug. 1676; d. there, 18 March 1745. He was educated at Eton and King's College, Cambridge, and became a good classical scholar. On the death of his elder brother in 1698 he resigned his scholarship, in 1700 entered Parliament as member for Castle Rising and in 1702 was elected for King's Lynn. He became a leader of the Whig party and soon distinguished himself by attention to business, and, though not an orator, by practical debating power. In 1708 he was appointed Secretary-at-War and entrusted with the management of the House of Commons. He was one of the managers of the impeachment of Sacheverell (q.v.) (1710), though privately opposed to that measure. Soon after this the Whigs were dismissed from office. On the meeting of Parliament in 1712 he was convicted of a high breach of trust and notorious corruption, the charge being due wholly to party hostility. He was expelled from the House of Commons and imprisoned in the Tower. By his party Walpole was regarded as a martyr. He refused to make any submission and was freed only on his own defense. He remained in prison, or held his levee in the Tower, till the prorogation. He was returned again for King's Lynn, after the dissolution in 1713 and resumed his place and influence in the House. In the first ministry of George I (1714) he was appointed paymaster of the forces. He was also in 1715 made chairman of the committee to impeach the late ministers, Bolingbroke, Ormonde, Oxford and Stafford. In 1716 he became First Lord of the Treasury and Chancellor of the Exchequer. In April 1717, a split having occurred in the ministry, Walpole resigned and made himself formidable in opposition. He opposed the quadruple alliance and the South Sea Scheme, in which, however, he did not disdain to speculate and make a fortune. In 1720 he again took office as paymaster of the forces, and was entrusted with the measures rendered necessary by the failure of the scheme. On the resignation of Sunderland he again became Chancellor of the Exchequer and First Lord of the Treasury, 3 April 1721, and for 21 years held the highest office in the state without interruption. During his long administration the Hanoverian succession, to which he was zealously attached, became firmly established, a result to which his prudence and political sagacity largely contributed. He promoted by an enlightened policy the commercial prosperity of the nation, and relieved the weight of taxation by many improvements in the tariff. He was the first English minister after the Restoration to make particular study of commerce and finance, and it was he who laid the basis for the free-trade and colonial policies of Great Britain. To the war with Spain he was decidedly averse. In February 1742, two days before his resignation, he was created Earl of Orford. So long a period of office did not of course pass without opposition. In 1733 his important excise bill failed to pass, and during the next ministry he encountered increasing difficulties. When, after successive defeats in Parliament, he resigned, he was consulted by the king as to his successors and allowed to stipulate for his own immunity. An attack was made on him in Parliament, and a committee of secrecy appointed to inquire into his administration.
The committee's report charged him with having used undue influence at elections, with granting fraudulent contracts, and with peculation and profusion in the use of secret service money. The king exerted himself to frustrate the inquiry, and the committee did not gain credit for impartiality. The prosecution against Walpole was dropped for want of evidence. He took little further part in public affairs, but was frequently consulted by the king. Walpole has been characterized by Burke as an 'intelligent, prudent and safe minister.' He was ambitious for power, but had above his contemporaries an understanding of true national interests. Consult various standard histories of England; Coxe, 'Memoirs of Sir Robert Walpole' (1798); the studies by Ewald (1877) and John Morley (1890); 'Historical Sketches of the Reign of George II' in Blackwood's for April 1868; 'Original Papers' (ed. Macpherson 1775); King, 'Political and Literary Anecdotes' (1818); Macpherson, 'Annals of Commerce,' vol. 111 (1895); Courtney, 'Parliamentary Representatives of Cornwall' (1889).

**WALPOLE, Sir Spencer**, English historian, son of Spencer Horatio Walpole (q.v.): b. England, 6 Feb. 1839; d. London, 8 July 1907. He was educated at Eton and entered the war office in 1858. He became inspector of the fisheries in 1867, lieutenant-governor of the Isle of Man in 1882 and in 1893-99 was secretary to the post office. He was knighted in 1898. He wrote 'A History of England from 1815' (1878-86); 'The Electorate and the Legislature' (1881); 'Life of Sir John Russell' (1889); 'The Land of Home Rule' (1893), etc.

**WALPOLE, Spencer Horatio**, English statesman: b. 11 Sept. 1806; d. London, 22 May 1898. He was educated at Trinity College, Cambridge, was called to the bar in 1831 and in 1846 became queen's counsel. He was Home Secretary in 1852 and in 1856-82 was a member of Parliament for Cambridge University. He was again Home Secretary for a few months in 1858, and was an unofficial member of the Cabinet in 1867-68. From 1867 until his death he was high steward of Cambridge University.

**WALPOLE, Mass.,** town in Norfolk County, on the New York, New Haven and Hartford Railroad, about 20 miles southwest of Boston. It contains the villages of South Walpole, Walpole and East Walpole. It was settled in the 17th century, but was laid out as a town about 1720, and in 1724 was incorporated. The chief manufacturing establishments are a large paper mill, a furniture and a cotton factory. There are eight churches, a high school and 15 district schools. Pop. 5,490.

**WALPOLE, N. H.,** town in Cheshire County, on the Connecticut River and the Fitchburg Railroad, about four miles below Bellows Falls and 19 miles northwest of Keene. It is in an agricultural region, the place was founded in 1745 on a site granted by Massachusetts in 1735, and in 1752 confirmed or re-granted by New Hampshire. There are six churches, a high school, several graded and district schools and a public library. The town contains about 2,668 volumes. The bank has deposits amounting to nearly $300,000. Pop. about 2,668.

**WALPURGA, väl-poor'gä, WALBURGA, or WALPURGIS, Saint**, German abbess; b. England; d. 778. She was sister of Saint Willibald, first bishop of Eichstadt, in Germany, and niece of Saint Boniface, the apostle of the Germans. She went with her uncle and brother, to Germany as a missionary and became, about the middle of the 8th century, abbess of a convent at Heidenheim, in Franconia. She must have been a learned woman, as she was considered the author of a Latin dialogue of the 'Travels of Saint Willibald.' After her death she received the honors of a saint, was believed to work many miracles, and chapels in her honor were built in many places. From the circumstance that in German almanacs the name Walpurgis has been accidentally placed, sometimes alone, sometimes together with the names of the apostles Philip and James, against the first of May, the night previous to the first day of May, so famous in German legends for the assembling of the witches, has been called Walpurgis Night. The first of May is an important day for the German cultivator; many contracts are made at this time; the labors of the field assume new activity, etc. It is not strange that, on so important a day and the witches were supposed to be more active than usual and to assemble in a particular place to organize the work of evil. This superstition, however, may have had its origin in the ancient German mythology. Hence straw was burned in many places on Walpurgis Night, with a view of dispersing the malignant beings — a custom still preserved in some places. The chief invocation of the witches was considered to take place on the Brocken. Many customs connected with the first of May in Germany originated in this superstition.

**WALPURGIS-NIGHT,** the night preceding Saint Walpurgis Day (1 May), on which, according to the old popular superstition among the Germans, witches rode on broomsticks and goat's and sat in Parliament for Cambridge University. He was again Home Secretary for a few months in 1858, and was an unofficial member of the Cabinet in 1867-68. From 1867 until his death he was high steward of Cambridge University.

**WALRUS** (from Swedish hvalross, whalehorse), an arctic marine pinniped mammal of the genus Odobenus, of which two species are recognized — the Atlantic (O. rosmarus), and the Pacific (O. pacificus, or O. oculus). The walrus is allied to hair seals (see Seals and Sealing), from which it is distinguished by having the upper canine teeth largely developed, and growing from persistent pulps to form tusks. These may attain a length of 15 inches or more, and grow downwards, and slightly inwards. They serve the animal as weapons, as tools in digging up from the sand or bottom of the sea the mollusks upon which it mainly subsists, and in climbing out upon ice-cakes or rocks of the shore. They are much larger in the males than in the females. The walrus is ordinarily 10 to 12 feet long; the place was founded in 1745 on a site granted by Massachusetts in 1735, and in 1752 confirmed or re-granted by New Hampshire. There are six churches, a high school, several graded and district schools and a public library, which contains about 2,668 volumes. The bank has deposits amounting to nearly $300,000. Pop. about 2,668.

**WALPURGA, väl-poor'gä, WALBURGA, or WALPURGIS, Saint**, German abbess; b. England; d. 778. She was sister of Saint Willibald, first bishop of Eichstadt, in Germany, and niece of Saint Boniface, the apostle of the Germans. She went with her uncle and brother, to Germany as a missionary and became, about the middle of the 8th century, abbess of a convent at Heidenheim, in Franconia. She must have been a learned woman, as she was considered the author of a Latin dialogue of the 'Travels of Saint Willibald.' After her death she received the honors of a saint, was believed to work many miracles, and chapels in her honor were built in many places. From the circumstance that in German almanacs the name Walpurgis has been accidentally placed, sometimes alone, sometimes together with the names of the apostles Philip and James, against the first of May, the night previous to the first day of May, so famous in German legends for the assembling of the witches, has been called Walpurgis Night. The first of May is an important day for the German cultivator; many contracts are made at this time; the labors of the field assume new activity, etc. It is not strange that, on so important a day and the witches were supposed to be more active than usual and to assemble in a particular place to organize the work of evil. This superstition, however, may have had its origin in the ancient German mythology. Hence straw was burned in many places on Walpurgis Night, with a view of dispersing the malignant beings — a custom still preserved in some places. The chief invocation of the witches was considered to take place on the Brocken. Many customs connected with the first of May in Germany originated in this superstition.

**WALPURGIS-NIGHT,** the night preceding Saint Walpurgis Day (1 May), on which, according to the old popular superstition among the Germans, witches rode on broomsticks and goat's and sat in Parliament for Cambridge University. He was again Home Secretary for a few months in 1858, and was an unofficial member of the Cabinet in 1867-68. From 1867 until his death he was high steward of Cambridge University.

**WALRUS** (from Swedish hvalross, whalehorse), an arctic marine pinniped mammal of the genus Odobenus, of which two species are recognized — the Atlantic (O. rosmarus), and the Pacific (O. pacificus, or O. oculus). The walrus is allied to hair seals (see Seals and Sealing), from which it is distinguished by having the upper canine teeth largely developed, and growing from persistent pulps to form tusks. These may attain a length of 15 inches or more, and grow downwards, and slightly inwards. They serve the animal as weapons, as tools in digging up from the sand or bottom of the sea the mollusks upon which it mainly subsists, and in climbing out upon ice-cakes or rocks of the shore. They are much larger in the males than in the females. The walrus is ordinarily 10 to 12 feet long; the place was founded in 1745 on a site granted by Massachusetts in 1735, and in 1752 confirmed or re-granted by New Hampshire. There are six churches, a high school, several graded and district schools and a public library, which contains about 2,668 volumes. The bank has deposits amounting to nearly $300,000. Pop. about 2,668.
fur is of a tawny brown color, and the hide is so thick that it has been likened to a tough, flexible coat of mail.

Walruses are gregarious and are found on the seashore and on ice floes. They are said to be monogamous, and the female brings forth at nine months one calf, usually on the ice floes. In disposition they are quiet and inoffensive unless attacked, or during the mating season, or when their young are in danger, when they become desperately aggressive and furiously charge at the vessel for boats. The walrus is now confined to the regions within the Arctic Circle, though its extinct ancestors had a much wider geographical range, occurring numerously in ancient times as far south as Denmark and Nova Scotia in the Atlantic and about the Aleutian Islands on the northwest coast. Owing to reckless slaughter by sealers and whalers, they are greatly decreased even in the Arctic seas, and the few remaining seek unfrequented spots in high latitudes. The tusks yield and harness are extensively made of fine ivory, while the hide is most serviceable. Consult Allen, 'North American Phinipedia' (Washington 1880) and standard authorities.

Walsall, wäl’sål, England, a manufacturing town of Staffordshire, eight miles north-northwest of Birmingham. The environs present much fine scenery and the town is handsomely built. The chief buildings and establishments are a modern parish church, with tower terminating in a lofty spire, and other places of worship; a free grammar school; the town hall and jail; a public library; county court, a handsome structure with a Doric colonnade; a technical school and four public parks. The situation of the town gives it great advantages for carrying on the iron manufacture, which forms a leading industry; the chief articles consisting of ironmongery, including coach and carriage harness mountings, buckles, chains, locks, keys, screws, files, edge-tools, guns-tubes, etc. Saddlery and harness are extensively made and are the staple of the town. There are also brass and iron foundries, machine shops, tanneries and establishments for currying, dying and jappanning hides, malt-works and clothing factories, and in the vicinities extensive iron mines and coal pits. Walsall is of considerable antiquity, but the existing town is almost entirely of modern origin. Pop. 92,130.

Walsall—Walsh

Walsall, Francis Patrick, American lawyer: b. Saint Louis, Mo., 20 July 1864. He was educated at Saint Patrick's Academy and was admitted to the bar (1889). He was a member of the Kansas City Tenement House Commission (1906-08); president of the Kansas City Civil Service Board (1911); chairman of the Federal Commission on Industrial Relations (by appointment of the President), on which he conducted the investigation of conditions in Colorado (1914); in charge of the case of stock-yard employees (1918); was appointed marshal of the Federal Court of the United States, Ninth Judicial District (1918). In February 1919 he was one of the delegates dispatched by the Irish Race Convention at Philadelphia to attend the Peace Conference at Paris in an effort to secure a hearing there for the Irish republican delegates. With his colleagues, ex-Governor Dunne of Illinois and Mr. Ryan of Philadelphia, he visited Ireland and was joint author of the report of conditions there, which stirred the English press and public to set about a settlement of the Irish question. He is a member of the American Bar Association and of the Missouri State Bar Association.

Walsh, James Joseph, American physician, lecturer and author: b. Archbold, Pa., 12 April 1865. He was educated at the parish school, Wilkes Barre, Pa., Saint John's College, Fordham, N. Y., and the universities of Pennsylvania, Paris, Vienna and Berlin. He was at one time assistant editor of Medical News and collaborating editor of The International Clinics. Since 1898 he has practised his profession in New York. In 1900-05 Dr. Walsh was adjunct professor of medicine at the New York Polyclinic School, and from 1905 to 1912 was professor of nervous diseases and the history of medicine, and dean of the medical faculty of Fordham University. Since 1906 Dr. Walsh has been professor of physiological psychology at Cathedral College, New York City. He has lectured extensively on literary, historical and scientific subjects, and in 1916 was recipient of the Lottare Medal from Notre Dame University. Dr. Walsh is a member of the American Association for the Advancement of Science, the American Medical Association, the New York Historical Society, etc. His published works are 'Makers of Modern Medicine' (1907); 'The Thirteen Greatest of Centuries' (1907); 3d ed. (1912); 'The incidence of Cerebrum's' (1907); 'The New York State Medical Society' (1907); 'The Popes and Science' (1908); 'Education, How Old the New' (1910); 'Pastoral Medicine,' with Austin O'Malley (1906); 'Makers of Electricity,' with Brother Potamian (1909); 'Catholic Churchmen in Science' (1906, 1909); 'Old Time Makers of Medicine' (1911); 'Modern Progress and History' (1912); 'The Century of Columbus' (1914); contributions to The Catholic Encyclopedia (1905-14); 'The Encyclopedia Americana,' 2d ed. (1916-19). In 1901 Dr. Walsh received the degree of LL.D from Fordham, in 1909 that of Litt.D. from Georgetown and in 1910 that of Sc.D. from Notre Dame University. He is director of the sociological department of Fordham University and trustee of the Catholic Summer School of America.

Walsh, Robert. American lawyer: b. Baltimore, Md., 1784; d. Paris, France, 7 Feb. 1859. He was educated at the Roman Catholic College, Baltimore, and at the Jesuit College, Georgetown, D. C., traveled in Europe until 1809, and on his return studied law and established a law practice at Philadelphia. Later he entered journalism and in 1811-13 published the American Review of History and Politics, the first quarterly issued in the United States. He edited the American Register in 1817-48, and in 1819 established the Philadelphia National Gazette, which he conducted until 1836. He revived the American Review in 1827 and edited it until 1832 and the National Advocate, which he founded in 1836, was United States consul there in 1845-51 and continued his residence in that city until his death. He wrote 'Letter on the Genius and Disposition of the French Republic' (1810); 'Appeal from the Judgments of Great Britain Respecting the United States' (1819);
WALSH — WALTER

'Didactics: Social, Literary, and Political' (1836), etc.

WALSH, Thomas, American critic and poet: b. Brooklyn, N. Y., 14 Oct. 1875. He was educated at Georgetown University and at Columbia University (Ph.D. 1895). At various times Mr. Walsh has served on the staff of "Warner's Library of the World's Best Literature," the "International Encyclopedia," the New York "Globe," the "Bookman" and "The Catholic Encyclopedia." He composed and read the dedication ode to the Prison Ship Martyrs, Brooklyn, 14 Nov. 1908; the Reunion Poem on the Battlefield of Antietam, 16 Sept. 1910; and poem at the unveiling of the John Carroll Monument at Georgetown, D. C., 3 May 1912. Dr. Walsh is a contributor in prose and verse to English and American magazines and reviews, and has published 'The Crusaders' (1897); 'The Prison Ships and Other Poems' (1909); 'The Pilgrim Kings' (1910); 'Eleventh Poems of Rubén Darío' (1916) 'Gardens Overseas and Other Poems' (1917).

WALSH, Thomas James, American legislator: b. Two Rivers, Wis., 12 June 1859. He was educated in the public schools and in 1884 was graduated in law at the University of Wisconsin. He taught school, becoming principal of the high school of Sturgeon Bay, Wis.; in 1884 he began the practice of law at Redfield, S. D., and in 1890 removed to Helena, Mont. Since 1880 he has been active in the law firm of Walsh and Nolan. Mr. Walsh was identified with a number of land and livestock companies in Montana; was Democratic candidate for Congress in 1906 and served as delegate to the Democratic national conventions of 1908, 1912 and 1916. Mr. Walsh was candidate for United States senator in 1910; in 1912 he was elected senator for the term 1913-19 and was re-elected for the term expiring in 1925.

WALSH, William, Irish archbishop: b. Dublin, Ireland, 1841. He was educated at the Catholic University of Ireland and at Maynooth College, and after graduating at Maynooth spent three years on the Dunboye establishment in post-graduate theological studies. He became professor of theology at Maynooth in 1864; president, 1875-78; president, 1892-97. He was chosen by unanimous voice of the Irish bishops. Before the Parliamentary "Bessborough Commission," 1869-70, Walsh, as proctor for the bishops and tenants, conducted their case against the Duke of Leinster, landlord, with great skill and discretion; his acts in this investigation had much influence in determining the tenor of the Land Act of 1881. At the death of Cardinal McCabe in 1885, the clergy chose Walsh vicar-capitular; they also named him to Rome for archbishop of Dublin. The British Cabinet had a different sort of candidate for the place, and the Pope's choice at first seemed to coincide, but the wishes of the Irish clergy and laity at length prevailed. Walsh is considered by the Irish the first archbishop of Dublin since the death of St. Lawrence O'Toole, who has been free from the taint of "Castle influence." He testified before the Parnell Special Parliamentary Commission 1888, and his evidence was considered by the perjured witness of the London Times and the British government, 1888-89. He has been active in questions of popular education, trade strikes and temperance. He has written much for reviews, and has published many books, e.g., 'De Actibus Humanis,' a treatise on one branch of moral theology; 'Harmony of the Gospel Narrative and the Passion'; 'Liturgical Music of the Mass of the Dead'; 'Grammar of the Gregorian Music.' On questions of secular concern he has published 'A Plain Exposition of the Land Act of 1881; 'Addresses,' on various subjects; 'Addresses on the Irish University Question'; 'Statement of the Chief Grievances of the Catholics in Ireland in the Matter of Education,' etc.

WALSINGHAM, wöl-síng-am, Sir Francis, English diplomat: b. Chiselhurst, Kent, about 1530; d. London, 6 April 1590. He studied at King's College, Cambridge, and traveled on the Continent until early in the reign of Queen Elizabeth. He was introduced to public service by Cecil. His first embassy was to France, about 1561. He resided in Paris; was ambassador from August 1570 to April 1573, and on his return was made principal Secretary of State and a privy-councillor, and soon after knighted. In 1578 he was Ambassador to the Netherlands, in 1581 to France and in 1583 to Scotland. After having the chief direction of the measures for the discovery of Babington's conspiracy, he was appointed one of the commissioners for the trial of Queen Mary in 1586. He made many voyages in the name of the duchy of Lancaster. He retired from public life some time before his death. It is somewhat remarkable that so little is known of Walsingham's career; but he worked in secrecy and dealt mainly in intrigue. He is said to have had 53 private agents and 18 spies at foreign courts, and many stories are told of his diplomatic proficiency. In his private character Walsingham is said to have been ascetically strict in his morals and puritanic in his religious zeal. An account of Walsingham's embassy to France appeared in a work by Sir Dudley Digges, entitled 'The Complete Ambassador,' published in 1653; and a work entitled 'Arcana Aulica' has been wrongly ascribed to Walsingham himself.

WALTER, wál'ter, John, English publisher: b. 1739; d. Teddington, Middlesex, 16 Nov. 1812. He was first engaged as a coal merchant, in which business he accumulated a considerable fortune, but lost it in subsequent operations as an underwriter. In 1782 his attention was attracted to an invention of one Henry Johnson, who had patented in 1778 and 1780 printing units known as logotypes, which substituted entire words or syllables instead of type characters of single letters. In 1784, having purchased the Johnson patents, he opened a printing office in London known as the Logographic Office, and engaged in publishing books. On 1 Jan. 1785 he issued the first number of a small newspaper, The Daily Universal Register, "printed logographically," which was really the first number of the Times, though that name was not assumed until 1 Jan. 1788, when The Times, or Daily Universal Register appeared, the alternative title being dropped in the second year of publication. The Times has immeediately a success, and the logographic process eventually had to be abandoned, but Walter seems to have derived some profit from
his book printing, and gradually the Times became a power in the land. In 1786 Walter was convicted of having printed a libel, the offense having been the statement that the dukes of York, Clarence and Cumberland were insincere in their congratulations on the king's recovery. He was sentenced to a year's imprisonment in Newgate, to stand in the pillory for one hour, pay a fine of £50 and to enter into recognizances for his good behavior for seven years. He was subsequently sentenced to a second year's imprisonment before the expiration of the first and further fines of £200 on other libelous charges, but was pardoned after 16 months at Newgate. Broken in health and spirit at his continued misfortunes Walter retired from the management of the business in 1795.

WALTER, John, English editor and publisher, son of the preceding: b. London, 23 Feb. 1776; d. there, 28 July 1847. He was studying for the ministry at Oxford, when in 1797 or 1798 his father summoned him to London to assist in the management of the Times. For the date of his assumption of the management a new spirit was manifested in the paper, and in 1803 he became sole manager. He maintained an independent course, which, while it made the reputation of the Times, cost its editor the little official patronage it had enjoyed. For 18 years the firm had been printers for the board of customs, but in 1803, in consequence of criticism of Lord Melville's administration of the admiralty department, he was deprived of the employment. His enterprise had increased the circulation of the Times from 1,000 to 5,000 copies in 10 years, notwithstanding the continued opposition of the government. In 1805 he made arrangements for obtaining foreign news, and in 1807 sent Henry Crabb Robinson (q.v.) to Germany, the first of the afterward numerous class of special correspondents; and though every measure possible was used by the government to delay his foreign despatches, Walter published the foreign information days before the same intelligence was officially received by the government. He afterward frankly admitted that smuggling was the only means by which he could obtain French journals. Ultimately the Times took its place as the leading English journal, and Walter may be considered as its real creator. On 29 Nov. 1814 he issued his paper printed by König's steam cylinder press, the first paper to be printed by that method. (See PRINTING PRESSES). He acted as editor of the paper until after 1810, but from that time entrusted a share of the editorial work to Sir John Stodart. In 1832-37 he sat in Parliament for Berkshire, but resigned in the latter year because of differences with his constituents; was returned for Nottingham in 1841, but was unseated in the following year. His later years were spent chiefly in retirement.

WALTER, John, English publisher: b. London, 8 Oct. 1818; d. 3 Nov. 1894; grandson of the founder of the Times. He was educated at Oxford, and was called to the bar 1847; was in early life a liberal conservative 1847-65 and 1868-85. His conduct of the Times—though successful on the whole—was not in all respects characterized by the wisdom and shrewdness which marked the régime of his father and grandfather. The Times was mulcted in substantial damages and had to pay enormous law costs for having become the dupe of a perjurer. The third John Walter erected a new office for the Times, and for himself a magnificent house in the suburbs of London.

WALTER, Thomas Ustick, American architect: b. Philadelphia, Pa., 4 Sept. 1804; d. there, 30 Oct. 1887. His early training was received in the office of William Strickland, and in 1830 he launched out for himself, building the Moyamensing Penitentiary in 1831. In 1847 he completed the Girard College building from his own designs, a building which has always been admired for the classic purity of its proportions. This classical motif he carried out also in his extension of the national Capitol at Washington, D. C., to which he added its noble dome. He erected many public buildings at Washington, including the Post Office and the Government Hospital for the Insane. He was one of the original members of the American Institute of Architects, professor of architecture in Franklin Institute, and lecturer on architecture in Columbia College.

WALTERBORO, S. C., town, county-seat of Colleton County, on the Charleston and Savannah Railroad (Plant System), about 50 miles west of Charleston. It is in an agricultural region, in which cotton is one of the chief products. It has cotton mills, a cotton oil mill, lumber mills, naval stores, lumber yards and large storehouses. There are two banks and one newspaper. Pop. 1,677.

WALTERS, Walt’erz, William Thompson, American merchant and art collector: b. on the Juniata River, Pa., 23 May 1820; d. Baltimore, Md., 22 Nov. 1894. He was educated as a civil engineer, but became interested in the coal and iron industry, and while in charge of a smelting establishment in Pennsylvania produced the first iron manufactured from mineral coal in the United States. He removed to Baltimore in 1841, and established himself as a wine merchant there in 1847. He was president of the first steamship line between Baltimore and Savannah and was one of the reorganizers of the Southern lines. In 1861-65 he resided in Europe, where he traveled widely in the interest of art, and purchased numerous additions for his collection. He was United States commissioner at the Paris expositions of 1867 and 1878, and also to that at Vienna in 1873. His private collection was one of the largest and most valuable in the United States, and his annual exhibit of his gallery for charity netted $30,000 for the poor of Baltimore. He wrote 'Barye' (1885); 'Notes Upon Certain Masters of the 19th Century' (1886), etc.

WALTERS COLLECTION, began in 1830 by William Thompson Walters of Baltimore who had been an artist at the Paris expositions of 1867 and 1878 and to the Vienna Exposition of 1873 and who acquired a remarkable collection of French and Chinese art work, and Greek, Roman and Italian sculpture. The collection was augmented suitably housed by his son Griswold R. B., 'Collection of W. T. Walters' (Boston 1895); and Bushnell, S. W., 'Oriental Ceramic Art Collections of W. T. Walters' (New York 1899).
WALTHALL, wid'hal, Edward Carey, American soldier: b. Richmond, Va., 4 April 1831; d. Washington, D. C., 21 April 1898. Admitted to the bar in 1852, he began practice in Coffeeville, Miss., and was district attorney for the 10th judicial district of Mississippi 1856-61. He then entered the Confederate army as lieutenant, becoming brigadier-general in December 1862 and major-general in June 1864. He especially distinguished himself at the battle of Missionary Ridge, where he led his brigade over ridges and through the Federal troops till the Confederate army made its escape; and he covered the retreat of General Hood's army after the defeat at Nashville. He practised law in Grenada, Miss., 1871-85, when he was appointed a United States senator to fill out the unexpired term of Lucius Q. C. Lamar. He was elected for full terms in 1888 and in 1892, was chairman of the committee on military affairs and served on the committees on the improvement of the Mississippi River and on public lands.

WALTHAM, wil'tham, Mass., city in Middlesex County, on the Charles River and on the Boston and Maine Railroad, 10 miles west of Boston. It is connected by electric railway with Boston, Newton, and surrounding towns. Waltham was settled by farmers in the early days of the colony. The first incorporation was that of Watertown, which then embraced the territory now included in Waltham. In 1738 Waltham was set off from Watertown and incorporated as a town; and in 1884 it was granted a city charter. The chief manufacturing establishments are the two famous watch factories. At the American Waltham Watch Works, the first successful attempt was made to manufacture watch movements, on a large scale, by machinery. It is now the largest watch factory of its kind in the world. In 1814 a cotton mill was erected here, the first in the United States in which, under the same roof, the raw material was put through all necessary forms, even through the bleaching, dyeing, and finishing, which came out the finished cotton cloth of the market. Other manufactories are saddlery and harness works, foundry and machine shops, wagon and carriage factories, emery wheel works, lumber mills, furniture factories and men's clothing factories. The value of the annual products is about $10,000,000.

The principal public buildings are the government building, the municipal buildings, banks, churches, and schools. There is one large park and a number of small squares. The water works are owned and operated by the city. The main business streets and many of those in the residential sections are paved. The roads leading to the near-by villages and towns are well made and kept in good repair. The pure water, favorable climate, and the level and flatness of the land make the place most healthful. There are 17 churches representing 10 different denominations. The educational institutions are the Massachusetts School for the Feeble-Minded, the Waltham Nurses' Training School, the Notre Dame Training School, a public high school and two private schools doing high school work, Saint Mary's School (Roman Catholic) and Waltham New Church School (New Jerusalem Church). There are several commercial schools and Mellor's Commercial College, public and parish graded elementary schools, public evening schools, several private schools, a public library which contains about 40,000 volumes and several school libraries. There are banks, one national and one state, and two daily newspapers. The government is administered under a charter of 1893 which provides for a mayor elected annually and a common council. The mayor appoints, subject to approval of the council, the major officers of the city. The board of education is chosen by popular vote. Pop. 30,154. Consult Hurd, 'History of Middlesex County.'

WALTHAM ABBEY, or WALTHAM-HOLY-CROSS, England, a market town of Essex, 12 miles north by east of London, on the left bank of the Lea. It consists chiefly of one irregular main street, and has a spacious Norman church, which once formed the nave of the famous abbey church of the Holy Cross, where King Harold is buried. There are here government manufactures of powder, percussion-caps, cordite and small-arms, besides breweries, flourmills, etc. The old abbey of Waltham was founded or enlarged by King Harold in 1060 and is said to have once possessed a fragment of the cross on which Christ suffered. In the neighborhood are the village of Waltham Cross, and an "Eleanor cross," recently restored. Pop. about 9,000.

WALTHER, Karl Ferdinand Wilhelm, Lutheran minister and author: b. Langenschursdorf, Saxony, 25 Oct. 1811; d. 7 May 1897. He was for a time pastor at Braunsdorf, Saxony. He emigrated to America with a large colony of his countrymen 1839, and settled in Perry County, Mo. He became pastor in Saint Louis 1844. He founded and edited Den Lutherer and a German theological journal entitled Lehre und Wehre. He was a leader in the extreme Lutheran confessionism, or strict adherence to the dogmatical standard, and was colloquially termed "the Lutheran pope." He organized in 1846 the Missouri Synod, which was the germ of the Synodical Conference. He was professor in the Lutheran Theological Seminary at Saint Louis from 1850 until his death. He was charged with holding Calvinistic principles, which he denied, and with which his doctrine of universal redemption would be quite inconsistent. He published a number of theological works in German; numerous sermons; and 'American Lutheran Pastoral Theology' (1872).

WALTHER VON DER VOGELEIDE, väl'tær fon der för'gel-vi-dé, German lyric poet of the class of Minnesinger; b. about 1100; d. about 1227. He was descended from a noble but not wealthy family, whose castle, Vogelweide, is supposed to have been situated in Tyrol. Walther resided at the court of Frederick, the youngest son of Leopold VI, Duke of Austria and on Frederick's death in 1198 left the court of Vienna and entered on a series of wanderings. He remained longest at the splendid court of the Landgrave of Thuringia, who had always around him a circle of poets. He instituted that celebrated poetic contest, the war of the Warburg (1207), in which Walther took part. Walther shows himself, in his political poems, a warm partisan of the imperial interests against the Papacy. The Emperor
Frederick II was also a patron, and bestowed upon him a small fief. His poems, all of which are lyric, have been published by Lachmann (1827). Consult Milmann, 'Leben und Dichter Walthers von der Vogelweide' (1882); Schönbach, 'Walther von der Vogelweide, ein Dichterleben' (1895).

WALTON, Walter, Brian, English Biblical scholar: b. Yorkshire, 1600; d. London, 29 Nov. 1661. He was graduated at Cambridge and from a curacy advanced through many preferments to a prebend in Saint Paul's. At the Restoration he was made chaplain to Charles II and bishop of Chester. His greatest work is 'Biblia Sacra Polyglotta' (6 vols. folio 1657). This work comprises the Hebrew original of the Old Testament, the Samaritan Pentateuch, the Chaldee, Syriac, Arabic, Persian versions and the Latin Vulgate with various readings, notes, etc., still intended to be 'the most complete Biblical apparatus in any language.' He wrote in 1658 his 'Dissertation on the Antiquity and Authority of His Texts,' in later editions called the 'Prolegomena,' under which name it was published in 1665 and in the original Latin (1627-28). 'The Considerator Considered,' etc. (1659) was written in answer to Dr. John Owen's, 'Vindication of the Purity and Integrity of the Hebrew and Greek Texts,' etc., a criticism on Walton's great Biblical work.

WALTON, Frederick Parker, Canadian lawyer: b. Nottinghamshire, England, 28 Nov. 1858. He was educated at Lincoln College, Oxford (1883), Edinburgh University (1886), and received honorary degrees from Aberdeen University (1906) and McGill University (1911). He was an assistant to the law lecturer on Roman law at Glasgow University (1894-95), was legal secretary to the Lord Advocate (1895) and (1897-1912) was dean of the law faculty at McGill University. He was joint editor of the 'Journal of Legal Studies' and (1912) was secretary to the Canadian Bar Association. He was a member of several law societies, including 'The Workmen's Compensation Act, with Commentary' (1910).

WALTON, George, American patriot: b. Frederick County, Va., 1740; d. Augusta, Ga., 2 Feb. 1804. He was a merchant, became a carpenter, and studied law at night by the light of pine-knots, in 1774 was admitted to the bar, and began practice in Augusta. Together with three others he called a meeting at Savannah 27 July 1774 for the purpose of discussing measures of resistance against the arbitrary proceedings of Great Britain, and was one of a committee inviting co-operation from the sister colonies. Later he was one of the committee which prepared a petition to the king and in 1775 was sent as a delegate to the Continental Congress. He was one of the signers of the Declaration of Independence, and continued a delegate to Congress until 1781. He was appointed colonel of militia in 1778 and commanded under General Heath when it was captured by the British in September 1778, was seriously wounded, taken prisoner, and held until September 1779. He was chosen governor of Georgia in the following month, was elected governor of the State in 1783, 1787 and 1793; re-elected governor of Georgia in 1789, and in 1795-96 was United States senator.

WALTON, Isaac, English author: b. Stafford, 9 Aug. 1593; d. Winchester, 15 Dec. 1683. After receiving a school education in his native town he went to London and was apprenticed to an ironmonger. In 1618 he was made free of the Ironmongers' Company and seems to have retired with a competency. The statement frequently made that he was a sempster or haberdasher is unsupported by research. He early became closely acquainted with Dr. John Donne, Sir Henry Wotton and other famous men; and was a strong royalist and the friend of prominent royalists. Doubtless, after Marston Moor, he devoted himself much to fishing. Walton's fame rests on 'The Compleat Angler, or the Contemplative Man's Recreation: Being a Discourse of Fish and Fishing, Not Unworthy the Perusal of Most Anglers.' It was published in 1653, and went through five editions in his lifetime. The fifth edition, issued in 1676, contained, as a second part, Charles Cotton's treatise on fly-fishing, written to correspond with Walton's, and titled 'Instructions how to Angle for Trout or Grayling in a Clear Stream.' The chief subsequent editions are those by Moses Browne (1750), Sir John Hawkins (1760), Major (1824), Sir Nicholas Harris Nicolas (1836), Jesse and Bohn (1856), Marston (1888), Harting (1893), Lang (1896). There is a facsimile reprint of the first edition by Elliot Stock (1876), republished in 1877, 1880 and 1896. Lowell wrote the introduction for an American edition in 1889. Walton also wrote almost equally famous biographies of John Donne (1640), Sir Henry Wotton (1651), in 'Reliquiae Wottonianae,' Richard Hooker (1655), George Herbert (1670), and Robert Sanderson (1678). The first four were published together in 1670, and have been often reissued, as for instance, under the editorship of A. H. Bullen (1884) and Austin Dobson (1898). Besides the short pieces of poetry in his works, Walton wrote other occasional and the British administration in Egypt. He is author of several law works including 'The Workmen's Compensation Act, with Commentary' (1910).

WALTON, N. Y., village, in Delaware County, on the New York, Ontario and Western Railroad, about 175 miles northwest of New York, and 30 miles northeast of Ithaca. It is in an agricultural and dairy region, and the industries are connected with farm and dairy products. It has a foundry, machine shops, novelty works, and furniture factory. There are eight churches, a high school, grammar school and a school library. There...
WALTZ — WAMPUM

is one national bank capitalized for $50,000, and a newspaper. Pop. about 3,103.

WALTZ, Jean Jacques, French writer: b. Colmar, Alsace, 1873. He studied at the Beaux-Arts in Paris, became a contributor to the *Durchs-Elsass* and made a chevalier of the Legion of Honor. For satirizing the main character in his sketches he was ordered sent to prison for a year (1914) but escaped to France where he served in the army during the Great War. He has published the volumes, "L'Histoire d'Alsace racontée aux petits enfants d'Alsace et de France" (1913), "Professeur Knatchbêche: œuvres choisies du grand savant allemand et de sa fille Elsa" (1915), and "Mon Village," his village sketches which attracted to him the attention of the German authorities and resulted in his conviction and sentence to imprisonment.

WALTZ, a dance executed by any number of couples, the gentleman having his arm around his partner's waist, the couple wheeling around on an axis of their own, and at the same time moving around the room. The music is in triple time in quadrilles or quavers. Compositions in waltz form are often not intended for dance tunes. The style of the waltz has varied much with the period and the country. See DANCING.

WALWORTH, wal'worth, Ellen Hardin, American writer: b. Jacksonville, III., 20 Oct. 1832; d. 23 June 1915. She was married to M. T. Walworth (d. 1873) in 1852. She was one of the three founders of the National Society of the Daughters of the American Revolution in 1890; also of the Women's National War Relief Association in 1898; and one of the first three women elected to the school board under the New York law. She was prominent in various club movements, and lectured and wrote extensively. Her writings include "Battles of Saratoga" (1891); "Parliamentary Rules" (1897), etc.

WALWORTH, Reuben Hyde, American jurist: b. Bozrah, Conn., 26 Oct. 1789; d. Saratoga, N. Y., 21 Nov. 1867. He was mainly self-taught, was admitted to the bar in 1809 and settled at Pittsburg, N. Y. He soon rose to eminence in his profession. He sat in Congress 1821-23, removing to Saratoga in the last-named year, was a circuit judge 1823-28 and chancellor of New York 1828-48. His decisions as circuit judge are included in 'Cowan's Reports' (9 vols. 1824-30); as chancellor, in 'Paige and Barbour's Reports,' 14 vols. (1830-49). He published 'Rules and Orders of the Court of Chancery' (1829); 'Genealogy of the Hyde Family' (1864).

WAMBAUGH, Eugene, American lawyer: b. Brookville, Ohio, 20 Feb. 1856. He was graduated at Harvard (1876) and was awarded his L.L.D. (1880) and his L.L.D. from the State University of Iowa (1892). After admission to the bar (1880) he practised at Cincinnati (1880-88) and at the Bar of the State University of Iowa (1888-92) and since that time at the Harvard Law School. He was an editor of the *American Political Science Review* (1900-13) and (since 1915) assistant to the Judge-Advocate-General. He is author of 'The Study of Cases' (1892, 1896), 'Cases on Agency' (1896), 'Cases on Insurance' (1902), 'Littleton's Tenures' (1903), 'Cases on Constitutional Law' (1915), 'Guide to Articles of War' (1917).

WAMPANOAG ("Eastern land"), a tribe of the Algonquian stock of North American Indians, closely related to the Massachusetts tribe, whose language they spoke. They were sometimes called Pokanokets, from their principal village, and Massasoits, from a prominent chief. The Wampanoags resided on Narrangansett Bay, in Bristol County, R. I., and Bristol County, Mass., but originally they claimed the territory between Narrangansett Bay and Pawtucket River and the Atlantic, including the islands of Nantucket and Martha's Vineyard. The Cape Cod branch of the tribe were visited by Gosnold in 1602, and by other whites at an early date. In 1617 many of their number perished from disease, prior to which time they claimed to have had 5,000 warriors, or about 18,000 souls. When the Plymouth Colony was planted in 1620 the Wampanoags inhabited 30 villages; Massasoit was their chief, and the treaty which he made with the colonists was faithfully observed by him until his death. He was succeeded by his son, popularly known as "King Philip," who, charging in his garment which his people had suffered at the hands of the whites, aroused the resentment of all the Algonquian tribes from the Merrimac to the Thames (except the Wampanoags of Cape Cod and Martha's Vineyard), and in 1675 began a war against the whites which continued for two years and proved to be the most disastrous Indian conflict in New England history. The Indians were ultimately overcome, but not until Philip and other leading chiefs had been killed, and the Wampanoags and Narragansetts almost exterminated. Those who could, fled to the interior tribes, many captives were sold as slaves, and others joined the various "praying Indians" of southern Massachusetts.

WAMPUM, SEAWAN, PEAG or SHELL MONEY, a fabric bearing beads formed of the interior of shells, arranged in patterns or designs, formerly much used by North American Indians as a medium of exchange among the Indians of the Atlantic Seaboard States. Not merely did it serve the Indian as a medium of exchange and a standard of values, but worn as an ornament it was his badge of wealth and position, in the hands of the chiefs his record book and ledger, and through the favor of the Great Spirit's Vineyard became in no small degree the passport to the happy hunting grounds of the future world. The use of wampum constituted a bond of union among the Indians such as was scarcely supplied by language. From the English the word wampum was made from shells, usually clam or oyster, and it was therefore not surprising that the coast dwellers were the most prolific producers of it. The black beads were made from the dark eye of the shell, the other end being the point of muscular attachment, while the white ones were taken from the outer parts. Black beads were known as sacki, white ones as wompi, and the black were usually considered twice as valuable as the white. Purple beads were also taken. They were made up as belts, necklaces, bracelets and occasionally as
WANDERER—WANDERING JEW

scabbards. The beads themselves were simply little shell cylinders about one-eighth of an inch in diameter and one-fourth of an inch in length. They were polished smooth by being rubbed and bored by means of a flint awl, many of which are still to be found in the shell heaps along the New England Coast. The English colonists were compelled to use wampum as a medium of exchange with the Indians for more than half a century. Three dark or six white beads were swapped for an English penny. Rhode Island recognized it officially as late as 1670. In New York it was used until after the end of the century—as for instance in the payment of the fare between New York and Brooklyn. It was used in Southern Connecticut as late as 1704, and in the backwoods regions of the northern and middle colonies well down into the 18th century.

WANAMAKER, Wön'am-a-ker, John, Amethath, Broad st., Philadelphia, 11 July 1838. He received a common school education, and began his business career at 14 as errand boy in a store. In 1861 he established, with his brother-in-law, a clothing store under the firm name of Wanamaker and Brown, which in 1869 became the firm of John Wanamaker and Company. He soon became the foremost merchant of Philadelphia. His success is attributable to his early comprehension of advertising, and of the principle of the department store. He was the first in Philadelphia to expend large sums in the newspapers, and to hire high-priced men to write and systematize advertising. After building up an enormous establishment in Philadelphia, he observed the decadence of the A. T. Stewart business in New York, and in 1896 purchased the building, and proceeded to revive the trade of his distinguished predecessor. In a short time the historic Stewart block on Broadwalk, from Ninth street to 10th street, proved too small, and in 1905 a skyscraper* arose on the block south. Mr. Wanamaker has been active in the public life of Philadelphia, and took a prominent part in the movement to secure public water for the city, in 1885-87, and in other reform movements. He has made liberal contributions to educational and national politics as an anti-machine* Republican. In 1888 he was a presidential elector, and in 1899 entered President Harrison’s Cabinet as Postmaster-General. During his term of office he established the postal system, and strongly favored a postal telegraph system. He has taken an active part in religious work, was for several years president of the Philadelphia Young Men’s Christian Association, and in 1888 organized a small Sunday school which became the Bethame (Presbyterian) Sunday school, one of the largest in the United States.

WANAPUM INDIANS (čriwer people*), a tribe of the Shoshapian stock of North American Indians—the Sokukels of Lewis and Clark. They range along both banks of the Columbia from Washington from above the Cab Creek down to the mouth of Snake River. Having never made a treaty or gone on a reservation, they are not yet officially recognized by the government. They number about 200.

WAND OF MERCURY. See DIVINING Rod.

WANDERING CELLS, or PHAGOCYTES. See PHAGOCYTOSIS.

WANDERING JEW, a traditional personage. See JEW, THE WANDERING.

WANDERING JEW, The, was one of the most popular of the long series of widely and eagerly read novels that gave Eugene Sue a foremost place among the novelists of the middle period of the 19th century in France. It remains, with the Mysteries of Paris*, the only one that still continues to find readers. It appeared as a serial in the newspaper Le Constitutionnel (1844-45), and created something of a sensation, provoking by the abundance of controversial matter it maintained a great deal of discussion, both bitter attack and ardent defense. It returned to those lower regions of Paris life and to those pictures of wretchedness and crime for which not long before the public curiosity had been excited by the Mysteries of Paris*, and exploited the then prevalent interest in social reforms, in the amelioration of the condition of labor and the elevation of the proletariat. It was thus a vehicle for the dissemination of the generous theories and dreams of Thiers, Leroux and others. It exhibits with realistic detail the intolerable lot of the working classes, especially of the women, and elaborates a program of profit-sharing, of community living, and of other industrial improvements. It also attacks the abuses to which certain institutions were liable, such as private asylums for the insane, convicts, etc. In these respects Sue was a forerunner of Hugo and Dickens. But these elements are submerged in a rushing torrent of melodramatic blood and thunder. A multitude of actors struggle in a world-wide web of intrigue relentlessly spun around them by the subtle cunning of the arch villain, Rodin. The means for his iniquities Sue represents as furnished by the vast, secret and perfectly disciplined organization of the Jesuits, of whose society he is a devoted but unselfish member. So the book added to its other interests that of a violent attack on the Jesuits, at that time the objects of much suspicion and of drastic repressive measures in France, Switzerland and elsewhere. The legendary figure that gives the novel its title plays an occasional and unimportant role in the story, intervening once or twice in the action, but for the rest serving only as a vague symbol of the restless striving that is the lot of poor humanity. If the book is still read, in spite of so much in its matter that no longer interests us to-day, and also in spite of its inordinate length of more than 1,200 closely printed pages, it is because the story is told with real art and the pictures are drawn with vividness and color. It is accessible in English translation.

ARTHUR G. CANFIELD.

WANDERING JEW, a name applied to various plants—in Great Britain to the beefsteak or strawberry geranium (Saxifraga sarmentosa) and to the Kenilworth ivy (Ligularia cymbalaria). Zebrina pendula, a leafy rapidly growing plant, with lance-ovate leaves glossy and bright green or purplish above with broad silvery stripes, is also known as the wandering jew; it will grow either in sun or shade, or in
water alone. Another wandering jew is a spiderwort (q.v.).

WANDERLY, João Mauricio, Baron Cotegipe, Brazilian statesman: b. Barro do Sal, São Francisco do Pacifico Museum, Brazil, 23 Oct. 1813; d. Rio de Janeiro, Brazil, 13 Feb. 1889. He studied law and soon entered politics, joining the Conservative party, and from 1842 was repeatedly elected deputy. In 1856 he became senator, holding the office until his death acting as president of the body in 1882 and 1885. He was created a baron in 1868, was Minister to the Platine republics in 1870, and concluded the treaty of peace with Paraguay. He was a Cabinet officer in nearly all the Conservative cabinets and in 1883 organized the ministry which secured the general emancipation law.

WANDEROO, or WANDERU, a large monkey (Macacus slerus) of southern India, especially the country bordering the Malabar Coast. The wanderoes have long, slim bodies, covered with black hair, and tufted tails. The head looks very large, because of a mane, or ruff, and beard, which sticks out around the face, and is either gray or white, enhancing the sly look of the broad face, dull eyes and broad muzzle.

The name is also given generally to monkeys of the genus Semnopithecus. S. urinus is the great wanderoo of Ceylon, and Eastern zoologists often restrict the name to this species alone. They live in small classes or groups of a few dozen individuals, are very intelligent, and make more agreeable pets in captivity than most monkeys. The gray beard and solemn mien gives them a venerable appearance sharply contrasting with related species.

WANDSWORTH, wandz'warth, London, England, a metropolitan and parliamentary borough on the south side of the Thames. Area, 9,107 acres (the largest of the London boroughs). It includes the districts of Putney, Clapham and Streatham. Wandsworth proper is situated close to the Thames, near the mouth of its small tributary, the Wandle, and is built between and on the slopes of two hills. New Wandsworth, a suburb of recent growth, lies to the east and south of both stretches of Wandsworth Common, beside which are the Surrey County prison, the county lunatic asylum, etc. It was the site of a French Huguenot settlement after the revocation of the Edict of Nantes, when important industries were introduced. Paper making, brewing, hat making and dyeworks are among the manufactures. Pop. about 311,360. Consult Arnold, 'History of Streatham' (1886); Grover, 'Old Clapham' (1887); Coward, 'Wandsworth and Putney'; with a 'Chapter on Pre-Historic Age' by F. Lawrie (1893); Hammond, 'Bygone Wandsworth' (1896), and 'Bygone Putney' (1896); Jackson, 'Putney: Past and Present' (1883); Mitton and Geilke, 'Putney, Hammer-smith and Fulham' in 'Fascination of London' Series (1903); Morden, 'History of Tooting Graveney' (1887); Rudolf, 'Clapham before 1700 A.D.' (1904).

WANG SHIH-FU, Chinese dramatic poet. He lived in the 13th century, was the creator of the Chinese opera 'Thsa-Khi, and composed 13 plays, of which only two survive. The 'Hsi Hsiang Chi,' or 'Story of the Western Pavilion'</p>
by the master, into its true domain of practical ethics. This achievement of Wang in the realm of thought ranks him, relatively, among the great masters of Eastern thought, with the great masters of Western thought, Augustine, Luther, Calvin and Kant; for his teachings have revolutionized the thinking of a fourth of a human race. Yet so far from being a man of books and study only, Wang was a man of action and general, whose victorious campaigns over the rebels in southern China fill a brilliant page in the history of the empire, under the Ming dynasty (1368–1644). Descended from a long line of military heroes and scholars, Wang saw the light on the 30th day of the ninth month a.d. 1472. The usual portents attending the birth of a great man are related by his biographers. Unable to speak until five years of age, he astonish ed his grandfather by then repeating the contents of his books, saying, "I remember what I heard you read." With his father, he visited the capital and surprised the elders with his poetic ability. Besides training in horsemanship, archery and military arts, he became adept in the system of the Taoists and Buddhists, being made at 28 a member of the Hanlin or Imperial Academy. After appointment to higher offices and further study of Taoist and Yoga doctrines, he built a home near the Yang-ming grove, resigned office and lectured to the students who flocked to his chair. Made inspector of the army, he shielded faithful officers, but thereby fell into disfavor with a powerful eunuch at court. He was exiled and lived for some time in the mountains as Kweichow, here receiving the great enlightenment—the duty and delight of investigating things for the purpose of extending knowledge—and wrote a commentary on the Five Classics. Restored to honors, rank and office, he put down the rebels in southern China, thereby greatly extending and consolidating the empire. During his prolonged activities in the field, he never ceased his meditations or discourse on the great problems of faith, life, duty and the ideals of conduct. Yet despite his military success and civic honors, his jealous enemies charged him with heterodoxy, and the heresy-hunters poisoned even the mind of the emperor against him. In time, however, imperial favor returned. He was made viceroy and loaded with fresh honors, his disciples multiplied and the voices of slander were hushed. After the last of his victories he established a college for the subdued people. Worn out with his manifold labors, he visited his ancestral temple, ordered his coffin made, and in full possession of his faculties, with parting words to his disciples, closed his eyes in death, at the age of 57. His body was reverently washed and arrayed for burial by his disciples and "the noise of weeping shook the earth." He was buried at Hungchi, a few miles from Hangchow (q.v.). Posthumous memorials, in defense of Wang's orthodoxy and in praise of his virtues, were sent to the emperor. Thousands of his followers came to his tomb to mourn. Posthumous honors were awarded by imperial edict in 1567 and again in 1583, when the emperor commanded sacrifice to be made to the Teacher (Wang) in the Confucian Temple, after the manner of the Chooi. Beyond this, higher honors to a subject could not be paid. Wang's effigy is still preserved in many temples in China. In Japan his philosophy received relatively wider acceptance and thus mediately, through Japan, the Chinese intellect was re- fertilized in our own day to the renovation of his own country. Consult 'The Philosophy of Wang Yang-ming' (translated by Prof. F. G. Henke, Chicago 1916).

**WANZIE,** wŏn'taj, England, a market-town in Berkshire, in the fertile vale of the White Horse, 15 miles south-west of Oxford. There are an interesting old church, a town-hall, corn exchange, grammar school and cottage hospital. Iron and brass founding and the manufacture of bagging and jute goods are carried on. King Alfred, to whom there is a statue by Count Gleichen, erected in 1877, was born at Wantage, as was also Bishop Butler. Pop. 3,628.

**WANZ RIVER.** See *CAPE RIVER.*

**WAPAKONETA,** wă-pa-kŏn'-ēt'sa, Ohio village, county-seat of Auglaize County, on the Auglaize River and on the Cincinnati, Hamilton and Dayton Railroad, about 80 miles south of Piqua and 13 miles south-west of Lima. It is in an agricultural region and in the natural gas and petroleum belt. The place was visited by whites in the early part of the 19th century and some settlements made. It was laid out as a village in 1833. Where the village now stands was the site of an Indian village of importance, the meeting place of certain tribes. In 1831 it was the scene of the signing of the treaty whereby the Shawnees and Senecas relinquished their lands to the government. Wapakoneta was the last place in Ohio occupied by the Indians. The chief manufactories are furniture, wagons, carriages and carriage wheels, machinery, refrigerators, woodworking machinery, etc. There are three banks, two national and one private, and one daily and two weekly newspapers. Pop. 6,000.

**WAPELLO,** wa-pel'lo, Iowa, town, county-seat of Louisa County, on the Iowa River and on the Burlington, Cedar Rapids and Northern Railroad, about 25 miles north of Burlington and 20 miles south of Muscatine. It is in a rich agricultural region in which the principal products are wheat, corn, vegetables and fruit. Considerable attention is given to stock-raising. The manufacturing establishments are flour and lumber mills, fruit and vegetable canneries, agricultural implement shops and creameries. The town makes large shipments of grain, canned goods, hay and livestock. There are two banks, one State and one private, and two newspapers. Pop. 1,532.

**WAPENTAKE,** or **WAPENTAC,** in England, an ancient county among some of the northern shires, still retained in Yorkshire. It corresponds to the "hundred" of the southern counties. The word means "weapon-touching" and refers to the custom of the chiefs of a particular district meeting at a certain day at a specified spot, when the head chief, alighting from his horse, raised his spear in the air, and the inferior chiefs, also on foot, touched this spear with their lances, and so acknowledged their fealty.

**WAPINSCHAW,** or **WAPENSHAW,** (A. S. wæpen, a weapon; sceawan, to view, to look at — lit, a weapon-show), a review of persons under arms, formerly made at certain
times in every district of Scotland. The name is now familiarly applied to a gathering of the volunteer corps of a district for purposes of inspection, for shooting, etc. The Wapsinschaw, or periodical gathering of the people for the purpose of exhibiting their arms, was ordained by various Scots statutes of the 15th and 16th centuries, which directed each individual to be armed on a scale proportioned to his property. In the time of war or rebellion, proclamations were issued charging all sheriffs and magistrates of burghs to direct the attendants of the respective wapsinschaws to join the king's host. During the reign of the later Stuarts, attendance on the wapsinschaws was enforced with considerable strictness; and in addition to military exercises, sports and pastimes were carried on by authority at these gatherings. The Covenanters, disapproving of the sports at these gatherings, did what they could to discourage attendance.

**WAPITI**, an Indian name of the great North American deer (*Cervus canadensis*), known in the West as "elk," but more like the red deer than the European or true elk (q.v.). It formerly ranged from the mountains of the Carolinas to lat. 56° to 57° N., but is now nearly extinct, except in the northern Rocky Mountains. It is closely allied to but considerably larger than the stag, standing about 64 inches at the shoulder; yellowish brown on upper parts; sides gray, long coarse hair in front of neck; antlers large, often exceeding four or even five feet in length; browine duplicated. In the Northwest it is represented by several related species, but the Eastern wapiti seems doomed to extinction, except as bred in captivity. During the winter these noble animals gather in large herds and feed on the open hills. The antlers are shed about March and the new ones are complete by September. The bucks fight fiercely and not infrequently with mortal results at the pairing season; and the stronger ones are polygamous, gathering into their herds every available cow and guarding them and the young with jealous care. They eat almost everything of a vegetable nature, leaves and twigs as well as grass and shoots. During the summer, when they are much troubled by mosquitoes and flies, they are fond of entering the water and of wallowing in mud holes. See DEER.

**WAPPÆUS, vá-pá'ósso, Johann Eduard**, German geographer: b. Hamburg, 17 May 1812; d. Göttingen, 16 Dec. 1879. He was educated at the universities of Göttingen and Berlin, and in 1833-34 traveled in Brazil and the Cape Verde Islands. He became a tutor at Göttingen in 1838, was appointed adjunct professor there in 1845, and from 1854 until his death was full professor in the university. His most widely known work is his edition of the Stein-Hörschelmann 'Handbuch der Geographie und Statistik' (1871), of which he wrote the volumes on 'Universal Geography' (1849); 'North America' (1853); 'Central and South America' (1854); 'Europe' (1855); 'Africa' (1856); 'Asia' (1857); 'Australia' (1858); 'Oceania' (1859); 'Antarctica' (1861); 'Arctic' (1862). His other writings include 'Untersuchungen über die historischen Entdeckungen der Portugiesen unter Heinrich dem Seefahrer' (1842); 'Deutsche Auswanderung und Kolonisierung' (1846); 'Allgemeine Bevölkerungsstatistik' (1859-61), etc.

**WAPPATOO**, an aboriginal name of the root of the common arrowhead (*Sagittaria latifolia*) which was a favorite food of the North American Indians.

**WAPPERS, väp-är, Gustav, Baron**, Belgian painter: b. Antwerp, 23 Aug. 1803; d. Paris, 8 Dec. 1874. Educated at the Art Academy of his native city under Van Bree and Herreyns, he went to Paris and devoted himself to copying the masterpieces of the Venetian School and subsequently studied the style of Rubens, Jordaens and the Flemish painters. He made his first great hit in 1830 by a large picture representing the 'Burgomaster Van der Werf of Leyden in the Spanish Siege.' Wappers surrounded himself with a number of young painters and under the enthusiasm he kindled a new school of Belgian painting came into existence. In 1832 he was appointed professor and eight years later director of the Art Academy of Antwerp; from 1846 to 1853 he was president of the Belgium National Museum and in 1847 was ennobled. Among his principal pictures are 'The People of Brussels Tearing up the Proclamation of Prince Frederick' (1835, in the Museum at Brussels); 'The Entomologist' (1836, formerly in St. Michael's Church, Louvain); 'The Madonna in Clouds Surrounded by Angels' (1838); 'Charles IX Shooting at Stag Hounds'; 'Anne Boleyn Taking Leave of Elizabeth'; 'Boccaccio Reading His Decameron to Joanna of Aragon'; 'The Capture of Rhodes by the Turks,' etc.

**WAPPINGER ('the east'),** a confederacy of the Algonquian stock of North American Indians formerly occupying the territory extending eastward from the Hudson River, between the neighborhood of Poughkeepsie and Manhattan Island in New York to the valley of the Connecticut River in Connecticut. They were closely related to the Mohicans, and by most authorities are regarded as having been a part of them. The component tribes of the Wappinger confederacy were: (1) the Wappinger, which formed the principal tribe and which occupied Dutchess County; (2) the Wappinger Kill; (3) the Requaawancas; (4) the Sixquesheegs; (5) the Sixquans; (6) the Tankiteses; (7) the Nochpeams; (8) the Chawano; (9) the Susquahans or Mattabessacs. As Connecticut became colonized by the whites, the eastern tribes of the confederacy, losing their lands and almost dwindled away, the survivors finally joining the Indians at Scaticook, Conn., and Stockbridge, Mass., while a few went to Canada. The Hudson River tribes became involved in war with the Dutch colonists in 1640, which continued for five years, the Indians losing 1,600 of their number and the Wappingers being the chief sufferers. The survivors retained their tribal customs until 1756, and continued to occupy a tract in Westchester County, when most of them joined the Nanticokes, then living under Iroquois protection at Chenango, near Binghamton, N. Y., and finally became merged with the Delawarees. Some of them also joined the Moravian and Stockbridge Indians, while a few still remain in Dutchess County just before the American Revolution.

**WAPPINGERS (wáp'ın-jërz) FALLS, N. Y., village, Dutchess County, on Wappinger Creek, about two and one-half miles from its**
mouth at New Hamburg and seven miles south of Poughkeepsie. It is connected with Poughkeepsie by an electric line, and has the advantage of the steamer traffic on the Hudson. The river port used by the village is New Hamburg. The name of the village is that of a tribe of Indians who once lived in this section. The creek here falls over a series of high ledges which form picturesque cascades, and also furnish water power for several manufactories. The chief industrial establishments are print-works, established in 1834; overall and sheeting factory, machine shop, grist mill and creameries. The village has a union school, public and parish elementary schools and a school library. There is one bank and a newspaper. Pop. 3,742.

WAR. The last resort for the settlement of disputes is the appeal to physical force, whereby the weaker is either compelled to yield to the demands of the stronger, put to flight, or, in the last extremity, slain. War is resorted to either for advantage or for vengeance. The one party possesses something which the other has resolved to seize, or has inflicted some real or supposed injury on the other, which he determines to punish by the execution of a corresponding chastisement. War and law are quite opposed to each other, but while opposed they are also related. The ultimate means of enforcing law is by physical force, but in every society the aim of law is to put down every appeal to force except on the part of the magistrate, and equally to restrict his use of it to the enforcement of the law. Where there is no organized society, every individual family, or group, enforces its own claims and appeals to force are consequently frequent, but as society extends its organization these partial appeals to force are declared illegal and put down. But the society, however extended, is still partial; outside of it exist other societies with independent laws and different interests. Between these, disputes are liable to arise, which, failing mutual accommodation, can only be settled by force. In each society, moreover, the central authority is liable to vicissitudes of strength. When it is active and vigorous, the whole society is kept in equilibrium and repose; when it is weak or idle, private或party interests assert themselves, the laws are disobeyed and the central authority may be defied and overthrown. Thus, three conditions of warfare arise according to the degree of organization of society: the state of private war, when no great central authority has been established, or when it has been wholly destroyed; the state of civil war, when such an authority, having been established, has decayed, and the society arranges itself in different parties for the purpose of maintaining the old or establishing a new central authority; and the state of international war, when states sufficiently powerful to control their own subjects quarrel among themselves. In each of these states war is conterminous with and opposed to law.

The aim of law is always to control war, and either suppress it or render it subservient to its own enforcement or re-establishment; the aim of war is either to supplement the impotence of law or accomplish some object forbidden by it. Hence the peculiarity of all laws relating to war. They are fluctuating in their nature, because the power to enforce them is frequently wanting; yet they are necessary and in the end efficacious, because force can be applied in favor of law as well as against it, and it commonly becomes the interest of society in the long run to apply it. It follows also from these conditions that as there are three states of warfare, so there are three relative states of law opposed to them: international law is opposed to international war, national law to civil war, and natural law to private war. In each case law forms the boundary of war and war of law, so that where one is strong the other is weak. International law may thus be defined as consisting of those common principles which still continue to be recognized and observed by beligerents. The persistent disregard of any principle of law by a beligerent would annihilate it as a principle of international law, and as the beligerent has already set the power of its immediate antagonist at defiance, the only considerations which can enforce its observance of an international law are its own respect for its principle, or its fear of the power of neutrals. In like manner national law is opposed to and limits civil war. In so far as either party sets the national law at defiance the law is abrogated and can only be re-established by force; in so far as it is observed it controls the acts of both parties. Private war is opposed by natural law because there is no positive law recognized by the parties. Violence is limited only by the power of conscience of the beligerents.

During the Great War of 1914 practically the entire industries of the nations involved were diverted from the usual channels to the one great task of keeping the armies in the field supplied. Great science and skill are applied to the conduct of military operations and the principles on which they ought to be conducted are carefully investigated in the light of experience. In the progress of society certain usages of war have come to be generally recognized. These have varied greatly at different times and in different countries, but the changes in them have been in the interest of humanity. The Hague tribunal has done much to codify these rules of warfare and to make their acceptance more general. Prisoners of war are no longer put to death, nor are they reduced to slavery, as was frequent in ancient times; and their treatment has become increasingly mild and kind. Quarter is now generally granted in battle whenever it is sought, although in the late war it was at times found almost impossible to grant it due to the necessity of detailing men to conduct prisoners to the rear, thus depleting the forces for attack. A state of war is ended by armistice, treaty or conquest, although it is more true to say that hostilities are brought to an end by an armistice while a state of war continues until a treaty of peace is signed and ratified by the beligerents. WAR. Censorship of the,—War, Civil.

One of the many paradoxes of the Great War fought for freedom and democracy against autocracy and irresponsible authority was, that the democratic champions were themselves compelled, for the purposes of their war of liberation, to adopt many of the methods and principles against which they fought. In all the belligerent countries, in democratic America as in autocratic Germany, there was built up a vast bureaucratic machinery, a virile college of propagandists, having for object the shaping of political opinion by the centralized government. This result was achieved mainly by manipulating the dissemination of information; autocratic and generally secret bodies deciding that the knowledge of such and such facts should be withheld from the public, such and such other facts emphasized and perhaps especially prepared for their consumption. In this way governments were in a position to determine the opinion of their citizens through control of the knowledge on which such opinion was based. This was the method, in all its purity, pursued by Prussia for so long, the very cornerstone of the system which gave the conscience of her people into the keeping of her government, and made possible certain moral results which appalled the world.

The official justification of a censorship as it affected both the individual and the press of the Entente countries was that its object must be realized if the war was to be won. This object was threefold: To prevent information of military value from reaching the enemy; to prevent information for the home government; and to check the dissemination of information useful to the enemy or prejudicial to the home government. In the course of the war it became apparent that in the censorship there lay ready to hand a weapon, the full value of which was perhaps not anticipated prior to the war. It was used to restrict commercial and financial transactions intended for the benefit of enemy governments or persons residing in enemy countries.

As might be anticipated the censorship regulations of the several belligerents differed somewhat. In Germany, due to the predominance of the military caste, the press afforded no problem, nor indeed in France. On the pretext of preventing the leakage of military information, Germany established a censorship which was constantly employed for the suppression of opinion and the stifling of political criticism. Foreign correspondents, in the early years of the war at least, were permitted to visit the advanced German lines, but their dispatches were subjected to the stringent regulations of the military authorities, and persons so visiting the fronts were not permitted to leave Germany before a period of six weeks had elapsed.

One of the results of the German censorship was the dissemination within Germany of a considerable body of clandestine literature, most of which originated among German revolutionists in neutral Switzerland. In La Liberté, Belgium, where the German censorship was more rigorous than even in Germany itself, Belgian journals were smuggled in and important passages were copied and circulated by underground routes. The most interesting and significant of these secret journals was Le Liberté Belge, which the German authorities were unable to suppress despite the utmost vigilance.

France issued no licenses to correspondents, and for a long time England permitted but 12 American correspondents to remain in London! Newspaper men found soon after the outbreak of war that the day of glory for correspondents had passed. Belgium was the only country that made any exceptions in this matter, but the part of Belgian territory that remained unoccupied by the enemy was so small that this action afforded comparatively little relief.

With countries like England and the United States having numerous routes of trade and communication always open to correspondence the censor was not as simple as in France and Germany; yet England moved 100,000 men to the Continent without any news of it reaching the public. To the press itself belongs the credit for this silence. The government was then unprepared for the exercise of censorship and the press itself was the governing factor in the matter. Later the British censorship was developed to a high state of efficiency and rendered excellent service despite many tactical blunders.

In this connection, it may be noted that news of the heroic stand of Britain's troops at the first battle of Ypres was not permitted to reach the public for four months after the event, and then its appearance was due to the patriotism of Lord Northcliffe who was willing to incur the displeasure of Kitchener and the War Office that England might learn of the heroic conduct of her sons.

American military censorship in France and other countries in which American troops operated was exercised by a department of the army's secret service and the little manual entitled 'Field Service Regulations,' defined the rights and limitations of war correspondents as guaranteed and decreed by the War Department. The American system worked great hardships on the correspondents; the personnel of the military censorship bureau often performed themselves in a vindictive manner toward certain correspondents who had ventured a protest against the methods of the censor. At home, the Committee on Public Information, headed by George Creel, was in effect a board of censors without a censorship, since it controlled the press through its control of the news sources it was as complete as that of any of the warring nations. The American press, however, imposed upon itself a voluntary censorship in agreeing to the suppression of all matter which might be of aid to the enemy.

The committee above named was not content to advise with publishers and writers in the administration of this voluntary censorship.

WAR, Civil. See United States — Causes of the Civil War, Military Events of the Civil War, Political Events of the Civil War, Etc.
WAR, EUROPEAN, the great conflict, brought to an end in 1918, changed not only the horizons of statesmen, but opened every interest and character of human life. It created a gigantic upheaval among the hitherto accepted fundamental principles underlying government, law, international relations, democracy, freedom, commerce, industry, finance, labor, etc. Over a score of throned peoples and their former occupants sought security in exile. Revaluations and restatements have become necessary in all fields of endeavor. The conflagration in 1918 involved 93 per cent of the world’s population, the countries classify as neutral had a combined population of only 130,000,000 whereas the countries which participated in the war had a combined population of over 1,700,000,000.

The war also brought to the front the eminent men of all nations; many of them new to fame, but whose names have now become household words. The biographies of these will be found under their respective names. The campaigns and battles brought to prominence nations, provinces, rivers, and localities previously little known. Descriptions are found in their proper places throughout the work.

In this section there is presented a complete general statement written by competent scholars and authorities on the causes, course, and determination of the war, showing every phase of the political, military, naval, economic and administrative aspects—a scientifically developed and connected history of events, together with a number of articles showing how the war has affected modern life. The subject divisions of this department are as follows:

1. Historical Introduction
2. Diplomatic History
3. Chronological Survey of the War
4. Fighting Strength of the Nations
5. Military Operations on the Western Front
6. The Eastern Front
7. Italian Campaign
8. Colonial and Japanese Campaigns
9. Turkish Campaign
10. Balkan Campaign
11. Naval Operations
12. Aerial Operations
13. Armistices and Conventions
14. Events Subsequent to the Armistice
15. Diplomatic Negotiations during the War
16. General Pershing's Report
17. The Peace Conference
18. The Peace Treaties

1. HISTORICAL INTRODUCTION.

Wars are invariably concerned with issues of great magnitude, although they frequently arise from unimportant circumstances. This is especially true of the European War which broke out in 1914. It would be rash, however, to describe any—or even all—of the political events of the past as "causes" of the war: they were incidental circumstances contributing to an event which, when it came, was extremely probable. The direct cause of the war was the German ultimatum to Russia on 1 Aug. 1914; it was that which converted a local quarrel between a first-rate and a fifth-rate power into a world-wide conflict. The critical situation was created by the murder of Archduke Franz Ferdinand of Austria and his wife at Sarajevo on 28 June 1914. Turning from direct to oblique causes, it will be found that these had been smoldering beneath the visible surface for many years and only needed a slight breath to produce a gigantic conflagration. History that is still in the making or is not yet crystallized gives rise to a confused mass of controversy and contradiction; each participant "hath his quarrel just," and the student of current events is largely cast upon his own resources and inclinations to form a judgment from the conflicting material at his disposal. Certain outstanding features of the past may, however, serve as a guide to read the riddle of the times in which we live.

Perhaps the most prominent of these features is the marvelous rise of modern Germany since its unification in 1871. The excellence of the educational system of the German people, their technical training, scientific research, and machine-like precision had all contributed to make them the most formidable competitors to the older and more slowly-moving nations of Europe. Economy in production and skillful labor enabled them to flood the markets of the world with their wares; in the chemical industry they were almost supreme; in shipbuilding and machine construction they rivaled Great Britain; their financial standing was of the highest; German capital stood behind the greatest enterprises, and magnificent German ocean steamships ploughed the Seven Seas. In short, Germany was in a fair way to conquer the world by the peaceful arts of commerce and industry. Above all, the German army was regarded as the greatest and most efficient fighting machine on earth, while the ever-growing German navy, created in 15 years, stood second only to the British. German settlers and commercial branches of German firms—as well as banks—were scattered throughout the five continents, and German blood flowed in the veins of nearly all the European royal families.

The ubiquitous penetration and expansion of Germany became a world wonder; her real and most profitable colonies were the countries she had never owned.

Increasing prosperity not unnaturally begat ambitions and aspirations which overflowed the narrow confines of artificial frontiers, and this appears to have been the case with Germany. Her leaders of thought had for many years emphasized the patriotic doctrine of German superiority and greatness. They argued, not without reason, that a nation which had achieved so much in the past was both capable and worthy of greater achievements in the future. Many of Germany's severest foreign critics ascribe a large share of responsibility for the war to the influence of Treitschke, Mommse, Nietzsche, Frobenius, von Bernhardi and Count Reventlow. Each of these was an exponent of the gospel of force, of the survival of the fittest among nations, and of the natural predominance of the strong over the weak. Treitschke, paraphrasing what Luther said 400 years earlier, described war as the "draconian life-saving method of the German race"; he taught that the hope of banishing war was not only meaningless but "immoral," and that its disappearance would turn
the earth into a great temple of selfishness. He also expressed the utmost contempt for the "idea of British Empire." Nietzsche instilled a new beatitude, "Blessed are the war-makers, for they shall be called, if not the children of Jahve, the children of Odin, who is greater than Jahve." Mommens preached hatred of England in his historical lectures and Count Reventlow and other writers issued pamphlets and articles aimed mainly or entirely against Great Britain. German fiction abounded in thrilling narratives of successful wars against England. Professor Delbrück compared the historical development of England with that of Holland, which, "without ever having been overcome in war, sank in the course of a single generation from the position of a great power to a state which is scarcely mentioned in history." In his sensational book, "Germany and the Next War" (1911), General von Bernhardi weighed up the possibilities of a European war with remarkable accuracy and stated that Germany must acquire more possessions in Africa — if necessary, at the cost of such a war. Years ago General von der Goltz wrote that "the prediction of a final struggle to assure the existence and grandeur of Germany is not a mere fancy born in the minds of ambitious fools, but that it would come one day inevitably, violently and serious as is every decisive struggle between peoples of whom the one desires to have its superiority over the others definitely recognized." In 1900 a book appeared in Berlin entitled "German als Zwanzigsten Jahrhunderts" ('Germany at the Beginning of the 20th Century'), in which the writer states: "We consider a great war with England in the 20th century inevitable." On Jan. 18, 1900 the Koloniale Zeitschrift remarked, "The old century saw a German Europe; the new one shall see a German world." Two months later (28 March) the same journal said, "In the history of the world the 20th century will be called the German century." In "The Reckoning with England" by C. Eisenhart (Munich 1900), we are shown how Germany first destroys the Japanese navy, and afterward, while Great Britain is fighting Russia in Asia, Germany destroys the British fleet; finally, the insolence of the United States is punished by their utter defeat. Whatever weight might be attached to such bellicose utterances, their sources and the unanimity of sentiment pervading them could not fail to attract respectful attention. Even so high an authority as Prince von Búlow, then imperial chancellor, spoke in the Reichstag on 10 Nov. 1912 of "the determination of Germany to make its strength and capabilities prevail in the world." So long ago as 26 Sept. 1898 the Kaiser himself proclaimed in the Stettin that Germany's future lay upon the water, while the year before (18 June) he had declared in a public speech at Cologne that "the trident (of Neptune) must be in our fists." Reduced to simple terms, Germany aspired to become a "Weltmacht" or world power with extensive overseas possessions such as the British Empire is composed of. To promote this object the Bismarckian doctrine of "blood and iron" was deeply imbedded into the minds of all people by the ruling military caste. The German Navy League (Flottenverein) carried on a nation-wide propaganda by lectures and cinematograph shows, while the members of the Pan-German League (Alldeutscher Verband) supplemented the campaign with pamphlets bearing such titles as 'The Fatherland in Danger?'; 'The British Peril'; 'The Next War,' etc. Throughout the agitation we invariably find Great Britain staged as the background of the scene. (See PAN-GERMANISM). The clearest explanation of this phenomenon was perhaps that of the late Joseph Choate, former United States ambassador to Great Britain: "But there was, and is, one insuperable obstacle in the way of this magnificent dream of a future world empire for Germany, and that is the accomplished, existing, actual world empire of Great Britain, of which England is the heart; and unless this obstacle can be removed, so that it shall never stand in the way again, the grand ideal of Germany's future can never be realized." Having thus far traced the fundamentals of German policy as proclaimed by Germany's representative spokesmen and revealed in her popular literature, it must be added that there existed two widely-differing schools of thought as to procedure in bringing that policy to fruition. While the militant section favored the forcible abolition of the British Empire, the other and more moderate point of view advocated a "working arrangement" with England, whereby the British Empire should be left intact and Germany given a free hand to expand elsewhere. Under the terms of such an understanding, according to Bernhardi's interpretation, England would have had to give up her claim to a predominant position throughout the world and recognize that Germany possesses equal rights, side by side, with her, and to agree beforehand to "any increase of Germany's power on the continent of Europe; to any possible change of the map of North Africa; to offer no opposition to Germany's economic expansion in Asia Minor, and no longer oppose the development of Germany's sea power by any movement of the cruiser fleet." In such an agreement, he believed, would assure European peace, and that a powerful counterpoise would be created to the growing influence of the United States. The result would have been the formation of an Anglo-German bloc against England and Germany, but for all civilization; but the basis of all negotiations between the two countries "would have to be the demand that England would have to leave the Triple Entente." When, however, the writer asked him- self the question, whether it was likely that England would enter upon such an agreement with Germany, he answered it with an "unconditional no." "Our Future: A Warning to the German Nation," 1912, of coalit stations, "The contrary to general outside opinion, the Germans are not essentially a warlike race; it was the stern Prussian military system that converted them into excellent fighting material. One must distinguish between Prussians and Germans. The former are a mixture of Slav and Finnish compounds, with a groove-like genius for unimaginative bureaucracy; the latter an industrious, peaceful and docile race. As one authority puts it, the Prussians are the best machine in the world, and their machine was all Germany." Certain it is that no nation was so thoroughly and scientifically prepared for war as Germany. The Germans are a prolific race, and oversea colonies were
considered a vital necessity for their growing population. Large numbers emigrated every year to other countries. Transplanted on foreign soil, these were entirely lost to the homeland within two generations, losing their nationality and not infrequently their mother tongue unless they settled in German-speaking communities. Few did that. Emigration, however, had fallen off considerably during recent years before the war, owing to industrial progress at home. Some German authorities have even asserted that economic conditions and domestic aspirations were not the reasons for German emigration, in proof of which statement they pointed to the enormous number of foreign laborers, Italians, Hungarians and Russians employed in the country in normal times. But although the Germans were over 100 years too late to join in the scramble for colonial possessions and did not enter the lists until long after Spain, Portugal, Holland, France and England had staked out the best claims, they were nevertheless fairly successful in acquiring territory. During about 16 years of colonial activity (1884-1900) the German Empire was able to annex some 1,028,020 square miles of territory with an estimated native population of about 12,000,000, in addition to the Atlantic-Herero territory in central Africa. In 1911 over 107,000 square miles of African (Congo) territory with a million population. The total number of Germans and other whites scattered over their colonial empire barely exceeded 23,000, composed mainly of troops and officials. The reason of this was the fact that desirable German emigrants had always exhibited a strong predilection for the English-speaking lands, while large numbers of them also settled in South Africa, South Africa and all the European countries—everywhere excepting in German colonies. Thus it appeared that German colonial acquisitions even at the average rate of 70,000 square miles per annum failed in the primary object of providing new homes for German severs, although it must be conceded that former German East Africa (Dar-es-Salam), was the only possession that offered any attractive prospects; all the others were too distantly isolated, undeveloped, or possessed of frontiers so diverse and so obtained all her former colonies while she had no navy; and those she had acquired, as Bernhardi confessed, "in agreement with England. Since 1900, when the German Navy Bill for doubling the strength of the fleet was introduced and passed, the only colonial addition to the empire consisted of the French Congo cession already mentioned, given by way of "compensation" over Morocco (q.v.). Up to the last few years of the 19th century we find Great Britain aiding the expansionist aspirations of Germany. The kaiser's telegram to President Kruger on 3 Jan. 1896 marks the turning point in British policy and the transformation of British sentiment toward Germany. The violent epidemic of Anglophobia which swept over Germany during the South African War gained the popular support for the Navy Bill, the preamble to which set forth that "Germany must have a fleet of such strength as to enable her to take the initiative in a war with her would involve such risks as to jeopardize its own supremacy." Not unnaturally, the British people read in the measure a direct challenge to themselves. Subsequent waves of Anglophobia spread in Germany during the Morocco crisis in 1906, the Austro-Serbian crisis of 1908, and the Agadir incident of 1911. Fresh navy bills were introduced after each of these events, with England ever held up as the danger point. There was no secrecy about German ambitions; they were very few did that. Emigration, however, had fallen off considerably during recent years before the war, owing to industrial progress at home. Some German authorities have even asserted that economic conditions and domestic aspirations were not the reasons for German emigration, in proof of which statement they pointed to the enormous number of foreign laborers, Italians, Hungarians and Russians employed in the country in normal times. But although the Germans were over 100 years too late to join in the scramble for colonial possessions and did not enter the lists until long after Spain, Portugal, Holland, France and England had staked out the best claims, they were nevertheless fairly successful in acquiring territory. During about 16 years of colonial activity (1884-1900) the German Empire was able to annex some 1,028,020 square miles of territory with an estimated native population of about 12,000,000, in addition to the Atlantic-Herero territory in central Africa. In 1911 over 107,000 square miles of African (Congo) territory with a million population. The total number of Germans and other whites scattered over their colonial empire barely exceeded 23,000, composed mainly of troops and officials. The reason of this was the fact that desirable German emigrants had always exhibited a strong predilection for the English-speaking lands, while large numbers of them also settled in South Africa, South Africa and all the European countries—everywhere excepting in German colonies. Thus it appeared that German colonial acquisitions even at the average rate of 70,000 square miles per annum failed in the primary object of providing new homes for German severs, although it must be conceded that former German East Africa (Dar-es-Salam), was the only possession that offered any attractive prospects; all the others were too distantly isolated, undeveloped, or possessed of frontiers so diverse and so obtained all her former colonies while she had no navy; and those she had acquired, as Bernhardi confessed, "in agreement with England. Since 1900, when the German Navy Bill for doubling the strength of the fleet was introduced and passed, the only colonial addition to the empire consisted of the French Congo cession already mentioned, given by way of "compensation" over Morocco (q.v.). Up to the last few years of the 19th century we find Great Britain aiding the expansionist aspirations of Germany. The kaiser's telegram to President Kruger on 3 Jan. 1896 marks the turning point in British policy and the transformation of British sentiment toward Germany. The violent epidemic of Anglophobia which swept over Germany during the South African War gained the popular support for the Navy Bill, the preamble to which set forth that "Germany must have a fleet of such strength as to enable her to take the initiative in a war with her would involve such risks as to jeopardize its own supremacy." Not unnaturally, the British people read in the measure a direct challenge to themselves. Subsequent waves of

The British people had witnessed the wonderful growth of Germany with mixed feelings of admiration and uneasiness. They had seen the German enterprise invade all markets of the British Empire. Unprotected by tariff barriers, the United Kingdom especially was flooded with commodities bearing the legend, "Made in Germany." Yet the British continued to buy German goods because they needed them; because they were cheaper than the home product or because British-made equivalents did not exist. Until quite recent years, indeed, England was entirely dependent upon Germany for the carbons used in the search of the British navy. Not only did the energetic Teuton run the conservative Briton close in every foreign market, but had even elbowed him out altogether in some. So far from adopting the
mother country's system of free trade or, more correctly, of free imports, the British self-governing dominions raised protective tariffs, in some cases granting preferential rates to the homeland. The economic necessities of a nation dictate its policy to a greater degree than purely political considerations, and it is in the domain of economics that perhaps one of the principal underlying causes of the war may be found. Nations, like individuals, live by their labor; their purchasing power is strictly regulated by the size of their population, and the greater this population demands increased production, for the disposal of which markets are essential. Great Britain and the United States were Germany's chief commercial rivals; in America she was faced with a formidable tariff wall, while similar restrictions confronted her in the British Dominions. The United Kingdom alone clung to "free trade," but its abolition seemed within measurable distance. The tariff reform and "Reciprocal Preference" campaign inaugurated by Joseph Chamberlain in 1903 gained millions of supporters throughout the empire and at home, and the probability loomed large that the vast territories it embraced would be closed to German trade. For years before the war Germany stood to a critical position in the Zollverein. Bismarck's protectionist policy during the period 1880-91 had evoked reprisals from neighboring nations, and the number of open foreign markets diminished. At the same time Bismarck neglected to create a colonial empire capable of becoming a national receptacle for the over-production at home. An industrial crisis ensued and a stream of emigration followed. Between 1891 and 1907 Germany concluded a number of commercial treaties with other countries and soon began a vast exportation of raw and manufactured products, aided by a flexible but precarious banking system of financial and industrial credit. German banks were constantly being drained by advances to manufacturers and traders, and frequent appeals for foreign capital became necessary. Enormous sums were borrowed from French banks and, to a less degree, from British financiers. Recurring international political crises and rumors of war between 1906 and 1911 instantly closed these sources of fluid cash, and when, on such occasions, the creditors pressed for settlement, the German banks were obliged to pay with real money instead of promissory notes. An instructive object-lesson on the intimate relationship between finance and politics was furnished by the Agadir crisis in 1911. On 1 July the German cruisers arrived at Agadir. Two months later Germany required $12,000,000 immediately, which was raised in the United States at 6 and 7 per cent; in normal times this money could have been obtained in Paris at 3 or 4 per cent. The system of making lavish advances to clients militated against the maintenance of adequate funds in hand, and it was not always easy for German savings banks to meet their liabilities in periods of panic, under the stress of which industry, trade and finance all suffered.

It was from outside, however, that German industry was more directly threatened. Even more than open markets in which to sell her goods, Germany needed an open market from which to buy other essential products, a real "matter of life and death." With ever-increasing commercial and industrial competition to fight against, practically all the progressive countries had erected tariff walls to protect their home industries, but none Kingdom alone excepted. Germany herself was protected by import duties, and when other states adopted like measures to favor their own industries, a conviction gradually grew among the German people that their country was being encircled, hemmed in, and deprived of its place in the sun; that a great conspiracy was afoot to throttle their national existence. In time, England came to be regarded as the instigator of this supposed plot, although the legend did not come into existence until the Anglo-French rapprochement in 1904.

Closely connected with the economic factors lay the question of overseas expansion, of colonization or at least the procuring of colonies by Germany. Bismarck, the creator of the former German Empire, could not foresee the vast industrial nation that would arise on the foundations he had laid. He discouraged colonization in his own country and encouraged it in France and Russia. He had brought Germany to the zenith of her influence at the Berlin Congress (q.v.) and made her the dictator and umpire of Europe. After a victorious war, Russia emerged empty-handed from that historic gathering; Austria, a passive spectator and a potential German ally, was compensated for Sadowa by being presented with Herzegovina and Bosnia and the prospect of an outlet on the Mediterranean via Salonica. With the gates of Constantinople closed against her, Russia turned toward Central Asia, and France, still smarting under her defeat of 1870-71, was skillfully guided into a series of colonial adventures. (See France and the War; Italy and the World War). Germany stood aloof from colonial enterprise. Bismarck made an ally of Austria, embroiled France with Italy in northern Africa and successfully manoeuvred the Italian kingdom into partnership with Germany and Austria to form the Triple Alliance (q.v.). But while this undoubtedly strengthened Germany's position in Europe, Bismarck also made grave errors in sacrificing a colonial empire and making an enemy of Russia. He seems to have realized the latter mistake when it was too late, for he devoted the remaining years of his administration to determined efforts to restore friendship with Russia. At the Conference of Berlin in 1884 Bismarck half-heartedly accepted Togo, Kamerun and Southwest Africa to satisfy public clamor, though in principle he remained hostile to colonial expansion, regarding Germany's real historical mission as anchored in Europe. Between 1885 and the fall of Bismarck in March 1890, Germany acquired her former East African possession and some Pacific island groups. Her colonial expansion ended in 1899; there was no useful unclaimed territory left.

From the seeds sown by the Treaty of Frankfort in 1871 and the Berlin Treaty in 1878, Europe reaped a harvest of tragic results. By

*Her most pressing necessity was iron, as it still is to-day. The German iron-mines are not many years distant from exhaustion; just as a tree may die in the basin of Briley, there is ore enough to last for 250 years.*
the first instrument France lost Alsace and Lorraine; it left behind inercidable sentiment of hatred and revenge and converted Europe into a great armed camp; the second granted an undeserved new lease of life to the Sick Man of Europe and violated that great principle of nationalities which has become the foundation of the polity of Europe. The Serbs were the first of the Balkan peoples to throw off the Turkish yoke in 1804, and when the Bosnians rose in 1875 their kindred in Serbia and Montenegro cheerfully responded to the battle cry against the historic foe. Their victory seemed assured and the freedom of Bosnia accomplished when Austria intervened, and the subsequent Congress deprived Serbia of the fruits of her sacrifice and left Bosnia nominally under Turkish suzerainty but actually in the possession of Austria. Macedonia was handed back to Turkey, and Serbia was left to struggle against a new and powerful enemy, whose road to Salonica she barred by the mere fact of her geographical existence. Austria anticipated into a conspiracy, and Bulgaria in 1885, and was mainly responsible for the second Balkan War of 1913. Two further direct results of the Berlin Congress must be noted: It brought together the two nations which had suffered at the hands of Bismarck—France and Russia—into an alliance which placed Germany, situated in the centre of Europe, between two powerful enemies, one on each border. By saving the Turkish Empire from the Abyssinian and by obligating the Sultan Abdul Hamid II under obligations, with the resulting advantage of the Balkans and Constantinople, and Mesopotamia, and the Persian Gulf. During the 20 years of his rule, Bismarck pursued a cautious foreign policy of conservative expansionism and delivered the position he had won for Germany. His sacrifice of Russia’s friendship at the Congress was unavoidable: he had to choose between better or Russia, though he afterward concluded a treaty which promised him 300,000,000 silver marks, by which means he believed he had isolated France and rendered her innocuous. He had no liking for England, yet he was careful not to endanger friendly relations with that country. If I should discover that we might lose touch with England, he said, I would act cautiously and endeavor to avoid losing England’s goodwill.

Not long after the retirement of Bismarck, German foreign policy began to shape a course that puzzled and not infrequently alarmed the chancelleries of the Old and the New Worlds. Concisely stated, that policy amounted to an insistent demand to play a leading part in the guiding and ordering of international affairs everywhere. With the accession of the new emperor, William II, had "dropped the pilot" and taken full command. Whereas Bismarck had been content to make Germany the foremost power in Europe, William II strove to transform her into a "Weltherrschaft" or World Power. There were four states at the time to which the term world power could strictly be applied—Great Britain, United States, Russia and France. As already pointed out, Germany was a late comer in the competition for places in the sun; the hope of creating a new world power could hardly, apparently, be realized without the menace of exercise of force. It is significant enough that all of those for existing world powers were subsequently arrayed in armed conflict against Germany; that they were actively supported on land and sea by eight other independent states, while yet another 15 republics and one kingdom (Siam) signed up to the treaty with the enemies of Germany by declarations of war or severance of diplomatic relations. Hemmed in on either side by France and Russia—one of them a mortal enemy—Germany beheld across the North Sea the island fortress of Great Britain, a country devoted for centuries to the principle of preventing any single power from dominating Europe. The British navy, furthermore, possessed the ability to close both exits from the North Sea to the Atlantic. Germany did not turn to the outer world, following the line of least resistance, consequently lay to the south. Yet even a maritime outlet through friendly territory to the Mediterranean via the Adriatic or Aegean would avail little in wartime without command of the sea. An overland route through the Balkan Peninsula furnished the one alternative, and the road must necessarily lead through either Rumania or Serbia, in order to establish communication with places beyond Europe. But Rumania’s situation on the Russian frontier offered no guarantee that such a passage could be kept open during war, hence the choice of a German corridor to the East was perforce limited to the Balkans, a poor, sparsely populated country. To Austria, Serbia was a thorn in the flesh, a real danger to the stability of the former Dual Monarchy by reason of the Pan-Serbian agitation which threatened to detach territories and millions of Austrian subjects from the empire. Serbia also stood in the way of the Austrian *Drang nach Osten* policy—the march to Salonica. To Germany, on the other hand, an independent Serbia was a stubborn obstacle that blocked the road to Constantinople and beyond to the Black Sea, and to the Russian and to the Ottoman Empire, embracing the Jugo-Slavs (Croatians and Slovenes) contained within itself the destruction of the Turkish and Austrian empires and the formation of a new independent state from the broken fragments of these two empires. Five centuries of Turkish effort had failed to stifle Serbian national unity, and upon that same rock the Hapsburg Empire had broken in vain for 40 years, only to shatter itself in the end.

Besides Germany and Austria, there were two other powers which claimed interests in the Balkans—Russia and Italy. Of the four, the claims of Austria were no doubt the most justifiable. She was the next-door neighbor to the peninsula and her existence was threatened. Italy’s interest was centered upon Albania, and more particularly the fine harbor of Valona, on the eastern shore of the Strait of Otranto and less than 50 miles from the Italian Coast. The first object of her policy was to prevent Austria from acquiring the port, while Austria strove to keep it out of account of its strategic position at the entrance
a vassal of Austria-Hungary, politically and economically. When the Serbians turned their attention to Macedonia, they came into collision with Bulgaria. In 1908 Austria violated the terms of the Berlin Treaty by the annexation of Bosnia-Herzegovina and a challenge to Russia to contest recognition, thus precipitating a Balkan war. Russia encouraged Serbia and Montenegro to resist this final separation from their fellow Serbs and war appeared imminent in 1909, when the intervention of Germany confirmed Austria's action. The dreams of grandeur cherished by the Southern (Jugo) Slavs were until then still vague and undefined when the annexation translated them into action. Austria's step was an act of defiance to Slavdom, for it thrust a wedge into the very heart of the lands which the Southern Slavs regarded as their inheritance, and seemed to dissipate forever their dream of ultimate union. Russia, though diplomatically supported by France and Great Britain as signatories to the Berlin Treaty, retired from the controversy, perfecing leaving Serbia and Montenegro to withdraw their claims. Austria and Germany had gained a great diplomatic victory; Russia had been driven from the field and Serbian aspirations seemed finally shattered. The incident was apparently closed; it emphasized the intention of Austria — supported by Germany — to allow no treaty obligations to interfere with her plans of aggrandizement.

Meanwhile, great changes had been taking place on the international chessboard. The German emperor's demonstrative visit to Constantinople and Palestine had led to valuable railway concessions into Asia Minor and ultimately into Mesopotamia. German military instructors, financiers and engineers were sent to Turkey, and Germany became the doctor to the Sick Man. In every crisis that set in — the Armenian and Macedonian atrocities and the Crete insurrection — Germany stepped in and paralyzed European interest. In 1897, while the hands of Abdul Hamed II still reeked with the blood of 200,000 Christians, the Cross and the Crescent were united in a strange alliance. The Baghdad Railway concession was granted at that time, and Russia only with difficulty was active in the Far East. The Chino-Japanese War of 1894-95 drew attention to the helplessness or defenselessness of China. The sudden emergence of Japan as an up-to-date naval and military power had alarmed Russia, who scent a possible obstacle to her Eastern policy. In framing the treaty of Shimonoseki, Germany joined with Russia and France in coercing Japan to surrender the chief fruits of her victories in Manchuria. Russia stepped in later and seized Port Arthur while Germany acquired Kiaochau and the Shantung Peninsula from China. At two intervals of 10 years each Japan reaped her revenge against both those powers. The Tsar Nicholas was skilfully encouraged to expend his resources in a struggle with Japan for the mastery of the Far East. (See Japan — Russo-Japanese War). Other regions fell within the perspective of Germany. South America particularly attracted Austria, and it compelled her to buy her chief imports, including guns and ammunition, in the Austrian markets, and which made Serbia more than ever
could be embroiled with the United States and British naval power enlisted as an ally. Early in 1914 the Italians, under General A. Vitali, planned an attempt was made to organize a European coalition against the United States, an effort that was frustrated by Lord Salisbury in London, Lord Pauwels in Washington, and Captain Childers in Constantinople. The incident at Monsul in Mandoulay Bay. We have it on the unimpeachable testimony of Sir Valentine ChiroI, who was specially invited to Berlin by Prince von Bülau at the time, that in October 1901 informal conversations were initiated in Berlin for a treaty of alliance between Greater Britain and Germany, by which each party would have guaranteed to the other all their existing possessious throughout the world except in Asia. There Germany had no intention of placing her sword at England's disposal against Russia. One of the most singular features of this proposal was Germany's insistence that the provisions of this alliance should extend to the American continent, though not in South or North America had Germany herself any possessions to be safeguarded. The peculiar insistence of Germany on this point was, it was urged, a proof of her singular disinterestedness. But the snare was laid in vain. It was too obvious an attempt to commit us (Greater Britain) to unlimited liabilities which would have some day compelled us to toe the line in a German campaign against the Monroe Doctrine and thus fatally embroil us with the United States. . . . The wooing throughout France entirely on the German side; and, after listening to what Germany had to say, Great Britain very soon indicated that conversations on such lines were not to her taste. (Consult Quarterly Review, October 1914, p. 415). The feverish restlessness of German policy created a widespread sense of alarm among other powers, induced them to reconsider their mutual relations and to draw closer together. The first move in this direction was the conclusion of the defensive treaty between Great Britain and Japan in 1902. In 1904 Great Britain and France composed their differences by the Anglo-French Agreement, popularly known as the Entente Cordiale. The next year, while Russia was suffering defeat in Manchuria and thus temporarily eliminated, Germany opened the Morocco controversy which led to the conference at Algeciras, at which Germany secured the recognition of her claim, but failed to shake Anglo-French friendship. In 1907 came the Anglo-Russian Agreement, thus forming a counterpoise to the Triple Alliance. The immediate object of the so-called Triple Entente was a mutual insurance against German pretensions. The agreement to which was drawn up between France and Russia were unknown to the British government up to the outbreak of the European War. On the other hand, Great Britain was not bound to her partners in the Entente conditions which were to secure engagement, as Sir Edward Grey told Parliament on 3 Aug. 1914. The Entente, in fact, was simply a diplomatic group, not a strict alliance. German statesmen quickly realized, however, that this group meant the restriction of their ambitions: it meant that Europe now became their policy to break up—or break through—what they conceived to be an iron ring that had been forged around them. The Bosnia-Herzegovina crisis in 1908 brought war within measurable distance, but the breaking of the ring only remained a matter of time. In 1911 Italy declared war upon Turkey and annexed Tripoli and Cyrenaica, a move contemplated for many years. In the same year another Moroccan crisis darkened the political horizon. In 1912, Germany asserted that the French military occupation of the Moorish Empire formed a new situation, and that without some sort of compensation she would be unable to tolerate the existing state of affairs. The German gunboat Panther and the cruiser Berlin were sent to the closed port of Agadir, a manœuvre provocative to France. War again hung in the air, and Germany was eventually bought off by the cession to her of 100,000 square miles of French Congo territory. This was the last German attempt to break up the Triple Entente.

While Turkey had the Italian War on her hands, the Balkan League suddenly declared war on her and began hostilities in October 1912. Germany expected an easy victory for her friends the Turks. They were defeated, however, and the war was a crushing blow to both Austria and Germany. Besides, a formidable, resurrected Serbia now stood in the way, and behind her loomed the substantial power of Russia, protector of the Slav nations. Three haunting preoccupationshovered in the minds of German statesmen—the Slav Peril, the Yellow Peril (Japan), and the British Peril. Of these three, they probably feared Russia the most. Her marvelous recuperative power, increasing prosperity, successful Balkan policy and, above all, her friendly relations with France and England, had firmly impressed the German mind that Slaventum and Germanentum must sooner or later come into collision. On the other hand, if Germany feared Russia, as considerable evidence seems to prove, it was nothing but fear of Germany that drove Russia and Japan into each other's arms. Undoubtedly, that group was a standing menace to Germany should she attempt to translate any ambitious projects into action. One by one Germany saw her avenues to expansion closing up around her. The Slav renascence had shut the door to the Near East; the proximity of Japan made the Far East too dangerous; South America was hedged by the Monroe Doctrine; Africa was already parcelled out, and in almost every other part of the world there stood the empire of Great Britain. Here, indeed, was an impasse that could only be broken through by force. Germany's navy had reached a high stage of efficiency; she was already the strongest military power in the French, Great Britain and Russia. Of the three, Germany was presumably not a match against Germany; Russia had not sufficiently recovered from her
WAR, EUROPEAN—HISTORICAL INTRODUCTION (1)

war with Japan, while Great Britain, it was supposed, would not fight. The opinion had long prevailed among military experts in Europe that Germany alone would be well equal to the task of dealing with France and Russia. The German plan of campaign in the event of a conflict with the Dual Alliance was well known years before the war. To take the right through Belgium, strike a decisive blow at France, dictate terms in Paris, and then turn with full force to the East before Russian mobilization could be completed. This was the essence of the strategy actually adopted, as it had frequently been discussed in French, German and British military periodicals. Signor Giolitti revealed in the Italian Chamber of Deputies on 5 Dec. 1914 that during his premiership in August 1913, while the Balkan peace conference was sitting in Bucharest, Austria communicated to Germany and Italy her intention of taking action against Serbia as a "defensive" measure. Italy refused to consider the plan; Signor Giolitti confirmed this. Rome at the time sent the following message to the Italian Foreign Minister: "If Austria intervenes against Serbia it is clear that a casus faderis cannot be established. It is a step which she is taking on her own account, since there is no question of defence, for no one is thinking of attacking her ... and we must hope for action on the part of Germany to dissuade Austria from this most perilous adventure." From this it is evident that Austria intended proceeding against Serbia just a year before the war broke out. Italy refused to countenance Austrian aggression in 1913 and again in 1914, after war had been declared on Serbia, on the ground that it was an aggressive and not a defensive undertaking. There was also an understanding that Italy's obligation to the Triple Alliance should cease if the war in which Germany and Austria engaged should involve England as an enemy.

British relations with Germany during the year preceding the war are dealt with elsewhere. (See GREAT BRITAIN AND THE WORLD WAR.) It only remains here to consider England as a potential enemy of Germany—from the German viewpoint as matters stood in 1913. The British army was then a negligible quantity in a hypothetical struggle in which millions alone counted. The aerial branch of the British fighting forces had been neglected, and England did not possess a single airship that could carry more than two or three men. The only thing to be feared at worst was the British navy, and that could do little harm so long as the German fleet remained in harbor and the German coasts were well mined. That German shipping would temporarily disappear from the seas was a foregone conclusion, but a violent offensive campaign would not last long; lightning tactics had not failed to win the day for Prussia in 1864, 1866 and 1870-71. There were other considerations that apparently precluded the probability of England joining in the war. In addition to the Dual Alliance, the smoldering animosity of Boer irreconcilables was expected to break into flames at the vision of recovering their independence, while the native populations of Egypt and India would probably rise in revolt and overthrow British rule. German naval expansion and the Pan-German propaganda had opened the eyes of many far-seeing public men in the British Isles; some, indeed, had counseled preparedness for 15 years before the war. Germany, they held, had no need of a great navy to protect her commerce, as alleged, since no one threatened that commerce, which could ride the oceans as freely and safely as any other, and across her own country, even into the ports of London, Liverpool and Cardiff. There were some extremists who proposed that England should demand explanations and order Germany to limit her warship building program. Others, again, suggested that both powers should agree to a "naval holiday," but the three offers actually made to this effect were met with a candid non possumus by Germany. Thus the race of piling up floating armaments continued with unabated zeal and lavish expenditure. To each big German naval budget England replied with a correspondingly bigger one. Writers on both sides of the North Sea frankly discussed the prospects of an Anglo-German war. Under the operation of such mental stimulants it is hardly surprising that, by degrees, the conviction gradually crystallized in the minds of the British and German peoples that a war between them was inevitable. The Liberal Party in Parliament and the Press clamored for reductions in both army and navy estimates, expressing a fear of "irritating Germany." The other side (Conservatives and Liberal Unionists) retorted that Germany was not afraid of irritating Great Britain. The persistent efforts of Germany to secure the neutrality of England during 1912-14 in any conflict that might ensue presents strong evidence that she neither intended nor perhaps expected England to participate in a war against her. Then came the Sarajevo assassinations, which supplied the necessary spark to produce a conflagration. Much criticism has been leveled against Germany in general and the ex-Kaiser in particular for provoking or forcing the war. Judging from our present knowledge and especially the revelations of Prince Lichnowsky (q.v.), it is difficult to doubt that Germany desired the war; it is not equally certain that the former emperor could have prevented it had he chosen to do so. It is possible that he was not entirely master of the situation, for circumstances may force the hand of the strongest ruler just as economic and geographical pressure may drive a nation even against its own will. In a sense, Germany was in the position of a full-grown man compelled to tear the clothes of boyhood. All great nations throughout history have been built up by war and conquest. As history never stands still, those nations maintained their pre-eminence only so long as they were strong enough to defend and hold what they had gained. The late tsar's peace manifesto of 1898 gave a powerful impetus to international idealism throughout the civilized world, especially in the United States and Great Britain. Well-meaning writers like the Russian novelist Turgenev, the Irish playwright Synge ("La Guerre" inspired the tsar), and Mr. Norman Angell, in his book, 'The Great Illusion,' have advanced many apparently cogent arguments that war was no longer possible. Looking back over the two decades 1899-1918, we then encounter a series of great international conflicts.
At the time the peace and disarmament manifesto was launched the Spanish-American War was in progress; Russia was conquering the Sudan; the South African War broke out in the following year; the next year (1900) all the great powers were rushing ships and troops to China; in 1904-05 Russia and Japan were at war. These were not merely minor incidents; there had been numerous revolutions, regicides, some Balkan wars and the greatest war of all.

HENRI F. KLEIN,
Editorial Staff of The Americas.

2. DIPLOMATIC HISTORY. The spark that was indirectly responsible for the outbreak of the world conflagration was kindled in the little city of Sarajevo, the capital of the former Austro-Hungarian province of Bosnia, on Sunday, 28 June 1914. On that day the archduke Francis Ferdinand, nephew of the late Austrian emperor Francis Joseph II and heir to the throne of Hapsburg, paid an informal visit to Sarajevo with his morganatic wife, the Duchess of Hohenberg. As commander-in-chief of the army, the archduke had attended some manoeuvres in the province, where he suddenly decided to inspect the troops in the capital. Driving slowly along in automobiles toward the Filipovitch Parade, where the troops were drawn up, a black parcel was thrown on the open hood of the archduke’s car. He picked it up and threw it over the back of the car. It fell in the street and exploded in front of the second car, in which Count Boos Walddeck and the count’s aide-de-camp were seated. Both those officers and a number of spectators were wounded. A composer named Cabrinovitch, a native of Herzegovina, had thrown the bomb and was promptly arrested. The remainder of the party then proceeded to the town hall, where an address was read by the mayor. The inspection over, the civic authorities endeavored to dissuade the archduke from riding again through the city. They had heard rumors and had received threatening letters; a stern, determined man resisted all entreaties — including those of his wife — and insisted on visiting those who had been wounded by the bomb explosion. On their way to the hospital along the Appel Quay another bomb was thrown to the car, but failed to explode. Immediately a young Bosnian student named Prinzip sprang out from the crowd and fired at the archduke with a Browning pistol. Of three shots the archduke received two — one in the neck, which later proved fatal — and one reached his wife, who was struck in the body while attempting to shield him. The two victims were carried into the Government House, where the last sacraments were administered during a few moments’ consciousness. Within an hour both were dead. The crime evoked a feeling of horror throughout the civilized world; universal sympathy went out to the venerable emperor on the latest tragedy of his tragic life. His wife had been murdered (1898); his only son had died by violence (1889); his brother had been executed (1867), and now his heir had also fallen a victim of assassination. To a great extent public opinion overthrew the Monarchy’s absolutism. At Austria, especially when it was given out that the Serajevo murders had been plotted by a band of Serbian agitators, alleged to have been encouraged by the Serbian government to propa-
to enlist Italian support for the venture. The prompt refusal of Italy to countenance any such aggression merely postponed the war to a later date. Ten months after came the Serajevo tragedy. For 18 months before that a violent press campaign against Serbia had been raging in Austria-Hungary, and it needed only a slight aggravation of the situation to provoke a conflict. The assassinations provided the Austrians with the necessary lever for action. Unfortunately, the Serbians had not enjoyed a very enviable reputation in Europe since the murder of their King Alexander and Queen Draga in 1903, and it was generally felt that Austria would be justified in exacting reparation for the Serajevo outrage; indeed, little sympathy with Serbia existed in either France or Great Britain. It was otherwise with Russia, the protector of the Slav nations, the country which, curiously enough, had been the principal agent in liberating the Balkan Peninsula from Turkish rule and securing for that freedom for the small nations which she denied the people within her own borders. It was no secret in Europe that Russia would never stand aside and see Serbia perish, a contingency which could be regarded only as an Austrian victory over Russia. Therein lay the great danger to the peace of Europe—of the world.

The murders happened on 28 June. For 25 days no word nor sign emanated from the Viennese foreign office. Anti-Serb riots broke out in Austrian territories; mobs in Vienna threatened the Serbian legation, while the Austro-Hungarian press clamored violently for the chastisement of Serbia. Disinterested powers began to exercise what influence they possessed in endeavoring to reconcile Justice with peace. But while the trend of public opinion both in Austria-Hungary and Germany was plain enough, the intentions of the Austrian government were shrouded in mystery. On 7 July the Serbian minister in Vienna, M. Vojnovitch, wired to his government "Whether it is proved or not that the outrage has been inspired and prepared at Belgrade, they [the Austrians] must now or later solve the question of the sale of Great Serbian arms to that Hapsburg Monarchy." As late as 20 July the same minister wrote: "It is very difficult, almost impossible, to discover here [in Vienna] anything positive as to the real intentions of Austria-Hungary. . . . There is, however, no place for optimism. . . . That which is chiefly to be feared, and is highly probable, is that Austria is preparing for war against Serbia." Not alone in Serbia was there anxiety; a feeling of intense uneasiness hovered over Europe, where the consequences of any possible action on the part of Austria were fully appreciated. On 22 July the Hungarian Minister-President stated in Parliament that the situation did not warrant the opinion that a serious turning point was necessary or even probable. The very next day came the first premonition of the approaching storm; when Count Bethold (q.v.) launched the fateful ultimatum at Belgrade. In this document the Austro-Hungarian frontier and military positions between the two countries and called upon the Serbian government to publish a regretful and semi-apologetic declaration on the front page of their Official Journal on 26 July. The following 10 demands were also made: That the Serbian government should undertake (1) to suppress any publication which incited to animosity against Austria; (2) to dissolve a certain nationalist society (Narodna Odbrana) and prevent others from being formed; (3) to eliminate all anti-Austrian doctrines from public instruction; (4) to remove from military, service and administrative departments officers and officials guilty of plotting against Austro-Hungarian integrity; (5) to accept the collaboration in Serbia of Austro-Hungarian government officials to assist in suppressing the movement; (6) to take judicial proceedings against persons accessory to the assassination plot, Austrian officials to take part in the investigations; (7) to arrest Major Voja Tankositch and a state employee named Milan Ciganovitch; (8) to prevent co-operation of Serbian authorities conducting traffic in illicit arms and explosives across the frontier, and punish those who had facilitated that traffic in aid of the perpetrators of the Serajevo outrage; (9) to explain utterances of high Serbian officials who expressed hostility to the Dual Monarchy; and (10) to notify the Austro-Hungarian government that the above demands have been complied with. This ultimatum was presented to the Serbs by 6 o'clock on Saturday evening, 25 July 1914.

The charges formulated against the two Serbian officials mentioned in the document were those of having aided and abetted the perpetrators of the crime. Three principal cases had been arrested on the spot: Nedeljko Cabrinovitch, who threw the first bomb; Trifko Grabesh, who threw the second bomb, and Gavril Prinzip, who had fired the fatal shots. These three had originally in their possession (according to the Austrian statement) six bombs and four Browning pistols with ammunition. Ciganovitch and Tankositch were accused of having supplied these weapons; the former was alleged to have instructed the three conspirators how to use the bombs and to have given Prinzip lessons in handling the pistol in a certain forest. Ciganovitch was also charged with having enabled the assassins to smuggle the weapons across the frontier. Furthermore, the Austrian government charged that a large arms depot of the Serbian army at Kragujevatz. These details appeared in a brief summary annexed to the ultimatum.

While the Serbian reply to the Austrian ultimatum was pending, the German ambassadors in Saint Petersburg, London and Paris called upon the respective foreign ministers of Russia, Great Britain and France and informed them that Germany approved the form and substance of the Austrian note, adding that, if the quarrel between Austria and Serbia were not localized, dangerous friction might arise between the Triple Entente and the Triple Alliance. Sir Edward (now Lord) Grey, on behalf of the British government, at once informed Count Mensdorff, the Austrian ambassador in London, that he had never before seen one state address to another independent state so formidable a document. He specially deprecated the imposition of a time-limit at this stage of the proceedings for mediatory measures. On 24 July the German government communicated a note to the powers declaring the guilt of Serbia and that the Austrian demands could only be regarded as "equitable and moderate," emphasizing at the
same time that "every interference of another power would, owing to the different treaty obligations assumed by each, have fearful consequences." In reply, Sir Edward Grey reminded the German ambassador in London, Prince Lichnowsky (q.v.), that some days before the latter had expressed a personal hope that Eng- land would endeavor to use moderating influence with Russia, but now, in view of the ser- iously stern character of the Austrian note and the shortness of time allowed, he (Sir Edward) felt quite helpless so far as Russia was con- cerned, and he did not believe any power could exercise influence alone. The only chance he saw was that the four disinterested powers, Germany, France, England and Italy, should work together simultaneously at Saint Peters- burg and Vienna in favor of moderation in the event of the relations between Austria and Rus- sia becoming threatening. The British rep- resentative at Belgrade was at once instructed to the effect that Serbia should give Austria the fullest satisfaction; that "she certainly ought to express concern and regret." The ultimatum brought forth the following from that influen- tial German newspaper, the Rheinisch-West- phälische Zeitung, on 24 July:

The Austro-Hungarian ultimatum is nothing but a pretext for war, and this time a dangerous one. As it seems, we are on the brink of an Austro-Serbian war... It is a shame that the Imperial Government had not required that demands of this kind should be submitted to it beforehand. Our one duty now is to de- clare war, and not to submit any objection to launching into a war to further the aggressive policy of the Haps- burgers.

Everything depended upon Germany at this critical juncture; as the Russian foreign min- ster, M. Sazonov, said a few days later, the key of the situation was to be found at Berlin. Privately the German foreign minister expressed his doubts as to the ultimatum; offi- cially, the German government regarded it as "equitable and moderate" and "desired urgently the localization of the conflict," although, on this date, 24 July, there was as yet no conflict to localize. On that same morning M. Sazonov summoned the French and British ambassadors in Saint Petersburg and bluntly told them that Austria was not to be left alone to ask for the support of France and Great Britain. The French ambassador pledged the support of France, as was inevitable under the terms of her alliance. The British ambassador, Sir George Buchanan, could give no such assurance on behalf of his country. The next day, 25 July, Sazonov made the following gloomy though truthful prophecy to Buchanan: "Austria's ac- tion," he said, "is in reality directed against Rus- sia. She aims at overthrowing the present status quo in the Balkans and establishing her own hegemony there. I do not believe that Germany really wants war, but her attitude will be decided by yours [the British]. If you [Great Britain] take your stand firmly with France and Russia there will be no war. If you fail us now, rivers of blood will flow, and you will in the end be dragged into war." The British ambassador replied that England could play no role in the present controversy to better purpose as a friend who, if her coun- sels of moderation were disregarded, might one day be converted into an ally [of Russia] than if she were to declare herself Russia's ally at once. (British 'White Paper,' Exhibit No. 17). To this M. Sazonov answered, "Unfortunately Germany is convinced that she can count upon your neutrality." This assertion suggests the question, would there have been no war if Great Britain had from the beginning declared herself an active partner in the Triple Entente? On 30 July, the war between Austria and Serbia began. President Poincaré expressed the same opinion to the British ambassador in Paris: "The President is convinced that peace between the powers is in the hands of Great Britain. If His Majesty's government announced that England would come to the aid of France in the event of a conflict between France and Germany as a re- sult of the present differences between Austria and Serbia, there would be no war, for Germany would at once modify her attitude." (Sir F. Bertie to Sir E. Grey; op. cit. 99).

To return to the ultimatum. Acting on Rus- sian advice, the Serbian government yielded all the 10 points with two reservations — articles 5 and 6—which they asked to be permitted to submit to The Hague Tribunal. At 6.30 on the Saturday evening, half an hour after the ex- piration of the time-limit, the Austrian minis- ter, Baron Giesl, left Belgrade, having an- nounced that nothing short of an entire ac- cession would suffice. Serbia urged that the two points to which she could not categorically agree were of a nature calculated to subvert her sovereign independence and contrary to her constitution. From this date began a week of feverish diplomacy to avert the impending catas- trophe. All the governments concerned have since published more or less of the official correspondence that was flashed from capital to capital during those momentous days. Whereas the German side laid the blame for the war first on Russia and later on Great Britain, the British, French and Russian authorities accused Germany—and not so much Austria—of being primarily responsible. The British diplomatic record was first issued as a "White Paper" on 5 Aug. 1914 and later published in pamphlet form with the heading, 'Great Britain and the European Crisis.' It gives what purports to be a complete account of all the communications that passed between the British and its representatives in European capitals from 20 July to 4 Aug. 1914, with two memoranda written in London by Sir E. Goschen and Sir M. de Bunsen, former ambassadors to Berlin and Vienna; these are dated 8 August and 1 September respectively. There seems no rea- son to believe that important documents were omitted. The French 'Yellow Book,' appeared in November 1914 in French and English and contains a complete record of the negotiations. The Russian 'Orange Book,' (September 1914) is less complete. The Austrian 'Red Book,' did not appear till January 1915 and gives a detailed statement of Austro-Serbian relations. It contains very little information of Austro- German relations, but much space is devoted to the negotiations with Russia. The Serbian 'Blue Book' and the Belgian 'Grey Book' cover less ground, but contain the full texts of important documents. On 4 June 1914, the Ger- man government issued a "provisional memo- randum" entitled "Vorläufige Denkschrift und Aktenstücke zum Kriegsausbruch." It contains fragments of dispatches; also the telegrams ex- changed between the Kaiser and the late tsar,
Mobilization, if only partial, was obviously necessary to back up this determination. It remained for Austria to decide whether the satisfaction of "punishing Serbia" was worth embroiling so far as could then be foreseen, herself, Germany, Russia, and France in a general war.

From the German point of view, as expressed at the time by all the German ambassadors, the turn of events depended upon Russia; if the latter had only to withdraw and acquiesce in any action taken by Austria. On July 21 the Russian ambassador at Vienna had been assured that the forthcoming demands on Serbia "would be thoroufully acceptable." He accepted this assurance and went away on his summer vacation, with the result that there was no Russian representative in Vienna when the crisis became acute; furthermore, half the ambassadors in Europe were away on leave at the time. President Poincaré of France and his foreign minister, M. Viviani, were on the sea, returning from a visit to Russia. All the German and Austrian accredited diplomats were at their respective posts. While the French and British correspondence shows the endeavors of the Triple Entente, and the Zimmermann memorandum reveals that we have to search the records published at a much later date in order to arrive at any knowledge of what were the intentions of Germany and Austria. It was not until October 1919, nearly a year after the Armistice, that Count Berchtold informed a correspondent of the New York American that the repeated conversations he had had with the German ambassador von Tschirschky in Vienna in 1914 "could create no other impression than that the German government expected warlike action on the part of Austria as against Serbia. "Especially a conversation I had with him during the early half of July," said Berchtold, "convinced me that if we did not show this time that we were in earnest, then on the next occasion Berlin not only would not support us but would in fact orient itself in some other direction."

In June 1918, Mr. Morgenthau, United States ambassador in Constantinople 1913-16, published in The World for May 4. The ambassador Wangenheim at Constantinople had gone to Berlin early in July 1914 and, on his return to Constantinople shortly after, had told him (Mr. Morgenthau) that he had attended a conference at Potsdam over which the kaiser presided. "Wangenheim now told me that the kaiser solemnly put the question to each man [present] in turn, was he ready for war. All replied 'yes' except the financiers. They said that they must have two weeks to sell their foreign securities and to make loans... then the several members went quietly back to their work or started on vacations. The kaiser went to Norway on his yacht, von Bethmann-Hollweg left for a rest, and Wangenheim returned to Constantinople." Continuing his narrative, Mr. Morgenthau says, "In telling me about this conference, Wangenheim, of course, admitted that Germany had precipitated the war. I think he was rather proud of the whole performance. He believed that he should be considered about the matter in so methodical and far-seeing a way; especially proud that he himself had been invited to participate in so momentous a gathering... The conspiracy that has caused this greatest of human tragedies was
hatched by the kaiser and his imperial crew at this Potsdam conference of 5 July 1914. One of the chief participants, flushed with his triumph at the apparent success of the plot, told me the details with his own mouth. The Serbian minister Yovanovitch, already referred to, published a report of a conversation he held with von Tschirschky in Vienna (apparently before the Serajevo affair), in which he begged the German ambassador to use his influence in Vienna to bring about the pacification of the Orient, and to prevent the renewal of the Treaty of Bucharest questions. The German replied, "Until there has been a war between you and Austria-Hungary, not one of the questions that you are actually negotiating with that country can be settled. Yes first the war, and then the settlement." (Balckan Review, London, March 1919). Again, on 25 July 1914 Count Szogvén, Austro-Hungarian ambassador in Berlin, telegraphed to the minister of foreign affairs at Vienna, stating that he had been given the assurance in Berlin that, in case of a possible refusal by Serbia, our immediate declaration of war will coincide with the military operations. A delay in the initiation of military operations is considered an greatest disaster in the ambassador in Vienna in case of the intervention of other powers. We are urgently advised to begin immediately and to confront the world with an accomplished fact. (M. Barthou in the French chamber, before the peace commission. Belgrade. Five days later, when Serbia had replied, Szögény telegraphed: "The Secretary of State [Herr von Jagow] informs me in a very clear and confidential statement that in the near future possible proposals of mediation on the part of England may be sent to your Excellency by the German government. The German government binds itself in the most solemn way not to associate itself in any way with these proposals; on the contrary, it is absolutely opposed to their examination and will transmit them only to comply with England's request." (Current History, New York, October 1919). Five days before the ultimatum was launched, the Bavarian minister in Berlin notified his government in Munich on 18 July that he had heard from the German Under Secretary for Foreign Affairs, from whom he gathered that "the step which the Vienna Cabinet has decided to take at Belgrade ..." will occur on the 25th of the present month. The deferring of this action until that time is based on the desire to await the departure of MM. Poincaré and Viviani from Saint Petersburg in order to make an agreement between the Dual Alliance Powers [Russia and France] for counteraction more difficult. Until that time the appearance of pacific intentions will be feigned in Vienna by the simultaneous granting of leave of absence to the minister of war and the head of the General Staff. The last-mentioned official, who was field marshal Conrad von Hoetzedorff, began the publication of his recollections in April 1919, nearly six months after Austria had suffered defeat. In these he testifies to returning from a feigned holiday in Tyrol (where he had stayed after the Serajevo affair) to attending a meeting of ministers at the foreign office in Vienna. Count Berchtold presided and asked the field marshal's advice on some military details. The latter did not conceal his opinion that the monarchy was unequal to the demands of war on three fronts. Three days later von Hoetzendorff was present when the late Emperor Francis Joseph signed the declaration of war.

War was declared on Serbia 28 July 1914. On 29 July Dr. von Bethmann-Hollweg, German Imperial Chancellor, told the British ambassador that he was "pressing the button" as hard as he could in Vienna, but was not sure whether he had not gone so far in urging moderation at the Austrian capital that matters had been precipitated rather than the contrary. As a matter of fact it appeared as though every one of the powers was working hard to preserve peace, with, apparently, one exception—Austria, for on the morning of the day when the ultimatum had expired the Vienna press comments left the impression that the surrender of Serbia was neither expected nor really desired. Great Britain participated in three attempts for peace. Seconded by Russia she had urged Vienna to extend the time limit and together they had begged Germany to join in this effort. Berlin consented to pass the message on to Vienna. Nothing availed to avert the catastrophe. Austria had refused extension of time; the German ambassador in Vienna had refused any intervention of other powers. In the midst of this situation there appeared the possibility that the Serbian concessions were a sham; that Austria was determined to punish Serbia; that Russia would keep quiet during the process and, finally, that Germany came to the rescue in the matter. ("White Paper," No. 32). Austria had disclaimed any intention of taking Serbian territory, though Russia certainly did not believe that Austria, once at war, would or could stop short of crushing Serbia entirely. Every diplomat foresaw what would happen unless Austria or Russia gave way: Russia coming to the aid of Serbia would inevitably bring Germany to the side of Austria; France would just as inevitably join Russia. So far, at least five nations would be involved. There yet remained two unknown quantities—Great Britain and Italy. True, Italy was a partner with Germany and Austria in the Triple Alliance, but very few who had followed European affairs up to this time seriously believed that Italy would join her allies in a war against France. The conditions which had originally led Italy into that alliance no longer existed. Above all, and this was a circumstance of which the outside world was unaware until two months after the end of the war, namely, that Italy and France had concluded a secret treaty in 1902. For Italy it was a "reinsurance" treaty precisely as those which Bismarck had concluded with Russia. By this instrument Italy and France mutually undertook not to participate in any war against the other. Signed in November 1902, the text of this treaty remained strictly secret; the mutual promise therein made and kept contributed decisively to maintain the peace of Europe for 12 years, and when the Great War came, the pact of 1902 was found to be so completely in harmony with Franco-Italian sentiments and interests that one might say no diplomatic act was ever more ratified by the world. In the circumstances, therefore, the existence of this treaty being unknown at the time, the Central Powers probably expected Italy would preserve a "friendly neutrality." An important question asked, not only by Europe and the
world at large, but by the British people themselves was — what would Great Britain do?
On 26 July 1914 Sir Edward Grey submitted to Paris, Berlin and Rome his proposal for the ambassadors of those three disinterested powers to meet him in conference in London, suggesting that Austria, Russia and Serbia should meanwhile suspend all active military operations pending the result of the conference. France and Italy agreed at once and Russia declared her readiness to stand aside; Germany alone rejected the proposal on the ground that it would practically constitute a "court of arbitration" and proposed instead that Austria and Russia should negotiate directly with each other. Considering that those two powers followed two utterly irreconcilable policies, the German counter-proposal promised little hope of a peaceful solution. However, negotiations were actually begun between Saint Petersburg and Vienna when Austria suddenly declared war. Moreover, Austria had refused even to discuss the Serbian reply, there could hardly be useful grounds for negotiation with Russia, seeing that the Serbian reply was the paramount point at issue in the whole dispute. M. Sazonov urged Sir Edward Grey to induce Germany to indicate, even at the 11th hour, under what terms she would consent to work for a peaceful settlement. The final stage of the crisis was reached on 29 July. Russia was partially mobilizing in her southern provinces; the Austrians were bombarding Belgrade; Belgium was mobilizing for self-defense; the German High Sea Fleet was recalled to port and the British navy was concentrating in the North Sea. Never, perhaps, in its long history had the world experienced a more dramatic day. At 4 in the afternoon Sir Edward Grey telegraphed to Berlin as requested by M. Sazonov, urging the German government, if they did not like the idea of the ambassadors' conference in the form he had suggested, to suggest any other form they pleased. "Mediation," he said, "was ready to come into operation by any method that Germany thought possible if only Germany would press the button in the interests of peace."

At midnight, a council of war was held at Potsdam, presided over by the kaiser. Judging from what followed immediately after that meeting, there is reason to believe that its deliberations were concerned less with the question of peace or war than with the problem of Great Britain's attitude in the event of war. Straight from the council chamber, the Imperial Chancellor sent for the British ambassador and made the following strong bid for British neutrality: "So far as he (the Chancellor) was able to judge the main principle which governed British policy, it was clear that Great Britain would never stand by and allow France to be crushed in any conflict there might be. That belief, he said, was the mainstay of British policy. Provided that neutrality of Great Britain were certain, every assurance would be given to the British Government that the Imperial Government aimed at no侵犯sions at the expense of France should they prove victorious in any war that might ensue. (Op. cit. No. 85)" The ambassador then asked the chancellor about the French colonies, to which the latter replied that he was unable to give a similar undertaking in that respect. As to Belgium, he said that it depended upon the action of France what operations Germany might be forced to enter upon in Belgium, but when the war was over, Belgian integrity would be respected if that country had not sided against Germany. Continuing, the chancellor said that since he had held office he had labored to bring about an understanding with England. What he had in mind was a "general neutrality agreement" between England and Germany and that "an assurance of British neutrality in the conflict in which the present crisis might produce would enable him to look forward to the realization of his desire." At this stage the ambassador presented the following note he had received from Sir Edward Grey earlier in the day: "The Chancellor may rely upon it that this country will continue, as heretofore, to strain every effort to secure peace and to avert the calamity we all fear. If he can induce Austria to satisfy Russia to abstain from going so far as to come into collision with her, we will join in deep gratitude to his Excellency for having preserved the peace of Europe."

Within a few hours the British answer to the German proposal arrived in Berlin. "His Majesty's Government cannot entertain the Chancellor's proposal that they should bind themselves to neutrality on such terms. What he asks us in effect is to engage to stand by while French colonies are taken and France is beaten so long as Germany does not take French territory as distinct from the colonies. From the material point of view such a proposal is unacceptable, for France, without further territory in Europe being taken from her, could be so crushed as to lose her position as a great power, and become subordinate to German policy. Altogether apart from that, it would be a disgrace for us to make this bargain with Germany at the expense of France, a disgrace from which the good name of this country would never recover. The Chancellor also in effect asks us to bargain away whatever obligation or interest we have as regards the neutrality of Belgium. We could not entertain that bargain either."

At 4 in the afternoon Sir Edward Grey telegraphed to Berlin as requested by M. Sazonov, urging the German government, if they did not like the idea of the ambassadors' conference in the form he had suggested, to suggest any other form they pleased. "Mediation," he said, "was ready to come into operation by any method that Germany thought possible if only Germany would press the button in the interests of peace."

And I will say this: If the peace of Europe can be preserved, and the present crisis safely passed, my endeavor will be to promote some arrangement to which Germany could be a party, by which she could be assured that no aggressive or hostile policy would be pursued against her or her allies by France, Russia, and the other Powers than has been possible hitherto. On the same day (30 July) that Sir Edward Grey made this unequivocal declaration of British policy, he also telegraphed to the British ambassador in Berlin, "I have warned Prince
WAR, EUROPEAN—DIPLOMATIC HISTORY (2) 273

Lichnowsky [German ambassador in London] that Germany must not count upon our standing aside in all circumstances. A slight ray of hope flashed across the darkening sky: Austria might, in effect, be able to resist the storm she had raised and Prince Lichnowsky informed Sir Edward Grey (30 July) that the German government would endeavor to influence Austria, after taking Belgrade and Serbian territory near the frontier, to promise not to advance further, while the powers endeavored to arrange that Serbia should give satisfaction sufficient to pacify Austria. The territory thus occupied "would of course be evacuated when Austria was satisfied." This simple plan originated with Sir Edward Grey himself and provided an admirable exit from the political impasse. It allowed Austria to retire gracefully and save her face, while Serbia was chastised. But a military plus a diplomatic victory in the Balkans for Austria could hardly be agreeable to Russia. Moreover, Austria had broken off conversations with Saint Petersburg by the declaration of war. The British ambassador in Rome wired on 30 July that the Italian frontier was in a state of alarm, and it was clear that Germany was now disposed to give more conciliatory advice to Austria, as she seemed convinced that we [Great Britain] should act with France and Russia and was most anxious to avoid war with us. She added, "I was only a week ago in Berlin, and it was urged there that the declaration of war on the part of Germany to force the war that was long regarded by her statesmen as inevitable. On this point we have the evidence of Prince Lichnowsky in his famous "Memorandum": "I was to work for the localization of the conflict. It naturally only needed a hint from Berlin to induce Count Berchtold to content himself with a diplomatic success and put up with the Serbian reply. But this hint was not given. On the contrary, we were pressed for war. . . . We rejected the British proposals of mediation . . . and Count Berchtold was even ready to satisfy himself with the Serbian reply. . . . In view of these indisputable facts, it is not surprising that the whole civilized world outside Germany attributes to us the sole guilt for the world war." These words of the former German ambassador in London have been amply corroborated during and since the war by the numerous revelations which emanated from highly authoritative German sources.

As a preliminary to the resumed conversations Sir Edward Grey suggested that, in the event of this mistrust preventing a solution being found by Vienna and Saint Petersburg, Germany might sound Vienna, and I would undertake to sound Saint Petersburg, whether it would be possible for the four disinterested Powers to offer to Austria that they would undertake to see that she obtained full satisfaction of her demands on Serbia, provided that they did not impair Serbian sovereignty and territorial integrity. Austria has already declared her willingness to respect them. Russia might be informed by the four Powers that they would undertake to prevent Austrian demands going beyond the limits of Serbian sovereignty and integrity. All the Powers would of course suspend further military operations and preparations."

In reply to this proposal the German foreign minister assured the British ambassador that both the kaiser, at the request of the tsar, and the German Foreign Office had been urging Austria to show willingness to continue discussions. Reports from Vienna, he said, had been of a promising nature—but Russia's mobilization had spoiled everything. On 31 July, while negotiations between Austria and Russia were in progress, Sir Edward Grey told Prince Lichnowsky that if Germany were to respond to our reasonable proposal put forward which would make
it clear that Germany and Austria were striving to preserve European peace, he would support it at Saint Petersburg and Paris. He further assured the prince that if Russia and France unreasonably rejected such a proposal, "His Majesty's Government would have nothing more to do with the consequences." During the day Sir Edward received two dispatches, one from Saint Petersburg, announcing that Germany had ordered in consequence of report received from the Russian ambassador in Vienna to the effect that Austria is determined not to yield to intervention of the Powers, and that she is moving troops against Russia as well as against Serbia. Russia has also reason to believe that Germany is making active military preparations, and she cannot afford to let her get a start. The other message, from Berlin, confirmed the Russian mobilization and announced that a state of Kriegsgefahr (Imminence of War) would be proclaimed at once. According to the chancellor, "it could only be against Germany that Russian general mobilization was directed." So far, Germany had not been involved in the dispute, which rested primarily between Austria and Russia.

Realizing that the prospects of a peaceful solution were growing more remote every hour, Sir Edward returned to the problem of Belgium. Cabling to the British ambassadors at Berlin and Paris, he expressed a hope that the situation was not irretrievable, but that in view of a prospect of a mobilization in Germany it became essential to the British government, in view of existing treaties, to ask whether France and Germany each were prepared to respect the neutrality of Belgium so long as no other power violated it. In a note to Brussels he assumed "that the Belgian government will maintain to the utmost of their power their neutrality, which I desire and expect other powers to uphold and observe." France immediately promised to respect that neutrality; Germany made no direct reply. Four days later, on 4 August, Prince Lichnowsky was instructed to assure the British government that, "even in the case of armed conflict with Belgium, Germany would take no premature action against Belgian territory; that the German army could not be exposed to French attack across Belgium, which was planned according to absolutely unimpeachable information," and that "Germany had consequently to disregard Belgian neutrality, it being for her a question of life or death to prevent French advance." (German troops had entered Belgium on that day.) On 1 August Prince Lichnowsky asked Sir Edward Grey whether, if Germany gave a promise not to violate the neutrality of Belgium, England would engage to remain neutral. Sir Edward replied that he could not give such a promise; that the attitude of Great Britain would be determined largely by public opinion, to which the neutrality of Belgium would appeal, whatever its character. The prince then pressed Sir Edward to formulate conditions on which England would remain neutral, and "even suggested that the integrity of France and her colonies might be guaranteed." The British minister "felt obliged to refuse definitely any promise to remain neutral on similar terms," and said that England must "keep her hands free." On the same day the British minister at Brussels reported that "Belgium expects and desires that other Powers will observe and uphold her neutrality, which she intends to maintain to the utmost of her power..."

On 31 July Germany suddenly dispatched an ultimatum to Russia demanding that she should countermand her mobilization within 12 hours; the time limit to expire at 11 o'clock the next day. The British ambassador in Paris announced that the German embassy there was packing up. Late in the evening the French government advised their representative in London that German army corps from Metz, Cologne, Trèves and Strassburg had been moved close to the frontier, and that German patrols had already entered French territory. It must be borne in mind that at this time Austria and Russia were engaged in negotiations, for on 1 August Sir Edward Grey wired to Sir E. Goschen in Berlin, "I still believe that it might be possible to secure peace if only a little more time in the future can be gained before any Great Power begins war. The Russian Government has communicated to me the readiness of Austria to discuss with Russia... and to accept a basis of mediation which has been raised in regard to the formula which Russia originally suggested. Things ought not to be hopeless so long as Austria and Russia are ready to converse, and I hope that the German Government may be able to make use of the Russian communications referred to above in order to avoid tension. His Majesty's Government [British] are carefully abstaining from any action which may precipitate matters."

On presenting this note to the German Secretary of State, Sir E. Goschen spent a long time arguing with him that the chief dispute was between Austria and Russia, and that Germany was only drawn in as Austria's ally. If, therefore, Austria and Russia were, as was evident, ready to discuss matters, Austria did not desire war on her own account, it seemed to me [Sir E. Goschen] only logical that Germany should hold her hand and continue to work for a peaceful settlement. In reply, the minister attributed Austria's acquiescence to German influence at Vienna, and that all would have been well had not Russia mobilized against Germany. But Russia by abstaining from answering Germany's demand that she should demobilize, had caused Germany to demand whatever answer. Germany must regard the refusal to answer as "creating a state of war." Here it is apposite to quote from the Paris Matin of 5 Feb. 1919, which published a statement made by the former Italian premier, Signor Salandra, to the effect that after Austria had begun hostilities against Serbia and had found that Russia was mobilizing, Count Berchtold hesitated and wanted to turn back, but that "Germany intervened and obliged her ally to continue the war."

During the time from 29 to 31 July an exchange of telegrams took place between the kaiser, the tsar and King George. The kaiser drew the attention of the tsar to the menacing character of the Russian mobilization and to the continuance of his own activity in the direction of mediation. The tsar responded on the 31st, thanked the kaiser, and pointed out that it was technically impossible to discontinue mobilization, which had been rendered necessary by Austria's action. The tsar promised that his troops would undertake no provocative action so long as the negotiations with Austria con-

The German Emperor replied that the responsibility for the safety of his kingdom
WAR, EUROPEAN — DIPLOMATIC HISTORY (2)

(Prussia) compelled him to take retaliatory measures. *My efforts to maintain the peace of the world have now reached their utmost possible limit,* said the kaiser, declaring that it lay with the tsar to avoid war by ordering cessation of military measures. The tsar's suggestion to submit the Austro-Serbian quarrel to The Hague Tribunal went unanswered. The kaiser also telegraphed to King George an outline of his communications to the tsar, who replied with a personal assurance that Germany proposed "to leave still open grounds for negotiation and possible peace." In one dispatch to the tsar the German Emperor declared that the proposals made by the German government in Vienna were conceived entirely on the lines suggested by Great Britain, and the German government recommended them in Vienna for their serious consideration. This statement seems to indicate that Germany, while offering no suggestion of her own, competitively considered the British proposals as sufficiently satisfactory for Austria to accept—if they were intended to be accepted. *Owing to the action of Russia,* reads the kaiser's message, "the Austro-Serbian question is left to future historians to speculate on the problem, if it promised a solution of the difficulty, why that answer was not given. According to the German 'White Book,' Russian troops are said to have crossed the frontier the same afternoon that the tsar's telegram was sent. This publication bore the subhead, "How Russia and her Ruler betrayed Germany's Confidence and thereby made the European War." The first Russian troops entered German territory on 3 August, three days after the declaration of war by Germany.

Meanwhile, in the evening of 31 July, the German ambassador in Paris called on the French foreign minister, informed him of the ultimatum that had been sent to Russia, and said that he would return at 1 p.m. on the following day to learn what attitude the French government proposed to adopt in the circumstances. He returned next morning and was told that the French government had not comprehended the reason prompting his communication of the previous evening. It was pointed out to him that general mobilization in Russia had not been ordered until after Austria had demanded that the Russian government was ready to demobilize if all powers did likewise. "It seemed strange to the French government that in view of this and of the fact that Russia and Austria were ready to converse, the German government should have at that moment presented an ultimatum at Saint Petersburg requiring immediate demobilization by Russia. There was no difference between France and Germany, but the German ambassador had made a menacing communication to the French and had requested an answer the next day, intimating that he would have to break off relations and leave Paris if the reply was not satisfactory." The ambassador stated that he had packed up. Later in the day it was reported that the French Republic "would be forced to consult her own interests.* The German ambassador then announced to the German premier that a state of war existed between Germany and France. At 3:40 P.M. (1 August) a general mobilization of the French army was ordered. The troops nearest the German frontier were ordered to leave a zone of 10 kilometers between themselves and the German boundary line, in order to avoid a collision. On the same day German troops entered Luxembourg.

In the morning the British Cabinet held a meeting and after its close Sir Edward Grey gave the French ambassador, M. Paul Cambon, an assurance that if the German fleet came into the Channel or through the North Sea to undertake hostilities against French coasts or shipping, the British fleet would give all the protection in its power. This assurance was given subject to the policy of the government receiving the support of Parliament and was not to be taken as binding the government to take any action until the contingency of action by the German fleet took place. On 3 August Germany demanded permission from Belgium to send troops through that country on the pretext that this proceeding would help Belgium to prevent the violation of her territory. Berlin was, of course, well aware that France had already solemnly promised to respect the neutrality of Belgium. At the time the German ambassador in Paris was carrying out his instructions, M. Sazonov was expressing his gratitude to the British government, "which had done so much to save the situation," and that "it would be largely due to them if war were prevented." Even at this late hour, when Russia, France and Germany were already technically at war, there were indications of Austrian wavering. Acting on instructions from Count Berchtold, the Austrian ambassador in Paris assured the French foreign minister that there was no intention on the part of Austria to impair the sovereignty or territorial rights of Serbia. Simultaneously, the Russian ambassador in Vienna was "begged* by Count Berchtold to do his best to remove the wholly erroneous impression in Saint Petersburg that the "door had been banged" by Austria on all further conversations. Special attention was drawn to the fact that the conversations *had not been broken off by Austria* and naturally gives rise to the question, if negotiations had not been broken off by either of the two principal disputants, who did break them off? As M. Sazonov described the situation, "Germany was unfortunate in her representatives in Vienna [the late Herr von Tscheschky] and at Saint Petersburg [Count Pourtales]; the former was "a violent Russophobe who had urged Austria on," and the latter had represented to his government that "Russia would never go to war." He (M. Sazonov) *had accepted every proposal that had been held out to him. He had accepted the proposal for a conference of four, for mediation by Great Britain and Italy, for direct conversation between Austria and Russia; but Germany and Austria had either rendered these attempts for peace ineffective by evasive replies or had refused them altogether."

A time limit of 12 hours was attached to the German ultimatum to Belgium, with a threat, in case of refusal to permit the passage of German troops, to treat Belgium as an enemy. Without hesitation the Belgian government answered that an attack upon their neutrality would be a flagrant violation of the rights of neutral nations and that to accept the German proposal would be
to sacrifice the honor of a nation. "Conscious of its duty, Belgium is firmly resolved to repel aggression by all possible means." During the day the French ambassador in London asked Sir Edward Grey to say about Belgian neutrality. The minister replied that the violation of Belgium was a more important matter than the Luxembourg raid, and added, "We are considering what stance we should take in Parliament the morrow — in effect, whether we should declare violation of Belgian neutrality to be a casus belli." The French government offered the support of five French army corps to the Belgian government. The latter replied (3 August): "We are sincerely grateful to the French government for offering eventual support. In the circumstances, however, we do not propose to appeal to the guarantee of the Powers." Meanwhile, what was the attitude of Italy, a partner of Germany and Austria in the Triple Alliance? The full conditions of that alliance were never made public till October 1919. Contrary to general belief, the treaty contained no definite military obligations; its spirit being purely defensive in case of an unprovoked attack upon any one of the partners. It was definitely laid down, however, that Italy was not expected to come to the aid of Germany in a war with Russia, while in 1896 Italy had notified her partners that she would not join them in any war in which France and England were aligned on the same side against the Central Powers. Furthermore, Italy was not to be called upon to fight against England. (New York Times, 24 Oct. 1919) Italy's attitude in the great crisis is explained in the following message from Sir Edward Grey to the British ambassador in Paris on 3 Aug. 1914: "The French ambassador made the following communication: 'In reply to the German Government's intimation of the fact that ultimatums had been presented to France and Russia, and to the question as to what were the intentions of Italy, the Marquis di San Giuliano [Italian Foreign Minister, d. 16 Oct. 1914], replied that the war undertaken by Austria, and the consequences which might result, had, in the words of the German ambassador himself, an aggressive object. Both were therefore in conflict with the defensive character of the Triple Alliance, and in such circumstances Italy would remain neutral.' In making this communication, M. Cambon was instructed to lay stress upon the Italian declaration that the present war was not a defensive but an aggressive war, and that, for this reason, the casus faderis under the terms of the Triple Alliance did not arise. On the news of the German declaration of war reaching England, all the naval reserves were called out and a partial mobilization was proclaimed in order to avert a financial crisis.

German troops invaded Belgium on 3 August, when the king of the Belgians telegraphed to King George: "Remembering the numerous promises made to your Majesty and that of your predecessor and the friendly attitude of England in 1870 and the proof of friendship you have just given us again, I make a supreme appeal to the diplomatic intervention of your Majesty's to safeguard the integrity of Belgium." Sir Edward Grey immediately instructed the British ambassador in Berlin to protest against the violation of a treaty to which Germany, in common with England, was a party, and to request an assurance that the demand made upon Belgium would not affect the neutrality of Belgium and that her neutrality would be respected. Next morning (4 August), however, the German minister in Brussels handed the Belgian foreign minister a note to the effect that as the Belgian government had declared war, and as Belgian peoples submitted to them by the Imperial government the latter would, deeply to their regret, be compelled to carry out, if necessary by force of arms, the measures considered indispensable in view of the French menaces. A state of war now existed also between France and Germany, for on the evening of 3 August the German ambassador in Paris had handed the following document to the French premier: "The German military and administrative authorities have ascertained that a number of hostile acts have been committed on German territory by French military aviators. Some of the latter have violated the neutrality of Belgium, invading its territory [here follow some fictitious details of alleged attacks on Nuremberg etc.]. I am directed and have the honor to inform your Excellency that in consequence of these aggressions the German Empire considers itself at war with France, due to the acts of this latter power." An interesting sequel to the German charges came to light 22 months later. In June 1916, Professor Schwalde, editor-in-chief of the German Weekly Review of Medicine, published in that periodical: "It is false that French aviators threw any bombs on Nuremberg on 2 Aug. 1914. The Mayor of the city recently wrote to the general commanding the Third Bavarian Army Corps that he never had any knowledge of any bombardment of the stations of Nuremberg, Kissingen, or of Nuremberg-Ansbach before or after the declaration of the war."

To return to 4 Aug. 1914. Germany made one more attempt, through her ambassador in London, to dispel any mistrust that might subsist on the part of the British government with regard to German intentions, by repeating most positively the assurance that, even in the case of armed conflict with Belgium, Germany would undertake no aggression upon the Belgian territory. "Please impress upon Sir Edward Grey that the German Army could not be exposed to French attack across Belgium, which was planned according to unimpeachable information, Germany has consequently to disregard Belgian neutrality, it being for her a question of life or death to prevent a French advance. Simultaneously, Brussels announced that German troops had entered Belgian territory, and that Liège had been summoned to surrender by a small party of German officers, and that Sir Edward Goschen delivered this message to Herr von Jagow, who at once replied that he was..."
sor to say that his answer must be "No," as German troops having crossed the frontier that morning, Belgian neutrality was already violated. The foreign minister explained that Germany had been obliged to take this step as she had to advance into France by the quickest and easiest route, so as to be able to get well ahead with her operations and endeavor to strike some decisive blow as early as possible. By dismantling the forts in the provinces they could not hope, in view of the paucity of roads and the strength of the fortresses, to get through without formidable opposition entailing great loss of time. Rapidity of action was the great German asset, while that of Russia was an inexhaustible supply of troops. Sir Edward Goschen pointed out that this accomplished violation of Belgium rendered the situation exceedingly grave, and asked whether there was not still time to draw back and avoid possible consequences. The minister replied that it was impossible for Germany to draw back. At a later interview in the evening the British ambassador again asked the same question and received the same answer, namely, that it was too late. Sir Edward Goschen told the German chancellor and found him "very agitated." The chancellor "at once began a harangue, which lasted about 20 minutes." He said that the step taken by the British government was tolerable to a degree, just for a word — "neutrality," a word which in war time had so often been disregarded — just for "a scrap of paper." Great Britain was going to make war on a kindred nation who desired nothing better than to be friends with her. All his efforts in that direction had been rendered useless by this last terrible step, and the policy to which he had devoted himself since his accession to office had tumbled down like a house of cards. What England had done, he said, was "unthinkable"; it was "like striking a man from behind while he was fighting for his life against two assailants." He also held Great Britain responsible for all the terrible events that might happen.

The British ambassador protested strongly against that statement and said that just as it was considered a matter of life or death for Germany to violate Belgian neutrality for strategic reasons so it also matters of life and death for the honor of Great Britain that she should keep her solemn engagement to do her utmost to defend Belgium's neutrality if attacked. That solemn compact simply had to be kept, or what confidence could anyone have in engagements given by Great Britain in the future? The chancellor said, "But at what price will that compact have been kept..."

Has the British government thought of that...? The ambassador hinted that fear of consequences could hardly be regarded as an excuse for breaking solemn engagements, but "his Excellency was so excited, so evidently overcome by the news of our action, and so little disposed to hear reason, that I refrained from adding further reflections." He added that as was leaving he said that the blow of Great Britain joining Germany's enemies was all the greater, that almost up to the last moment he and his Government had been working with us and was the flower of his old allies in front of Waterloo. His Majesty also begged that you will tell the King that he has been proud of the titles of British field marshal and British admiral, but that in consequence of what has occurred he must now at once divest himself of those of the Emperor. In his report on the incident Sir Edward Goschen stated that the above message "lost
none of its acerbity by the manner of its delivery. At 11 A.M. the British ambassador was handed his passports, and the last thread binding England and Germany was broken. Sir Edward Goschen paid a glowing tribute to the great assistance rendered to us all by the American ambassador, Mr. Gerard, and his staff. Undeterred by the hooting and hisses with which he was greeted on entering and leaving the Embassy, his Excellency came repeatedly to see me to ask how he could help us and to make arrangements for the safety of stranded British subjects. He extricated many of these from extremely difficult situations at some personal risk to himself, and his calmness and savoir-faire and his firmness in dealing with the Imperial authorities gave full assurance that the protection of British subjects and interests could not have been left in more efficient hands.

At this particular stage (5 Aug. 1914) the European situation presented a strange mosaic of international complications. Austria was at war with Serbia, but not with Russia; nor with France and England. Germany was at war with Russia, France, England and Belgium, but not with Serbia; Italy had declared her neutrality. While German troops were already operating in France and Belgium, Russia still clung tenaciously to the belief that Austria had not attacked her. The Russian ambassador had been instructed to remain at his post in Vienna till war should be actually declared by Austria. This only happened on the 6th, when Count Berchtold informed his Austrian colleagues in Vienna that the Austrian ambassador at Saint Petersburg had been instructed to notify the Russian government that, in view of the menacing attitude of Russia in the Austro-Serbian conflict and the fact that Russia had commenced hostilities against Germany, Austria considered herself also at war with Russia. On the 10th, France declared war on Austria, and on the 12th Great Britain followed suit. The participation of Japan in the war was due partly to considerations of policy based upon her alliance with Great Britain, who asked her (in August 1914) to safeguard their joint interests in the Far East, and partly to an unforeseen incident that happened nearly 20 years before. In 1894-95 Japan had defeated China in war and had failed to get satisfaction commensurate with her victory owing to the diplomatic intervention of Russia and Germany. (See Historical Introduction in this department). Japan had wiped off her score with Russia 10 years later in a great war, and after another decade the opportunity was offered her of settling with Germany. But while grievances sometimes rankle in the minds of nations for many years, they are not often seized upon as a pretext for war. Japan, 1914 and 1918, was ally of Great Britain. The treaty existing between the two countries had been renewed in 1905 and revised in 1911. Its provisions were operative only in the Far East and covered the maintenance of the prestige of Japan in China and the preservation and integrity of China, and the principle of equal opportunities for the commerce and industry of all nations in China, besides the maintenance of the territorial rights of special interests of the contracting parties in Eastern Asia and India. It was also provided that if by reason of unprovoked attack or aggressive action, wherever arising, on the part of any other power or powers, either party should be involved in the defence of its territorial rights or special interests, the other party will at once come to the assistance of its ally, and will conduct the war in common, and make peace in mutual agreement with it.

A new article was added in 1911 to the effect that "should either high contracting party conclude a treaty of general arbitration with a third power, it is agreed that nothing in this agreement shall entail upon such contracting party an obligation to go to war with the power with whom such treaty of arbitration is in force." This proviso presumably had specially in view the Anglo-American unlimited Arbitration Treaty signed in 1911, but not subsequently ratified by the United States Senate. On 15 Aug. 1914 Japan delivered an ultimatum to Germany demanding (1) an immediate withdrawal of all German armed vessels from Japanese and Chinese waters, and (2) the unconditional delivery of the leased territory of Kiaochow at a date not later than August 22; but, in order that it might be restored to China. As no answer was received by the specified time, Japan promptly declared war on that day and proceeded at once to active hostilities against the German forces stationed on the Shantung Peninsula. In 1914 Japan possessed twice the naval and military strength which she had when she began the war with Russia in 1904. The wheel of fate had come full circle with a vengeance. The participation of Japan in the war on the side of Germany has been in the fullest sense a consummation of a process that had been in operation for many years. Germany began to take a more than platonically interest in the decadent Turkish Empire not long after the signing of the Berlin Treaty in 1878. A German military mission under General von der Goltz was sent to Turkey to assist in reorganizing the Turkish army and a group of German financiers began to apply for railway concessions. The kaiser visited the sultan in 1889, and not long afterward the plan of a German railroad through Turkish territory to the Persian Gulf began to assume shape. In 1889 the kaiser again visited Constantinople and this time met with the sultan. The Kaiser visited the sultan in the Holy Land, proclaiming himself under all circumstances the friend of the 300,000,000 Mohammedans in the world. Both Germany and Austria-Hungary had a "Drang nach Osten" or "push toward the east" policy in view, the former seeking an outlet from her geographically encircled position and the latter a predominance in the Balkans. The situation was well explained by the Frankfurter Zeitung a few months before the outbreak of the Great War. In the July-August, 1914, edition of the Frankfurter Zeitung, with France and Russia at the time appears, fortunately, to be ever more improbable, but the possibility of such a conflict cannot be excluded. The Triple Alliance countries [Germany, Austria-Hungary, and Italy] who portent to have recourse to large armies, cannot hope to compete successfully with the fleets of England and France on the high seas. Where, then, shall the Triple Alliance countries look for the defense of the special interests of the contracting parties in Eastern Asia and India?
WAR, EUROPEAN — CHRONOLOGICAL SURVEY OF THE WAR (3) 279

Bulgaria and Turkey into Asia Minor . . . . The states lying on the eastern border of Hungary and Asia Minor have, indeed, no choice but that must be the friends and allies of the Triple Alliance, or they must reckon with the unflinching hostility of the Triple Alliance in any conflict which threatens their independence. Austria, too, has no choice. Either the countries on the Lower Danube must be her friends, or she must exterminate them . . . . The German military mission in Constantinople is not merely helping to reorganize the Turkish army out of pure joy . . . . Bismarck could not have foreseen that this territory would one day become so essential a route for German imports that we should not, if necessary, shrink from a conflict with Russia to maintain our freedom of trade there. 8 Thus those Balkan states which did not fall in with the plan would have to be exterminated. By an agreement in 1894 Rumania was linked to Austria; Bulgaria was evidently regarded as “safe,” 8 while Serbia remained the sole obstacle. During the first month of the European War Turkey maintained an armistice with Greece. The German and British forces were sent into the Dardanelles. Germany, Serbia, and Rumania hastened matters. German men, gold and arms were sent to Turkey through Bulgaria and Gen. Liman von Sanders became a high official in the Turkish army. The army was mobilized and large quantities of war stores were dispatched to Bagdad and Syria; the Dardanelles forts were strengthened and an approaching Jehad (holy war) was preached by German agents. The Kaiser was represented as a convert to Islam and stories were circulated of Mohammedan uprisings in British, Russian and French territories. Egypt was believed to be ready to revolt, and the khedive’s sympathies had already been secured. The sultan, a mere figurehead, and his grand vizier and finance minister were opposed to war, while the Turkish people were by no means hostile to the Allies. Directly after declaring war against Germany, Great Britain took over two Turkish battleships in course of construction in England and which had been ordered by the Turkish government. These vessels, the Sultan Osman and Reshadieh, were renamed Agincourt and Erin and were added to the British navy. The Turks were offended at this action, but they had little regard for the Young Turk Party ruled by Talat Bey and Enver Bey. It was announced that the Goeben and Breslau had been purchased by Turkey to replace the other two vessels, but it soon became evident that the German ships, while flying the Turkish flag, were commanded and manned by Germans. They were repaired under German direction and made cruises in the Black Sea. The Allies protested against this procedure when Turkey suddenly denounced the capitulations under which European residents in Turkey had always enjoyed extra-territorial rights (9 Sept. 1914). Finally, on 29 October, the Breslau and some Turkish war craft appeared off the Crimea and bombarded Theodosia and Novorossisk at the entrance to the Sea of Azov, both unfortified towns. The Allied ambassadors in Constantinople had their telegraphic communications cut off and could not get in touch with their government. A Turkish squadron shelled Odessa on 30 October and the Goeben bombarded Sevastopol on 2 November, although Turkey was still at peace with Russia. The Turkish ambassadors in London and Paris stated that their government was acting under duress, that the German guns had been turned upon Constantinople, and that an apology would be forthcoming. On 3 November a joint British and French squadron bombarded the entrance forts of the Dardanelles, and two days later Great Britain declared war on Turkey, simultaneously annexing Cyprus. The khedive of Egypt, Abbas Hilmi II (q.v.), was at the time in Constantinople plotting with the Turks and Germans to oust the British; whereupon the latter deposed him, proclaimed Egypt a British protectorate, and appointed his uncle, Hussein Kamil, sultan. Russia, meanwhile, invaded Asia Minor from the Caucasus. According to the Greek ‘White Book’ laid before the Greek Chamber on 18 Aug. 1917, M. Theotokis, Greek minister at Berlin, telegraphed to Athens from Berlin the day Great Britain declared war against Germany (4 Aug. 1914): “The Emperor informs me that an alliance has to-day been concluded between Germany and Turkey. Bulgaria and Rumania are also taking their stand alongside of Germany . . . . The Emperor added, ‘What I ask to-day is the execution of what the two sovereigns [of Germany and Greece] have often discussed. 9 Italy came in against Austria on 23 May 1915, and Bulgaria against Serbia on 14 October of the same year. On 19 Oct. 1915 Italy declared war on Bulgaria. In March 1916 Portugal precipitated a crisis with Germany by seizing 30 Austrian and German ships in the Tagus, and on the 9th of the month Germany issued a declaration of war. See GREAT BRITAIN AND THE WORLD WAR; FRANCE AND THE WAR; GERMANY AND THE WAR; ITALY AND THE WORLD WAR; UNITED STATES AND THE EUROPEAN WAR; WAR, EUROPEAN—AMERICAN NEUTRALITY, etc.

HENRI F. KLEIN,
Editorial Staff of The Americas.

3. CHRONOLOGICAL SURVEY OF THE WAR. The following tables present a chronological outline of the more important international events preceding the war, and also of the principal occurrences during the progress of the war. The seeds of the present lie in the past: economics, geography, ideals and aspirations shape the bent of history; the public utterances of leaders of thought and action reveal the trend of events and illumine the converging paths of causes and effects.

The tables are divided into

1. Pre-War Events.
2. Declarations of War.
3. Western Front.
4. Eastern Front.
5. Southern Front.
7. Colonial Campaigns.
8. Rulers and Principal Statesmen.

1. PRE-WAR EVENTS.

1870

July 19. — Franco-German war begins.
Dec. 10. — German Empire proclaimed.

1871

Jan. 18. — First German Emperor proclaimed.
May 10. — Peace of Frankfort; France loses Alsace and part of Lorraine.
WAR, EUROPEAN — CHRONOLOGICAL SURVEY OF THE WAR (3)

1875
May 6.—London Times reveals (through Blowitz) German plan to attack France. England, the guarantor of Belgian neutrality, will not have Belgium touched—Belgium will not be touched and England and England will remain quiet. Intervention of Tsar Alexander II and Queen Victoria.

1878
July — Treaty of Berlin.

1879
Austro-German alliance.

1880
German colonial expansion begins.

1882
Triple Alliance forming.

1884
Professor Treitschke, in 'Deutschlands Kämpfe': 'We have reckoned with France and Austria. The reckoning with England has still to come; it will be the longest and most difficult.'

1886
Pan-German League founded.

1888
June 15.—Accession of William II as King of Prussia and German Emperor.

1889
May 14.—Emperor declares: 'For me, every social democrat is synonymous with enmity of the nation and of the fatherland.'

1890
March — German Emperor declares at Bremen: 'It is a tradition in our house (Hohenzollern) that we regard ourselves as chosen by God to govern and guide the people... We Germans fear God and nothing else in the world.'

1899
Feb. 26.—Prince Radschwill, representing the Kaiser at the funeral of Félux Faure in Paris, says: 'There is the United States, whose pretensions and riches are becoming a danger for us all.'

March 9.—British First Lord of the Admiralty (Gechens) suggests limitation of navies.

May 18.—First Peace Conference at The Hague.

Oct. 11.—South African War begins; outbreak of German Anglogephobia.

* 18.—German Emperor declares at Hamburg: 'Germany is in bitter need of a strong fleet.'

Nov. 9.—Lord Salisbury, British Premier and Foreign Minister, describes Germany as 'That one of the Continental States with which we have for many years entertained relations of sympathy and friendship beyond all others.'

* 30.—Chamberlains advocate alliance between Great Britain, United States and Germany.

1900
Jan. — Prof. Hans Delbrück in North American Review: 'So the German nation... has now directed the hate against England. England must have no illusions on this point... The experience of history shows that in the long run monarchies have always overpowered democracies... The House of Hohenzollern never can be separated from the fortune of the nation.'

Feb. 8.—Introduction of new German Navy Bill with hostile preamble. Fleet to be doubled. Admiral von der Goltz declares: 'Our chances of success in a war against England grow more favorable every day.'

March — Sir R. Blennerhassetts in the London National Review: 'But the true reason why an increase of the [German] navy is supported by ministers and politicians is to prepare for a struggle with England.'

April — German Emperor's message to Daily Express (London): 'Tell the British people that my first hope, now and always, is the preservation of international peace; my second, the consolidation and maintenance of good relations between Germany and Great Britain.'

July 5.—German Emperor at Kiel: 'The ocean is indispensable for Germany's greatness, but the ocean also reminds us that neither on it nor across it in the distance can any great decision be again consummated without Germany and the German Emperor.'

Sept. — L. J. Mace (editor) in National Review (London): 'Germany has secured her position as the first military power in Europe by smashing Austria and France. She has now turned her attention seawards, and is bent on becoming the first naval power. England stands in her way, and therefore must be smashed.'

Oct. 18.—Count von (Prince) Bismarck becomes Imperial German Chancellor.

Nov. 12.—Lord Lansdowne becomes British Foreign Minister.

1901
Jan. 22.—Death of Queen Victoria; accession of Edward VII.

1902

Feb. 23.—Prince Henry of Prussia arrives in New York.

May 19.—A German squadron under Prince Henry of Bismarck, at the request of the British Admiralty—visits naval bases and harbors in France.

* 31.—End of South African War.

June — Sir Rowland Blennerhassetts, in National Review: 'The desire to overthrow the British Empire, and to substitute for it a great German empire, was quite as strong in the days of Mr. Gladstone as it is at the present moment.'

* 19.—German Emperor at Aix: 'No thought is born of science which is not first sterilized by us, order later to be taken over by other nations.'
WAR, EUROPEAN — CHRONOLOGICAL SURVEY OF THE WAR (3)

June 28. — Triple Alliance renewed.

July — "The conclusion is irresistible that the Kaiser is either the most powerful or the secret enemy of England." Maxse, in National Review.

11. — Mr. Balfour succeeds Lord Salisbury as Premier.

Dec. — Berliner Tageblatt says: "The views of the English Press, although we would not deny that they are of a certain importance, are known to be the opposite of the views of the English government and also of the Admiralty. The latter knows very well that the creation of an English North Sea Fleet is, on the one hand, politically unnecessary, and at the same time false policy, and, on the other hand, an open sign of hostile intentions against Germany."

1903

Feb. — Sir R. Blennerhassett: "The virulent hostility of Germany to England is the work of Prussia. The ultimate object of Prussian policy is the overthrow of the British Empire. The highest authority in the fatherland has told us that the trident ought to be in the hands of Germany. It must therefore be forced from the grasp of England." (National Review).

May 1. — King Edward in Paris; invention of the "Sestente Cordiale."

1904

April 6. — Anglo-French Agreement signed.

July 12. — Anglo-German arbitration treaty.

Sept. — "It is impossible for Great Britain to be on equal terms with France and Germany. Any attempt to become so will result in making enemies of both." (National Review).

1905

March 22. — German Emperor at Bremen: "God has called us to civilize the world; we are the missionaries of human progress. . . . We are the salt of the earth."

31. — German Emperor at Tanger.

June 6. — Fall of M. Delcassé, French Foreign Minister; German intimidation of France.

Sept. 5. — Peace of Portsmouth (N. H.); end of Russo-Japanese War.

Dec. 5. — Resignation of Balfour Ministry.

1906

Jan. — General election in Great Britain; overwhelming victory of Liberal-Radicals; Campbell-Bannerman premier.

16. — Algeciras Conference opens; Great Britain supports France.

Aug. 15. — King Edward and German Emperor meet at Kronberg. Kaiser describes approaching Hague Conference to Sir Charles (now Lord) Hardinge as "great nonsense."

Sept. — German Emperor informs Mr. (Lord) Haldane that Germany would not entertain disarmament proposals.

1907

"The Germans are aflicted with the severest attack of swelled-headness known to modern history. The British are practically ignorant of this dangerous state of mind in their greatest rivals." Dr. Emil Reich, a Hungarian, in "Germans' Abroad." (London), reprinted as "Germany's Madness" (New York, 1914).

Aug. — Herr Bebel, leader of German Socialists, at the Second Hague Congress in Rotterdam: "It is the aim of the Imperial government to make Germany the most powerful empire in Europe, in order to rival or displace that empire, they may be sure of my support."

31. — Anglo-Russian Agreement signed, completing the Triple Entente.

Sept. 1. — German Emperor at Munster: "The German government be the blocks of granite on which our Lord will be able to elevate and achieve the civilization of the world."

Nov. — Great German Navy Bill passed.

Dec. — Great Britain is the sole objective of those fraticidal cruisers. . . . The entire naval literature of Germany is saturated with the idea of a war with England, and the people have gradually become impropagated with the obsession of their Sovereign who regards himself as the divinely appointed executor of the British Empire." (National Review).

1908

Feb. 16. — German Emperor's private letter to British First Lord of the Admiralty (Lord Tweedmouth) pointing out that the British Navy was sufficiently strong.

April 16. — Mr. Asquith becomes premier.

June — Döberitz. "It seems likely that people wish to isolate and provoke us. We shall be able to stand it. So let them attack us; we shall be ready."

1909

July — Dr. von Bethmann-Hollweg succeeds Prince von Bülow as Imperial Chancellor.

Aug. — German Chancellor makes overtures to secure British neutrality in the event of a Continental War.

1910

Admiral Mahan, U. S. N.: "For reasons absolutely vital, Great Britain cannot afford to surrender the supremacy at sea. The British navy is left the sole military force in the world superior to anything that Germany can as yet bring into the field. . . . This removed, neutral or fallen in power, Germany . . . becomes the dominant naval state of the world, as well as the predominant country of Europe." (Interests of America in International Conditions).

May 6. — Death of King Edward; accession of George V.

Aug. — German Emperor declares: "Looking upon myself as the instrument of the Lord, regardless of the views and opinions of the hour, I shall go my way."

1911

Dr. Paul Rohrbach: "Egypt is a prize which for Turkey would well be worth the risk of taking sides with Germany in a war with England."

March 30. — German Chancellor declares disarmament problem insoluble.

July 1. — German cruiser Pauker at Agadir; Morocco crisis.

15. — Germany demands territorial compensation from France, consisting of the whole of the French Congo from the coast to the river Sanga, and also French right of pre-emption to the Belgian Congo.

21. — Mr. Lloyd George, speaking for the British government, warns Germany.

24. — Germany prepared to make concessions to France.

Oct. — Appearance of General von Bernhardi's sensational book, 'Germany and the next War.' Empire Magazine (London) declares: "All that we can do is to await Germany's pleasure — Peace or War — and prepare for the worst."

Nov. 4. — Franco-German Agreement on Morocco.

27. — Sir Edward Grey, in Parliament: "One of the essential conditions of our friendships with France and with Russia in the last few years has been the certain knowledge that neither they or we wished to pursue a provocative or aggressive policy. . . . German strength is by itself a guarantee that no other country will desire or seek a quarrel with Germany."

Dec. — "If a nation constantly proclaims that it is the strongest and greatest people on earth, that its destiny is to dominate the world, and what wonder that its neighbors take it at its word, and insurance another's property and safety by ententes and understandings?" Round Table (London).
WAR, EUROPEAN—CHRONOLOGICAL SURVEY OF THE WAR (3)

Dec. 6. — Premier Asquith in Parliament states explicitly that the British government was bound by the military engagements which would compel it to make war without the consent of Parliament.

9. — Lord Haldane, former war minister, declares: "The thing I most desire is to see Germany rededicate the whole of the German empire to the service of peace, and give up all her overseas possessions."

1912

"Europe is drifting slowly but steadily towards an awful catastrophe. . . . This formidable evil is threatening England, but it does not threaten in England wants war. Germany is the storm-centre, the volcanic zone, in international politics."—Charles Sarles (a Belgian), in 'The Anglo-German Problem.'

Edward VII, son of a Couburger, grandson of a Saxon princess was never an enemy of Germany. 'Monarchs and Men,' by Maximilian.

May — Mr. A. J. Ballour, in the German magazine 'Nord und Sud': "If Englishmen were sure that the German fleet was only going to be used for defensive purposes, i.e., against aggression, they would not care how large it was. But does Germany make it easy for Britain to take this view?"

March — German efforts to obtain unconditional pledge of neutrality from Great Britain during the present year into which Germany might be forced. British offer 'Naval Holiday.'

April — German naval increase. Great Britain demands that "Germany strikes when Germany's hour has struck."

8. — Balkan War begins.

15. — End of Turco-Turkish War.

30. — "Do not let us talk as if the Kaiser could play the part of a German king or an Attila ravenging around the world at the head of armed hordes to devour empires and kingdoms."

Dec. 5. — Canada offers three dreadnoughts to British navy.

1913

Prince von Billow, former German Imperial Chancellor, in his book, 'Imperial Germany': The fleet was to be built while we maintained our position on the Continent, without our coming into conflict with England, whom we could not as yet oppose at sea. Patriotic feeling must not be aroused to such an extent as to damage irreparably our relations with England, against which assertion British power would for years still be insufficient.

Feb. 17. — M. Poincarré elected President of France.

March — Three Years' Service Bill in France.

14. — Mr. Foch in Parliament declares that Great Britain is under no obligation by treaty to intervene in any European War. Sir W. Byles, M. P.: "I believe that England has no enemy."

26. — Mr. Churchill proposes a "naval holiday" to Germany.

May — Second Balkan War.

10. — Mr. L. V. Harcourt, British Colonial Secretary: "I conceive of no circumstances in which Continental operations by our troops would not be a crime against the people of this country."

Aug. — Italy refuses to agree to an Austrian attack on Serbia.

10. — End of Balkan War.

Sept. 30. — Lord Roberts, on his 81st birthday, in message to the nation: " Fellow-citizens and fellow Britons. . . . Arm yourselves! Arm and prepare to quit yourselves like men, the day of your ordeal is at hand."

Oct. 11. — Great increase in Austro-Hungarian army.

Nov. — German Emperor and General von Moltke visit King of the Belgians. General tells King Albert of war with France: "We must settle the business once and for all."

Dec. 1. — Lord Haldane, in Edinburgh: "Our relations with Germany are twice as good as they were two years ago."

17. — Liberal-Radical deputation to Mr. Asquith entreating for relaxation in naval expenditure.

30. — Sir John Brunner, former M. P., issues a circular signed by members of the National Liberal Federation urging pressure on the government to reduce British armaments.

1914

Jan. 1. — Mr. Lloyd George, Chancellor of the Exchequer, quoted in 'Daily Chronicle': This is the first time in 20 years to overhaul our expenditure on armaments. . . . We will pay our way friendly than for years past; Germany in particular must be precluded from any idea of challenging British naval supremacy, and that a revolt against military supremacy was spreading through western Europe.

15. — Lord Haldane: "There is far greater prospect of peace than ever there was before. No one can say war will not come."

Feb. 4. — Plans in London to celebrate 100 years' peace between Great Britain and United States. Radical disarmament meeting at Queen's Hall.

5. — 'Daily News' (London) declares: "The German bogey has vanished."

24.— British Post demands immediate war.

28. — Lord Roberts heads deputation to Premier urging preparations for home defense.

March 4. — German press campaign against Russia begins.

25. — German Emperor's visit to Vienna.

April 21. — British King and Queen in Paris.

28. — Sir Edward Grey repeats the premier's statement that Great Britain is under no European military obligations whatsoever.

May 14. — German Foreign Secretary informs the Reichstag that negotiations with England were being conducted on the basis of a most friendly spirit.

June — Anglo-German agreement concerning Africa.

5. — Admiral Sir Percy Scott declares battleships obsolete owing to submarine developments.

11. — Sir Edward Grey repudiates allegations Anglo-Russian Naval Convention, and again deprecates that Great Britain is under any obligation to participate in a European war.

9.— Turkish battleship sunk by British submarine.
11.— Italian submarine sinks Austrian submarine.
12.— Turkish transport sunk by British seaplane.
14.— British transport Royal Edward sunk.
16.— Russian-German action in Gulf of Riga.
18.— Majestic torpedoed by British submarine.
19.— German submarine sinks the Arbek.
20.— Russians deserting operations on the Gulf of Riga.
21.— Germans evacuate the Gulf of Riga.
22.— Allied fleet bombsards Zeebrugge.
Sept. 4.— Russian squadron bombsards Yarna.
7.— Allied fleet destroyed Belgian coast.
21.— British bombared Bulgarian coast.
22.— Russian squadron bombsards Yarna.
23.— German cruiser sunk in Baltic by British submarine.
26.— British transport Marquette torpedoed in the Egean Sea.
29.— British mine-sweeper Hythe sunk, Gallipoli.
Nov. 5.— American protest against the maritime policy of England and France.
7.— Italian liner Asses sunk by German submarine.
14.— British submarine lost in Sea of Marmora.
17.— German hospital ship Altmark sunk by mine.
16.— German cruiser Bremen sunk in Baltic.
24.— French liner Ville de Dieppe sunk in the Mediterranean by a submarine.
30.— British liner Italia sunk in Mediterrane.

1916
Jan. 2.— British passenger steamer Glaucia sunk in Mediterranean.
7.— Italian steamer conveying 400 Montenegrin refugees to America sunk by mine in the Adriatic: 202 lives lost.
8.— British warship King Edward VII sunk by mine in North Sea.
13.— German raider Morev captures British steamer Appomattox.
18.— British coast bombard by Francon-British warships.
Feb. 1.— The Appomattox, manned by a German prize crew, arrived at Norfolk, Va.
6.— Austro-Italian action in the Adriatic.
8.— French cruiser Amiral Gras sunk by submarine.
11.— British war vessel Arran sunk by mine.
26.— French transport Provence I1 sunk in Mediterranean; over 2,000 lives lost.
28.— Fight between the British war vessel Alcantara and the German raider Greif in the North Sea; both sunk.
March 1.— British Primula sunk in Mediterranean.
4.— Raider Morev returns to Germany.
12.— British warship Coquille sunk by British torpedo boat sunk by mines.
16.— Dutch liner Hulshout sunk by Germans.
18.— Italian line Palermo sunk by Germans.
22.— German sink line Mesopotamia, used as a transport, in Mediterranean.
24.— Germans torpedoed the思木 in the channel.
25.— British destroyers and seaplanes raid Zeppelin sheds in Schleswig.
30.— Hospital ship Portugal sunk by Turks in Black Sea.
April 21.— German auxiliary cruiser Smyrna. A submarine attempt to land arms in Ireland. The cruiser is sunk; arrest of Casement.
25.— German squadron and Zeppelins raid Lowestoft and Yarmouth, England.
May 31.— Battle of Jutland.
June 1.— End of battle of Jutland.
5.— British war vessel Rangipure sunk with Lord Kitchener on board, off the Orkneys.
13.— British destroyer Lasso torpedoed or mined, off Dutch coast.
19.— British light cruisers Nottingham and Falmouth torpedoed and sunk. German battleship of Nassau class torpedoed by British submarines.
25.— British armed boarding steamer Duke of Albany torpedoed and sunk by submarine in the North Sea.
Oct. 7.— German war submarine U-53 reaches Newport, R. I.
8.— U-53 torpedoes five vessels outside of Nantucket.
20.— Russian battleship Imperator Maria sunk by internal explosion near the Danube.
23.— British mine-sweeper Gisissa torpedoed and sunk.
26.— German destroyer attack in English Channel. British destroyer Flot lost and Nebian disabled. Empty British transport Queen sunk.
Nov. 1.— Dutch vessel Aldemmi, being taken by German prize crew into Zeebrugge, rescued by British scout craft and five German destroyers were put to flight. Italian torpedo boats raid Austrian naval base at Pola.
4.— Russian fleet again bombards Costanza.
10.— Baltic port west of Reval, shelled by German destroyers, six to nine of which sink near the Russians.
21.— British battle ship Britannic sunk by mine or torpedoed in the Egean Sea.
24.— British battle ship Dreamer Castle sunk by mine in Egean Sea.
26.— German naval raid on Lowestoft, England.
Dec. 8.— French battleship Suffren sunk by submarine northwest of Lisbon.
10.— German commercial submarine Deutschland completes second voyage to the United States.
14.— British horse transport Russia sunk in Mediterranean by submarine. Seventeen Americans lose lives on the Atlantic.
27.— French battleship Gaulois sunk by submarine in the Mediterranean.

1917
Jan. 1.— British transport Ivernia sunk by submarine in Mediterranean; 120 men and 33 of crew missing.
7.— British seaplane carrier Brennan-Three sunk by gunfire at Kastelorizo, Asia Minor.
9.— British battleship Cornwallis sunk by submarine in Mediterranean; 13 lives lost.
14.— Japanese armed cruiser Tokebe destroyed by internal explosion in Yokuska Harbor.
17.— British Admiralty announces German raider sunk eight British and two French ships between 12 December and 1 January; crews put on board three captured craft, one of which reaches Pernambuco, Brazil.
Jan. 18.—German Admiralty announces that the Yavvuda, captured by German raiders, was taken to a German port on 14 December, with 469 prisoners.

22.—Dutch and British warships encounter light British naval force off Holland; one of former sunk. Similar action off Schouwen Bank; one British destroyer torpedoed. German destroyer V-69 puts into Ymmuiden badly wrecked.

25.—British auxiliary cruiser Larne sunk by submarine or mines off the Irish coast. Light German warship raids Buffalo coast causing loss of life.

26.—New United States mine-field off Jutland coast announced from Scandinavia.

Feb. 22.—Seven Dutch ships torpedoed outside of Falmouth; three sunk.

25.—German destroyers bombard Broadstairs and Margate.

March 22.—German Admiralty announces arrival at home port of commerce destroyers Morowe from second voyage, having captured 23 steamers and five sailing craft.

23.—London battleship Dorset in Mediterranean by torpedo, on 19 March, announced by French Admiralty.

April 2.—American naval base liner Astic torpedoed off Falmouth.

7.—Two German destroyers torpedoed off Zeebrugge; one sunk.

10.—British hospital ship Salle mined in the Channel.

17.—British hospital ship Dangast sunk with all on board except one man by submarines in Channel.

20.—Six British destroyers steamed a raid on Dover; two and possibly a third sunk by British destroyers Swift and Drake in old fishing boat.

26.—British naval raid on Ramsgate.

27.—British destructive loses 62 men by striking mine in Channel.

10.—Eleven German destroyers emerging from Zeebrugge; forced back by Commodore Tyrwhitt, operating light naval force from Harwich.

12.—Zeebrugge bombarded by Tyrwhitt with assistance of air squadron.

15.—Austrian light cruisers and destroyers sink 14 British drifters operating in the Adriatic; they are driven off by British cruisers Durban and Bristol, French and Italian destroyers, and Italian airmen, who sink one cruiser outside Cattaro.

26.—British hospital ship Dover Castle torpedoed in Mediterranean.

29.—British Admiralty announces sinking of auxiliary cruiser Hilary by torpedo in North Sea. British torpedo-boat sunk in collision.

June 2.—British transport Camerounaion sunk by submarine in Eastern Mediterranean.

5.—Commodore Tyrwhitt, with squadron of light cruisers and destroyers engages six German destroyers in running fight and sinks the E-24. E-30.

13.—British armed merchantman Average torpedoed in the North Sea.

27.—French armored cruiser Kleber sinks mine off Point Saint Mathieu.

July 9.—British battleship Vanguard, dreadnought class, destroyed by internal explosion while at anchor.

17.—British Admiralty announces that British light squadron has sunk four and captured four German merchant craft off Holland.

30.—British armored cruiser, Ariadne, torpedoed and sunk.

Aug. 14.—British destroyer sunk by mine in the Channel.

Sept. 1.—British light forces sink four German minesweepers off the coast of Jutland.

9.—German submarine U-293 interned at Cadiz.

Oct. 2.—British armored cruiser, Drake, torpedoed off north coast of Ireland.

5.—Official Washington bulletin announces wreck, on 30th of the German raider Tegetnoad, the See Adler, on Lord Howe Island.

7.—German submarine U-293 escapes from Cadiz.

13.—British Admiralty announces the sinking by torpedo of the loss of all hands of the mine-sweeping schooners Bogosia and the auxiliary cruiser Champagne.

16.—American destroyer torpedoed but reaches port.

17.—British destroyers Mary Rose and Snowdrop convoyer 12 Scandinavian merchantmen, assisted by two British raiders off Shetland and sunk with nine of the escorted vessels.

17.—American transport Avillier, homeward bound, torpedoed with a loss of 67.

Oct. 18.—Russian battleship Naua sunk by gunfire in the Gulf of Riga.

20.—British submarine in Gulf of Riga sinks German transport and torpedoed a dreadnought.

23.—British destroyer sunk in coast defense. British destroyer torpedoed. German destroyer V-69 puts into Ymmuiden badly wrecked.

Nov. 2.—British sink German auxiliary Marie and 10 armed patrol ships in the Catsages.

5.—Announce destruction of yacht Alidae torpedoed.

14.—British destroyer and monitor sunk off Jaffa, Palestine.

17.—Light cruiser fight off Heligoland; German lobe patrol boat and one cruiser is crippled.

19.—American steamer Canopo sinks in collision in war zone.

Dec. 6.—Italian destroyers penetrate harbor of Trieste and torpedo the Austrian battleship Wies.

17.—Sir Eric Geddes announces loss of 11 vessels in a British convoy in the North Sea.

29.—British Admiralty announces the sinking of three British destroyers.

1918

Jan. 7.—Mutiny among the German sailors at Kiel.

9.—British destroyer Raccoon strikes a rock off the coast of Ireland and goes down with her crew of 105.

12.—Two British torpedo boat destroyers on Scottish coast.

20.—The ex-German cruiser Dresden sunk, and the Goeben damaged off Imbros.

Feb. 5.—American steamer Almansor torpedoed, six of crew lost.

6.—Ttanual ormail, American transport, torpedoed off the coast of Ireland, 101 lives lost.

April 14.—Announcement of probable sinking of the United States collier Cygnet. This vessel's fate remains one of the greatest mysteries of the war.

22.—British carry out naval raids at Zeebrugge and Ostend. They blocked the entrance to the Bruges Canal by sinking vessels filled with concrete. The Ostend Harbor was blocked.

May 9.—A second raid upon Ostend was carried out by British naval forces. The old Vindictive was filled with concrete and sunk partly athwart the ship channel.

31.—United States transport President Lincoln sunk; four officers and 22 men lost.

June 2.—The schooner Edward H. Cole sunk by a submarine off the New Jersey coast.

July 7.—British naval air forces bombard Constantintopol.

11.—United States steamship Woonsocket sunk by a submarine.

19.—American cruiser Sea Diego sunk off Fire Island.

21.—German submarine sinks three barges off Cape Hatteras.

Aug. 7.—Mutiny of German sailors reported from Liverpool.

27.—German naval crews revolt at Kiel and Hamburg. The German navy passes into the hands of the Bremen workers.

21.—German fleet surrenders to the British.

1919

June 21.—German crews sink most of the German fleet at Scapa Flow.

7. COLONIAL CAMPAIGNS.

1914

Aug. 23.—Taotung bombarded by the Japanese.

28.—Samos captured by New Zealand forces.

Nov. 5.—Cyprus annexed by Great Britain.

21.—Bara, on Persian Gulf, occupied by British.

Dec. 9.—Dutch Rebellion suppressed.

17.—Egypt proclaimed a British Protectorate, and a new ruler appointed with the title of Sultan.
Great Britain.

Reigning Sovereign: George V, King and Emperor.

H. H. Asquith.
D. Lloyd George.
Viscount Haldane.
Sir Eric C. Geddes.
Sir Edward Grey.
Lord Rhondda.
Earl Kitchener.
Sir Auckland C. Geddes.
Winston Churchill.
Sir Edward Goschen.
Earl Curzon.
Lord Northcliffe.
Marquis of Lansdowne.
Lord Cunliffe.
A. Bonar Law.
Lord Reading.
Austen Chamberlain.
Louis Botha.
Arthur J. Balfour.
Premier Hughes of Australia.
Lord Robert Cecil.
Premier Massey of New Zealand.

France.

President: Raymond Poincaré.

Georges Clemenceau.

Herr Kuhn.
Pfandmester von Poustals.
Herr Dr. Solf.

President Herr Havenstein.

Austria-Hungary.

Reigning Sovereign: Franz Josef I, Emperor of Austria and King of Hungary, succeeded December 1916 by Emperor Karl.
Count Leopold Berchtold.
Count Stephen Tisza.

Bulgaria.

Reigning King: Ferdinand.
M. Radoslavoff.
Toncheff.
M. Pechoff.

Rumania.

Reigning King: Carol I, succeeded 11 Oct. 1914 by Ferdinand I.
T. Majoreco.
T. C. Bratianu.
A. Marghiloman.
Take Jonscu.

Turkey.

Reigning Sultan: Mohammed V, succeeded 3 July 1918 by Mohammed VI.
Prince Said Halim Pasha.
Ibrahim Bey.
Halil Bey.

4. FIGHTING STRENGTH OF THE NATIONS. Man-power.—The peace armies of the seven great powers before the opening of the Great War in 1914 totaled less than 4,500,000, or about 12½ per cent of those finally engaged. If to these be added the trained reserves, then the available armies figure over 18,000,000, or nearly one-third of the final total of combatants and about that number, which were enrolled early in 1915. The best estimates obtainable are placed below.

THE ARMIES OF 1914.

If to these we add 117,000 for Belgium's brave little army, 500,000 for Rumania and Serbia, and 500,000 for the smaller nations that came in later, we have a grand total of 5,500,000 for the armies before the war, on a peace footing. This total is an under-statement of the forces ready to fight because Germany had prepared, and so had Austria-Hungary, and Russia was mobilizing very fast, at these three very probably had another 5,500,000 under arms. France was not generally credited at that time with the totals here given, and she had probably not a fourth of them immediately available at the time of Germany's declaration of war, but were in the service, and brought to duty with remarkable efficiency of munition, the armies of the Central Powers were far the best equipped, and it was this superiority that enabled the Central Powers to take and hold the lead in the war for three years. Germany's trained reserves were actually in her army at the time of the Declaration of War, and by the time fighting was really begun she had 4,500,000 men in the ranks. Russia did the same thing, and within two months had as many or more troops than Germany; but they were not as well positioned or as well commanded, and hence not nearly as effective. And further, the supplies of ammunition behind them were inferior. By 1 Jan. 1915, France had 4,800,000 men enrolled, and Great Britain about 500,000. Austria's total at the same period was over 2,000,000, so that 1915 opened with 11,000,000 men in the field for the Allies and about 8,000,000 for the Central Powers. Most of these were raised by conscription, though Great Britain adhered to the voluntary system for many months, and there were also many volunteers in the French and Belgian armies. The development of the armies in the leading nations is her summarized.

France.—Starting with 62 army corps and 800,000 men, France rapidly enrolled her reserves and undertook intensive training of more men, raising her total to 5,000,000 within six months. The new recruits were arranged in four classes, and taken in as they were ready, and the army strength at its greatest was 6,300,000. More were enrolled, but the losses prevented the number from increasing.

Great Britain.—England's land forces at the outset were trifling, less than 200,000 being immediately available. By the fall of 1915 she was able to place in France 1,000,000 men, but it was not until the summer of 1917 that she had 2,000,000 men in the fighting area. There was severe criticism of the slow growth of the Militia Service Act was passed early in 1916, which provided for systematic conscription and development of the army. In January 1918, the total of British and colonial troops was raised to 7,500,000, of which England 55 per cent, Scotland 8 per cent, Wales 3.7 per cent, Ireland 2.3 per cent, while the other 26 per cent was divided between Canada, India, Australia, etc.

Italy.—Having had time to prepare, Italy came into the war with her standing army of 515,000, plus 245,000 mobile militia and 340,000 territorial militia. There was rapid development and training, so that by the autumn of 1917 the Italian army totaled 3,500,000. This was gradually increased to 5,500,000, her greatest total. In the last year of the war her losses were enormous, the wounded, dead, missing, and prisoners depriving her of over 2,000,000, so that at the time of the armistice she had but 2,800,000 men under arms.

Russia.—The vast population of Russia was thoroughly militarized in the years preceding the war, and it is claimed that 13,000,000 men were more or less trained. At least 5,000,000 were available, and early in 1917 it is stated that almost 11,000,000 were credited to the army. This number was steadily reduced,
the losses in both East Prussia and off the Austrian front being enormous, and probably not more than 5,000,000 were under arms at the time of the Russian débâcle.

Belgium.—Brave little Belgium, which bore the brunt alone, started the war with 117,000 troops, increased to 137,000 by volunteers within two months, and was gradually swollen thereafter to 180,000 in the autumn of 1917, and 267,000 at the close of the war.

Serbia.—Serbia entered the war more than unhappy Serbia. Starting with a few hundred thousand troops, she was so beset that soon one-fourth of her population was mobilized, and over 700,000 men put in the field. This meant practically all the active men of the nation. In the first two years there were 171,000 battle deaths in this little army, and at the close only 150,000 men remained to return to rehabilitate their devastated territory.

Greece.—The Greeks had 230,000 men in their army at the date in 1917 when they entered the war, and about as many at the close, their losses being 87,000.

Portugal and Japan.—Portugal mobilized 750,000 men and Japan had a standing army of 800,000, but neither of these saw much service.

Turkey.—Before the war Turkey had compulsory military service, and an army of over 100,000. She first mobilized about 210,000, and later her war strength was brought up to 750,000, with 150,000 more in training. The casualties were severe, totaling about 400,000, and about 60,000 deserters added brought down the army at the close to about 400,000 men.

Rumania.—By means of conscription Rumania came into the war with about 290,000 troops, who were reorganized under French direction and increased to about 400,000 at the highest total.

Bulgaria.—The 36 regiments of Bulgaria presented a war strength of 280,000, increased from about 60,000 on a peace footing.

United States.—Entering the war in April 1917, with only 200,000 troops, the United States by voluntary enlistments had over 4,000,000 men in the service when the armistice was signed. Over 2,000,000 troops were on the fighting ground within 18 months, and their efficiency, and the well-known fact that they were continuing to come in, trained and fresh, at the rate of 70,000 a week, had much to do with the German’s sudden decision to give up the struggle.

Germany.—The following table affords a clear idea of the German forces, and the time and manner of their increase:

<table>

Austria-Hungary.—Germany’s ally had nearly 3,000,000 men in the field before the war was six months old. She trained and mobilized men steadily until near the end, enrolling a total of 6,500,000. Her losses were so stupendous that she was credited with only 1,500,000 at the close.

The grand total of men enrolled in the various armies is shown under the sub-heading War Casualties, being over 56,000,000, of whom 7,553,600 were slain, 16,937,000 wounded, and 6,729,000 missing or prisoners. Making allowance for the wounded who returned to fight, there were about 30,000,000 under arms at the close, as against 19,000,000 at the beginning of 1915.

Armaments of the Belligerents.—The Great War was fought mainly with established types of weapons and arms, machine guns and rifles, field pieces, howitzers, etc., doing most of the work of throwing deadly metal and explosives. The difference as compared with earlier wars lay largely in the methods of attack and defense, and the vastly increased amount of powder and explosives employed. The aircraft added a scouting feature which did away with the value and importance of cavalry that figured so prominently in earlier conflicts. The anti-aircraft gun was the one novel firearm used to any degree. The use of bursting shells instead of solid shot was inaugurated at the outset by the Germans, and proved so effective that the large howitzers were developed as fast as possible. The tank was the first successful radical fighting machine introduced on the Allied side, and did much to offset the advantages won earlier by the Germans from the illicit use of gas. These weapons and mechanisms are all described elsewhere, but it is desired to record here the numbers and use made of them in the war.

The production of artillery by the three leading nations among the Allies is a fair guide for the artillery employed, since the amount of manufactured and unused artillery at the close would about offset the amount available at the outset by France and Belgium. This production, up to the close of the fighting, was 57,000 gun bodies and carriages; and 6,500,000 machine guns and machine rifles and ordinary rifles. The details follow of the three nations’ production during the war:

While the United States figures are very much lower than those of the other Allies, it should be remarked that, at the time of the armistice, the United States had caught up, and was producing as many shells and explosives as either of her Allies.

### Machine guns and machine rifles:

The German infantry used the Mauser magazine rifle mostly, and Austria and Turkey employed the Mannlicher. The Germans used both light and heavy howitzers, introducing the largest known, with great distance capacity. The Austro-Hungarians used a field howitzer of 1,000 pounds, throwing a 30-pound shell, and a much lighter mountain howitzer, throwing a shell of 10.6 pounds. France employed the Lebel magazine rifle, and howitzer batteries of four and 6.2 inches. England manufactured the Lee-Enfield rifle; their regular army had field pieces throwing 13-pound and 18-pound shells, and howitzers of 40-pound and 60-pound capacity. All these weapons are described under other headings in this Encyclopedia.

Charles H. Cochrane,
Editorial Staff of the Americans.

5. MILITARY OPERATIONS ON THE WESTERN FRONT. 1. General Strategy and Numbers.—Viewed as a whole the World War ended as it began, in an attempt to take Paris. That was in accord with the German war plan, made many years before and taken out of the general staff’s pigeon-holes in 1914. The plan failed to work as expected and four years of bitter fighting followed. Early in 1918 Russia had been worn down to surrender and Germany threw herself on her exhausted enemies of the western front to overwhelm them. She herself was tired almost to the point of collapse, but she had made a magnificent fight, won many local victories, and her spirits were high. Another thrust and victory! She made it as she made the first, pushing again down to the Marne. She failed as she first failed, in nearly the same place, and in the same kind of a blow on the right flank of the great German salient. Her second defeat was inflicted by the same man; for it was Foch who gave the decisive blow at the first battle of the Marne, and it was he who won the victory of 1918. Between the first and second battles of the Marne were fought many her battle was won, and they had their places in the final victory. The losses entailed on the Germans broke their recuperating power and made it impossible to withstand the Entente Allies and the United States in 1918. The history of the operations on the western front is the history of these two great battles and of the four years of thrust and counter-thrust that came in between.

In the beginning Germany was better prepared for war than any of her opponents. Her system of military training was believed to be as nearly perfect as human skill could make it. The general staff was excellent, the large number of minor officers were well trained and spirited, the private soldiers were obedient and attached to their officers for the most part. The whole army had confidence in itself and was inspired by traditions of German military glory. For many years the whole nation had lived for the day that war should come. Hardly a soldier in the army but knew that there were to be strong thrusts at France first and then at Russia, and they all believed that the war would be won quickly. Besides these considerations the army was abundantly provided with munitions and supplies. Close students of military science had observed that the machine gun was a wonderful new instrument of defense and the army was well supplied with it. They also knew that Belgium and France were counting on the protection of their barrier fortresses, and for taking the forts they had developed great howitzers, they and their allies the Austrians, which fired from a safe distance would destroy any fort in Europe. They had accumulated, also, a vast supply of high explosive shells. They had developed tractors for moving heavy guns which hitherto had been thought immovable. They had prepared a vast number of motor trucks for moving troops quickly on the excellent roads of Belgium and France. In aviation they had miscalculated. The Zeppelin was to prove a failure against the airplane, but their opponents had not come thoroughly to appreciate the military value of airplanes. The Germans were the best prepared of the belligerents, and they had chosen the time and place for opening the war.
WAR, EUROPEAN—MILITARY OPERATIONS, WESTERN FRONT (5) 283

The French army was well trained and there was an excellent general staff. The spirit of the French was the spirit of the Germans. If one had confidence in victory, the other had the memory of 1870 to wipe out. The Frenchman fought for his country's existence. If the German won, the fate of France was sealed. In munitions the French were at a disadvantage with the Germans. They were well supplied with an excellent light field gun, the celebrated 75 mm., and had a sufficient quantity; but they were lacking in heavy guns and in high explosives. The British, whose interest in defense had centred chiefly in their navy, had a small army well equipped in the manner that was considered proper before the war between China and Japan. The French they were poorly supplied with machine guns and high explosives. So far as equipment was concerned, the German and Austrian armies at the beginning of the war had an advantage over the armies of their opponents. As to numbers of trained soldiers who could be assembled quickly, Germany and Austria had a similar advantage. In the German first line were 1,500,000 men, with a second line of an additional 1,000,000. Behind these were reserves amounting to 4,000,000, giving her a total strength of 7,000,000. It is believed that she threw into France and Belgium by the middle of October considerably more than 2,000,000 men. Austria's first-line army contained about 1,000,000 men increased by 1,500,000 by the middle of October. In all she was able to raise about 4,000,000 men. Her troops, however, were of various nationalities and some of them were not to be trusted in fighting against Serbians and Russians.

On the side of the Entente the strongest military power was France. She had about 1,500,000 men in the first line and 500,000 in the second line with 2,000,000 in reserve. Most of her first line troops had seen actual service in Africa, which proved of great value in the first months of the Great War. The regular army of Russia numbered about 1,000,000 with at least 3,000,000 in reserve. She could, of course, call up a vastly larger number from her untrained population, but she did not have the equipment for them, nor could she expect to import it in sufficient quantities. Germany closed the Baltic, which the German fleet would undoubtedly do as soon as war was declared. The only other avenues of importation into Russia were the Black Sea, which Turkey might interrupt; through Bulgaria, which would be closed if Bulgaria joined Germany in the war; through Archangel, connected with the interior by a single track railroad; and by way of Vladivostok, which would mean much elapsed time and the threat of a return to the sea from the front in France made it but a slender reliance. As for Great Britain, her regular army numbered 250,000 well-trained men. She had, also, nearly 700,000 militia in various stages of training. By the end of July, 1,000,000 men were in the fighting area in France. The Belgian army numbered 263,000 on paper, but half of them were needed to man the forts, which were the country's main reliance for defense, and the remainder were not used. In Serbia, among others, there was an army of 250,000 men, with as many more who could be called into the field. Her hardy population furnished superior soldiers, as their conduct in the Balkan War had shown. She had an excellent general staff, but her weakness lay in her lack of artillery and other equipment.

Germany's grand plan of operations, often discussed before the war began, was to overwhelm France in a sudden and furious attack; and she thought her superior strength would make this an easy task. She considered Russia a slight menace for some months after the campaigns opened, because of the expected slowness of Russian mobilization. She thought that 250,000 men placed along the East Prussian and Polish frontier would hold back any army Russia could send against her territory for several weeks after the war began. She assigned to Austria the duty of attacking Russia from Galicia, believing that such an attack would keep the tsar busy until the work was done in France. This plan came to its defeat at the battle of the Marne.

In the long series of trench engagements that followed in France and Belgium two factors come prominently into view. France had to throw in her fighting force as freely as a sense of necessary economy of man power, permitted, while Great Britain strained her energy to raise and train armies to take over a due proportion of the battle-line. Both nations had set to work in the most industrious manner to manufacture cannon, machine guns and aircraft to make up for the deficiency with which they began the war. There were many months during which their troops held trenches without adequate weapons of defense, exposing their unprotected bodies in the most heroic manner while the industries of France and Great Britain worked day and night to produce the vast stores of munitions that were needed. In meeting this emergency they were aided by the British command of the sea, which allowed the allies to buy freely in neutral countries. It had long been an accepted principle of international law that neutrals could sell supplies to a belligerent, provided the same facilities were extended to all parties to the war. To have reversed this rule during the war would have been an act favorable to Germany, and the Entente would have been justified in pronouncing it a violation of neutrality.

Following her grand plan, therefore, Germany concentrated her armies against France until her forces exceeded those of her opponents in that region as seven exceeds four. Her superiority in heavy cannon and other weapons, as well as in rapid means of transport, was even greater. Her supreme command thought that her success was assured.

France had made preparations for invasion on her eastern frontier. A series of strong forts, according to prevailing ideas of military science, had been erected from the Swiss border to Longwy, at the southern bounds of Belgium. It comprised the fortresses of Belfort, Epinal, Toul, Verdun and Longwy, with many outlying forts and battery positions. A fortress, in the sense here used, is a strong central position with outlying forts at a distance of from four to eight miles, so placed that their guns can cover most of the intervals between the walls themselves. In these intervals trenches were constructed to be held against infantry attacks. The forts were generally made of strong concrete walls and contained cannon whose range was about six miles. Between the great for-
tresses along this line, 150 miles long, were many smaller forts and well-defended ridges, so that the French had a right to feel that their eastern border was well defended.

But north of Longwy the line of defense was weaker. Here began the border of Belgium, which France had long believed would protect her against Germany. It is true that there were many indications that Germany would not respect Belgian territory nor the neutrality of Luxemburg, the southwest corner of which touched France on a barrier of 15 miles, just east of Longwy. She expected that fortress to give her security in this quarter, if Germany, violating international law, massed troops in that neutral duchy. As to Belgium, it was believed that its people would resist a German attack until the French could send help, but if that failed there was a fortified line just southwest of the Belgian frontier in which were the fortified towns of Lille, Maubeuge and Membres, the second being very strong. The French were commoner in the area along the high ground northeast of the Meuse, but west of Lille it was in the air. It was not a strong line, but the French thought it would derive additional strength by the support of the Belgian fortresses of Liége and Namur.

In considering possible lines of defense the French High Command had to choose between looking for the enemy either along the eastern border or through Belgium. They concluded the former the more probable, and their best efforts of defense were spent there. Probably for this reason the Germans chose the latter as the surest way to finish France in a quick blow; for they could never hope to penetrate the eastern line of fortresses in the six weeks during which they expected to crush their western foe.

Now the Belgian area of operations is like this: Draw a straight line on the map from Longwy to the Dutch border on the north and the distance is 90 miles. For the first 70 miles from Longwy to the Meuse line the Limburg forested and rather thinly populated regions, the southern Ardennes and the wooded valley of the Meuse, the northern border of the latter being the Meuse River from Namur to Liége, which forms a border with the Dutch border by way of Maestricht. This wooded region is not favorable for maneuvering large armies, although the Germans proved that it was possible to send them through its roads in order to concentrate heavy forces in the region beyond. North of this wooded region lies the Belgian plain, thickly populated in 1914 and devoted to many kinds of industry in which lived a body of skilled workers. North of the Meuse Valley this plain runs in a narrow neck, 20 miles wide, as far east as the German border near Aix-la-Chapelle. It is crossed by the Meuse north of Liége, and the river, if well fortified, would make a good line of defense. The Belgians, however, had done much to defend Liége, but they did nothing to hold the river Liége after they retreated; they left it in the possession of the Germans. They might have held it until they came to it and taken it by siege operations. The Germans, when they had decided to attack Liége, massed their troops in the plain, swept around to the west of Namur until the place was either taken or masked, and then pour down past Lille, Peronne and Amiens to the vicinity of Paris. If the French tried to hold Maubeuge, or the country south of it, the superior German army would encircle them between the two and repeat the tactics by which great French armies were captured in 1870 at Sedan and Metz.

The plan of the French High Command was as follows: It would concentrate the best troops on the eastern front. If the Germans met them there great battles on equal footing would follow. The French wanted nothing better than to meet the foe as equals. If, however, the Germans came through Belgium they would be checked by the Belgians, who, reinforced by troops from France, would hold the German advance at Liége, Namur and Maubeuge, while the main French forces would break through the German defenses into Alsace and Lorraine, seize the Rhine and produce consternation in Germany itself. We shall see what befell this plan.

2. Serbia Leads the Fighting.—Serbia was the incidental cause of the war which Germanic and Slavic rivalries brought on. The Austrian ultimatum of 23 July 1914, if accepted, implied the subordination of Serbia to the plans of the Teutonic empires. It also meant the defeat of Russian prestige, already badly damaged when Austria established definite sovereignty over Bosnia in 1908. Serbia chastised and humiliated, the idea that Russia was the protector of the Slavic Balkans would vanish into air. Russia was thus bound by her best interests to help Serbia; and Serbia, if she did not mean to live the rest of her days as a crouching figure at the feet of Austria, awaiting the fate of Bosnia-Herzegovina, must now stiffen her back before the big bully. She showed herself willing to stiffen it; for bravery was one of the cardinal virtues of her people, who in other respects had many shortcomings. Through her borders were two in their way to the Slavic Balkans. Her usefulness was to meet the crisis of her history in the manliest way. The suppressed Slavs of Austria, whose resentment of Hapsburg rule had brought on the dark deed at Sarajevo, thrilled, also, to the sight of Serbia against the tyrant who had wronged them.

It was 28 July when Austria-Hungary declared war on Serbia. She probably had plans for a quick invasion of the country; but the rapid mobilization of Russia on the Austrian border made it unwise to attempt to put them into operation at the moment. She contented herself with establishing a protecting force along the border, waiting for a good opportunity to humble the Serbians. Her gallant foes were not disposed to allow her to take her own time. They forced the fighting at once, being too wise to allow the opportunity to pass unused when their enemy was fully engaged in other quarters.

The kingdom of Serbia was divided from Austria-Hungary by three rivers: the Danube on the north from the Rumanian border to Belgrade, the Save on the north also, from the northwestern corner of the kingdom to Belgrade, where the Save unites with the Danube, and the Drina, which flows from near the boundary of Montenegro to its junction with
the Save at Racho. The capital, Belgrade, was so exposed to the enemy that it was not defended seriously, the government being moved to Nisch soon after war was declared. The Serbian High Command had determined that the first thing to be done was to drive back the Austrians in his辖区, and give the Slavic inhabitants an opportunity to join the armies fighting against their oppressors. Serbia's policy was to hold the northern frontier, protected by the Danube and Save rivers, with as few soldiers as were needed there and to concentrate the remainder of her armies on the Drina, crossing it, if possible, in order to liberate the Bosnians. She had no fear of trouble on her western front, where Montenegro, Slavic in spirit, was ready to declare war against Austria, and did declare it on 7 August. On the east was her old enemy, Bulgaria, built up in recent years as a Teutonic friend and soon to be an open ally. If Bulgaria kept out of the war, Serbia, with the support of the Serbs in and beyond the Balkans, would probably be able to defend her country, so full of mountain passes, from general invasion. The weakness of her situation was found in two circumstances: (1) The district of Bosnia, if successful, could hardly be maintained by so weak a state as Serbia. The Slavs there might well hesitate, therefore, to rise against Austria until it was evident that Russia had weakened her materially in operations on other fields; and (2) Bulgaria was a menace. Filled with hatred for the conduct of Serbia in the Balkan wars, emboldened by the idea that she was to become the Germany of the Balkans, she was ready to swoop on her ancient enemy when the time of crisis left that enemy in no state of security.

In the first days of the war Austria assembled two armies near Belgrade, one to the east and one to the west. They both tried to cross the rivers into Serbian territory but were driven back by the Serbs with severe loss. Then the scene of combat shifted to the Drina at a point opposite the Bosnian capital, Sarajevo, where the Serbs hoped to initiate their campaign in Bosnia. Here a combined Serbian and Montenegrin force crossed the border and won initial successes; but the Serbs then continued the campaign on account of a counter movement which the Austrians made on the Save, 40 miles west of Belgrade. Protected by a severe bombardment they threw a heavy column across the river at Shabatz and occupied the town on 16 August. The Serbs concentrated quickly and beat the enemy in a severe battle on the 17th.

The plans of the Austrians had been cleverly made. The northwestern corner of Serbia, between the Drina and the Save, is a peninsula whose neck is 25 miles wide. Opposite Shabatz is the little river Jadar, and on the 17th its banks were occupied by 80,000 Austrian troops that had crossed from the Bosnian side of the Drina. This force was slightly behind the Serbs concentrated at Shabatz and stood in a position to close in and surround them. The plan was defeated by the courage and alertness of the Serbian crown prince, who started the Austrians. Turning from the battlefield of Shabatz immediately after his victory over the first body of Austrians, he moved on the army that was lying on each side of the Jadar on the 18th. In a four days' battle he completely routed it, driving it back across the Drina and taking a large number of prisoners and guns. By these two brilliant victories the crown prince freed his country of her invaders and gave them such a smarting blow that they could not resume the offensive at once.

The invasion of Bosnia, suspended to meet the attacks at Shabatz and the Jadar, was now resumed. Although they were handicapped by lack of material the Serbs advanced slowly and took the Bosnian town of Visegrad, 10 miles within the enemy's territory, on 14 September. This success prompted Austria to renew her efforts in the northwestern angle of Serbia. Concentrating about 100,000 men opposite the little river Jadar she crossed at three places between Janja and Libovica. The Serbs again attacked, and with their usual vigor. The first and second columns were driven back into Bosnia but the third managed to fortify the bridgehead at Libovica, where they remained. These operations, known as the battle of the Drina, occurred between 8 and 17 Sept., 1914.

Thus far Austria's best troops had been used against Russia in Galicia, and the operations against the Serbs had been left to troops of the second line. By the end of October the Germans were strongly engaged against Russia, and Austria-Hungary felt that it was time to make an effort against Serbia in keeping with her strength. She thus made plans for the winter campaign which led to her disastrous defeat in the Battle of the Ridges. Her decision pleased Germany, since Turkey was just coming into the war, and that accomplished it was only necessary to crush Serbia and use a little more judicious diplomacy with Bulgaria in order to open the railroad from Berlin to Constantinople.

For delivering this blow Austria organized an army of seven corps, nearly 300,000 men. It is not thought that the Serbs were more than 200,000, and they had a slender supply of ammunition, their only means of getting it from the outside world being through Antivari, in Montenegro, by pack mules over the old Montenegro Greek neutrality did not permit the open importation of munitions through Salonica.

Early in November the Austrian advance began on a large scale. A strong column crossed the Danube at Semendria and advanced southward along the railroad that parallels the Great Morava River. If not opposed it would reach Nisch 110 miles southward. But the greater part of the invading force crossed the Drina in two columns, one near the Jadar and another opposite the head waters of the Western Morava, 70 miles to the south. Against this triple force the Serbian crown prince stood with his chief army in the hills overlooking the Jadar. But he did not dare remain here for battle, lest the first and third Austrian columns should turn his flanks and cut off his communications with Nisch. Drawing back into the hills, he took a strong position on two elevations, the Maljen and the Rudnik or Suborov ridge, about 30 miles south of Belgrade. In front of him was the central Austrian column, flushed with
the confidence its unopposed advance for 40 miles into Serbian territory gave it. To the southwest the third column stood before Ushitza, faced by a determined Serbian force well placed in the hills.

If the Austrians had attacked promptly they might have won a victory, but they waited two weeks. They were so sure of their position that they sent away two corps to help in the defense of Cracow, threatened by the Russians. In this interval the Serbs received a much needed supply of ammunition from the Entente Allies through Greece, by what means we have not yet been told. It gave new courage to the Serbians, who now prepared to force the battle. Their artillery was admirably placed on the hills and commanded the Austrian lines. On 3 December they delivered their attack. King Peter, old and ill, came out to the battlefield and sent his soldiers forward with a ringing proclamation. Any man who desired might go home, he said, and no punishment would be inflicted; "the lands and my sons," he added, "stay here."

Not a man left the lines. During the afternoon of the 3d and throughout the 4th and part of the 5th the battle raged furiously, Serbian infantry and artillery inflicting great damage on the enemy. On this and the next day, however, the Austrians could stand no more. They broke their lines and the Serbs rushed through, dividing them into two masses who sought to escape through the narrow passes among the hills. From the 6th to the 15th the pursuit was maintained until the invaders were driven out of Serbia at all points. Belgrade, which had been occupied, was recovered, and the victors had 40,000 prisoners and many guns as the reward of their bravery. It was reported that the killed and wounded among the Austrians numbered 40,000. In this heroic way did the Serbs justify the confidence of their king and again proved themselves equal to any warriors in the world.

3. The Campaign in Belgium.—Germany ordered mobilization on 1 August. It was completed on 12 August, three days before the process was achieved in France. But the Germans did not wait for complete mobilization before they moved on Belgium. On 2 August they informed the Belgian government of their intention to attack France through Belgium. A similar notice was given to Luxembourg on the same day. Both were accompanied with the assurance that the rights of person and property would be respected if no opposition was offered to the German forces. Luxembourg was too small to raise objection and the Germans promptly occupied the duchy, filling it with troops destined to march on Longwy. In Brussels, on 3 August, King Albert laid the communication before the Belgian Chambers, who refused the demand and resolved to defend their country to the utmost.

On 4 August 12 regiments of German cavalry crossed into Belgium and followed the road south of the Dutch border to the Meuse, occupied the town of Visé, and seized the west bank of the river, driving back a weak Belgian force that retreated to Liège. On the same day General von Emmich commanding the 10th corps crossed into Belgium and approached Liège directly. It was to this German Chancellor, announcing to the Reichstag the presence of German troops in neutral Belgium, said: "We are now in a state of necessity, and necessity knows no law. We were compelled to override the just protest of the Luxembourg and Belgian governments. The wrong—I speak openly—that we are committing we will endeavor to make good as soon as our military operations permit." On 5 August von Emmich appeared before Liège and demanded permission to pass through the town. Receiving a refusal he formed his forces in line of battle and undertook to pass through the spaces between the eastern forts. The Belgians had about 20,000 men in Liège and received the Germans so steadily that the assault was beaten off with heavy losses. Von Emmich then used his artillery, which outranged the artillery of the Belgians. Placing it at a safe distance he poured a heavy fire of high explosive shells on the easternmost of the 12 forts defending the town. These works were supposed to be the highest achievements of the art of military defense. They were constructed of heavy concrete, the walls 26 feet, the turrets sometimes 12 feet thick. They were conical turrets flush with the surface of the ground, with disappearing guns operated by men who lived well protected beneath the surface. At first the Germans used their ordnance heavy artillery. With their high explosives they were able to destroy the mechanism of the disappearing gun in one of the forts. This made an opening through the line of ring-forts through which attackers began to work their way against the spirited opposition of the infantry. Next day, the 6th, another fort was silenced, opening a still wider gap and giving the Germans an approach to the town from the southeast. A venturesome party of hussars saw the opportunity and galloped into Liège. They hoped to seize General Leman, the Belgian commander, but he escaped them. Two more forts were destroyed this day, and thus the whole eastern side of the town was uncovered. The Belgian infantry remained in their positions and held back the men of von Emmich's command, but they were not numerous enough to hold the lines south of the place also. By this time the attacking troops were being heavily reinforced, and General Leman withdrew from the town. Last he be surrounded and captured. A德国 hoped to storm the town wide of Namur, where the main Belgian army had taken position. The forts on the west and north of Liège held out several days longer. The last fell on the 15th, by the Belgian account, although the Germans claimed that it fell earlier. In this fort, Loncin, was General Leman; when a shell penetrated and exploded the magazine. He was found in the ruins, unconscious and near death from the flames of the explosives and taken prisoner by the victors.

Thus the invaders were delayed at Liège until the middle of August. Through the place ran the four-track railroad from Aix-la-Chapelle into France, a main line of the Germans for the transportation of heavy stores. As long as the forts held out this line could not be used by the Germans for concentration to the westward. During the interval, however, they were crossing the Meuse in large numbers, deploying also, that the German troops were the west of the town until on the 12th they seized
Huy, midway between Liége and Namur. About the 15th, having completed their mobilization, they began to pour into Belgium in great waves, filling every road with men, artillery, and supplies.

The defense of Liége was pronounced a great achievement by the Entente. Considering the weakness of the defenders and their lack of training, it was a good piece of soldiery work; but it was not as successful as the newspapers reported. The Germans suffered moderate losses but accomplished all they attempted. However, they did not take Liége with a coup de main, as they had expected. The resistance of General Leman was spirited. To see this small nation which might have found refuge in timid counsels, stand to arms and oppose resolutely the overwhelming force of those who violated her sovereignty, aroused the admiration of every country that was not obsessed with the view that might gives right. In the United States, in particular, it was received with enthusiastic sympathy, and found immediate expression in large contribution for the relief of the suffering Belgians.

It was an advance to a French defense Liége was only an advanced post. Mobilization had been completed on the 6th, and the main Belgian army under the king had taken position along the small river Geete on a line that had Namur on the right and Diest on the left. It thus covered Brussels and Antwerp, and the king hoped to hold it until help came from Great Britain or France. If enough troops could be assembled here to hold back the invaders for a time, not only would Belgium be protected in its richest parts but northeastern France would be saved. The French, however, refused to move a corps until mobilization was complete, that is until the 15th of the month; and the British did not arrive in sufficient numbers to save their gallant allies. Looking backward, we have to admit that no allied forces could have been thrown into Belgium in time to repel the vast numbers that were thrown against it.

While King Albert stood before his two corps, the advanced guard of German troops continued to enter his country. They threw out before them a screen of cavalry that ran up to the front of the Geete line and concealed the arrival of troops in eastern Belgium. This situation lasted until the middle of the month, and the Belgians began to fancy that they could retain their position until the French and British arrived. During this period the French were establishing a line along the border, the scene of their mobilization. It ran northward and reached the Belgian boundary south of Namur. Connected with the Belgian line at that place, would it be carried on in increased strength to Antwerp? That was a question that dominated the situation in the north until the middle of October. If this line as first established could have been held the richest part of Belgium would have been saved from German fury. But to hold it the French and British must come in strength and come quickly. The thin Belgian line could not withstand the forces the Germans were assembling near Liége and along the Meuse line.

On 18 August King Albert saw signs of a strong attack on him and decided to wait no longer for the sorely needed help. He abandoned his Geete line and drew off to the northward, where he tried to make a stand near Brussels. It was high time that he looked to his safety; for the armies of Generals von Kluck and von Bülow, about 500,000 men in all, were moving against his force of 100,000. As he fell back he broke his line near the southern end, leaving Namur to its fate. The Germans poured through the breach and von Bülow quickly invested the fortress, bringing up the fatal great guns which had eaten away the defenses of Liége. Von Kluck, who marched north of von Bülow, drove the Belgians out of Louvain and pressing on entered Brussels, King Albert withdrawing to the defenses of Antwerp. The king may have expected his opponent to follow him and besiege the place or occupy the coast towns; but von Kluck was after other game. Leaving other troops to hold back the Belgians in front of Antwerp, he swung through the central part of the Belgian plain to the Sambre River and took his place on the right of von Bülow, who was already making sad havoc with the outlying forts at Namur. The remainder of his story belongs to the history of the campaign in France.

It only remains to tell the fate of Namur. Von Bülow brought up his great howitzers with tractors and great teams of horses and opened fire. One after another the forts fell in a bombardment that lasted little more than 24 hours. The garrison, consisting of 12,000 Belgian infantrymen and two French battalions who arrived at the last moment, held out until the 23d and barely escaped as the Germans moved into the city. They fell back to the protection of the French lines and later took their places by the side of the king when he had moved his Antwerp army to the line of the Yser in the vicinity of Nieuport. Thus ended the attempt to block the German advance through Belgium. The fall of Antwerp was delayed for nearly two months, because the Germans preferred to give their efforts to their intime march into France.

It was during this early period that most of the heartless incidents occurred which shocked the world under the general description of "Belgian Outrages." In the story there was, probably, a certain amount of exaggeration, but at bottom there was undoubtedly a great deal of truth. The German is a hard master. His phrase, "This is war," sums up much relentless cruelty. He arrived in Belgium with the conviction that the population was treacherous and ready to wage guerrilla warfare, when opportunity offered. He decided to employ such a course of repression as would strike terror to the people. It is also true that the Belgians were bitterly incensed at their treatment and hated their conquerors fervently. There seems to have been enough sniping by the inhabitants to demand some kind of notice by the military authorities; but good administrators would have found a more humane way than to seize hostages and shoot innocent men as warnings. When the Belgians found that their labor went to the support of their oppressors they ceased to work. This led to attempts to make them work and finally to forced drafts of laborers, men and women, to be sent
away to German towns. Worse things than these occurred in a country where the native women were frequently left to the mercy of unrestrained soldiers.

Two incidents in this series of black horrors stood out then and shocked the world. One happened at Aerschot. The story that is oftenest told has it that the German officer conducting the massacre was being entertained by the burgomaster. As the evening advanced the guests were excited and called for more wine. The daughter of the host brought it into the room, and one of the officers offered her the kind of insult that drunken soldiers too frequently offer to woman. The young brother of the girl resented this action, words followed, and the officer was killed. This was construed as an attack on the Germans by the inhabitants, and next morning the burgomaster and other prominent citizens were shot by the Germans. Then the town was delivered to the torch. Two-thirds of the houses were destroyed after they had been looted. Vi Louvain to the place town, the streets deserted, and the ruined houses littered with furniture and clothing that had been broken or scattered about in sheer wantonness. The sidewalks were slippery with spilled wine and bristled with broken bottles. Ruin and blood bathed the town testifying to the energy of the German fury.

The incident at best was a ghastly display of lawlessness. The destruction of Louvain was accompanied by every token of barbarism. The city contained many buildings of the Gothic style, survivals of the Middle Ages. It had, also, a university whose library was rich in ancient manuscripts. Its church of Saint Peter was a notable edifice and contained some famous paintings beside rare carvings. In this town on 26 August was a body of German troops commanded by Major von Manteuffel, when firing occurred during the evening and several Germans were injured. The inhabitants explained it by saying that a body of Germans that marched against Malines, then occupied by Belgian troops, had been repulsed and thrown back on Louvain. Coming into the town in the darkness they were mistaken for Belgians and fired on by the Germans in the town, many of whom were drunk. They returned the fire and soldiers were wounded in party. This story of the origin of the trouble was confirmed by the inhabitants and published by the Belgian officials. The Germans alleged that there was a conspiracy by the inhabitants, who fired on the soldiers. There is little question that most of the German soldiers, seeing their fellows wounded, believed this to be the origin of their wounds. Major von Manteuffel made no careful investigation, took the readiest explanation that suggested itself, and ordered the town destroyed. The work was carried out systematically. Houses were looted and fired by bands of soldiers who passed from block to block. The usual procedure was to leave the Church, with a large number of the handsomest old residences, were reduced to ruins. Only the city hall was left standing of all the early architectural monuments. An American newspaper correspondent, Mr. Arno Lyman, of the Paris, where his train remained two hours, saw the effects of the fire from the railroad station 24 hours after the disturbances began. He writes as follows:

"It was not until we came to Ghent that we realised the extent of the destruction. Some of us had not been able to credit it until we saw it with our own eyes. I was prepared to find one or two of the more treasurers destroyed, but the first thing that caught my eye was the ruined church of St. Peter's. The Place the Hotel de Ville still stood, but everything in between, a distance of half a mile, and everything for a mile beyond, to the last vestiges of modern houses in the northern end of the city were bare brick and stone walls. There were a few buildings standing to the east still standing, but those, too, were burning when our train went on two hours later. My first inclination, as the train pulled in, was to go through the ruined town, but the train had hardly come to a stop before a soldier, drunk from excitement and drink, had broken a window and cried with an exasperated gesture, "Three cities rased! Three! There will be more!"

Another soldier appeared and threatened to kill the reporter, mistaking him for an Englishman, but a third soldier pushed him aside with the remark: "He's drunk." Of the final act in the tragedy the observer reports as follows:

"About a hundred English prisoners were led across the Place de la Station and, after they had been placed in cars, the long line of cars was put in a circle under guard. I could not make out at first what the purpose of this was as my view was entirely cut off by a cow that was led to the main entrance of the station. But presently a bayonet was run into the neck of the cow, and, with a shout it fell. I could see a group of men in colored clothes, closely guarded. The long line of Louvain citizens was led around them. It was difficult to make out what was going on. I asked the soldier at our window and he said carelessly, 'Oh, those are the civilians who returned today to shoot us after we had burned half the town. We are going to shoot some of them.'

The outer line of civilians kept marching in a circle until they had all passed close to the men in the center. Then the line opened and the inner group passed out to the right. A group of soldiers followed. After an interval of only a minute or two, hardly time for absolution, we could hear the rifles of the firing squad. Evidently the careless soldier knew what he was talking about. 'Hear that,' he said, as the rifles cracked. 'What did I tell you?'

'I immediately some one climbed on a gun carriage among the group of citizens standing motionless before the station entrances. I could not hear a word he said, but his expressive gestures showed he was exhorted his fellow townsman to accept their fate and yield to the conquerors. While he talked, the butcher in the foreground grinned in a way with professional coolness, and began carving the carcass.

Many a Belgian village and small town paid as dearly as the city of Louvain for the unsubmitting spirit with which it took up the yoke of the conquerors. It would seem that the German High Command at the time was so sure of winning pre-eminence in world affairs that they thought they could control the judgment of public opinion in the world.

4. The French Border Offensive.—It has been said that the French High Command had made plans for an early quick offensive against the German frontier south of Belgium. They lost no time in putting it into effect. On 7 August, eight days before their mobilization was complete, they pushed troops into Alsace, occupied Altikirk on the 8th, and took Mühlenhausen on the 9th. France burst forth into peals of rejoicing when it was announced that the lost provinces were being recovered. The Germans, however, rallied on the night of the 9th and recovered Mühlenhausen. Then another French army, coming from Saint Petersburg, swept into the province, which retook Mühlenhausen and occupied a considerable portion of the slopes of the Vosges Mountains. Feeling that all was going well here the High Command then undertook a similar movement in Lorraine. Here a French force crossed the border on the 12th, moving steadily forward. In a week they had
penetrated the province from 15 to 20 miles and had crossed the railroad connecting Metz and Strasbourg. The Germans had expected the attack to be a defensive war, while the main strength of their armies for the time was thrown against Belgium. The French found them strongly placed at Morhange and charged impetuously. Then became apparent the nature of the war for which the French were not prepared. Rushing forward the lines came under the fire of the heavier type of German field gun. These pieces outranged the French 75's, which were useless against the enemy and not close enough to support their infantry. When the Frenchmen charged forward they suddenly came to strong wire entanglements. Here they were exposed to heavy fire and lost many men. Under the circumstances the 15th corps, from Marseilles, broke confusedly and carried other troops with it in disorder to the rear. The Germans delivered a counter-attack, pressed back the French, and it was not until General Fouquet, commanding the 20th corps, had used his greatest efforts that the retreat was checked and imminent disaster averted. To save the day, the army which had won successes in Alsace was shifted to Lorraine, thus relinquishing most of the ground won there. When these two movements ended the French stood in general along the line which for 40 years had separated France from her lost provinces.

The German army in this section, commanded by the crown prince of Bavaria, now pressed forward, hoping to seize Nancy. It was met with great steadiness by the French under General Castelnau and failed in its effort. Three weeks later, while the battle of the Marne was being fought, it renewed the attack and was again defeated in a great battle. Thenceforth to the end of the war there was no more serious fighting on the battle-line from the Moselle to Switzerland.

A third French offensive was undertaken along the line east of the Meuse Valley and north of Verdun. Here two French armies commanded by Generals Ruffey and De Langle de Cary took the offensive, the first attacking the German crown prince in front of Longwy, and the second attacking the Duke of Württemberg, near Neufchâteau. Each met the same disadvantage that their fellows encountered at Morhange. Their guns outranged, the men lost heavily before the German barbed wire and fell back from the encounter. Here again the Germans took the offensive at once, and the French retired behind the Meuse. But they fought bravely as they went and did much damage to their foes.

The combined French offensives were thus brought to disastrous ends by the German superiority of equipment. Herein was a most significant fact in the war. Improved machines of destruction were to be the order of the day. In no other war in history did the contest open with small arms and LAW weapons since the last previous struggle; and in no other war were such improvements made in the weapons actually in use while the conflict lasted. One of the consequences was that in no other war have men been killed so freely. Never before did the actual combatant have so little chance for his life in the presence of the enemy.

5. From the Sambre to the Marne.—We come now to the main German offensive in France, a campaign of three weeks, extending from the time Germany completed her mobilization and threw her massed troops on the defensive line of the Sambre to the time she encountered the smashing thrust of the French and British south of the Marne, that is from 20 August to 5 September. First as to commanders: At the head of the Germans was General von Moltke, nephew of the great general of the Franco-Prussian War and chief of staff when the war began. He was esteemed a master of war according to German methods, and his name aroused confidence and enthusiasm in his army. Experience, however, was to show that he relied too much on prepared formulas, that he was not keenly alive to the opportunities that presented themselves and that his influence was broken by his failure to carry out the long cherished plan successfully. His failure to deceive the French at the Marne and his neglect of the opportunity to seize the Channel ports in the first weeks of the war led to his resignation on 22 Oct. 1914.

The chief of the general staff in France was General Joffre, then little known outside of army circles. To the soldiers, however, he was known for a level-headed and straightforward man, a faithful engineer officer who had done well in constructing colonial fortifications. No one who knew him disliked or distrusted him.

To the soldiers he was endearing for his simple manners and his readiness to respond to every demand that the service made upon him. The first weeks of the war, when the fortunes of France seemed dark, found him cheerful and always master of himself. He had able assistants who trusted him as much as he trusted them.

The two great bodies of troops that faced each other in France were organized in field armies of about 200,000 men each. As they stood in the last days of mobilization the German armies were as follows: 1. The 1st Army, under General von Kluck, made up of four army corps and a body of cavalry, about 200,000 men and stationed near Cologne. 2. The 2d Army, under General von Bulow, consisting of three corps and a large body of cavalry, stationed on the Rhine just south of Cologne, about 200,000 men. 3. The 3d Army, under the Duke of Württemberg consisting of four corps and a body of cavalry, stationed in the Moselle Valley in front of the Belgian Ardennes, containing more than 200,000 men.

4. The 4th Army, under the German crown prince, consisting of three corps, stationed near Treves to the east of Luxemburg, and containing nearly 150,000 men. 5. The 5th Army, under the crown prince of Bavaria, consisting of four corps, stationed just south of Metz, about 200,000 men. 6. The 6th Army, under General von Heeringen, consisting of two corps, stationed near Strassburg, about 100,000 men. Just as the preparations began still another army was organized under General von Hausen, partly by drawing two corps from the 3d Army, and it was assigned position just south of the 2d Army. As the march was taken up most of
these armies were strengthened by the addition of troops just arrived from Germany. The whole assemblage of troops numbered more than 1,000,000 at first. The British stood in a line 190 miles long, although it was not continuous. It faced toward France, and the plan, as soon revealed, was for the lower part to move forward slowly toward the west, while the upper part advanced around to the southwest and then moved on toward Paris. As this part had further to go its movements were as rapid as possible, and to that end a large number of motor trucks were used. To the 3d Army was assigned a direction due west, through the Belgian Ardennes, in order that it might come into close support of the 1st and 2d armies and the new army of General von Hausen. It struck the French defenses at Dinant and south of it. These several armies were ordered to move into position in such a way that they would come into a continuous line north and west of Verdun, and swing round to the south with that place for a pivot.

Opposite to them General Joffre assembled six French armies. In the angle between the Sambre and the Meuse, south of Namur, was one under General Lancerac; northeast of Sedan stood another under General De Langle de Cary; in front of Longwy stood a third under General Ruffey; in front of Nancy was a fourth, under General Castelnau; a fifth, under General Dubail, stood on the border of upper Alsace; while the sixth, under General Paul, was to the east. But facing lower Alsace. From the time the French offensive on the border was checked these armies were on the defensive. Conscious of the superior strength of the Germans, General Joffre ordered his commanders to feel the enemy and wait for a favorable time to deliver battle. He had a seventh army, but generally known as the sixth, under General Maunoury, but more of it later.

Another army opposed to the Germans was the relatively small British force commanded by General French. The British mobilized on 3 August and on the night of the 7th an expeditionary force began to embark for France. Ten days later 130,000 men had landed. It was considered a great 10-day achievement to assemble and equip this force and gather the ships to transport it to France with the necessary artillery, horses and supplies. The point of concentration in France was Amiens. General French had an early conference with General Joffre and he agreed that it should move northward as soon as his force was ready and take position by the side of the Belgians who were then holding the Geete line across Belgium. At this time the French lines were being extended as rapidly as possible to the region south of the Sambre, and it was thus expected that the allied line would be made safe from Antwerp to the Swiss border. The British expedition contained two army corps; the British were under General Haig, the sector under General Smith-Dorrien, aggregating about 80,000 men, and a cavalry division under General Allenby. General French had objected to the appointment of Smith-Dorrien, wishing General Plunket instead. But he had great confidence. He had a third corps in France, but as it was not completely organized he moved forward with his first and second corps and Allenby’s cavalry. By this time the British Belgium and General French found himself obliged to take position west of the French army under Lancerac in a line running from Binche through Mons to Combe, with his cavalry a little in front of his right. But such as the extreme allied left, his left flank in the air.

Neither Joffre nor French realized how many Germans were in Belgium, and they both thought Namur could hold out a month, checking the invaders. It was their plan, therefore, to drive back their opponents in this section, swing the British and Lancerac round to the north and re-establish the line the Belgians had been forced to relinquish. They soon learned their error. In fact, they were so badly outnumbered that von Kluck, on the German right, was ever extending his line westward, trying to get around the British position. In order to avoid being surrounded, as Napoleon III had been surrounded at Sedan, it became necessary for the Allies to fall back continually.

The Germans got their heavy guns before Namur on the 20th, the day von Kluck entered Brussels, and the place was occupied on the 23d, the last fort being silenced two days later. The air service of the British and French was as good as that of the Germans, but it was relatively undeveloped. It did not reveal to the commanders the vast concentration of the enemy in Belgium. They did not know that in these critical days three great armies, more than 600,000 men, were moving on Lancerac and French. Von Hausen was coming up just to the south of Namur, von Bülow had enveloped it and was marching southward, and von Kluck was moving with great rapidity on Mons and the region to the west.

Lancerac was at Charleroi, which von Bülow’s forces reached on the 22d. Furious attacks occurred at once and the place changed hands several times on this day, the French at last standing their ground. But at this moment the news came that a part of von Hausen’s army had forced its way across the Meuse south of Namur and was threatening Lancerac’s communications. He decided that a withdrawal was necessary and made the move in good order. Next day, the 23d, the remainder of von Hausen’s army in a hard battle forced the crossing of the same river at Dinant, eight miles south of his position in front of Charleroi, and he continued his retreat until his line rested on the forts at Maubeuge and Givet.

Meanwhile the British at Mons were preparing to receive the attack of von Kluck, which they expected hourly. All day on the 22d they heard firing in the distance and thought it the guns before Namur, 30 miles away. By some strange chance Lancerac failed to inform them of his withdrawal and they worked to the forward positions, the British sector was for them to protect the western part of the Allied line. Late in the afternoon some of von Bülow’s men appeared on their right and tried to turn it. General French’s two corps were holding a line 13 miles long, about 3,000 men to a mile. General French thought that only
two German corps were in front of him and felt that his own two corps were sufficient to deal with them. In the afternoon of the 23d his line was strongly attacked throughout most of its length, but with especial severity at Mons and eastward. In this battle the British soldier showed great courage and inflicted heavy losses on the enemy. Although pushed back by a portion of von Kluck's army on his extreme right, General French still held his position until nightfall with great pressure on his entire front. About 5 o'clock in the afternoon he learned from Joffre that Lancerac was in full retreat, that von Kluck had, not two, but three corps on the British front and another thrown out to the westward, trying to turn the British left. It was at once evident that the British position was perilous. The commander decided to fall back and ordered his heavy transport trains to move southward at once. He directed his army to hold their position until nightfall, then get what rest they could and begin to retreat at dawn the next day, the 24th. Thus began the celebrated retreat of the British army through northern France.

The 24th was a hard day, the Germans pressing strongly on the retreating columns; but Allenby's cavalry, riding from one point to another, where danger was greatest, gave much relief, and the infantry turned now and again to fight off the enemy when he came too close for comfort. At nightfall the army had gone back 10 miles and stood at Maubeuge. Its position was critical; for von Kluck was pressing posts near the village of Landrecies, a fresh German corps attacked suddenly in the darkness, thinking to make short work of the exhausted British soldiers. But the men stood to their arms and during three hours beat off a strong assault along their whole line. They were materially helped by the arrival of two French divisions, who came up on their right flank, and at midnight the Germans gave up their battle.

At dawn on the 26th the retreat was resumed. Haig's corps, stiff and sore from the previous marching and the night battle of the 25th, could only hobble along. Smith-Dorrien's and the fourth division were in better condition, but in the early dawn they were so fiercely attacked by the Germans at Le Cateau that they could not hope to move off safely. Hastily entrenching
they prepared to resist to the end. Charge after charge was repulsed. At 3 P.M. their position was critical, when General French ordered them to break off the battle and withdraw as safely as possible. But they did not consent, and the German Guards had suffered too much to continue the fight and did not pursue as vigorously as was expected. Falling on some of the last units that withdrew they inflicted great losses, but the corps did not disintegrate, and their faith remained unshaken. It marched through the night in front of the pursuing foe until in the early morning of the 27th it halted at Saint Quentin. That day help came from the French and the pursuit slackened, so that the British arrived at the Oise River on the 26th, where they were in comparative safety.

The five days' retreat from Mons was a bitter experience for the British Expeditionary Force. They only barely escaped complete disaster and lost heavily, but they showed a signal courage. General French was chagrined at his treatment by Lanzèr, who certainly should have communicated with him as soon as he fell back. He was also aggrieved by the failure of the French to follow him promptly in the five bitter days of retreat. On the other hand, it is claimed that General French himself was nearest to von Kluck and should have known first of the superior concentration on his own front, that he did not begin the retreat as promptly as he should have begun it, and that he did not recognize that the French were also hard pressed by the armies opposed to them. Lanzèr, it must be remembered, did not make a general retreat on the 22d, but only swung back his right to adjust it to the thrust of von Haused, south of Namur. It was not until the 23d that von Haused seized Dinant and forced the French army to fall back along the whole line. A few hours later Joffre gave his warning to the British commander. Of course, Lanzèr should have communicated both pieces of information to General French, whose safety was closely related to any changes on the French front but it was only the second move that put the British in dire peril, and in regard to that movement the delay in communicating with General French was not great. The traditional distrust of the British soldier of the military efficiency of the French was not dispelled until after the battle of the Marne, and General French, who had both the faults and virtues of his countrymen, felt that he was the victim of Gallic instability. However, he did not lose confidence in Joffre and his book, '1914' bears abundant evidence of his friendly appreciation of the generous and tactful attitude of the French generalissimo. Lanzèr was removed at the end of the retreat, although he had fought magnificently on the retreat and in the fight at Guise the heaviest defeat they experienced before the battle of the Marne.

The withdrawal of the British from Mons to the Oise was the most spectacular feature of the general retreat; but we must not forget that it was only a part of the general movement. Von Kluck made the most powerful demonstration of all the German generals, but east of him came in turn von Bülow, von Haused, the Duke of Brunswick, the crown prince of Bavaria and the crown prince of Germany, all of whom were in motion as far as Verdun in unison with the general German sweeping movement. Facing them were the Allied armies in the following order: the British, Lanzèr, Langle de Cary, Ruffey and Castelnau. The French thrust across the Aisne, hastened by a heavy rain, before the Germans began to swing their line forward. The counterthrusts following that movement were really synchronized with von Kluck's, von Bülow's and von Haused's movements. As von Kluck fell back, the crowd and complete collapse of the left of the great line, it became necessary for the interior part of the French line to fall back. The Germans in front of it followed and fought when they could. It was thus that they crowded Lanzèr at Guise, whose retreat from Charleroi gave them the idea that he was shaken. His splendid reply, a bad defeat for his opponents, showed that his army was intact and left him opportunity to continue his retrograde movement unhindered. The world was surprised to see what a small check the French fortresses gave to this advance. Between the 23d, when Namur fell, and the 28th, when the line reached the Oise, Longwy, Montmédy, Hirson, Mezières and Lille, all the northern fortresses but two fell to the Germans. Mau- beuge, with a garrison of 30,000 did not succumb to the 11-inch howitzers until 7 September.

A story was told in connection with the siege of this place that should be remembered as an illustration of the bad effects of ill-conceived assertions. It was said that before the war a Belgian had built an engine factory at Lanières, near Maubeuge, the real owners of which were the Krupp's, of Essen, and that when the Germans arrived they uncovered concrete foundations at the factory on which they placed 16½-inch howitzers for use against the forts of Maubeuge. Investigation showed that they did not use guns of that calibre in this action but 11-inch howitzers, fired on their own wheels. It was also recalled that Lanières is southwest of Maubeuge, while the German guns attacked it from inside the Belgian frontier and to the northeast. The story seems to have originated with a Paris newspaper. It was widely repeated and went far to give the French their reputation for unusual ability in espionage. It was responsible for a wave of hysterical searching for pre-arranged gun positions in London, which, in the end, proved to be mostly fancy.

6. The Battle of the Marne.—At the Oise the British obtained a day's rest. The Germans were nearly as tired as their opponents and needed respite from their heavy marching. The line then ran from Verdun almost straight to Guise, where Lanzèr's victorious army stood, and then curved through Saint Quentin until it came to Noyon. Behind it about 12 miles was a position through La Fere, Laon and Rheims, at which the French High Command had been expecting to stand against the invaders. Joffre visited General French on the 29th and talked over the situation. His conclusion was that it would be wise to offer battle until the British had recovered from their recent trying experiences. Accordingly, he ordered all the armies to retire south of the Marne. From 30 August to 3 September the retirement went on, the German guns finding every opportunity offered. The British proceeded to the Grand Morin, the French on the east
WAR, EUROPEAN — MILITARY OPERATIONS, WESTERN FRONT (5) 308

placing themselves in a line that ran through Provins, Sézanne, Maity and Bar le Duc. The Germans followed and were crossing the Marne at many places on 4 September. Their rapid march into the heart of northern France to a line east of Paris itself gave them the assurance of victory. Day after day strong cities fell into their hands; Lille, Péronne, La Fère, Saint Quentin, Noyon, Rheims, Soissons, Château-Thierry, Chalons and many others. Victorien Sarrail ran the gauntlet back to the Fatherland. The German High Command thought the British crushed and the French so weakened that only a smashing blow was needed to finish them. It was at this point that a movement was made to deliver the smashing blow.

On 1 September von Kluck, on the western end of the line, was at Senlis, north of Paris, and the German crown prince was west of Verdun, to the east. In between the armies of von Bülow, von Hausen and the Duke of Württemberg, in all considerably more than 1,000,000 men. On that day orders were given to draw the lines in. As the crown prince moved southward he veered to the west, and as von Kluck moved southward he veered to the east. The result was that late on the 5th the line was only 90 miles long and proportionately denser and more powerful. This concentrated force was thrown on the French with the intention of breaking through at the centre and crushing the two wings in detail.

Two facts served to defeat this scheme: (1) At the French centre was an army under Foch, newly constituted and ready to die in its tracks. Foch had saved the day at Mouzon, and he was to save it several other times during the course of the war. It was a bit of extremely good fortune that he was at the critical point in the battle of the Marne; (2) Joffre had assembled a strong army on von Kluck's right, unsuspected by the Germans, which was ready to play an important part when the proper moment arrived. It came into touch with the enemy on 28 August. All the way down from the Somme von Kluck kept a French reserve operating off his right flank, but his cavalry took care of them, pushing them southward and occupying Lille, La Bassée and Amiens. When he heard of troops on his left and south he was not slow to recognize the character. His mistake was very costly. This 6th Army, as it was called, numbered 100,000 on 5 September, and was led by General Maunoury, one of the best French commanders.

It was 1 September that von Kluck veered eastward at Senlis. He crossed the Marne at Meaux and arrived at Coulommiers, 12 miles south of the river. The other German armies had kept touch on the east and stood, in general, from 12 to 15 miles to the south of the Marne. Von Kluck's order, west to east, was von Kluck, von Bülow, von Hausen, the Duke of Württemberg, whose lines ran across the river at Vitry-le François, and the crown prince, whose lines turned northward to the west of Verdun. South stood the British, the Franchet d'Esperey who had superseded Lanzerac, Foch, with his new army, De Langle de Cary, and Sarrail who had superseded Ruffey and faced the crown prince, looking north-westerly. Maunoury was west of the fortified area around Paris and faced eastward.

On 3 September Joffre learned that von Kluck was trending eastward. Divining the purpose, and also seeing the opportunity it gave him, he decided that he must strike before the German concentration became effective. A blow against the German flank at this moment would fall as a disconcerting surprise, and if the whole French force struck at the moment the German commander-in-chief would not have time to rearrange his line of battle. The defenses of Paris were entrusted to General Gallieni, an old man, but one of the best men among the older officers of France. He it was who discovered von Kluck's eastward movement and told Joffre of it. Next day the two men had a conference in Paris and a plan of attack was prepared. Von Kluck had left one corps, about 40,000 men, north of the Marne to protect his communications. It was proposed that Maunoury should fall on this force, sweep it back beyond the Ourcq and interpose between von Kluck's communications and attack him in the rear. To enable him to achieve success it was necessary for General French to deliver a simultaneous attack on von Kluck's advanced corps and hold them in the tracks south of the river, so they could not be sent to meet Maunoury. To carry out the plan it was arranged to reinforce Maunoury with troops from the city of Paris.

These arrangements Joffre and Gallieni visited General French and told him what was expected of him. French replied that he needed 48 hours to get his army in condition for attack, an interval which would have enabled the Germans to proceed so far with their concentration that the plan would not have been feasible. Joffre had no authority over General French and left him to co-operate to the best of his ability. It seems that General French was too much aggrieved over recent mishaps to attempt a hazardous movement in dependence upon the French in another great manoeuvre. Slow in action and hard to convince, he was not the man for the situation in which he found himself. His removal from the chief command later on was partly due to the belief that he did not do all he could have done in the battle now beginning.

On 5 September Joffre issued his order commanding his men to engage the enemy. "I feel it my duty," he said, "to inform you that I no longer the time to look behind. We have but one business on hand — to attack and repel the enemy. An army which can no longer advance will at all cost hold the ground it has won and allow itself to be slain where it stands rather than give way." All the commanders of armies were directed to assume the offensive.

Early on the 6th Maunoury struck von Kluck's exposed flank. One part of his army fell on the lone single corps on the Ourcq, and the other moved around to the north of the German line of communication. Von Kluck, finding the British did not press his southern front, left his cavalry to hold them in check and with the remainder of his army hastened to the northern side of the Marne. He thus found himself facing a superior army and saved himself only by the most heroic fighting. He was not crushed, as he might have been, and he punished von Kluck severely, forcing him to draw back to the Aisne after four days of heavy losses. General French followed von
Kluck leisurely, pushing back the German cavalry, and crossing the Marne on the 9th, more than two days after von Kluck had crossed it. Had he fought as vigorously as Joffre expected, his 100,000 men would have made the battle of the Ourcq a German disaster.

It has since been disclosed that the German armies aimed primarily at cutting off the French armies and not at taking Paris. This plan, von Kluck himself asserts, failed for two reasons: First, the crown prince kept urging a general advance, insisting that there were no French troops in Paris, and, therefore, that von Kluck, who was on the German right flank, was free from all danger. Consequently, when 160,000 men appeared on von Kluck’s right the latter with great courage, but they could not hold their lines intact. On the right they were driven back three miles and a dangerous gap was made between them and the next army to the east. Their left had also suffered so much that it was merely able to hold its own. But the fighting had placed the Germans in a precarious position; for as their line stretched out to push back his two flanks it became very thin in the centre. This was the situation on 9 September when Foch borrowed a corps from d’Esperey, who was relieved from immediate necessity by the retreat of von Bülow. He placed this corps on his left flank, moved one of his own corps from that point and placed it opposite the attenuated German centre, held by the Prussian

was left no choice but to retreat; second, the original German plan drawn in Berlin before the war called for an army of 2,000,000 to follow the attacking army. That army failed to appear.

Von Kluck’s retreat left von Bülow’s right flank exposed and he also had to fall back, Franchet d’Esperey pressing him all the way across the Marne in a vigorous battle. Still farther east was von Hauser, before whom stood Foch with the newly formed 9th Army. It was here that General von Moltke had expected to break the French line. He did not relinquish his plan because of von Kluck’s withdrawal to the Ourcq. Reinforcing von Hauser heavily he poured his ultimate strength against Foch, whose centre was at La Fère-Champe noise. The Frenchmen took the punishment Guards. Then, late in the afternoon, he sent it forward against the Guards. It cut them through like a knife going through cheese. At the same time he ordered a general attack all along his line. The result was that von Hauser’s army, cut through in the middle, broke into disorderly flight, streaming northward. The French pressed on after them, and followed them to the Aisne, the Duke of Württemberg and the German crown prince shifting their lines on the east, so that they kept touch with the retreat.

The battle of the Marne, as history has named this general engagement, was fought on a line 90 miles long, but within its scope were two encounters which, in pre-war wars, would have been called great battles. One was on the Ourcq River, where Maunoury with 200,000

would have remained in German hands during the war.

7. The Race for the Sea.—When the Germans were forced back across the Marne they did not stop until they had crossed the Aisne, 40 miles north of the scene of their defeat. The allied armies pursued vigorously and crossed the river hard after them. They did not go much farther; for the Germans entrenched themselves in the hills overlooking the Aisne. For several days there was a ding-dong battle along the whole line, but the most notable feature being the fighting of the British near Soissons. After crossing the Marne on the 9th General French recovered his fighting spirit, and from that time on the British army did all it could have done.

Here began trench warfare for the duration of the war. Two systems of trenches were constructed from the Oise to the Swiss border, between them the cheerless waste of No Man's Land. To locate the lines on the map, the Allies first had to take a map of France and mark it with the Oise just south of Noyon, then pass the pencil eastward to Creaonne, on the Aisne, a distance of 40 miles, then carry it eastward to the northern side of Rheims and thence southward to the western edge of Saint-Mihiel and east to Pont-à-Mousson, on the Meuse, and thence southward to the Swiss border. The result was that the general line stood 20 Sept. 1914. Rheims was thus left to the French, but it was won by General Foch after hard fighting. At once began the demolition of its splendid cathedral by the German artillery. The deed was defended on the ground that the cathedral towers were being used as observation posts by the French, an allegation that the French denied. Battering this handsome cathedral into ruins was bitterly resented in France and shocked the feelings of the neutral world.

The first efforts against the Aisne line showed General Joffre how useless it was to attempt to defeat the entrenched enemy by direct assault, and he tried to turn his line. He moved General Castelnau and most of his army north from Nancy and placed them on the left flank with orders to pass around Noyon and get behind the German line. Castelnau acted promptly, but when he turned around Noyon he found before him the crown prince of Bavaria, his old antagonist at Nancy, and there he halted, his army facing east. His efforts to get behind von Kluck thus proved futile. Trying again Joffre assembled an army north of Castelnau's, giving the command to Gen. de Maud'Huy with orders to strike in behind the elongated German line. De Maud'Huy made the attempt, only to find that the Duke of Württemberg was before him with an ample army. The practical result was that the entrenched line was extended from Noyon to La Basse, step by step, and thus was formed that great angle which disfigured the map of France throughout the remainder of the war.

In the latter part of September General French became anxious to move northward, where his forces would be nearer their bases of supplies and have the added incentive of fighting to protect the Channel ports, that were, in a sense, the outer defense of Britain. As soon as French troops could be found to
replace them in the Aisne line Joffre consented to the transfer, which was made between 3 and 19 October. The object of the Allies at that time was to recover Lille, which von Kluck's cavalry had taken in August, and pushing on to the northeast to touch hands with King Albert at Antwerp. If the movement succeeded the international battle line, turning north at Noyon, would be continued through northern France and central Belgium, so that the Germans would be kept away from the Belgian seacoast. It was even hoped that Lille might be recovered and the invaders deprived of their main line of communication in the north.

To carry out this plan it became necessary for Antwerp to hold out against the Germans who were pressing it as hard as they could. With its outlying forts and redoubts it was considered the strongest place in Europe, next to Paris. Against these forts the great howitzers of the enemy were concentrated and a bombardment was opened on 29 September. The story of Lille and Noyon was repeated. Fort after fort crumbled, and by 7 October the city was in flames, so that the king dared not risk the capture of his army. As it was, he had stayed too long—at the urgent request of Winston Churchill, of the British Cabinet. That impetuous man visited Antwerp after the French staff and King Albert had decided to withdraw, and by offering British aid induced them to stay two days longer. The promised help did not arrive. The French army came into the city, and a division of infantry arrived at Ostend without being able to reach Antwerp. As the Belgian force moved out on the 8th the Germans pressed northward to cut them off. All escaped but one division, which was forced to cross into Holland and submit to internment. The Belgians drew back toward France, leaving their enemy to occupy the coast as far as Nieuport. Zeebrugge and Ostend thus fell to the Germans, who made of them submarine bases from which the damage was later done to British shipping.

8 The German Drive for the Channel Ports.—Early in October the German High Command formed a new design. It had failed in its great objective of destroying the French army and taking Paris. It now wished to reach the Channel ports of Dunkirk, Calais, and Boulogne, cut the British line of supplies, and place the southern coasts of England within reach of the long-range German cannon. If it could extend the line directly west from Noyon to the sea it would be materially shortened, the French would be cut off from the British and made an easier victim of later campaigning, and a large and wealthy portion of France would be brought under German control. The line reached the sea south of the Somme all the work of dislodging the invaders would have to be done from a line still farther south, and it is doubtful if it could have been carried through successfully. Here, as in the Atine campaign, the Germans failed by a narrow margin. The design pleased the German people because it was directed against Great Britain. The Kaiser himself went to Flanders to cheer his troops, and his whole available strength was put into the effort. Joffre's action in defense was not originally a mere act of resistance. It began as an offensive, the object being to close the gap between de Maud'Huy, whose northern flank was near La Bassée and the Belgian army which, having moved out of Antwerp on 8 October, was falling back along the Belgian Coast. There was still hope that the wavering line could be stabilized somewhere toward Noyon, but it could not be saved, possibly Zeebrugge or Ostend could be made the northern terminus of the line of defense.

North of La Bassée the line was held, for the most part, by the British, as far as the northern outskirts of Ypres, in Belgium. Farther on it was held by some French troops, south of Diksmuide, and beyond this to Nieuport, on the sea, it passed into the hands of King Albert's army, which had withdrawn from Antwerp along the seacoast, followed by the German army that had pressed it out of that city. Besides these main elements, the forces contained a corps of Indian troops, Gurkhas, Sikhs and Rajputs, long trained for the British in India. They had been landed at Marseilles and carried thence to the areas behind the British lines, where they first served as supporting troops. There were, also, native troops from Africa, Senegalese, Moroccans and Turcos, fighting with the German army, a striking complex of nationalities assembled to wage with the last available ounce of strength the battle for the preservation of civilization. Europe had seen nothing like it since the hosts of Martel met the Moslems at Tours in 732 and drove them south of the Pyrenees.

To direct operations in the north Joffre sent General Foch, whose splendid work at La Fère-Champenoise and Rheims had revealed his eminent military capacity. Hither came, also, on a visit, the aged General Roberts, of the British army. He wished to see again his beloved Indian corps, most of whose native officers looked on him as their best friend. He was handsomely received and spent several happy days in the country. L. L. J. over the plans Foch had made for the battle he said simply, as was his way: "You have a great general." On this visit it was stricken with illness and died at British headquarters on 14 November. Between Foch and French Government was standing, and the British soldiers, realizing how completely their battles were for the safety of the empire, spent life and strength as few other soldiers have spent them. On 20 Oct. 1914, the Allied line was well established though thinly held. Including de Maud'Huy's sector, from Albert to La Bassée, it was 100 miles long, and its defenders were about 500,000. Against them were thrown probably three times that number, fighting under the eyes of the Kaiser himself. Just as the battle began, 22 Oct., a General von Molkte, German Chief of Staff, retired from office on the plea of bad health. He was succeeded by General von Falkenhayn.

To break through the Allied line the Germans had the choice of four points of attack: Nieuport, Ypres, Bassée and Arras. If they had concentrated all or most of the striking force at either of them they could hardly have failed to break through to the coast. They chose, however, to attack at all simultaneously, as a last resort.

The first attempt was at Nieuport, on 18 October. The Belgians were exhausted and
dispirited by their retreat from Antwerp, but they met the attack bravely. Nevertheless they were being pressed back steadily when three British monitors, built for service in shallow water, got inshore and opened fire on the Germans on the beach, driving them inland several miles so that Nieuport itself was saved. The attack was renewed a few miles south of the town with great force. The Germans crossed the canalized Yser and seemed about to press on to the rear of Nieuport, when the Belgians managed to construct a dam across the canal, so as to flood the area held by their foes, who fell back with some losses. The battle then shifted to Dinxmude, still farther south. Here again the superior force of the British line back two miles, losing a great many men, but they did not break through. Probably they would have succeeded if they had brought up fresh troops and kept up the fight a week longer; for the second corps was almost at the limit of endurance, and no re-enforcements were in sight. But by this time the kaiser was putting all his strength into the attack on Ypres and drew off some of his troops to that area. The battle of La Bassée thus came to an end, and the net result was a German defeat.

Meanwhile, the Germans had opened a third battle at Arras, where Gen. de Maud'huy was confronted by the army of General von Kluck, who attacked on 24 October. After fighting two days without success the battle receded. Then Gen. de Maud'huy assumed the offensive and forced back von Kluck until the town of Arras, which had suffered severely from the German bombardment, was out of danger. The battle of Arras, 24 October to 1 November, was rated by the Germans as one of their important engagements. It was of the greatest importance to the Allies; for if the French had given way at this point, the British armies in the North would have been completely divided from the French, and would have been forced to surrender or withdraw under trying circumstances.

The fourth and most formidable of these attempts to reach the sea was made against Ypres, defended by the first British corps under the immediate command of General Haig. On 20 October Haig’s men were four miles northeast of Ypres. At that time the two battles to the south, just described, had not been begun. The Germans had screened their operations so well by cavalry that General French did not know how far their concentration had proceeded. Bent on carrying forward the plan agreed upon between him and Joffre, he ordered Haig to move forward, if possible, with the hope that he might reach Ghent and Bruges, and open the way into northern Belgium. Haig’s men had just arrived from the Aisne and were tired, but they responded with firmness to the order to advance on the 20th, and in doing so brought on the first battle of Ypres. The Germans were on their front in overwhelming numbers and threw themselves on the British most furiously. South of Haig’s corps were Allenby’s cavalry, the third British corps, under General Pulteney, and a French cavalry corps, under General Conneau. South of Conneau came Smith-Dorrien, whose battle at La Bassée has been described.

When Haig was given the order to move forward, if conditions on his front warranted he was four miles northeast of Ypres, astride the road to Bruges, with a front eight miles wide. He tried to execute the plan on the 21st. The Germans were massed in front of him and attacked furiously. It was soon evident that he would have all he could do to hold his own. Joffre promised to send reinforcements, but he gave assurance that they could not arrive before the 24th.

The interval was a period of bitter combat. Attack after attack was delivered, now at one point and now at another. Frequent breaches were made in the lines, but the Germans seemed to have had little idea what to do when they
had gone through and the British always re-
paid the damage before serious consequences
occurred. The Germans were trained to mass
tactics and lacked initiative enough to utilize a
new situation. The expected assistance arrived
late on the 23d and early on the 24th, and con-
ditions changed for the better, though they
still remained serious; for despite the help from
Joffre the Germans were greatly superior in
numbers. The exhausted defenders had no op-
portunity to obtain rest and continued for days
in the trenches, where they had to repel many
charges.

From the 24th to the 29th the battle was
waged fiercely along the line from Zonnebeke
to Hollebeke, here one thrust and there an-
other. On the 29th the enemy attacked in
overwhelming force all along this part of the
line. There was nothing to do for the de-
fenders but to stand in their tracks and die
or beat back the tide that ever flowed on.
Many a unit was wiped out or reduced to a
handful of men, but there was no surrender.

For three days the terrible struggle went on.
On the 31st a French corps and a body of
cavalry arrived and the Germans were forced
back from the positions they had gradually
won in the preceding days.

But the battle was not over. The kaiser
was determined to have Ypres and kept bring-
ing up other troops. These movements pro-
duced a lull in the battle. On 6 November
the bitter struggle was renewed and continued
for three days. Then came an interruption.

On the 11th two brigades of Prussian Guards
were brought up, and the kaiser made an earn-
est appeal to them for a victory, giving the
encouragement of his presence. They were his
favorite troops and they went forward with
the parade step. The British fired coolly and
with telling effect, but the Prussians penetrated
the British trenches. Then they hesitated, as if
they knew not what to do next. The British
left them no time to determine. A shower of
shrapnel shot through them and then the
British charged and drove them back into
their trenches. This was the last German ef-
fort in the first battle of Ypres.

While this period of fighting was going on
east and south-east of Ypres rearward attacks
were made on Bixchoote, five miles north
of the town. If the place had been taken
Ypres would have fallen and the British would
have been forced to retire. Bixchoote was
defended by General Dubois, with the ninth
corps and some French Territorial troops and
cavalry. With the greatest courage his men
fought off the German attacks, inflicting great
slaughter. By 15 November quiet reigned in
this part of the line also. A few days later
winter fell on the trenches, with rain, sleet
and snow, and aggressive military operations
ceased.

On the 17th another French corps arrived,
sent by Joffre, of whom it was said in another
connection that there was never a time when,
in dire need, he could not find a fresh divi-
sion to relieve a hard-pressed sector. The
new arrivals gave General French an oppor-
tunity to withdraw his troops for the recupera-
tion they so much needed. Through four
weeks the weather stilled the heat, enemy inter-
ty the Germans could deliver against them. They
had died in great numbers, 40,000 killed and
wounded out of something more than 150,000.
One division, the seventh, lost 356 of its 400
officers and 9,664 of its 12,000 rank and file.
The German losses are not known, but they
must have been far in excess of the losses of
their opponents. The kaiser had made a stum-
pendous effort, based upon the theory that if
men were sent forward persistently in great
masses they would carry any position. The
theory failed here, as in other battles in this
war. When the fighting was over, the Channel
ports were safe from the hands of the ambi-
titious emperor. If he had struck for them
when he first entered Belgium, instead of
chasing rainbows in the valley of the Marne,
the story would most probably have been
different, and the outcome of the war would
certainly have been placed in serious doubt.

GRAND SCALE PREPARATIONS, 15 Nov. 1914 to
1 July 1916.

1. A Year and a Half of Preparation—
Looking back to the history of the World War
as a whole it is seen that Germany assumed
the offensive in the beginning of the strug-
gle and kept it until the spring of 1917.
This statement applies to the large features
of strategy. She knew what her enemies
could do, took liberties with them and
managed to carry on the struggle without
endangering her own position. The result
was that she was able to strike in the West
and in the East as occasion seemed to demand
and thus apply her strength where it seemed
likely to yield the best results.

This was due to Great Britain's state of
unreadiness. Had the British army been as
strong in 1914 as in 1917 such a course
would have been impossible; for with 1,500,000
trained troops ready to attack by the side of
an equal number of Frenchmen, and with an
overwhelming supply of munitions with which
to smother the German entrenchments, the
kaiser could not have forced them to attend to
the menace in the East, and in one field or the other he would have been
pressed to disaster. These speculations, how-
ever, would not be complete without the state-
ment that if Great Britain was equally heavily
prepared as France in the beginning it is not
likely that the war would have occurred.

The plan of the German High Command
in 1915 was well made. Granted that Great
Britain would not at first become a serious
factor in the war and that France alone could
do any great things, she contented herself
in 1915 in playing a defensive game in the
West and throwing her entire surplus energy
into the Eastern theatre of operations. It was
already evident that Austria was no match for
Russia, not even in a defensive war. Nor
could Bulgaria and Austria combined deal with
Russia and Serbia. Strong German efforts
were necessary here if the balance was to be
kept even.

For the time being results seemed to justify
her expectations. When the year opened the
Russian army of General Brusiloff was south
of the main passes of the Carpathians, ready
to March through the plains of northern Hun-
gary, and the Eastern Allies were sufficiently
of an expected capitulation by the
WAR, EUROPEAN—MILITARY OPERATIONS, WESTERN FRONT (5) 309

eastern half of the Dual Empire. Then fol-
lowed the battle of Dunajec, which forced
Brusiloff to retire from Galicia, and with
him the Transylvanian and the Transcarpathian
forces. This campaign was not ended before the great
German drive on Warsaw was begun, and by the end
of the year Poland was occupied and Riga was
all but held in the tight German fist. So com-
pared a German intransigence and stubbornness that it
could do nothing to help Serbia, and all that
luckless country was overrun but the south-
western corner. It was only by prompt action
that the Entente Allies could fortify and hold
Salonica, in Greece, and thus bar the Central
Allies from that important means of access to the
Ægean Sea.

By these operations the Germans came into
possession of the railroad from their own
country through Austria to Nish, in Serbia,
then to Soña, in Bulgaria, and thence to
Constantinople. The *Berlin-to-Bagdad* route
was thus made a reality. It was a means of
sending supplies to Turkey and helping her
invasion, the campaign against the British
at the Isthmus of Suez; and it gave a great
stimulus to the Pan-German sentiment. The
war revealed the weakness of Austria-Hun-
gary. In fact, she was like putty in the hands
of Germany, and Bulgaria and Turkey were
little less than dependent provinces. Greece
was kept from coming over to the side of
the Central Allies by nothing but the fear of
the British and French fleets. Before the
war a great central confederacy under the
direction of Germany was a dream of the
Pan-Germans; at the end of 1915 it was all
but a reality.

Later events showed how little it profited
Germany to spend 1915 chasing this South-
eastern rainbow. All that she gained in that
quarter but increased her obligations to de-
defend. If the day came when her strength at
home was so much exhausted that she could no
longer succor these outlying states they would
fall within the orbit of her power. The smallness of
the whole structure. Her real menace was in the
West, and it would have been better for her,
but not for the world, if she had given it her
best and earliest efforts. Save Galicia and
draw Brusiloff from his threatened conquest
of Hungary, if necessary, but after that con-
fine the eastern campaigns to the defensive.
Such a course would have enabled her to
throw heavy armies against the forces in
France and Flanders at a time when they were
little prepared to meet her.

Meanwhile, the task of raising an army was
going forward in Great Britain in a truly
British manner. On 6 Aug. 1914, Parliament
voted an increase of the army by 500,000 men
to be raised on the voluntary principle and
voted a credit of £100,000,000. The preceding
day Lord Kitchener had been appointed Sec-
retary of War, and he immediately issued a
call for 1,000,000 men. To the troops who
were the first expedition he gave the
uncomforting assurance that they could
expect no reinforcements from across the Chan-
nel for at least six months.

The spirit of the British people was all that
could be desired. Recruiting offices were
swamped by the numbers who offered, and men
stood in line day after day to get up to the
doors. The greatest difficulty was to obtain
equipment and supplies. To put into operation
the vast and intricate machinery of production
and distribution necessary to fit out an army
demanded organization and reorganization.
During the first months the newly recruited
men suffered much inconvenience and some
hardship because the supplies were not ready.
To manufacture arms and artillery in even
greater time. Existing plants were in-
adequate and trained mechanics were lacking
to produce half of what was needed. More-
over, when the war began British labor, long
schooling in the idea that wars are made by
capitalists and for the benefit of capitalists,
did not fully realize how vital the outcome
would affect the very basis of British life. It
took time and some disasters to show them
how essential their efforts were to the success
of the British arms.

The war found British political life in its
acquiescence a jangling state. Party spirit had to be
subdued, and a prime minister had to be
found in whose abilities and administrative
the people had confidence. All these elements of
internal weakness were well known to the
Germans, who were as well prepared for war
in economic as in military matters. But their
delay in the West gave the British people the
opportunity to remedy these deficiencies. In
fact nothing could have worked better to show
the British their defects than the very tri-
umphs which Germany made in the Southeast.
There is nothing the Briton holds more essen-
tial than the preservation of the empire. To
talk about *Berlin-to-Bagdad* was the Ger-
man's strongest challenge to the Briton.

Throughout the autumn and winter of
1914-15 vast preparations went on in camp and
factory. Compared with what had been done
before the war, and what the average man ex-
pected when the war began, the results were
excellent; but compared with what was needed
they were not satisfactory. The situation de-
manded every soldier the country could spare
from industry and every ounce of industrial
energy in the munitions works that could be
spared from the production of the essentials
of life. To obtain such results no means were
adequate short of compulsory service. Every
man in the United Kingdom ought to be at the
disposal of the government to do that part in
the war which he could do best. Such was
the course pursued in France and in Germany.
But it was a course as foreign to British ideals
as to American ideals. The existing voluntary
system was firmly rooted in the British de-
mocracy, and a democracy changes its point
of view slowly.

By the end of 1915 it became evident that
the voluntary system had yielded to the govern-
ment most of the men it was going to yield.
While a large number had joined the colors
it was evident that there was still a great num-
ber who would never join under the voluntary
system. It was also observed that a propor-
tionately large number of the very poor were poor
with nobody dependent upon them. Opinion,
therefore, slowly formed for forcing such per-
sons to take their share of the burden of na-
tional defense. It came to its triumph when on
14 May 1916, Parliament passed the general con-
scription act applying to all males from 18 to
41 years of age. Passage of the law not only made it certain that the full soldier strength of the country would be called out, but it abolished the sense of inequality which dwelt in the popular mind as long as many able-bodied men remained free from military service. We must, however, not forget that the voluntary system served England well in the beginning of the war. By the end of 1914, 2,000,000 Britons were in service in the army, and a large number volunteered during the following year. In May 1916 it was said in Parliament that more than 5,000,000 men were then in the military and naval service of the country.

Equally important was the lack of munitions. It did not cease until the Ministry of Munitions was created in July 1915, with Mr. Lloyd George at the head. His influence with the labor unions was great, and he induced them to waive some of their restrictions on industry. He well said that if the British and French armies had been as well supplied with stores they would have been able to drive the Germans out of France and Belgium by mid-summer in 1915. No story of the campaigns on the western front is complete without full recognition of that other campaign in Britain herself to bring her resources of men and things into as full state of service as Germany had at the beginning of the war. It was not fully accomplished until late in 1916. While it was going on the men in the fields of Flanders had to mark time, losing to a large extent on the efforts of the French to enable them to hold what they had.

Not that the western front was quiet throughout the year 1915. On the contrary, it saw some severe encounters, most of them initiated by the Entente Allies. They were all based upon an imperfect realization of the changed conditions of war. They were begun with the idea that vigorous action would enable the attacking party to break through the enemy's line of defense and produce consternation in his rear. They all failed because there were not enough artillery and trained soldiers. These failures, however, had their uses. They taught the leaders what mammoth efforts had to be made, and they contributed their parts to the necessary work of wearing down the German morale and man power.

2. France in Aid of Russia.—During the winter of 1914-15 and early in the following spring the French conducted several isolated campaigns that had an important influence on operations in the East. For France was a faithful ally and it had long been agreed between her and Russia that when, in that great war which both nations had expected, Germany flew at one the other she would strike her in the rear. As soon, therefore, as she turned from the first battle of Ypres to the eastern front, France proceeded to carry out her promised part and by severe blows forced Germany to use reserves which both nations had expected. Germany flew at one the other would strike her in the rear. To this process Joffre, speaking to a careless inquirer, gave the name "nibbling." But he was under no delusion about the situation. He was fighting as he had to fight to bring relief to a hard-pressed ally. More than that he would not undertake.

France had lost heavily in the campaigns of 1914—some estimates putting the figure at nearly 1,000,000—but that was evident in the end was not yet. Wise policy demanded that the strength of her armies be conserved to meet the great blows that would come in good time.

The first of these isolated operations was undertaken in Alsace in December 1914, while General von Hindenburg was making his assault on the Bzura-Rawka line. A feint was made along the western slopes of the Voges Mountains, and in the extreme southwest, opposite Mülhausen, there was an advance until the town of Thann was recaptured and the village of Cernay, the key of Mülhausen, was threatened. After long-continued fighting the French took Hartmannswillerkopf, from which they could see the steel manufacturing city, not more than 10 miles away. Farther they could not go. Mülhausen remained in German hands, but 350 square miles of Alsatian territory, including several villages, were redeemed from the hands of the Teuton and the tricolor was unfurled in their midst. This fighting much of the success was won by the Chasseurs Alpin, who descended the snow-covered mountain sides on skis.

Another effort was the attack known as the battle of Soissons. It began on 8 Jan. 1915, just as the Hungarians were demanding German aid to repel the Russian movements in Bukowina. At Soissons the French held the town, situated on both sides of the Aisne, and the flat meadow beyond with in the foot of the foothills. The Germans were on the ridges that marked the beginning of the northern plateau. A weak division, about 12,000 men, held the French lines and was ordered on the 8th to take two hills that dominated the plateau in the region east of the town. They carried out their orders with good effect, but the Germans brought up two corps and counterattacked with great energy. Heavy rains had come in the interval, and the flooded river had carried away two of the three bridges by which ammunition and reinforcements could be forwarded. Thus cut off from succor, the French troops were hopelessly outnumbered and forced to escape as well as they could. By hard fighting the major part escaped to the south bank, losing 5,000 men and a considerable number of guns. Encouraged by their success the enemy now made a determined attack in mass against Soissons itself. Here the bridge was intact and the French brought up reinforcements and repelled the assault. The Germans spoke of the battle of Soissons as a great victory. It was an unsuccessful French offensive which involved German losses of nearly 10,000 men and resulted in a German advance of one mile on a three-mile front. It was fought between 8 and 19 Jan. 1915.

A third attack was delivered in the Champagne region during February and March, at the time when von Hindenburg was winning the battle of the Masurian Lakes. In Champagne the battle would have been sent to the East. To this process Joffre, speaking to a careless inquirer, gave the name "nibbling." But he was under no delusion about the situation. He was fighting as he had to fight to bring relief to a hard-pressed ally. More than that he would not undertake.
essary to reorganize the line of defense. General Joffre's purpose, therefore, aside from drawing reserves away from the East, was to reassert the road or bring it within effective range of his artillery.

The battle opened on 16 February with a violent artillery duel followed by an infantry charge. It was directed against the German position opposite Beaune-four Farm, where there was a depression flanked by two hills on which the enemy had strong artillery defenses. The charge failed but it was renewed from day to day and at last succeeded on the 27th when some French Colonial were brought up. Hard fighting ensued until the arrival of reserves from Flanders in the middle of March. At its close the French had not reached the coveted railroad. They had lost severely, more than 100,000 men in killed and wounded, while their opponents, fighting on the defensive, had lost less than that number. Aside from its effect on the fortunes of the Russians, the battle of Champagne must be considered a French defeat.

The operations stand out as distinct strokes in a series of minor operations from the Swiss border to the northern end of the French line at La Bassée, a distance of more than 400 miles. Sniping was constant, as opportunity offered. The artillery kept up its persistent work. Where the trenches were close enough together hand grenades were hurled from one to the other. It was at this time that trench raids were inaugurated, and they soon became frequent. They kept the men in training and were a means of gaining information. Now and again some more substantial attack was carried through, gaining a bit of trench, cutting off an obtruding angle, or seizing an elevation on which some machine guns or sharpshooters were stationed. In the Argonne, especially, there was much of this kind of fighting. The French line at this point ran along a gap in the forest, from Varemes to Vienne-le-Château, following a road from one end of the gap to the other. The Germans had pressed down toward this pass from the north, which was all important for the French, since it was the link between their armies on the east and west. Forest fighting went on here all winter, and the French had the better of it, gaining ground on the north and holding it. Still and new movement that is noteworthy here was an attack by the French on the Heights of the Meuse south of Verdun. Here the Germans had pressed westward nearly to the banks of the river. There was danger that they would cut off communications and force the army of the fortress. General Brecy commanded the French forces here and had well won the thanks of the country for his faithful and skilful defense of the greatest fortress of the French frontier. In February he started operations to drive the intruders back from the edge of the heights. He took Les Eparges and the high ground around it, which, when fortified, became a safeguard of Verdun on the southeast. At the same time operations conducted by other French forces near Pont-à-Mousson carried the Germans back from one to two miles. Saint Mihiel, at the angle between Verdun and Pont-à-Mousson, however, remained safe in German hands. It was too strong to be stormed, and the French contented themselves with holding firmly the sides of the salient, knowing that the point would not be advanced if the sides remained intact.

In all this fighting the net results were small. It would be incorrect to say that this was no more than the French expected. At that time neither side had that respect for the fighting qualities of the other that each came to have in time. Nor did either side fully realize the conditions and limitations of the new style of war. Painfully and slowly and at great cost in life they were to learn how hard it is to take well-defended trenches. If the armies that faced one another at the end of the first winter of the war could have known how long their struggle was going to be, and if the nations behind them could have known what sacrifices were to be demanded, it is doubtful if the contest would have been allowed to go on.

3. The British Struggle in Flanders.—The first battle of Ypres closed with the futile assault of the Prussian Guards near Nieuport, 11 Nov. 1914. The Germans had made many costly charges and were satisfied to suspend the engagement. Already heavy work had begun in the East, and their reserves were demanded for it. The tired British were relieved temporarily by trench troops whom Joffre sent, but they were eventually back in the trenches, wading through mud and slush, standing sentinel in the wearying winter days, and always ready to challenge the foe.

This spirit became aggressive when it was learned that the enemy had withdrawn some of his troops to serve in the East. Some isolated attacks were made on his lines with good results, and this led the officers in command of the Indian troops in the trenches at Givenchy, two miles west of La Bassée, to the Germans held, to attempt to drive them from the latter position. An attack was opened before dawn on 19 December. Two lines of trenches were carried but the straggling dawn showed them unprotected on the flanks which had to be abandoned in the succeeding night. The Germans seem to have decided to give the Indians a lesson. On 20 December they drenched their lines with shrapnel and trench mortar bombs and sent forward their infantry in heavy formation. The Indians in Givenchy fell back, and that important place passed into enemy hands. General French ordered up English and Welsh troops to restore the lines, which the Indians had given up on a two-mile front. By hard fighting this object was attained. The Indians had been two months in the trenches and were dispirited by the hardships, to which they were unaccustomed, and by their heavy losses. They never adapted themselves to the monotony of trench warfare. This affair left the troops facing one another at this section in a state of tenseness, and another struggle of the same character occurred from 25 January to 6 February. It was brought on by the Germans, who were supposed to wish to have some success for celebrating the Kaiser's birthday, 27 January. They succeeded in taking Givenchy but were
promptly thrown out. They took position in a brickfield where the kilns and stacks made excellent defenses, and some bitter fighting ensued before they were at last driven back. Much hand-to-hand fighting occurred in this region and the losses were severe on each side. Thus two sharp blows had been given in this region and battle blood was nowise abated by the results. A third was about to follow, and it was to be a much greater effort than either of the others. By the end of winter the British had been heavily reinforced. In November 1914 the Territorial troops, fresh from intensive training in England, began to come over by battalions. By the end of February they had arrived in divisions. A whole division of Canadians were also on the spot, full of that vigor which the American air gives to those who have breathed it deeply. There were, also, troops of British stock assembled from many far flung imperial garrisons, shivering in a climate that had nothing in common with the tropical scenes from which they had been able to shift. By April about 500,000 men when spring opened. He organized them into two field armies, in each of which were three corps. Over the first army General Haig had command, over the second was General Smith-Dorrien. The first stood on the southern part of the British line, from the French army of Gen. de Maud'Huy. The second held the front from Estaires north to the point of the Ypres salient, where it connected with the French forces organized into an army under General D'Urbal. This was the largest body of British soldiers assembled up to that time and it was better equipped with arms and artillery than any other force. But for all that, experience was to show that it was not well enough supplied for the demands of the new type of warfare.

General French and his officers were confident that they could break through the German lines. The people at home shared their feeling and there was a general expectation that something would be done commensurate with the great effort that had been expended. It was thought that only the coming of spring and the diminution of the mud that filled the trenches and covered the surface of the north country were needed for the realization of these hopes.

The scene selected for attack was that which had witnessed the two affairs just described. Three and a half miles north of Givenchy was Neuve Chapelle, a straggling village which had been in British hands early in the war. It was later taken and held by the Germans and made an inconvenient salient in the British lines. Behind it was the Aubers Ridge commanding the approaches to Lille. To cut through the lines here and seize this ridge would have an important effect upon the whole German position in this region. After due deliberation it was decided to make the attack prepared and prepared movements were made in the most careful and elaborate manner.

By this time it was known to all men that the war was an artilleryists' war to a larger extent than in any preceding struggle. The Germans had foreseen this fact, but it was left for the French, with their keener wits, to show how the best use was to be made of the vast numbers of cannon that were assembled. In their fighting in Belgium they showed what they called the curtain of fire, later known as the "barrage." Placing their 75's close together side by side with identical range and firing rapidly they were able to drop a continuous line of exploding shell. Then by increasing the range by successive brief intervals they gradually moved this curtain forward. As it went it demolished wire entanglements, trenches and their defenders and permitted the infantry, who were held in check as they advanced behind the moving curtain, to pass unscathed across No Man's Land and occupy and organize the enemy's trenches. By raising the range still more the artillery could make it impossible for the enemy to deliver his counterattack before the newly established lines were safely occupied. The value of the barrage against entrenchments was well established in the war. It was at Neuve Chapelle that the British used it first. Although it appears simple to the experienced observer, it is a very delicate affair and depends for success upon exact cooperation between infantry and artillery, as well as upon good staff work and perfect transmission of orders by telephone.

At this point the British had control of the air and were able to mass their artillery without detection by the foe. At 7:30 on the morning of 10 March they opened the most concentrated fire the scene of war had yet witnessed. The troops were massed in the trenches in front of Neuve Chapelle and went forward at 8:05, when the barrage was shifted to the back German areas. The houses of the village were now leaping into ruins and no Germans in them were able to escape. At 8:35 the artillery shifted to the area back of the village, and the infantry followed into the ruined streets, where some dazed Germans were left to surrender. So far as Neuve Chapelle itself was concerned, the attack was a success. A hole had been blown in the German line a mile and three-quarters wide, and the British troops who had been assembled in the forward trenches were in the village safely established in newly constructed trenches. It was a part of the plan to have them followed with a strong column in support which would rush through the gap and seize the ridge to the east that led into Lille. This feature of the program miscarried for three reasons: (1) The gap was not wide enough to permit extensive operations through it. The German positions on each side of it enabled the undisturbed enemy artillery to enflame the troops in the gap and confine them closely in their trenches; (2) the necessity of bringing up the supporting columns promptly was not understood, with the result that it was not until four o'clock in the afternoon that they were sent forward, and at that time the Germans had organized strong defenses on the ridge; (3) the intense bombardment made heavy demands on the stock of ammunition that there was not enough at hand to carry on the action on the scale that was necessary to insure success. The result was, therefore, that this action, which began so well, did not yield the full fruit that had been expected. The

WAR, EUROPEAN—MILITARY OPERATIONS, WESTERN FRONT (5) 313

German salient was flattened out, but the further advance toward Lille was not realized. During the 11th and 12th the British made insignificant advances with very little advantage to the front. On the latter day the Germans made the expected counterattacks, but their thrusts were badly co-ordinated and caused little trouble to the British. On the night of the 12th General Frew, recognizing that the front had suffered itself, ordered the army to organize their trenches in the ground gained and give over the offensive. Although the battle of Neuve Chapelle yielded no territorial results comparable to the sacrifices, it taught the British a useful lesson in the conduct of massed attacks on enemy trenches. They lost 12,811 killed, wounded and missing and estimated that their opponents lost nearly 20,000.

This blow aroused the Germans to retaliate. On 14 March they assembled a great many cannon under cover of mists opposite Saint Eloi, a position just north of the Messines Ridge, at the inner point of the salient the Germans had driven into the line southeast of Ypres during the first battle at that point. By the 17th night the entire British line in this sector would be in danger. The bombardment they opened on the British trenches at 5 P.M. is described as "tremendous," showing that they also had profited by the lesson of Neuve Chapelle, and it was reinforced by the explosions of two mines under the British defenses. Then the infantry attacked in heavy masses, forcing their opponents out of the crumbling trenches at many places. By bringing up light artillery they then enfiladed the position to which the defenders still clung, and by nightfall the village was in their hands. Under cover of darkness, however, the British organized a strong counterattack, which, delivered at 2 A.M., retook all the positions lost that were deemed of importance. In this battle the first of the Canadian regiments came under fire, the Princess Patricia’s Light Infantry, with such good results that the spirits of both Canada and Britain were raised to an enthusiastic pitch.

The Germans arrived later in this ding-dong fighting on the western front. Saint Eloi was a German offensive and the British reply to it was an attack, opened on 17 April against Hill 60, an important elevation in the flat country north of Zillebeke. To take it would push back the German lines at a point where they were within three miles of Ypres. The position was seized by the British on the 17th, the Germans counterattacked on the 18th and desperate fighting followed on the hill itself until the 21st, when the Germans were driven off and the British remained in possession, with heavy losses on each side.

It was while this affair was in progress that the second battle of Ypres began, the German reply to the attack on Hill 60. The first step was a heavy bombardment of the town of Ypres with 42-centimetre shells. The object was to block the streets and interrupt the bringing up of reinforcements by the roads that led through the town. As these roads led to the northwest of Ypres and Hill 60 of as well as on the southeast, it indicated to the British that the scene of attack was about to be shifted. Their forecast was confirmed on the evening of the 22d in a most gruesome way. The time was five o’clock and there was a steady wind from the northeast. Artillery observers noticed a bank of green smoke on the front of the German lines toward the Allied trenches. It came on along a front of more than four miles, part of it held by soldiers of the Ninth French Army and part, on their right, held by the third and second brigades of the Canadian division. The vapor rolled along by the breeze was asphyxiating gas. The Germans had prepared to use it, and in order to break the shock of horror to the minds of their own people had previously circulated the false story that the Entente Allies were using it. The French and Canadians knew not what it was until it was on them. Says General French: "It was at first impossible for anyone to realize what had actually happened. The smoke and fumes hid everything from sight and hundreds of men were thrown into a comatose or dying condition, and within an hour the whole position had to be abandoned, together with about 50 guns. In the Canadian trenches the fumes were less severe, and the men stood their ground, but those on the right suffered greatly. To their left a gap had opened in the line four miles wide, leaving their flanks exposed, forcing them to bend back their line and to hurry forward their brigade reserves. Fortunately the Germans did not advance hastily, probably because of fear of their own gas. The approaching darkness was some relief, also, and by the next morning General French had sent forward five battalions, which with the two reserve battalions of the Canadians had to repel the German attempts to penetrate the gap during the 23d. It was not until late on the 24th that effective reinforcements arrived, and by that time the losses in the lines were so heavy that the reinforcements did not restore security. The retiring French had abandoned their artillery and the reinforcements had no means of keeping down the artillery fire that raked the field over which they had to fight. The Germans continued to employ gas and the Canadians had a second bombardment on the 24th; but they had learned that to fix a wet handkerchief over the face gave much relief and by sticking to their posts they observed that the gas quickly passed by, whereas those who ran were longer within its grasp.

The week of sheer slaughter that followed has no redeeming feature other than the courage of the men who met it. The Germans threw themselves with special vigor on the two Canadian brigades who carried themselves, as General French said in his report, with a magnificent display of tenacity and courage. If there had been a break where they stood the enemy would have turned the whole eastern front of the Ypres salient out of its position, and the result would have been disaster. On 1 May General French ordered the troops on the east to be drawn into positions nearer the town. His lines of communication in the salient were under hostile fire from the heights north and south of the trenches, and thus he shortened the difficulty of supply for his troops while he shortened his lines by three miles and gave opportunity to the occupants to take longer rest periods. The retirement was effected
quickly and without the knowledge of the Germans, who continued to shell the trenches after they were abandoned. Hard fighting continued until 13 May, when the Germans ceased to attack. They had been fighting for no territorial gains. To take Ypres at the expense of the British, to shatter their morale and to waste the strength of the British army was all they had in mind. They had not succeeded in the first of these objects nor in the second; but they had taken heavy toll of their adversaries.

The lesson of the battle was written plain for the eyes of all to read. The British army was fired with as great courage as any that ever answered the summons of battle, but it did not equal its opponents in organization. None realized this better than the British themselves. They took the lesson to heart, realizing that ultimate victory could not come until their own organization was improved.

The introduction of poison gas will ever be associated with the second battle of Ypres, although asphyxiating shells had been used earlier. The gas was chlorine and being drawn into the lungs produced acute bronchitis, congesting the face until it was lividly purple and producing most intense pain. Those who first encountered it ran backward, thus accompanying the gas as it was wafted forward. Running and gasping caused heavy breathing, which resulted in the inhalation of larger quantities of the deadly fumes. The British authorities set at work to provide respirators, and by 16 May army surgeons were able to use devices that were effective for preventing the worst effects of the gas. The use of this gas and the stories of the excruciating pain it produced shocked the neutral world. On 7 May came the news of the destruction of the Lastingham. It seemed that the Germans were determined to give one proof after another that they were callous alike to the feelings of humanity and the esteem of civilized peoples.

The Allied Offensives of 1915—When the second battle of Ypres occurred the British and French were prepared for a co-ordinated offensive against the German front at points south of the Ypres salient. It was their intention to cut through the railroads in this portion of France by which the enemy got his supplies for the part of his line north of the angle at Noyon and south of Ypres. If such a blow succeeded it would necessitate the readjustment of a large section of the line. It would also force him to draw off reserves that otherwise would be used in the Russian campaign. The battle was undertaken primarily as the Franco-British offensive of the spring of 1915. The allied High Commands did not think that they were reduced to the necessity of keeping the defensive. The French army was called out to the extent of its numbers. The British army stood at 500,000, the greatest land army Britain had ever possessed. It was believed that they were sufficiently supplied with munitions. Certainly they had quantities far in excess of any that a preceding British army had possessed. It was spring and the time for an advance.

A part of the British preparations and opened the second battle of Ypres and carried it on for three bitter weeks in the hope of drawing off the British forces and so preventing the movement. They produced such a critical state of affairs in the salient that the French were forced to open the battle in order to draw the Germans from Ypres. It was a well-judged feature of the German policy that seeing themselves threatened by this double attack at a time when their general western policy was the defensive, they concluded that it was to anticipate one of the proposed blows. Their attack on the British succeeded in turning aside most of the energy that was due from that source, fighting while the French were still unready to strike a blow. When that blow came the British were so far spent that they were of little weight, and most of the attention of the Germans was given to the French. We cannot withhold our admiration for the good generalship and daring that would try this alert strategy, truly Napoleonic in concept, of dividing the foe and striking first one and then the other of the parts.

The British portion of the double spring offensive was against Aubers Ridge, near Festubert, a mile north of Givenchy; the French portion, known as the battle of Artois, was staged in the 10-mile sector between Lens and Arras, eight miles south of Givenchy. The pressure on the British lines at Ypres did not entirely stop the British preparations at Festubert; and General French opened his projected attack at that place on 8 May. It was a short and cutting thrust and netted him 8,000 casualties in a few hours without any noteworthy gain. On 16 May the British were 10 miles to the southward, at Festubert itself, but the gain was slight and the losses great. In both of these engagements the British suffered from lack of high explosive shells, which alone could destroy the enemy's wire entanglements. The same lack had been felt at the first and second battles of Ypres, but little had been done to remedy the deficiency. The reappearance of it in these two engagements and the resulting heavy sacrifices of life caused an outburst of indignation in Great Britain. The shell scandal, as it was called, was one of the painful experiences of Great Britain's war, but it led, finally, to a better organization of the War Department and to an intricate system of altered character of warfare. How slowly the officials changed their views is shown by the fact that when General French returned from the scene of slaughter at Aubers Ridge he received a dispatch ordering him to send 20 per cent of his reserve ammunition to Gallipoli. It is difficult to relieve Lord Kitchener, Secretary of War, of serious blame for this situation. Splendid soldier as he was, and always doing his utmost for his country, he had not yet realized how much had to be done to make the British war machine equal to the demands on it.

The controversy over munitions became a chief subject of political interest at this period of the war. Mr. Asquith, the Prime Minister, was an optimistic man and could not be brought to see the need of more ammunition. General French made many requests to the Secretary of War and they came to the knowledge of the Prime Minister. The opposition newspapers took up the cudgels against him. But Mr. Asquith remained unmoved, fobbing the criticism aside in a speech in which he said that the army had all the ammunition it needed. At this time the Gallipoli expedition was demanding a large part of the products of the
munitions mills, which was another untoward effect of that expedition. After the battle of Festubert, General French took the extraordinary step of appealing to Mr. Lloyd George, submitting to him copies of his ignored requests with a memorandum of the actual need of the situation. At the same time he gave a startling statement to the troops that to the enemy's trench he had laid bare the situation. The upshot was the overthrow of the existing government and the installation of a Coalition Ministry, with Lloyd George as Minister of Munitions. From that time matters improved. The public did not understand that high explosives were necessary in trench warfare. Ordinary shrapnel had no effect on entrenchments, dugouts and machine-gun nests, in making which much concrete was used. The more powerful high explosive shells were needed to pulverize these works, reduce the artillery to inefficacy, destroy wire-entanglements and thus make it possible for charging troops to advance without slaughter. General French was undoubtedly a man of little tact and he had acquired the reputation of a man who complains, but he was right in holding that the British suffered heavy and needless repulses at Ypres and Festubert because the ammunition was not in conformity with the requirements of the modern type of warfare.

The French government had not failed, as had the British, to profit by the lessons of nine months of actual war. As soon as it found itself in the struggle it turned all its energy to the production of high-grade ammunition. By the spring of 1915 it had made long strides forward in these respects. When it opened its portion of the double offensive, therefore, it was prepared to make a heavy impression on the German lines. It was not able, however, as we shall see, to cut them completely, largely because the Germans had also utilized the interval since the beginning of the war to carry forward the same kind of improvements. They had prepared such strong defenses that the attack was met with very heavy losses. It was not until September that the Germans were able to advance in any considerable numbers, and even then they had to overcome a great deal of ground before they could reach the important line of the Somme.

The Somme, which was the scene of the greatest fighting of the war, was a wide and shallow stream, which flowed through a vast area of open country. The enemy's trenches were located on the opposite side of the river, and the British lines were at least eight miles to the rear. The Germans had constructed a series of strongly fortified positions, which were defended by a large number of machine guns and artillery. The British were able to break through the German lines and capture a large number of prisoners, but they were unable to take the city of Arras, which was strongly held.

The battle of Amiens, which took place in August, was a great success for the British. The enemy was completely surprised, and the British were able to advance several miles. The Germans were forced to retreat, and the Allies were able to gain control of a large area of the Somme.

The battle of the Somme was a great victory for the Allies. The Germans were forced to retreat, and the Allies were able to gain control of a large area of the Somme. The battle was a great blow to the German Army, and it was a turning point in the war. The Allies were able to gain control of the Somme and to advance northward, and the Germans were forced to retreat. The battle of the Somme was a great victory for the Allies, and it was a turning point in the war.
Now came the inevitable lull after a great effort. Great stores of munitions had been used up, and it would require time to collect what was required for another great attack. That such a renewed attack would be made went without saying; for it was of the Allied plan to keep trying until they at last found the means of breaking through the German resistance. Each attempt had its lesson. Neuve Chapelle showed that it was necessary to have great masses of reserves ready to follow the first charge through a breach made by masses of artillery. Second Ypres showed that it was necessary to have high explosives in vast quantities and to take precaution against gas. The experience of the battle of Artois confirmed the already established fact that the strongest entrenchments could be pierced, but also revealed the immense power of defense in scientifically constructed entrenchments lavishly supplied with machine guns. The Allies were encouraged by reflecting that they were ever growing in strength as the volunteers of Great Britain came through preliminary training. There was, in midsummer, 1915, no question about holding out in the West until Great Britain was ready. Germany herself had taken the defensive in the West, and the time was approaching to determine if her defensive could be broken.

The next great attack of the Allies came on 23 September, the British striking at Loos and the French in Champagne. In the three months' interval between its inception and the battle at Passchendaele, steady series of small engagements occurred at various points in the line. Sometimes the initiative was with one side and sometimes with the other, but the result was always the same. A heavy bombardment, a charge of infantry into a demolished trench, and then the inevitable countercharge, with the result that the place seized was held under distressing fire or given up because its retention cost more than it was worth. But the total result was little more than a steady loss of lives. The general situation was not affected.

The most notable of these isolated operations was the German attack, conducted by the imperial crown prince, on the French line in the Somme sector. This was followed by a counterattack in which he not only acquitted himself well in the preceding fighting, and murmuring against him had already begun in Germany. It is believed that he was allowed to have another try in the hope that he would restore his damaged reputation. He was reinforced until he had 50,000 men along a front of eight miles, and the movement was inaugurated on 20 June. The three weeks of fighting that followed was a series of infantry battles in small sections. The terrain lent itself well to machine-gun defense, being protected by undergrowth and many ravines and rocky ledges. It yielded the Germans an average advance of 400 yards on the entire line and was not commensurate with the sacrifice. The Argonne was long a debated region between the two sides, and many lives were lost before it was finally taken in October 1918, when the Americans and French conducted great fighting movements on each side, while American troops, at great cost, carried the forest lines northward by heroic efforts.

Throughout the summer preparations were going forward for a great Allied advance in September. The place selected for the main blow was in the Champagne sector, the scene of the battle of the 29th August. The object was to cut the railroads that supplied the German lines east of the great angle near Noyon. This done a general readjustment of lines would be necessary. In support of this main thrust the Allies desired a forward drive to cut the railroad defenses at the defenses of Lens, chiefly to engage the Germans in the northern sector and prevent very heavy concentrations in Champagne. The particular point of the Lens defenses to be attacked was Loos, three and a half miles north-west of Lens, although the battle was pressed on a front that extended nine miles north and five miles south of Lens. In this supporting movement the British had the area to the north and the French the area to the south. In the main attack, in Champagne, the operations were conducted wholly by the French. The battle opened in each area on 23 September.

In the Champagne it extended from Auberive to Massiges, a front of 15 miles. The new French guns were present in the greatest abundance and there were vast stores of ammunition. The bombardment lasted two days. The German trenches had been constructed with great skill and strength in the chalky soil. They were intricately laid out and supplied with large dugouts. The advanced position consisted of four or five parallel lines and was 500 yards deep. The bombardment reduced it to powder. As the infantry came forward each of the German position was defended except for stray machine guns manned by some survivors in the dugouts. Leaving detachments to "mop up" these survivors the columns went forward to the second line of trenches. As the men went they sang snatches of the Marselles and that other song of the Revolution, the Carnagnoles. The second line was better defended by the German infantry and machine guns, while the hostile artillery had the French under accurate range. Now the losses were great, but there was no faltering. The men went on to the positions of the guns cheering and throwing themselves on the gunners in irresistible force. Orders now issued to bring up the guns and the batteries went forward in great leaden-uniformed columns. "For the first time since the Marne," said an artillery officer, "we were galloping to battle, guns and limber jolting and shells bursting all around us." A part of the French line penetrated the second German line of defense. Late in the afternoon the advance had to be suspended on account of the heavy weather, which made it impossible for the artillery to obtain accurate observations. Next day it was resumed, and the additional reinforcements and the progress was more difficult. The French guns going forward were heavily impeded by the mud which soon churned up in the chalky soil. In the end, it was decided to give up the attempt and go farther and the French found that their total gain was from one to two miles on a 15-mile front. They had taken 25,000 prisoners, 150 cannon, and vast quantities of munitions and small arms. From the American point of view about 120,000; but the enemy's were larger still.

In this second battle of Champagne the French failed to do what they had set out to do, penetrate the German defenses, cut the
railroads, and force a retrograde movement in great force. It was under the direction of General Pétain destined to come into greater prominence at Verdun. It was undertaken in the fullest confidence of success. For months the newly established munitions works had piled up reserve ammunition and it was used without stint or economy. The lesson of Neuve Chapelle impressed upon by the Germans at Dunajec, was still further developed by the French in this battle. The attack was staged on a front wide enough to permit fair operation through its broken section, and there was no trouble about the necessary reserves, thus removing the defects of Neuve Chapelle. But it did not result, as Dunajec resulted, in a great victory for those who projected it. The reason was simple. Dunajec was fought against an army that had not anticipated this kind of tactics. At Champagne the Germans had prepared for just such an attack. The long interval of quiet was improved by the erection of rear defenses. The lines were fortified with innumerable strong places which resolved themselves into forts as the intervening spaces were carried, thus giving time to check the attackers at the rear lines. Finally, the lateral railroad behind the line enabled the Germans to bring up reserves and stop the gap before the French charges had entirely overcome the resistance. It failed on the second day, when the decimated French armies found that these newly arrived forces would also have to be defeated and others behind them, before they could hope to stand free in the open country behind the enemy's entrenchments.

Nevertheless, the results of the battle of Champagne gave the French and British a great feeling of satisfaction. If it had not given September, General Foch was in superior command of both attacks, but General French as commander-in-chief of the British armies in France had the direction of the attack on Loos. Both armies were well supplied with ammunition, and the British had received many troops of the New Army of volunteers raised and trained since the war began, but not yet seasoned by actual battle experience. At that time the British forces in France numbered as many as 1,000,000 and were organized in two armies, the first, commanded by Sir Douglas Haig and the second by General Plumer. It was Haig's army that held the lines opposite Loos.

The French troops had for their main objective the Vimy Ridge, three miles south of Lens, overlooking a wide stretch of country to the eastward. If it were taken and held the Germans would be forced back for a con-
considerable portion of their lines. Foch's men battled hard for the position when the infantry was sent forward on the 25th on a six-mile front. The bombardment had destroyed the German trenches but machine gunners held up in the ruins and a heavy barrage and a massed counterattack were encountered. Nevertheless the French infantry worked away systematically day by day, and, notwithstanding the heavy German reinforcements they carried their lines to the top of the Vimy Ridge on its western side. The enemy clung to the eastern edge and the narrow plateau on the top became No Man's Land. Here on the 26th the two armies faced one another ready for the final effort, which, it seems, would have freed the ridge from German control, when General Foch, at the request of General Joffre, sent his famous Ninth Corps to take over the trenches just north of Lens, where the British were in trouble through creating too narrow a salient in the enemy's lines. The withdrawal of this corps made it necessary to stabilize the French lines where they were.

Meanwhile, the British battle of Loos had been in progress since the 25th. As it was launched four separate attacks were made to the northward, designed to hold as many of the enemy as possible in their positions, so that the main attack might meet less resistance. These operations were as follows: (1) In the Ypres salient where General Allenby attacked the Germans at Hooge, winning ground in a brilliant dash and giving up the first of heavy artillery concentration; (2) at Bois Grenier, where some of the first and second German trenches were taken before the enemy's concentration forced the attackers back to their original position; (3) at Neuve Chapelle against the Moulin du Pietre, where the Indian troops with some British units fought a losing battle by rashly charging through the German trenches beyond the reach of aid from their supports; (4) at Givency, where a slight attack was given up before the end of the day. These engagements probably justified their purpose of holding the attention of the enemy while his lines were attacked elsewhere and are not to be judged by immediate results. In fact, they occurred an unusual war incident. The authorities had adopted the plan of placing tried British battalions in the Indian brigades. Two of these brigades charging in the heavy mist found the trenches opposite them undefended and went on without stopping to mop them up, with the result that Germans reoccupied them and attacked the advancing column from the rear. As the reserves did not come up the two brigades in the front suddenly shifted from victors into hard pressed and perilously situated men. They cut themselves out with great losses, especially the second and fourth Black Watch, serving with the Bareilly brigade of the Meurick division.

Meanwhile the operations known as the battle of Loos were under way on a line of four miles, between La Bassée and Lens. The country was flat and was littered with mining villages and slag heaps, out of which the Germans had constructed excellent defenses. The British artillery was very strong and made sad work with many of these positions. It could not however, destroy all the machine guns, which the Germans used in greater numbers in each succeeding battle, and there was work to do in all parts of their lines. It was told later for when the assault was delivered at 6:30 on the morning of the 25th the first and second German lines were taken along their whole front. Before Loos the attack was especially brilliant. The 15th division composed of New Army men, here faced the enemy. Told to take Loos and Hill 70 the high slope beyond it, they streamed forward, subduing whatever resistance was offered until they advanced four miles from their starting point and passed beyond the last of the German defenses. One of their sergeants cried to his men, as they raced forward: 'Hold your swearing, lads, and keep your breath. The next stop's Potsdam.' At the end of the day the victors, exhausted by their efforts but determined, were fortifying their positions and preparing for the enemy's counterattack. Hill 70 commanded Lens and in that town the Germans were making hasty efforts to remove the heavy guns while it was time. The Highlanders hung on to the hill but in diminished numbers.

At this point, during the afternoon of 25 September the cause of the Entente Allies stood at a crisis. If the charge of the Highlanders had been supported in force, they they knocked in the German defense could not have been mended. If a great British and French army had been sent through to the rear of the German lines, the most serious confusion the enemy's columns would have given up to the French was a keen disappointment to all Britons. The cause of failure was the bad arrangements for reserves. The battle began with no other British reserves than the brigade each division kept in support. At 9:30 on the morning of the 25th, when the Highlanders were in Loos, General French placed two newly arrived divisions, under the orders of General Haig, who was in command on the field of battle. They were then eight miles from the scene of action and did not arrive at the front until late in the night. Next morning they broke before the German counterattacks. From that time the battle consisted of a series of vain attempts to hold what had been taken. The list of British operations was narrowed by turning over the southern part of the line to the French on 28 September—2 October. The battle, so nearly a great victory, yielded the British an advance of two miles on a four-mile front. The enemy's line was bent back but it was not seriously altered. The British lost 45,000 killed and wounded, a heavy toll, but probably equaled by the losses of the Germans. One of the results of the battle was the resignation of General French on 15 December and the promotion of General Haig to the chief command of the British forces in France.

Thus the threefold offensive—in Champagne, at Vimy and at Loos—came to its end without achieving its objective but with substantial advances toward it. Within the ensuing month came several reacting assaults by the Germans, but none of them made notable gains. The best of their armies were engaged on the western front and the attacks were no more than local affairs, undertaken to keep up the spirits of the soldiers. They fell away with the coming of winter and the two armies settled down to the weary fight
against cold and wet. The next action of note was the German attack at Verdun.  

5. The Battle of Verdun: The end of November 1915, saw the German army at the height of its success in the eastern area. Russia had been driven back to the eastern borders of Poland, Riga was all but taken, Serbia was overrun, and a conquered province, Bulgaria and Turkey were active and composite allies. Austria-Hungary was converted into a willing tool, and the dream of a Berlin-to-Bagdad line of communication seemed to be an actuality. To the German High Command it seemed only necessary to wage a defensive war in this region and turn with concentrated energy to the western area in order to make the cause of Germany triumphant over all opposition. The decision was quickly taken and preparations made with great care and energy. A great breaking-through movement against the French line of defense was proposed, to be followed by the same kind of turning strategy against the severed wings that had characterized the plans that went into effect at the first battle of the Marne. The point selected for the blow was Verdun. Why was this place selected? Several reasons can be given: (1) The Verdun angle was a spear-like thrust far into the German defense; for, their lines on the east ran south from it to Saint Mihiel, a distance of 25 miles, and on the west sloped off to Vauxois, about the same distance, the rounded point of the angle between Étain and Mauncourt being the most vulnerable. (2) Verdun in French hands held the Bresy coal fields under long range fire, and it was considered important to free these fields from that menace, since the ore was needed in the manufacture of munitions essential to the conduct of the war; (3) the Germans had ample railroad facilities in front of Verdun, enabling them to bring up troops and supplies as freely as were needed; (4) the crown prince commanded, he had not been very successful in previous movements, and from what he had shown in the war he should have the honor of winning a great victory; (5) Germans had a strong sentiment for Verdun, partly through feelings that had endured from the 16th century when as one of its parts of the French and as the site of a fort, it was a bastion of resistance between France and Germany and partly because several attempts to take it during the course of the war had been thwarted by the defenders.

Verdun was important to the French for three reasons: (1) Its successful defense so far had made holding it a point of honor; (2) as long as it was held it was an effective barrier against German operations in the upper Marne Valley; (3) much of the French artillery of approach to Paris; (3) it protected the Argonne, another important obstacle to German progress in this region. If Verdun were taken, therefore, it would be necessary for the French to make extensive readjustments in their lines of defense, as well as for them to learn that they could not make them safely in the face of such heavy pressure as Germany could now bring to bear.

In the beginning of the war, Verdun, one of the main forts of the eastern defense, had been changed into a fortified area to comply with the progress of the science of siege operations. Its steel and concrete forts no longer constituted the chief features of the defense, but outlying trenches had been dug, and as the war progressed these trenches had been improved and supplied with dugouts and were entirely of the strongest kind. It was by this means that the place was able to meet the strong bombardment that was about to come upon it. Verdun, however, had one weakness, and it may well have been a reason why the Germans decided to make their grand attack at this place. One standard gauge railroad led into the place, from Sainte-Menehoult, but it passed within five miles of the German guns at Vauquois and its use was subject to interruptions. There was a narrow-gauge railroad from Bar-le-Duc to Verdun, but to use it meant great delay in unloading and reloading at the junction point. The Germans believed it would be impossible for the defenders to obtain the munitions over these roads to withstand the attack they proposed to make. The French, however, had provided an excellent motor-transport service from the main railroads into Verdun, and it proved sufficient for their battle needs.

The German line in front of Verdun ran from Étain, east of the town, and in the Plain of the Woëvre, to Ormes, where it rose to the heights of the Meuse and crossed them to Brabant on the Meuse. Thence it crossed the river to Forges and Mauncourt and reached the edge of the Argonne four miles west of Vauquois. South of Étain it continued across the Woëvre Plain in a southerly direction, climbing the heights of the Meuse just east of Les Eparges and passing through the Argonne envoirs of Saint Mihiel. The whole line, from Saint Mihiel to the Argonne, was 60 miles around the loop, whereas straight across country from end to end it would have been only 28. The section of the line selected for attack was on the north, along the heights on the east, or right, bank of the river from Ornes to Brabant in the first phase of the battle and across the hills on the west bank from Forges to Avocourt in the second phase. From Ornes to Brabant is eight miles and then it turns northwestward. The Heights of the Meuse are from five to eight miles wide in this region. In trying to advance along their crest from the north, the Germans showed that they preferred that way of approach to an attack along the Argonne Plain or the Woëvre Plain, which would have brought them to the foot of the Heights at Éix, only five miles from Verdun. They perhaps chose wisely; for to have climbed the escarpment at Éix in the face of French defense would have been very difficult.

Their reliance was massed artillery with which they expected to repeat the experience of Dunajec. On the eight-mile stretch from Ornes to Brabant they concentrated an unheard of number of guns, from four-inch caliber to 13-inch howitzers. Airmen flying over the woods in which these guns were assembled reported that they lay like apples in a basket. The plan was to pulverize one section after another of the French lines so that the infantry could go forward without serious opposition. To support the artillery the Germans brought up new troops until there were 14 divisions, at least 230,000 rifles, in the sector from Ormes to Brabant, and there were ample numbers in the other sections. The French are said to have anticipated the attack at Verdun. If the statement is true they
were gravely responsible for carelessness in failing to make better preparations. In the critical sector they had three divisions of Territorial troops, by this time inured to warfare and dependable for good results, but not equal to the best troops. It was for them to hold the lines until reinforcements arrived. General Herr was in command of the sector, which was in the eastern area under General Dubail until the middle of December, when it was transferred to the central area under Gen. De Langle de Cary. The northern defenses of the town were in a weak condition. Having given up the policy of manning the forts, the authorities had removed the guns from those positions for use elsewhere. The lines had been indicated and the strong positions had been occupied, but through the frightful barrage to the supporting lines. At noon the enemy advanced without opposition, took the first line unopposed, and most of the first line of support. In the afternoon the French won back the support lines in the Woods of Caure, but those in the Woods of Haumont were not recovered. Hurried efforts were made to construct strong rallying lines in the rear, and the troops were ordered to resist until the last in order to permit these lines to be finished.

Now followed a period of bitter fighting. It was for the French a matter of staying until the last possible moment and repeating the process in a position slightly in the rear. The bombardment was intense. Nothing like it had been seen in any other battle of the war. On

22 February Haumont was won by the Germans after a heroic defense. Its loss imperiled Brabant which was evacuated on the night of the 22d. Next day the attacks were renewed with unflagging violence. The heavy German guns could not be moved easily and their aim became less efficient as the target became more removed. The French artillerymen handled their 75’s brilliantly; the Territorials did all that was demanded of them; and as the enemy came on in massed formations a great toll of life was taken. On this day attacks were made on the French line in the Wovre, and it was decided to draw them back to the foot-hills of the Heights of the Meuse, so that Ornes was given up. At this time the French line had been driven back on an average of a mile and a half in three

days' fighting. In the centre it made a loop around Beaumont and there throughout most of the 24th the tide of death rose high. In the afternoon the Germans surrounded the place but the French managed to escape capture. On this day there was a general retirement.

The 25th was a death day in the battle. When General Joffre realized on the 24th how serious was the attack on Verdun he sent thither General Castelnau with authority to act as he saw fit. He had previously ordered up regiments, among them the famous 20th corps which had saved Nancy under Castelnau. Only two brigades had arrived by the morning of the 25th and the 20th corps was not on the field until afternoon of that day. The first act of Castelnau on arriving at Verdun was to direct General Pétain, commanding the second army, to come to Verdun with his staff. His immediate response and the vigor he infused into the operations perhaps saved Verdun for the French.

The retiring army reached the reserve positions during the night of the 24th. The trenches were well constructed and afforded comfort to men who had been fighting incessantly with little cover during four days. They became surrounded and were driven back. The afternoon of the 25th they fought back. The main body of the 1st Army was in the field on the morning of the 25th awaiting the onset of the German, himself conscious that before him were exhausted troops in their last line of defense and that reinforcements were about to arrive. He massed his superior forces for a final crushing blow, believing that victory was in his grasp. The dogged defense made by the Territorials that day cannot be forgotten in French history.

When day broke it was snowing and bitterly cold, a bad thing for the attacking parties, since it made them more distinct against the horizon. But the Germans showed little caution that day. They had men in abundance and thought little of losses. A few miles to the north the kaiser and his staff halted on the twin peaks near Ormes watching the operations through glasses, and no one dared falter under such conditions. His troops attacked at each end of the new line, at the Côte du Poivre on the west and at Douaumont on the east. At Poivre the Germans came up time after time and were driven back continually by the 75's and the riflemen. The place was never in danger. At Douaumont the attacks were heavier and more stubborn, for the position was rightly believed to be the key of Verdun. Once fortified with German guns the French lines would be forced back from the surrounding hills. With reckless regard for their men the kaiser's officers sent up unit after unit against the well placed French lines. They seem to have thought that each blow that failed would weaken the defense to some extent, and that eventually it would be so weak that the attack would carry through. It would be difficult to explain the slaughters of brave Germans that day as wave after wave was urged forward into the French barrage. The valley through which they approached was covered with the dead and wounded. At its exit the prostrate bodies lay in piles where the fugitive were caught trying to get away. But they ever came on. As evening fell the infantry rallied for a final attempt. The kaiser was waiting to announce victory, and already persons in the government confidence in Berlin were waiting at the telegraph wires for the word that would confirm the good news. This last charge was the most violent. The infantry of two corps was sent forward against the crest of Douaumont on a line two miles long. They fell in swaths at the crest as they tried to cross the narrow plateau in front of the French lines. Wave after wave had thus been mowed down and the mowers were tired and sickened with their work, when at the very close of the day the 24th regiment of Brandenburgers, one of the crack units of the German army. In narrow formation it plowed its way through the defenses east of the town of Douaumont and broke through the lines at the site of the ruined fort, and here it stood during the night, behind it the lines forming anew. The kaiser seized the moment to announce to his people that Douaumont was taken.

Late in the afternoon General Pétain arrived at Verdun. A few hours later came the 20th corps. The new commander seized the situation promptly. The forces in the front and the next morning they delivered a counterattack which drove all the Germans from the crest around Douaumont, except a few Brandenburgers who managed to hold out. The 20th corps had proved a Black Friday for the Germans. At a tremendous loss they had won a precarious hold on the crest of a ridge, and at an early hour next morning they lost it.

Now followed three days of hard and desperate lunges at first one and then another place in the French defense. A great many lives were sacrificed uselessly in an attempt to cut through in the centre, between Poivre and Douaumont. Another effort was an attempt to make a great flanking movement by way of the Woëvre Plain to the Heights south of the line of defense, but the two corps to which the task was assigned were crushed when they attempted to climb from the Heights into the Heights. When Castelnau arrived in Verdun on the 24th the officers there were ready to give up the place. He declared that it must be held. Pétain took the same ground. It was then that the French soldiers, high and low, joined in the vow, 'Ils ne passeront pas' ("They shall not pass"). All France poured its soul out in those words. To have given up Verdun after that would have been a moral defeat.

The first week of the fighting had shown the Germans that they could not break through the French lines by frontal attacks and they decided to shift their efforts to the western side of the Meuse. Now came a pause while the heavy artillery was being transferred. The first stage of the battle of Verdun was over, and it had yielded the Germans nothing but a serious loss of men. It is true their lines had been advanced four miles along the northern portion of the Heights of the Meuse, but against this gulf the factor of surprise was expanded and the French, thoroughly aroused, were present in force and bringing up men all the time. West of the river the French were placed on a ridge known as Côte de l'Oie (Goose Heights),
shaped something like a ham. The small end is on the river opposite Brabant and is about a mile wide, while the large end is five miles due west and is two and a half miles wide. This ridge is bordered on the north and west by a brook with narrow meadows above which the ground rises to a heighth of from 150 to 225 feet, the highest point being at the western end, an elevation known as Mort Homme (Dead Man). Still farther west and two hills from Hill 257, whose slopes reach to the vicinity of Avocourt, eight miles west of the Meuse. In the beginning of the battle the French lines ran along the narrow part of the ridge for three miles at the foot of the northern slope and then crossed the brook and took in the villages of Béthiscourt, Haucourt and Malancourt, and then it ran southwesterly until it took in Avocourt and proceeded thence to the Argonne. Since the Germans had carried their line forward on the east bank for four miles, this strong position on the west bank embellished their advance along the eastern bank and convinced them that nothing could be done until they had cleared the west bank. The key of the Argonne ridge was Mort Homme, its highest point. It stood at the centre of the position and if held and fortified by the Germans it would force the relinquishment of the positions on each side. If this hill could not be taken the next best tactic was to sweep around Hills 304 and 267 at Avocourt, turning the whole elevated area. Such was the work to which the German army gave itself as soon as it realized that the way along the Heights of the Meuse was blocked at Douaumont and Pioret. The fighting in this region falls into two phases, which we may recognize as the second and third stages of the battle of Verdun. The first concerned the capture of the Côte de l'Oie, the second was an attempt to turn the defenses by way of Avocourt. But we must remember that the operations were in progress there were many supporting blows on the eastern side of the river, designed mainly to hold French troops in that section while superior forces attacked on the western side. On the 1st stage of the battle opened on 2 March, when the Germans began an active bombardment on the line from the Meuse to the Argonne. It steadily grew stronger until it was intense on the 5th. General Pétain interpreted it correctly as the precursor of a new movement and prepared accordingly. He was not deceived by a holding attack made on Douaumont, which resulted in the loss of the village of that name but did not shake the French hold on the ridge above it.

On 6 March the infantry battle on the west side began on the end of the line opposite Brabant. The Germans followed the plan used on the eastern side, subjecting a section of the line to severe artillery fire and then sending the infantry forward, a process that was successful against the weak territones at the beginning of the battle. It was the practice of the French in the World War to use their men with economy. When they stood in a position that was not essential to the main plan of the battle the policy was to make the enemy pay as dearly as possible for it but to give it up when holding became very costly. Such was the policy adopted at Verdun. There was a steady recession until the critical positions were reached at Douaumont, on the east side, and at Mort Homme on the west side, and Mort Homme had not been taken. This was in one's tracks and die, if necessary. This policy was understood by the French soldiers. It was put into use on the west side of the Meuse in the battles that occurred in the second stage, from 6 March to 17 March. The result was a gradual drawing back to the Mort Homme position, from the east end of the Côte de l'Oise until all the narrow portion, corresponding to the shank of the ham, was in German hands. But the French line would yield nothing around the eastern base of Mort Homme. Many of the enemy gave up life in trying to drive them from this position. On the 14th a main effort was made against Mort Homme. Forward went 25,000 men in five waves. In general they were checked, but a portion of them, 4,000 on the 15th, managed to lodge themselves just under the crest of a hillock, called 265, a spur of Mort Homme. They drove the defenders from the hillock and news went to Berlin and the neutral world that Mort Homme was taken. It was false. Hillock 265 had the same fate as Mort Homme that the town of Douaumont had to the ridge of Douaumont, it was an outpost and useless unless the main position was carried. It was the German's nearest approach to Mort Homme for many days.

While these operations went on severe blows were delivered on the east side of the river, with the purpose of attaining Douaumont from the east. Here at the village of Vaux and the old fort of the same name the Germans fought desperately for three days to establish themselves, 9–11 March; but they were repulsed with great losses. Wherever the enemy appeared the Frenchmen appeared ready to oppose him. All France watched the struggle, as, indeed, all the world watched. The Germans spent up division after division, and Joffre did the same thing. It is said that every division in the French and German armies had gone through the Verdun trenches when the battle ended. When the smoke of the battle stage of the battle cleared the crowned prince was beaten, but he was unwilling to admit it. To withdraw now, he felt, would be a blow to his prestige. It was decided that he should have another try, and this time it was to be around the extreme western end of the French defensive position west of the river. Here we come to the third stage of the battle, the attack on Avocourt. West of Mort Homme is Hill 304, which is higher than Mort Homme and commands it. It, in turn, is approached by Hill 287 to Mort west, and the western slopes of that are reached from the woods north of Avocourt. Through these various positions, therefore, woods, Hill 287, and Hill 304, the Germans proposed to take Mort Homme, which, in turn, would enable them to clear the west bank of the river, and which, finally, would make it possible to clear the east bank and outflank Douaumont on the west, and so enter Verdun. It was a long series and it had taken a month's hard fighting to develop it. But there was a better plan, but reflection seemed to confirm the German faith in the series. They felt that
they had at last worked it out to a logical statement — take Hill 304 and hard fighting will accompany it.

On 17–20 March they delivered an intense bombardment on the trenches around Avocourt, and on 20 March began the long and desperate fighting that continued until 9 April. They first tried to advance by Belle Wood. By using flame throwers they gained a foothold in the woods and built a redoubt as a base for further advance. At the same time they drove forward in Avocourt Wood until Pétain decided to spend some of his valuable forces in a counterattack. It was worth what it cost; for it drove the invaders back from the position. At the same time he withdrew from the village of Malancourt but took such a strong position at the foot of Mort Homme that the position they won was worth nothing to the Germans. This happened late in March. After a breathing spell the Germans became active again on 3 April, fighting hard for the approaches to Mort Homme on the north. On 8 April they had driven up to the foot of the hill on the northern end and to the foot of Hill 304 on the northwestern side. They then massed five divisions and made a final attack on the 9th, comparable in intensity to the great attack on Douaumont on 26 February. Here, as then, they had driven forward by piecemeal attacks until they stood within touching distance, as it were, of their main objective. Here, as then, they gathered their strength and made a final assault along their whole line. The 9th was a day of great effort and a day of great slaughter for the Germans. They came on in close formation, only to be destroyed by the French artillery. Driven back they rallied and came forward again, and again they were forced back by the shower of death that fell from the hills. At nightfall all grand offensive was a gigantic failure.

For some time it now seemed as if the German High Command was willing to acknowledge defeat, since the battle front was comparatively quiet for nearly four weeks. The renewal of the conflict was probably due to political pressure. The German armies had much to say about the great victory that was to crown the sacrifices that the ruling class did not dare confess defeat. The part of the struggle that came after this lull has been called the second battle of Verdun, but it was, properly, only a deferred part of the first battle. It was taken up and carried on in dogged determination but without a clear feeling that victory would be worth its cost. In this part of the battle three stages are also observed, one on the west and two on the east side of the Meuse.

Before they began a change had occurred in the French command. General Pétain had succeeded De Langle de Cary in command of the middle portion of the great battle line, stretching from Soissons to Verdun, and General Nivelle, under his supervision, was in command of the second army defending Verdun. The change in command did not mean a change in tactics.

The fourth stage of the battle, the first after the lull in April, was an attempt to sweep back the defenses on the west bank of the river. It began with a severe bombardment on 3 May against Hill 304. During four days artillery and infantry made alternate attacks on this hill without success. At last it was assaulted with the equivalent of two corps against two regiments defending it. Five times they rushed forward and were repulsed, the last time in a fierce counterattack that was delivered in the darkness. Next day, the 8th, the top of Hill 304 was so violently swept by hostile fire that the French drew their lines down to its base, yielding the position for which they had taken heavy toll. From 17–21 May Mort Homme was carried in the same kind of a concentration. Then came a period of great rushes and counter-rushes to carry the lines farther along the river bank. They yielded the Germans nothing and cost them tremendously. At the end of the month the line of battle on the west side was about a mile south of the crests of Hill 304 and Mort Homme and ran straight east and west, to the river on one hand and to Avocourt and the Argonne on the other. Now the battle died down in this part of the field.

The next and fifth stage of the battle of Verdun belongs to the story of the eastern side of the river and here the offensive was taken by the French. The object was to press back the enemy at Douaumont and to draw off some of the troops being used on the other side of the river. After a two days' bombardment the infantry went forward on 22 May and took most of the ruins of Fort Douaumont out of the hands of the Germans. Only the northeast corner and a few machine guns in great numbers. Here the French held on despite the maddening crash of shells over their heads until the 24th, when two fresh Bavarian divisions recovered what three French regiments had won. Thus ended the French offensive without profit. The sixth stage of the battle was a series of operations around the right end of the line that ran across the Heights of the Meuse. In this position they had gradually worked forward until they were within five miles of Verdun at some points. At Douaumont they had high ground from which they could observe all the ground to the city. They had found it impossible to go forward in a straight line and they decided to make the attempt by their left flank. Blocking their way on the left stood Fort Vaux, held by determined French soldiers. Its guns covered a wide area right and left and protected the strong Fort Souville, which was the last strong protective work of Verdun.

On 31 May, a heavy bombardment was begun, and the next day an infantry attack was made. There were some gains west of Fort Vaux and others to the east, and the next step was to make a converging assault on the fort from three sides. Some idea of the intensity of the fighting in this section may be obtained from the fact that for three months an average of 8,000 shells had fallen on this fort. On 2–3 June the infantry went in employed, and again Bavarians were used in wave after wave. They were received by the garrison in cellars and among the ruins of the concrete construction, with Major Raynal in command. The name of this heroic man deserves special mention in a series of operations in which heroic deeds were common. Under his indomitable will the garrison held
out until 6 June and did not surrender until it was reduced to a mere handful. On 7 June came a massed attack on a long stretch of trenches. The result was an advance as far as Fleury. Here was the farthest advance of the Germans in the battle, although the heavy fighting was over by the end of June. Indeed the battle flared up occasionally until August. But it is better to say that it did not continue in its proper form beyond 30 June, which was the 130th day of its continuation. At its close the Germans were 16 miles from Verdun at the nearest point.

The battle of Verdun, as an incident in the military history of the war, is a long fog of slaughter in which only the larger divisions of operations stand out, as the six stages into which it here has been divided for the convenience of the reader. It was a series of bombardments any one of which may safely be pronounced the severest of the war up to the time when it occurred. To carry a position of a few yards after such artillery preparation frequently demanded charge after charge, but the Germans were willing to pay that price for a slight gain. In 130 days they went forward on the German front at an average of four miles along the entire front. But this does not express the actual rate of advance in the later part of the struggle. From 9 April to 30 June the progress on the east bank was one mile while it was a mile and a half on the west bank. At this rate the city of Verdun might have been taken in another three months, but at such cost as would have revolted the world. To hold it had long been no more than a matter of honor with the French, and so deeply had they bitten into the German resources of men and material that this sense of honor was well satisfied many weeks before 30 June. It would be no discredit to give up a place which had been so well defended whenever the High Command saw fit to take the step.

The Germans came to the battle of Verdun fresh from victories over Russia and Serbia, convinced that by massing artillery and men they could break down all resistance, as in the East they misjudged in failing to appreciate the endurance of French soldiers under artillery fire. "Passeront pas" sang the poilu and he made the sentiment good with his life. It was he more than any general that won the battle for France. No figures have been given to show how heavily he lost. It is certain that he took heavier toll than he gave, and the estimate he made of the loss of the enemy at 300,000 seems no exaggeration for the whole battle. It is likely that the French losses were not more than two-thirds as heavy.

There is an addendum to the battle of Verdun, that may as well be mentioned here. The battle of the Somme, which began on 1 July, drew away the German forces in increasing numbers, and finally the Verdun front was left in a comparatively weak condition. General Nivelle took advantage of the opportunity and made a sudden attack on 24 October. A short bombardment leveled the German trenches and then the French troops advanced one mile and a half miles on the eastern side of the Meuse. Douaumont and several positions on its west were thus recovered. Artillery was then concentrated against Fort Vaux and made the place so hot that the enemy left it on 2 November. It was now only necessary to move the guns forward and repeat the tactics of 24 October. Thus a second bite was taken in enemy territory on 15 December when the Germans were thrown back for two miles between the Woevre Plain and the Meuse. They were thus in the positions from which they had begun their attack along the Heights of the Meuse on 21 February. All their gains on the east bank were nullified, and the world was given additional evidence of the defeat they had suffered. In this time the Germans themselves had come to realize it, as was shown by the removal on 29 August from the position of chief of staff of General von Falkenhayn, who was chiefly responsible for the battle.

**Minor Operations.**

1. **Supplementary Engagements Early in 1916.** During the first half of 1916 the battle of Verdun was followed up in all other parts of the Western area. Into this struggle were drawn the best of the French forces; for it was here that the fate of France seemed at stake. It was the evident purpose of the German High Command to deal France a death-blow and that done to turn at leisure against the British in the northern section of the line. To use a term common in German newspapers, France was to be "bled white."

The result showed how wisely the French High Command husbanded French resources, doing the greatest amount of damage with the smallest amount of loss. The end of the struggle saw the French badly shaken, no doubt, but still strong and only awaiting a period of recuperation to go on with the struggle.

In making their plans the Germans counted on a state of unreadiness in the British army. It is true that the number of Britons in arms was 5,000,000, and it is true that munitioning had progressed to a remarkable degree; but the New Army lacked something in training for the vast task of the war. As a machine it needed "tuning up" and concentration at some point at which the weight of men and material could be brought to bear in the right direction. There was expectation that it would soon take the offensive on a grand scale, but it could not be ready until the summer. Perhaps, if the Germans had not forced the fighting at Verdun the grand offensive would have been delayed until the autumn, when there would have been a mighty cooperating attack by the armies of the two nations. By striking one of them early in the year the Germans wisely anticipated such a double attack.

The inactivity of the British during the battle of Verdun led to some criticisms. German influences in neutral countries indulged in sneering remarks about the willingness of the British to let France sacrifice herself, evidently hoping to create dissension between the Allies. Probably some echoes of this attitude appeared in the French press; but the responsible organs of opinion in France understood the situation too well to be caught by such a bait. In respect the British gave a vital and helpful aid to their Allies: Early in the year they took over the Arras sector previously held by the 10th French Army under General d'Urbal, so that their lines extended from the Somme River to Pilckem at the northern limit of the Ypres salient. a
distance of 80 miles. Beyond them was a short sector in the hands of the French and beyond that the Belgians held the line to the sea. The extension of the British lines to the Somme, besides releasing the 10th French army for service elsewhere, gave the British some solid ground for their future operations and thus made their work much easier, when it began, than it had been in the flat and soggy area around Ypres.

In fact, during this interval the British were making steady preparations for a great attack in the region just north of the Somme. Weeks were spent in collecting guns and ammunition in that section and in organizing the intricate system of transportation behind the lines that was necessary to enable the army to move properly in a large-scale modern battle. The Germans seem to have known that some such an attack was imminent, for they did not weaken their lines before the British troops but delivered several sharp holding blows in that quarter. One of their plans was to organize a strong mobile artillery force which traveled up and down the sector, shelling trenches at various times and denying the way for sharp infantry attacks. The British troops called this artillery force "the flying circus." These isolated attacks did not alter materially the relative positions of the two sides in the north, although there was probably little German after they afforded the newly-organized British army some valuable training, for they were on a larger scale than the trench raids which had by this time become of almost nightly occurrence. Most of them were delivered in the Ypres sector, where sharp local actions occurred from February to May, one side attacking and receiving a counterattack, only to be succeeded by the reverse process a little later. The net result of these affairs was practically nil. It was an unpleasant business, as the surface of the earth was a broad mud-sluice interrupted by numerous shell-holes, into which the soldier who slipped was liable to drown. It is told of one column that was sent forward to cover 200 yards that it took hours to cover it with no other obstacle in their way than the mud. The sufferings of the men were great, and especially those of the British, whose positions were generally on the plain, while their adversaries were on the hills and had the range of their trenches and lines of supply. As the time approached when the British could be expected to be ready for their great offensive, the Germans made a series of sharper thrusts in the Ypres salient. Some writers have spoken of them as the third battle of Ypres. The term is not applicable to operations that call to mind the first and second great effort at this place, where the design was to break through to the Channel ports. In this case the object was merely to retain the British forces in this section and prevent concentration on the Somme.

The first of the series occurred on 2 June between the village of Hooge and Hill 60, where Canadians held the British trenches. An intense bombardment of four hours was followed by a massed infantry attack by nine or 10 battalions. The attackers came forward confidently and then got the shock of finding that there was nothing to do. But the crumbling trenches sheltered a few who had strength and reason enough left to rise and fight desperately, some of them with undamaged rifles, some with the butts of broken weapons or with entrenching tools, and some with naked fists. The fierce battle lasted well into the night, the Princess Patricia's Canadian Light Infantry and the Canadian Mounted Rifles bearing the brunt of it. At nightfall the Canadians fell back to reorganize, yielding their enemies a gain of 700 yards. Next day came a counterattack through which most of the lost ground was recovered, but so destructive a rain of shells fell upon it that it could not be held; nor could the Germans stay in it under the British fire. It became a new addition to No Man's Land.

On 6 June the enemy attacked again, this time at Hooge and to the northward. The action opened with heavy bombardment and the explosion of several mines, with the result that Hooge itself was occupied. It proved a bad gain for the Germans; for their line which had formerly been on high ground overlooking the British in the plain, was now brought down to the plain also. The Canadians, however, were not willing to leave the situation as it was. Their pride was aroused and they made a counterattack on 13 June and took the most important part of their old trench position which was not recovered. After this the Ypres sector returned to the less exciting practices of night raids and intermittent bombardments. The attacks in June and in the preceding months had not interfered, with the preparation for the Somme drive, they had not reduced the British holdings materially, and we must consider them failures.

2. First Battle of the Somme.—The battle of the Somme lasted from 1 July to 30 Nov. 1916. It was a grand effort by the British and French armies to penetrate the German defenses at a vital point and force the Germans out of a large portion of occupied France. Three million men fought here on the two sides and a third of that number were killed, wounded or captured. It was undertaken after a great deal of preparation had been made. Verdun was launched by the Germans in order to anticipate the part France would take on the Somme. The losses of France at this point lessened somewhat her striking force in the North, but not more than the German striking force was lessened. Was the battle of the Somme fought too soon? Undoubtedly it would have been better to have waited a few weeks longer, as first intended, but there is little to suggest that the ultimate result would have been satisfactory to the Entente Allies if they had waited. The battle was undertaken as a decisive thrust against the Germans in the West, to begin their destruction. It actually. Joffre and Haig worked together in good hope, striving to make the best possible preparations, and although the terrific grind of death was going on at Verdun the preparations for the great battle were not interrupted. Time and again Haig offered to break them off and send help to Verdun. Joffre's reply was ever that the French could take care of Verdun and that the British should go on with their preparations for the great battle. At last, however, the June fighting showed that French Front line was wearing thin on the Douaumont plateau. Then Joffre consented that Haig should play his part, and the great battle was opened.
on 1 July in order to take pressure off Verdun. It probably saved the fortress from capture.

The place selected for the attack was 35 miles north of the great angle in the battle line near Noyon, on the Oise. If the British could break through here and the French a little southward and sweep along in a straight line to the east they would get behind a large section of the German line and force it to fall back. If they could go through with dash and reach Saint Quentin, 40 miles in the rear, they would

its middle point. It passed through Albert, two miles west of the line, and Bapaume, nine miles northeast. This highway, an old Roman road, was the axis of the British attack, but by the failure of the attack of the northern wing it became the northwestern limit of the area of actual progress. The British went about their preparations for battle with that care and precision which cost them so dearly in the first two years of the war. They made slight efforts to conceal their activities, as though they thought concealment unnecessary. Thus warned, the Germans made unusual defensive preparations. The chalky soil lent itself to entrenchments, and they spent days and nights in making dugouts strong enough to resist bombardment. Behind their first line they constructed a second line, and behind that a third was begun. When the attack was delivered this particular sector was the best defended in the entire German line.

For the attack the British had an army under Gen. Sir Henry Rawlinson containing 20 divisions, in all about 250,000 infantry, besides artillery, engineers and other troops. The French had two armies to the south of the British, one commanded by General Fayolle and another by General Micheler. The first took an active part in the initial stages of the battle and had an infantry strength of a little more than 50,000 men, while the second did not come into the struggle until it had passed into its later stages. Under Fayolle, who was an excellent commander, were the famous 20th Corps, the Iron Corps—which saved the day at Nancy in September 1914, and turned the tide at Verdun on the fateful 26 Feb. 1916, and an equally famous unit, the Colonial Corps. They were considered the flower of the French shock troops. In artillery the French were well supplied, and they had been using it long enough to know how to get the best results out of it. The British had a larger supply than ever before, but not as much as the situation required. Nor had they yet learned how to use it with the most precise results. Their troops, newly organized and well trained in the camps of instruction, lacked actual experience in large-scale fighting. They were especially weak in co-ordination of infantry and artillery service, shamed to be eager to go ahead in the battle of the Somme that they often ran into their own barrages. In the latter part of the battle the supply of artillery was larger, which illustrates the disadvantage the British were under in having to begin the fighting before all their preparations were made.

The Germans on the opposite side were parts of two field armies, one commanded by Rupprecht, crown prince of Bavaria, and the other by Gen. Otto von Below—not to be confused with the von Bülow who fought at Kluck's left in the battle of the Marne. For purposes of strategy, however, von Below was under the direction of Rupprecht, as Fayolle and Micheler were under the direction of Foch, who commanded the northern great section of the French line. The Germans had about 20 divisions in the sector attacked, but they were continually shifted during the battle. It was said that each side put in more than the divisions while the engagement lasted.

General Haig opened the battle on 1 July after the fiercest artillery bombardment of the
war. Remembering that the failure at Neuve Chapelle was because the breach in the enemy line was too narrow and at Loos because the support sent forward quickly enough, he now attacked on an 18-mile front and assembled a great mass of troops to follow up the success of the first moment. He expected the artillery to level the opposing trenches, as on former occasions. The Germans, however, had constructed their dugouts so deep that they were safe from a fire that leveled the trenches on the surface, and when the barrage lifted the defenders came to the surface with their machine guns, which were in great numbers, and opposed unbroken lines to the attacking parties all the way from Gommecourt to Fricourt.

The British advanced with their traditional courage, singing and jesting in the assurance that they were going to occupy abandoned trenches. They were met with a withering fire but did not falter, rushing forward to the work of the moment in succeeding waves. Then the German guns opened on the areas behind them, cutting off the supports and making it as unsafe to retreat as to go forward or to remain stationary. The hours of the slaughter of brave men that now followed can best be understood by saying that at the end of the day the British losses amounted to 50,000, or more, and that the German lines on the section indicated stood intact. Southeast of Fricourt, however, there was better success. The German trenches were penetrated for a mile on a seven-mile front and 3,500 prisoners were taken, with a number of guns and other material. It was a bad return for the effort made, and the cost was so heavy that for weeks the authorities did not dare let all the facts be known at home.

The French also attacked on 1 July from Maricourt to Fay. The Germans had taken no extraordinary precautions against them, thinking the Verdun fighting had left them too much exhausted to be feared. The attack, therefore, was not the best, but the French were supported by artillery that had leaped its lessons well at Verdun, was unexpectedly successful. It went forward nearly two miles on the entire front, and yielded 6,000 prisoners. Although the line of the French front was cut, General Haig did not falter in his purpose. Setting his teeth with British determination he began to hammer away at the part of the line which had yielded to his initial blow, and for five months ate his way into it. He did not break through, as the British public expected in the beginning, but he forced the Germans to readjust their lines to the northward and eventually to move back on all that front on which they had stood so steadily during the first hour of the battle. To the Germans the initial attack was a victory. They concluded that the British effort was measured by the results of the first day's fighting and that the onslaught at Verdun, apparently so near to victory, could go on. They were soon undeceived. The continued assaults of the British were adapted to the experience gained on 1 July. There was to be no more assaulting a long line but the artillery fire was to be concentrated on a short, the German line being enveloped. The area of activity was small, about 50 square miles, but nearly 1,000,000 men fell in that area, and after the bitter experience of 1 July the British losses were not excessive.

To understand the main features of this stage of the fighting it is necessary to consult the map. Haig's chief objective was Bapaume, important because several roads centred at it and because once attained the British would be beyond the previously constructed German lines and in a position to force a further retirement on each flank. To reach Bapaume from the British front, a distance of eight miles at any point in the arc from Gommecourt to Maricourt, it was necessary to penetrate five lines of defense. The British and French trenches extended across the base of the angle made by the Somme and the Ancre rivers, the surface of which is generally flat and low. Back of the first German trench the ground rose 150 feet to a ridge that interposed its barrier across the lines of access to Bapaume all the way from the Ancre to the north and south road that connects Bapaume with Péronne. On the southern and western edge of this ridge—which was from two to three miles wide—was the second German line of defense. North of it three lines interposed before Bapaume, all constructed after the attack of 1 July. They were strong obstacles to the British advance.
